Netherlands Colonial Empire. Total area excluding mother country (approx.): 789,700 sq.mi.; total pop. excluding Netherlands (est. Dec. 31, 1940): 70,760,000. The accompanying table lists the overseas territories of the Netherlands, together with statistics appropriate to each of them.

History.—The year 1946 opened on a troubled scene. The commander of the British forces, representing the supreme allied commander, Southeast Asia command, was in control of the situation only in a few key areas in Java (Batavia, Bandoeng, Soerabaja, Semarang) and Sumatra (Palembang, Medan, Padang) as well as in parts of the other islands of the archipelago. In the interior, however, the radical Indonesian nationalist elements of the republic, armed and supported by the Japanese after their defeat, held sway; many thousands of European internees were held as hostages in prisons and internment camps. On the outskirts of the sectors held by Allied forces, desultory fighting and sniping by Indonesian bands went on; and the considerable Japanese armies in the interior, still to be disarmed and evacuated, formed a sinister background.

In these unbalanced circumstances, political negotiations began on March 13 between the Dutch, represented by the lieutenant governor-general, and the Indonesians of the "republic" in Java, led by Sutan Sjahrir, with the British ambassador, Sir Archibald Clark Kerr (later Lord Inverchapel), acting as chairman. Discussions soon reached a stage where it became necessary to consult the home government in the Netherlands. All parties participating in the talks therefore went to the Netherlands by air, and discussions were continued there till the end of April; they broke down on the Indonesians' claims that the republic should receive formal recognition as a sovereign power

Overseas Territories of the Netherlands and Essential Statistics

Country and Area, sq. mi. (approx.)	Population (000's omitted)	Capital	Status	Governors, Premiers, etc.

Curaçao	403	119 (est. 1941)	Willemstad	Governor: Dr. P. A. Kasteel
Surinam (Dutch Guiana), etc.	54,000	183 (est. 1943)	Paramaribo	Governor: Dr. J. C. Brons

and that its administration should cover Sumatra as well as the other islands of the archipelago, although in many parts opposition against domination by Javanese intellectuals was manifest among the Indonesian population. To these claims the Dutch government therefore found it impossible to agree, and after the return of the Indonesian delegation to Java a prolonged deadlock followed. On June 17 Sjahrir came forward with counter-proposals, but these offered less than had been agreed upon in April; a few days afterwards he himself was kidnapped, the president of the Indonesian republic, Achmed Soekarno, assumed dictatorial powers and negotiations broke down. During June the Indonesian extremists in Java indulged in atrocities against the Chinese living in the interior (Tangerang massacres), and Chinese people in Sumatra were threatened by the same fate.

The Japanese armies in the interior, on orders from the Allied supreme command, marched to the coasts, and by the end of June the bulk of them had been evacuated. The support which they hitherto had lent to the republic thereby came to an end. Newly raised Dutch troops began to arrive in the archipelago; by Nov. 1946 the last British forces had left the area. When responsibility over the whole of the archipelago, with the exception of Allied bridgeheads in Java and Sumatra, was resumed by the Dutch on July 15, a conference was held in Malino (near Macassar) in which Indonesian leaders from the liberated islands (particularly Borneo, Celebes and the eastern part of the territory) took part. Agreement was quickly reached on a number of important points, *e.g.*, that the Netherlands Indies should henceforth be reconstructed as a federation of autonomous states (United States of Indonesia), which in its turn would maintain a status as a federal part of the state of the Netherlands. These developments made the more responsible elements in the republic inclined to seek a reasonable political settlement with the Dutch. This tendency was strengthened by the growth of the Communist movement; led by propagandists who trickled into the interior, this party got some support among the masses after their three years of starvation, oppression and spoliation by the Japanese. The Communists ultimately threatened the members of the Indonesian intellectual class who led the republic in their newly acquired positions.

To expedite a constructive solution from the side of the Dutch, the queen and parliament of the Netherlands sent three commissioners-general to Batavia with extensive powers to promote a political settlement. These met a number of representatives of the republic at Batavia on Oct. 7, 1946, with Lord Killearn, British high commissioner for Southeast Asia, in the chair. The auspices seemed favourable; a truce to stop the irregular fighting between Allied troops and the Indonesian bands was concluded, and a cease fire order was given.

The political problem lay in reconciling recognition of the republic with the authority of the crown of the Netherlands and the Netherlands state, thereby safeguarding minimum standards of law and order as well as the fulfilment of Dutch obligations under paragraph 73 of the United Nations charter.

On Nov. 15, 1946, a draft agreement was initiated at Linggadjati (near Cheribon, in West Java), by the Dutch commissioner-general and the leaders of the Indonesian republic of Java and Sumatra. According to this agreement the republic would take its place in a federation with the other islands of the archipelago. This federation would bear the name of United States of Indonesia, and in its turn would enter into a union with the kingdom of the Netherlands, headed by the queen. As

this agreement, which would come into force on Jan. 1, 1949, virtually meant the end of Dutch parliamentary control over the affairs of the union and of Indonesia, opposition to it in the Netherlands was strong. Nevertheless, the Dutch cabinet gained for it the support of a substantial majority in parliament (65 votes to 30, on Dec. 20), and the commissioners general returned to the Indies with authority to sign the agreement on behalf of the Dutch government. (*See also* CURAÇAO; NETHERLANDS INDIES; SURINAM.) (W. G. P.)

Netherlands Indies. The Netherlands Indies constitute a major portion of the largest archipelago in the world. They extend 3,000 mi. along the equator from Sumatra to New Guinea between 6° N. and 10° S. lat. The Netherlands Indies include the Greater Sunda islands (Sumatra, Java, Borneo, and the Celebes), the Lesser Sunda islands (Bali, Lombok, Sumbawa, Flores, and Timor), the Moluccas (Halmahera, Ceram) and the western half of New Guinea. Area, 735,000 sq.mi.; pop. 72,000,000 (est.) of whom 40,000,000 live in Java, 8,000,000 in Sumatra, 4,000,000 in the Celebes, and 2,500,000 in Borneo. Capital, Batavia, pop. 1930 (435,184). The white population on the islands before World War II was estimated at 250,000. About 90% of the Indonesians are Mohammedans; there are approximately 2,500,000 Christians and 1,000,000 Hindus. Attachment to the great world religions has failed to stamp out pagan practices and natives generally indulge in the worship of ancestral spirits.

History.—Japan conquered the Netherlands Indies early in 1942. When Japan surrendered in Aug. 1945, orders were issued to the Japanese forces to maintain peace and order in the islands. Lack of Dutch forces led to the dispatch of British troops who moved into Batavia on Sept. 29, 1945. The occupying forces, under the command of Lieut. Gen. Sir Philip Christison, proposed to restrict the occupation to a few of the larger cities and refused to interfere with local administration. A strong nationalist movement led by Achmed Soekarno and later by Sutan Sjahrir was in control of local administration. Dutch authorities refused to deal with the nationalists and in October fighting broke out between the Indonesians and the forces of occupation. On Feb. 10, 1946, the Netherlands government issued a declaration stating that the people of Indonesia should, after a given preparatory period, be enabled freely to decide their political destiny. The declaration looked forward to a commonwealth of Indonesia associated with the Netherlands on the basis of the federative principle. Dr. Hubertus J. van Mook, acting governor-general, and Sutan Sjahrir, Indonesian nationalist leader, entered into negotiations. In June negotiations were broken off due to a disagreement over the question of sovereignty in the period of transition. In August the Netherlands states-general created a commission-general to carry on negotiations. On Oct. 14, a truce was declared between Allied (British and Dutch) and Indonesian armed forces. Negotiations were resumed at Linggadjate, near Cheribon on Java on Nov. 11.

On Nov. 12, 1946, a most significant agreement was reached which brought the 14-month rebellion to an end. The Indonesians and the Dutch agreed to the establishment of a commonwealth of Indonesian nations under the Dutch Crown. The Netherlands East Indies, under the name of The United States

of Indonesia, was to become a sovereign state by Jan. 1, 1949. It was to be composed of three states: the Republic of Indonesia (Java, Sumatra, Madura), East Indonesia (Celebes, the Moluccas, Bali, Lombok, Dutch Timor) and Dutch Borneo. Arrangements for Dutch New Guinea were not completed in 1946. The second state, East Indonesia, was proclaimed Dec. 25. A conference was scheduled to meet in Borneo in Jan. 1947 when that island would receive statehood.

The three states were to have equal status in the United States of Indonesia. Each of the states was to have control over affairs of a local nature. The central government, as outlined in the plan of government, was to exercise control over foreign affairs and currency. The United States of Indonesia was to have coequal status with the Netherlands under the Dutch crown. In 1946 Achmed Soekarno was president and Sutan Sjahrir premier of the Republic of Indonesia; Rajah Sukawati was president of East Indonesia and Tadjuddin Noor was premier.

Education.—The Dutch established two types of schools in the islands. The first, village or native schools, were designed to provide an elementary education for those who would go no further in school. These indigenous schools, offering a three-year or four-year course, employed native teachers and the native language. In 1938 there were 1,677,000 enrolled in these schools. The second type of school was intended for children who would continue their training. There were 142,726 children enrolled in these European schools which employed the Dutch language. Link schools were established for graduates of the village schools who wished to prepare themselves for more advanced training. There were approximately 10,000 enrolled in junior high schools and 6,500 in secondary schools. Eleven per cent of the students in the European elementary schools were natives. There were three colleges with a total enrolment of 1,051 in 1938.

Finance.—The Dutch budget, in 1942, anticipated revenue of 750,918,773 guilders and expenditures of 813,802,815 guilders. The three main sources of revenue were import duties and excise taxes. In 1938 these yielded 64,000,000 guilders. In the same year government monopolies on opium, salt and pawnshops yielded 14,250,000 guilders. An additional source of revenue was the profits on the government sales of cinchona, rubber, timber, gold, tin and coal.

Trade and Communication.—Imports in 1941 were 384,200,000 guilders and exports 854,200,000 guilders (value of the guilder 53 U.S. cents). In 1939 the Netherlands Indies produced 2.8% of the world's export of oil, 17% of tin, 37% of rubber, 6% of sugar, 91% of quinine, 86% of pepper, and 27% of copra. Production was greatly curtailed as a result of Japanese occupation and estimates of 1946 exports were generally far below prewar levels. The Netherlands Indies Rubber fund announced on July 19, 1946, that it had purchased 23,400 tons of rubber for export after the end of the war. It expected to accumulate another 47,000 tons by the end of the year. Monthly figures indicated steadily mounting production. In the 12 months following Japan's surrender 10,000 metric tons of copra were exported. Mining of tin had made only a slight recovery due to the lack of machinery and power. Japan curtailed tea production in order to produce more vitally needed foods; only 50 of 222 tea factories were continued in operation and large tea areas were uprooted. Spice production was almost at a complete halt in 1946.

In 1940, there were 43,450 mi. of highways and 4,620 mi. of railways, 3,387 in Java and 1,233 in Sumatra. There were 94,000 motor vehicles in 1941.

Agriculture.—In Aug. 1946 sugar production in Java was reported as only a fraction of normal. Only 51 out of 85 sugar

JAVANESE REVOLUTIONARIES, armed mostly with bamboo spears, at a meeting to demand independence from the Dutch. On Nov. 12, 1946, an agreement was reached, bringing the fighting to an end and leading to the establishment of a commonwealth of Indonesian nations under the Dutch crown

factories were in good operating condition. Rice production in Java in 1945 was 3,088,618 tons as compared with normal production of 4,000,000 tons. Corn production decreased from 2,165,281 tons in 1942 to 1,208,596 tons in 1944. It was reported that less than 1% of the 20,000,000 pepper trees on

Bangka Island and only about 20% of those in Southern Borneo were left standing. The Japanese did less damage to the 610,000 ac. of rubber plantations but 43,000 ac. were said to have been uprooted in Java.

Manufactures and Minerals.—Many tin mines were damaged by the Dutch prior to evacuation and further damage was done by the Japanese. The mines on the islands of Bangka and Billiton were largely inoperative in 1946. It was reported full production would not be resumed until dredging machinery was available. Nine of the 85 open mines were expected to resume operation shortly but lack of coal for power was a major obstacle. None of the tin smelters on Bangka were operating in June 1946. (See also JAPAN; NETHERLANDS COLONIAL EMPIRE.)

Neurath, Konstantin von, COUNT (1873–), German statesman, was born in Wuerttemberg. After studying law he entered the German foreign service. He was appointed foreign minister of the reich in 1932 and retained this post after Adolf Hitler became chancellor in 1933. In 1938 he was ousted by Hitler in favour of Joachim von Ribbentrop, and the following year (March 1939) he was appointed reich protector for Bohemia and Moravia.

During his tenure as ruler of Bohemia and Moravia Von Neurath ordered abolition of political parties and trade unions, instituted racial laws and made Czechoslovakian industry work for the German war effort. However, he also intervened with the German security police for the release of many Czechoslovakians arrested in the fall of 1939. In 1941 Von Neurath was summoned before Hitler, told that his rule was "too lenient" and was dismissed; his successor was Reinhard Heydrich.

He was captured in the closing days of the war in Europe by French troops and was brought to trial before the International Military tribunal at Nuernberg.

Although he was found guilty, the court recognized circumstances mitigating in his favour and returned a sentence, Oct. 1, 1946, of 15 years of imprisonment.

Nevada. One of the southwestern group of states, popular name "Battle born," was the 30th state admitted into the union on Oct. 31, 1864. Land area 109,802 sq.mi.; water area 738 sq.mi.; it ranks 6th in size among the states. Population (1940 census) 110,247 of which 66,956 were rural and 43,291 were urban. Native whites numbered 93,431 and foreign-born whites 10,599. Capital, Carson City (2,478). Reno (21,317), Las Vegas (8,422), Sparks (5,318), Ely (4,140), Elko (4,094) are largest cities. On July 1, 1946, the estimated population of the state was 159,790.

History.—The 1946 general election was marked by a political upheaval in Nevada in spite of an almost two to one Democratic registration. The voters elected Republican George W. Malone to the U.S. senate and Charles H. Russell as representative in congress. Vail Pittman, Democrat, however, who had been acting governor from July 24, 1945, was elected governor by a large majority, carrying with him the entire Democratic state slate of officials. Supreme Court Justice Edward A. Ducker died on Aug. 15; Judge Edgar Eather was appointed by Gov. Vail Pittman on Sept. 6 to fill the vacancy; thus, for the first time all three members of the state supreme court faced the voters in the general election.

Dec. 31, 1946, marked the first full year during which the

1% tax on gross income of all gambling establishments doing more than \$3,000 worth of business was in effect. Based on the state revenue from this tax, totalling \$270,179.13, the Nevada tax commission estimated that Nevada's residents and visitors bet \$650,447,825 on gambling tables throughout Nevada during 1946.

On Jan. 1, 1947, state officers were: governor, Vail Pittman; lieutenant governor, Clifford Jones; secretary of state, John Koontz; state controller, J. P. Donovan; state treasurer, Dan W. Franks; superintendent of public instruction, Miss Mildred Bray; attorney general, Alan H. Bible; chief justice of the supreme court, Edgar Eather; justices, Charles Lee Horsey and E. J. L. Taber.

Education.—On Jan. 1, 1947, Nevada had 201 elementary schools with a total enrolment of 18,366; teachers numbered 678; high schools totalled 36 with enrolment of 5,888, staffed by 280 teachers. Enrolment was 1,372 in 10 kindergartens with 22 teachers. The total school enrolment was 25,620, compared with 23,114 pupils Jan. 1, 1946.

Social Insurance and Assistance, Public Welfare and Related Programs.—The amount spent for social security and old-age assistance was \$959,609.87 for the fiscal year ending June 30, 1946. Aid to the blind expense was \$6,500.00. Nevada spent \$1,672,510.68 for unemployment security benefits. On Jan. 1, 1947, the state prison had 293 inmates including 4 women; total expenditures for the fiscal year ending June 30, 1946, were \$157,723.92. The state industrial home had 25 boys and 3 girls on Jan. 1, 1947, and 17 boys and 3 girls on parole. Support of the school for the fiscal year was \$26,898.59. The state hospital for mental diseases had 327 inmates on Jan. 1, 1947; expenditures were \$179,876.69. The orphans' home had 60 inmates on Jan. 1, 1947; expenditures were \$51,961.56.

Communications.—During 1946 highway mileage completed was 11.93 mi. of gravel surface at a cost of \$145,000 and 63.38 mi. mixed bituminous-covered highway at a cost of \$1,800,000. Projects carried over to 1947 were 104.40 mi. of mixed bituminous highway at an estimated cost of \$2,858,000 and 80.35 mi. of gravel-surfaced roads to cost \$712,000.

On Jan. 1, 1947, plans called for 95 mi. of gravel highways to cost \$840,000 and 140 mi. of bituminous surface treated to cost \$4,317,000. The state highway budget for the year 1946 was maintenance \$900,000 and new construction \$5,900,000. Total expenditures during 1946 were \$5,047,570 of which 82.67% was contributed by the federal government and 17.33% by the state.

Railroad mileage in Nevada including main-line tracks and sidings totalled 2,349.42 on Jan. 1, 1947; of this main-line mileage was 1,819.08.

Airways and airports totalled 48 on Jan. 1, 1947, and consisted of 4 army, 1 navy, 7 Civil Aeronautics administration, 1 department of interior, 5 state, 7 county, 3 municipal, 1 commercial and 19 privately owned. Plans called for the improvement of 16 existing airports and the construction of 30 new airports during the ensuing 3 years.

Banking and Finance.—On Dec. 31, 1946, there were 23 banks in Nevada; total assets were \$170,354,648.99. Three state banks with 4 branches had total deposits of \$22,911,251.47 and resources of \$24,104,440.39. The First National bank of Nevada had 11 branches and on Dec. 31, 1946, had deposits of \$116,471,780.93 and resources of \$122,892,482.47. In addition the following national banks operated in the state: the Security National at Reno, deposits \$8,686,579.58 and resources of \$8,909,306.68; the Ely National bank had deposits of \$6,474,114.96 and resources of \$6,817,489.92; the First National bank of Ely had deposits of \$4,373,801.18 and resources of \$4,664,378.15; the First National bank of Lovelock had deposits of \$3,068,457.37 and resources of \$3,202,924.38.

Of state funds on July 1, 1946, cash on hand was \$13,466,490.07, disbursements were \$8,102,412.61, leaving a cash balance of \$5,364,077.46. There was no state debt on Jan. 1, 1947. Total securities held by the state treasury on Jan. 1, 1947, totalled \$21,183,831.12. Nevada's Postwar Reserve fund totalled \$1,649,000, all in U.S. bonds.

Agriculture.—The 1946 Nevada grain crop was slightly greater than in 1945; weather conditions were favourable throughout 1946. Beef cattle increased 3% in 1946 and were in good condition. Sheep numbered 4% less than in 1945; hogs 20% less and chickens 15% less.

Table I.—Leading Agricultural Products of Nevada, 1946 and 1945

Crop	1946 (est.)	1945
Barley, bu.	840,000	640,000
Potatoes, bu.	800,000	700,000
Wheat, bu.	500,000	388,000
Hay, tons	370,000	599,000
Oats, bu.	276,000	273,000
Corn, bu.	120,000	64,000

Mineral Production.—The estimated total mineral production in 1946 was \$26,294,384—an increase of 9% over that of 1945. During 1946 mining conditions improved, encouraged by the increased price of silver which was 90.5 cents per pound compared with 71.11 cents for 1945, and an upward market on copper, zinc and lead, after removal of Office

Table II.—Principal Mineral Products of Nevada, 1946 and 1945

Mineral	Value 1946 (est.)	Value 1945 (actual)
Gold	\$ 3,097,500	\$ 3,229,275
Silver	859,874	741,959
Copper	15,335,250	14,200,650
Lead	1,292,800	1,079,300
Zinc	5,708,960	4,935,110
Totals	\$26,294,384	\$24,186,294

of Price Administration price ceilings. Nevada was the second largest mercury-producing state in 1945. Tungsten productions were also substantial during 1946. The hope for a large increase in mining operations in 1946 did not materialize, because of shortage of labour, increased costs and scarcity of materials. (E. C. D. M.)

New Brunswick. New Brunswick, one of the three maritime provinces of Canada, entered the union in 1867. Area, 27,985 sq.mi., including 512 sq.mi. of fresh-water lakes; pop. 457,401 (1941 census), 68.64% rural. In 1946 the dominion bureau of statistics estimated the population at 468,000. The largest cities are St. John (51,741) and Moncton (22,763). The capital is Fredericton (10,062). Administered by a lieutenant governor, an executive council and a 48-member legislative assembly, New Brunswick was represented federally by 10 members of parliament and 10 senators.

History.—Throughout 1946 the Liberal administration of J. B. McNair continued in office and converted industries from war to peace production without major dislocations. Production in many lines boomed; the full effect of government stimulation of agriculture was felt with poultry and dairy farming expanding; lumbering activity continued unabated, with encouraging growth of secondary industries based on wood; the biggest annual run of sardines ever known reached Bay of Fundy fishermen; mink ranchers held the largest show on record, exhibiting entirely new colour phases.

Transportation services expanded during 1946; a \$10,000,000 road-improvement program got under way. Tourist traffic was high, with the first air-borne sportsmen's tour occurring when 20 businessmen from Washington, D.C., arrived for September angling in Miramichi trout and salmon waters. (C. Cy.)

Education.—For the school session, 1943-44, enrolment in all educational institutions was 99,630; the revenues of provincially-controlled schools in 1944 were \$3,468,361. The University of New Brunswick with its seat at Fredericton was the provincial university.

Agriculture and Industry.—In 1944 the estimated gross value of agricultural production was \$61,508,000; farm income \$32,200,000. In 1945 the value of field crops was \$34,138,000 (1944: \$37,978,000). In 1944 the value of the fisheries was \$5,389,000.

New Caledonia: see FRENCH COLONIAL EMPIRE.

Newfoundland and Labrador. A British dominion of North America, with suspended constitution. Area: Newfoundland 42,734 sq.mi.; Labrador 110,000 sq.mi.; pop. Newfoundland 312,899 (1945); Labrador 4,780 (1938). Capital: St. John's (pop. 1945, 43,179). Language: English; religion (1935 census): Roman Catholic 93,925; Church of England 92,732; United Church 76,100; Salvation army 18,054. Governor: Sir Gordon Macdonald.

History.—Governor Sir Humphrey Walwyn resigned in Jan. 1946 and was succeeded by Sir Gordon Macdonald. In March the British dominions office announced that a convention of 40 members would be elected in June which would make recommendations on possible future forms of government; its proposals would be submitted to the British government, which would in turn submit them to the people in the form of a referendum. In April a group of Newfoundlanders led by Peter Cashin organized a petition to the king asking for the immediate return of self-government and the holding of general elections in 1946. Polling took place in Newfoundland on June 21, in Labrador (because of communication difficulties) from Aug. 8 to Sept. 4. Cashin and nine members of his group were among those elected.

Under the terms of an agreement signed by Canada, Great Britain and Newfoundland on May 8, the airbase at Gander

installed by the Canadian government at a cost of \$25,000,000 was handed back to Newfoundland for \$1,000,000. Control of the airbases at Gleneagles and Botwood was handed back to Newfoundland, but Canada retained the right to operate Torbay airport as a civil airport. (J. RA.)

Education.—In 1945: schools 1,197; scholars 69,000; teachers 2,227.

Banking and Finance.—(In Canadian dollars) Revenue (est. 1946-47) \$30,757,200; expenditure (est. 1946-47) \$22,939,700; reconstruction expenditure \$11,065,000, to be paid for by excess of revenue over ordinary expenditure (\$7,817,500) and by surplus accumulated in previous years. Public debt (March 31, 1946) \$82,188,070; sterling debt at rate of \$4.45 per £1. Exchange rate (1946): Canadian dollar=100 U.S. cents.

Trade and Communication.—Overseas trade (1944-45) (in Canadian dollars): imports \$65,824,066 (\$57,000,000 excluding imports by or on behalf of the armed forces); exports \$46,414,485; re-exports \$2,297,495. Communication: roads (1946), main and secondary, 2,200 mi.; railways 747 mi.; motor vehicles licensed (1945) 6,903.

Mineral Production and Fisheries.—Exports (year ended March 31, 1945) (in short tons): fluorspar 48,014; iron ore 647,654; limestone 350,840; copper concentrates 27,161; lead concentrates 36,234; zinc concentrates 84,107; newsprint 283,360. Value of fish exported (year ended March 31, 1945) (in Canadian dollars): codfish, dried (salt bulk and soft cured) \$12,434,000, fresh and frozen fillets \$3,855,000; herring \$2,071,000; other fish \$3,509,000.

New Guinea. The largest island of the East Indies with an area of more than 310,000 sq.mi., stretching from the equator in the N.W. to 12° 5' S. in the S.E. and from 130° 50' E. to 151° 30' E. The island is separated from Australia to the south by the Torres strait and the Arafura sea. The Bismarck archipelago and the Solomon Islands lie to the east. Total estimated population (1940) 1,420,000, including surrounding islands within the jurisdiction of New Guinea.

Before World War II New Guinea was one of the least explored and least known parts of the world. Although the island was discovered in the beginning of the 16th century, it had never been completely explored. The non-native population before the war never totalled as much as 5% of the entire population. The native population is quite diversified in language, race and social customs.

Shortly after the outbreak of the Pacific war, the Japanese occupied most of the settlements on the northern coast of New Guinea and several on the southern coast. In the autumn of 1942, Japanese troops attempted to drive overland from North-eastern New Guinea across the Owen Stanley mountain range to capture Port Moresby, the capital of Papua (Australian New Guinea). U.S. and Australian troops, however, stopped the Japanese advance and, after taking the offensive, drove the Japanese from Lae, Salamaua and other towns in Northeastern New Guinea. This was followed by successive drives against other Japanese-held areas and by the time of the Japanese surrender in 1945, U.S. and Australian forces had retaken practically all of the coastal areas of New Guinea which had been occupied by the Japanese. New Guinea is divided under Dutch and Australian control into three administrative units. The single Dutch area is about equal in size to the two Australian units.

Dutch New Guinea (area 151,789 sq.mi.; pop. (est. 1940) about 400,000) prior to World War II was administered as part of two districts or divisions of the Moluccas residency with headquarters in Amboina. Dutch rule was represented by two assistant residents, a few lesser officials, and native assistants and native police. As a result of native discontent in the Nether-

lands Indies after the end of World War II in opposition to Dutch rule, at the end of 1946 there was under consideration a plan for the formation of a "United States of Indonesia" in equal partnership with the Netherlands in the "Netherlands-Indonesia Union." This plan would establish three autonomous states in the United States of Indonesia: the Indonesian Republic (Java, Sumatra and Madura), Dutch Borneo and East Indonesia (Celebes, Moluccas and the Lesser Sundas). The status of Dutch New Guinea was not defined under the proposal. Principal towns of Dutch New Guinea are Hollandia, Manokwari, Merauke and Babo.

Papua (also known as Australian New Guinea) (area 90,540 sq.mi.; pop. [1940] 338,822) is governed by Australia under a Lieutenant governor with administrative headquarters at Port Moresby.

Northeastern New Guinea, together with the islands of the Bismarck archipelago and the northern Solomon Islands, are former German possessions which were turned over by the League of Nations in 1920 as a class "C" mandate for administration by Australia. Area of the mandate, about 93,000 sq.mi.; pop. (1940), about 680,000, fewer than 10,000 of whom were non-natives. Headquarters of the Australian administration are at Rabaul. During 1946, Australia submitted a draft agreement whereby Northeastern New Guinea would be transferred to the supervision of the Trusteeship council of the United Nations with Australia to retain the administration of the territory. This was accepted by the United Nations assembly on Dec. 13, 1946.

Economy.—New Guinea has a primitive agrarian economy with only slight development of existing natural resources. The natives subsist on sweet potatoes, sago, coconuts and fish. Gold, silver, platinum, lead, zinc, bauxite, coal and petroleum are known to exist, but only a small portion of the island has been intensively surveyed. Some coconut, coffee, tobacco and rubber plantations were developed by non-natives before the war. Dutch New Guinea and Northeastern New Guinea exported sizeable quantities of copra prior to World War II, averaging about two-thirds and one-third, respectively, of the total value of exports of these areas. Coal and petroleum are found in the Vogelkop area of Dutch New Guinea; copper is found near Port Moresby in Papua. (See also NETHERLANDS COLONIAL EMPIRE.)

W. Stirling, *The Native Peoples of New Guinea*, Smithsonian Institution (1943). (S. Nr.)

New Hampshire. One of the New England states and one of the original group of 13, popularly known as the "Granite state"; area, 9,304 sq.mi., including 280 sq.mi. of water. Population (1940) was 491,524, of which 57.6% was urban and 42.4% rural. Estimated population, July 1, 1945, excluding armed forces overseas, was 452,174, of which 445,930 was civilian. In 1940 there were 490,989 whites, including 422,693 native and 68,296 foreign born. Capital, Concord, with estimated population (1943) of 27,495. Other cities: Manchester 78,436, Nashua 33,914; Berlin 16,480; Dover 16,393 and Portsmouth 20,530, as of 1943. An estimated total of 62,000 men and women entered the armed services during the war, of whom 56,000 had been discharged by Nov. 30, 1946.

History.—The general court was not in session during 1946. Town meetings were held on March 12 and the state primary election on Aug. 6. At the general election in November, Charles M. Dale (Republican) was re-elected governor by a vote of 103,204 over F. Clyde Keefe (Democrat) who received 60,247. The Republicans likewise won decisive majorities in the state senate and house of representatives. On a question as to the

expediency of calling a convention to revise the constitution of the state, 49,230 votes were cast in favour of the proposal and 29,336 against it. The state poll tax was reduced from \$5 to \$2, as a result of action taken by the general court in 1945, repealing the levy of \$3 to provide revenue for a soldiers' bonus.

State officers in 1946 were governor, Charles M. Dale; secretary of state, Enoch D. Fuller; state treasurer, F. Gordon Kimball; commissary general and adjutant general, Charles F. Bowen; attorney general, Ernest R. D'Amours; commissioner of education, James N. Pringle, succeeded on Feb. 16 by Edgar Fuller. U.S. senators were H. Styles Bridges and Charles W. Tobey, both Republican.

Education.—In 1945-46 there were 1,734 public schools, classified as follows: kindergartens, 53; mixed (one-room) schools, 194; classified schools, 1,327, opportunity schools, 16; junior high schools, 37; senior high schools, 85; evening schools, 22. The total number of elementary pupils was 44,020 with 1,807 teachers; the number of high school pupils, 22,952, with 1,222 teachers. There were 372 evening school pupils with 22 teachers. Total payments for public elementary and high schools during the year ending June 30, 1946, were \$8,713,962. In 1940 private and parochial elementary schools and secondary schools had an enrolment of 25,007.

Other state educational institutions were the University of New Hampshire, at Durham, Keene Teachers college, at Keene, and Plymouth Teachers college, at Plymouth.

Social Insurance and Assistance, Public Welfare and Related Programs.—Following a period of decline in previous years, the burden of general relief showed a rising trend during the year ending June 30, 1946. In June 1946 there were 2,315 cases on general relief, with an expenditure of \$72,272 as compared with 2,185 cases in June 1945 with an expenditure of \$62,877. Expenditures for public assistance under the Social Security act were \$314,198 as compared with \$276,873 for June 1945. The total for June 1946 included \$231,640 for old-age assistance; \$72,064 for dependent children; and \$10,494 for aid to needy blind. During the calendar year 1945 a net amount of \$3,095,863 was collected in contributions for unemployment compensation as against \$318,755 paid in benefits to an estimated 3,779 individuals. A total of 4,215 former servicemen and women received benefits to the amount of \$411,123.

On Jan. 1, 1943, there were 242 persons in prison and in reformatories in New Hampshire. The net appropriation for the state prison at Concord for the fiscal year ending June 30, 1947, was \$150,113; and for the Industrial School for Committed Minors at Manchester, \$108,313.

Communication.—At the end of 1943 there were 12,508 mi. of rural roads in New Hampshire, including highways under state, local and federal control. Disbursements from the state highway fund for the fiscal year ending June 30, 1944, amounted to \$4,315,109.68. In 1944 there were 952 mi. of steam railways owned in the state. At the close of the same year there were 27,236 business and 72,670 residential telephones in operation.

Banking and Finance.—As of June 30, 1946, there were in New Hampshire 51 national banks with deposits of \$186,678,000 and resources of \$204,499,000, as compared with 52 banks with deposits and resources, respectively, on June 30, 1945, of \$171,475,000 and \$188,294,000. Fifty-five state-chartered banks reported deposits of \$333,919,000 and resources of \$371,790,000 as compared with \$290,318,000 and \$325,566,000, respectively, on June 30, 1945. There were 25 state-chartered building and loan associations with resources of \$17,800,000. State-chartered savings banks and savings departments of trust companies reported deposits of \$317,925,729 as of June 30, 1946, an increase of \$41,803,410 over the total for June 30, 1945. The

number of savings accounts was 375,836, an increase of 17,226 over the preceding year. Two federal savings and loan associations reported combined assets of \$15,111,527 and shareholders' accounts of \$12,946,025.65. Time deposits in savings departments of national banks within the state amounted to \$41,598,000.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1946, were \$42,738,658.25, cash disbursements \$43,234,164.89; cash balance, June 29, 1946 was \$5,564,215.68. Cash balance, July 1, 1945, was \$6,059,722.32. Gross fixed bond and note debt, June 29, 1946, \$9,390,000; net bond and note debt, \$8,714,237.37.

Agriculture.—In 1945 there were 18,786 farms in New Hampshire with a total acreage of 2,017,049. Acreage of land from which crops were harvested or hay cut, or which was planted in orchards, amounted to 435,602. The total value of farm lands and buildings in 1944 was estimated at \$80,000,000. Cash receipts from farm marketings in 1945 were \$43,167,000, including poultry, \$20,406,000; dairy products, \$12,249,000; and meat animals, truck products, forest products, potatoes, fruit and miscellaneous crops, \$10,512,000. In 1943 the value of products consumed on farms where produced was estimated at \$5,826,000, while in 1945 government payments yielded approximately \$2,000,000.

Leading Agricultural Products of New Hampshire, 1946 and 1945

Crop	1946 (est.)	1945
Corn, bu.	533,000	492,000
Oats, bu.	259,000	272,000
Hay, tons	445,000	472,000
Potatoes, bu.	1,159,000	1,020,000
Apples, bu. (commercial)	367,000	139,000
Maple syrup, gal.	36,000	25,000
Maple sugar, lb.	12,000	9,000

The estimated apple crop for 1946, while much larger than that for 1945, was still only about 50% of the ten-year annual average for 1935-44 of 767,000 bu., frost damage being largely responsible for the low yield. Production of maple sugar and maple syrup, while larger than for 1945, was also far below normal owing to unfavourable weather conditions.

Lumber production in 1944 amounted to 356,000,000 bd.ft. as compared with 392,000,000 bd.ft. in 1943.

Manufacturing.—Estimated value of manufactures in 1943 was \$393,055,000, an increase of 65% over 1939. The number of persons employed in industry (1943) was approximately 102,000.

In 1943 New Hampshire enjoyed an estimated annual income of \$75,000,000 from recreational enterprises, which thus ranked next to manufacturing and ahead of agriculture as a source of income.

Mineral Production.—Principal mineral resources were feldspar, mica, building stone (chiefly granite), brick clays, and sand and gravel. In 1944 New Hampshire ranked second among the states in the production of mica. The output of stone declined greatly during the war years while the production of clay for brickmaking virtually ceased. Total value of minerals produced in 1944 was estimated at \$1,166,000, as compared with \$1,350,000 for 1943. (W. E. Ss.)

New Hebrides: see FRENCH COLONIAL EMPIRE; PACIFIC ISLANDS, BRITISH.

New Jersey. The third state to enter the union, New Jersey is situated on the middle Atlantic coast between New York and Philadelphia. Its 1940 population of 4,160,165 ranked it ninth among the states and the bureau of vital statistics estimated its population at Jan. 1, 1947, to be 4,200,941. Capital, Trenton (1940: 124,697). The largest city is Newark (429,760); second is Jersey City (301,173); the area

ALFRED E. DRISCOLL, Republican governor of New Jersey, was elected Nov. 5, 1946

is 7,836 sq.mi. including 314 sq.mi. of water.

History.—In 1946, Alfred E. Driscoll, the Republican organization candidate, defeated former Governor Harold G. Hoffman in the June primary and in November was elected governor of New Jersey over Judge Lewis G. Hansen, his Democratic opponent, by 221,000.

Election of Driscoll was the first time the Republicans held the governor's office for two successive terms after 1909 and reflected the resurgence of the party nationally. The Repub-

licans increased their pluralities in the legislature, controlling the 1947 assembly by 48 to 12 and the senate by 16 to 5. Re-election of U.S. Senator H. Alexander Smith continued two Republicans in the senate from New Jersey, and the Republican party retained 12 of the state's 14 congressional representatives.

In 1946 legislation was passed permitting the state government to seize and operate all public utilities in which service was interrupted or threatened by virtue of labour disputes, the first such legislation in the nation. As a result, when workers in nine gas production plants went on strike against utility management, the state took over and operated the plants successfully with their regular personnel. Later in the year other strikes in the same plants found the employees unwilling to work for the state, but under Governor Walter E. Edge's direction full production was maintained and within a few days the men were back at work, the issues at stake going to arbitration.

Other legislation enacted saw repeal of the intangible personal property tax and its replacement by a net worth tax, initiation of two major north-south highways traversing the state, increased state road aid to counties and extension of the juvenile delinquency act to include those 18 years of age. When the federal housing program bogged down, the state made an outright appropriation of \$6,000,000 of current funds at a special session of the legislature Sept. 30 and a \$35,000,000 bond issue for veterans' housing was approved at the Nov. election.

As of Jan. 1, 1947, the state's bonded debt stood at \$57,310,000. Sinking fund assets of \$20,000,000 left the net debt at \$37,000,000. In addition a cash surplus exceeding \$30,000,000 was left for the incoming administration.

Education.—In New Jersey there were in 1946 1,594 elementary schools, 288 junior or senior high schools, 20 vocational schools and numerous parochial and private institutions. During 1946 Rutgers was expanded as the state's university at New Brunswick, and the University of Newark was merged with it.

Enrolment in all educational institutions, which had dropped far during the war, increased so rapidly that makeshift arrangements were worked out in all institutions during 1946 to accommodate the clamour for education. Significantly, public attention was called to the low salaries paid New Jersey teachers with all indications being that remedial steps would be taken to increase them.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average monthly grant for old-age assistance in New Jersey in 1946 was \$33.30 and for dependent

children \$65.15. Federal-state grants to the blind averaged \$35.30, and the general relief assistance averaged \$38.09 per family. All represented substantial increases in excess of 1945.

Banking and Finance.—Deposits in 156 state banks, trust companies and savings banks totalled \$2,713,891,000 on Dec. 31, 1946, a drop of \$5,000,000 from Dec. 31, 1945. Government deposits dropped \$168,000,000 to a total of \$207,107,000. Banks in the federal reserve system had 71.2% of all deposits, the 56 nonmember banks having the remainder. Government securities represented 60.5% of the total assets of all New Jersey banks as compared with 61% in 1945. A reduction of \$1,360,000 in the value of real estate owned by banks, or a drop of 57.2%, was noted during the year.

Agriculture.—About 2,000,000 ac., or 40% of New Jersey's land area, is devoted to agriculture. New Jersey stands high in the production of potatoes, grossing about 14,000,000 bu. in 1946, a gain of 2,000,000 more than 1945. Peaches average 1,500,000 bu. annually and 3,300,000 bu. of apples are grown.

A leading poultry state, New Jersey sends about 10,000,000 chickens annually to market; approximately 700,000,000 eggs are produced annually and 250 hatcheries produce 30,000,000 baby chicks. The dairy industry in New Jersey ranks high with approximately 520,000,000 qt. of milk produced yearly from 210,000 cattle.

Manufacturing.—Because of its variegated industries, New Jersey moved quickly to reconvert from wartime economy to peacetime production. While New Jersey suffered from the effect of major strikes elsewhere during 1946, no large-scale work stoppages shut down the state's principal industries. New Jersey is represented in 90% of all industries with more than 8,000 factories and shops employing 200 different classifications of labour.

(W. E. EE.)

New Mexico. Fourth largest state in the southwestern United States, popularly known as the "Sunshine state"; admitted to the union in 1912. Area 121,666 sq.mi. (121,511 sq.mi. land, 155 sq.mi. water); pop. (1940) 531,818; rural 355,417; urban 176,401; native white 477,065; Negro 4,672; foreign-born 15,247. On July 1, 1945, the bureau of the census estimated the civilian population of the state at 535,220.

History.—The administration, legislature and congressional representation were Democratic in 1946. The chief officers of the state elected in the 1946 elections were: governor, Thomas J. Mabry; lieutenant governor, Joe M. Montoya; secretary of state, Mrs. M. A. Romero; auditor, E. D. Trujillo; treasurer, H. R. (Ray) Rodgers; attorney general, Clyde C. McCulloh; superintendent of public instruction, Charles L. Rose; commissioner of public lands, John E. Miles.

Education.—For the school year 1945-46 there were 732 schools. The rural schools enrolled 45,760 pupils; employed 1,455 teachers, average salary \$1,733.30; total expenditures were \$5,326,432.86. Municipal schools enrolled 82,814, employed 2,362 teachers, average salary \$2,037.50 and total expenditures were \$8,394,607.19.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the calendar year 1946, \$256,740.50 was paid out for civilian unemployment benefits; for veterans \$4,151,211. On June 30, 1946, \$219,636 had been spent for old-age and survivors insurance, and \$3,855,822.35 for public assistance.

The penitentiary appropriation was \$157,500 for 598 inmates (Sept. 1); insane asylum, \$415,000, 967 inmates (Nov. 15); School for Mental Defectives \$48,000, 75 inmates; Industrial school \$103,980, 88 inmates (November); Girls' welfare home \$72,000, 118 inmates (December).

GOV. THOMAS J. MABRY, of New Mexico, elected on the Democratic ticket Nov. 5, 1946

Communication.—New Mexico had an estimated 63,090.8 mi. of roads in 1946; 9,453 mi. constituted the state highway system. The state highway department expended \$7,338,460.37. Steam railway companies operated 2,526 mi. of main track (1945). There were 86 airports and approximately 846 mi. of airways operated by three scheduled air carriers. There were about 64,600 telephones.

Banking and Finance.—On June 30, 1946, there were 22 national banks with deposits of \$198,670,000; loans \$43,474,000, investments \$103,891,000; and 20 state banks with deposits of \$67,663,000; loans \$13,975,000; investments \$34,241,000. Total resources of 12 building and loan associations in 1945 were \$5,377,029.42 and of 7 federal savings and loan associations \$5,099,868.99.

The total of all state receipts for the fiscal year ending June 30, 1946, was \$42,057,805.99; expenditures \$38,462,815.30. The gross and net debt were respectively \$18,291,000 and \$18,169,038.96.

Agriculture.—The total value of agricultural production in 1946 was \$67,178,000 (estimate); acreage harvested 1,333,000 (estimate). Livestock was valued at \$99,997,000, Jan. 1, 1946.

Table I.—Leading Agricultural Products of New Mexico, 1946 and 1945

Crop	1946 (est.)	1945
Tame hay, tons	514,000	453,000
Grain sorghums, bu.	1,127,000	587,000
Winter wheat, bu.	2,648,000	2,484,000
Corn, bu.	2,256,000	2,100,000
Beans, bags	308,000	290,000
Cotton, bales	145,000	106,000
Cottonseed, tons	58,000	43,000
Forage sorghum, tons	159,000	157,000

Manufacturing.—Manufactured products were valued at \$25,123,641 in 1939; an average of 3,250 employees received \$2,912,993 in wages.

Table II.—Principal Mineral Products of New Mexico, 1946 and 1945

(Year ending Oct. 31)

Mineral	Value, 1946	Value, 1945
Copper	\$12,927,701	\$17,116,956
Potash	15,035,037	13,620,367
Coal	5,351,388	5,709,027
Zinc	2,840,124	9,193,478
Lead	214,996	663,916
Silver	172,822	256,373
Gold	77,917	125,512

Mineral Production.—Potash was New Mexico's chief mineral in 1946. For the year ending June 30, 1946, 36,410,907 bbl. of oil, valued at \$37,249,052, were produced. (F. D. R.)

New South Wales. A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. June 30, 1945) 2,899,112. Chief cities: Sydney (cap., 1,398,000); Newcastle (120,000). Governor (1946): Lieut. Gen. Sir John Northcott.

History.—The commander of the British empire forces in Japan, Lieut. Gen. Sir John Northcott, was appointed the first Australian-born governor of New South Wales. He succeeded Lord Wakehurst in August.

Following the resignation of the minister of lands, John Tully, who was appointed agent-general in London, a cabinet reshuffle took place in May. W. J. McKell, premier, created a new portfolio, that of tourist activities and migration. One of the first actions of the new cabinet was to approve a scheme for a 20-mi. electric underground rail service to Sydney's suburbs at a cost of some £A25,000,000. There were to be 19 suburban stations: construction had already begun in 1946. In March the premier officially opened the crude oil factory at Clyde. Twelve million gallons of crude oil per annum from N. Borneo and Sarawak were being refined into gasoline, kerosene, diesel and furnace oil.

Crop returns for 1945-46 were good after two seasons of severe droughts, but lack of rain during 1946 caused grave fears for the 1946-47 crops.

Education.—In 1942: number of schools (state) 2,864, (private) 719; teachers (state) 11,112, (private) 3,886; scholars enrolled (state) 350,962, (private) 103,692; average attendance (state) 275,722, (private) 84,718.

Finance.—In 1944-45: revenue £A74,796,875; expenditure £A73,828,125; debt outstanding (June 30, 1945) £A355,050,937. (£A1=\$3.2 U.S.).

Communication.—Roads (1942) 126,325 mi.; railways, government (Sept. 1945) 6,128 mi.; tramways (June 1943) 172 mi.; motor vehicles licensed (Dec. 1945): cars 189,774, commercial vehicles 89,719, bicycles 17,900. Wireless receiving set licences (June 1945) 571,790. Telephones (June 1941): exchanges 2,018; instruments connected 280,161.

Agriculture, Manufacturing, Mineral Production.—Production (in short tons): wheat (1945-46) 1,875,000; butter (1944-45) 35,860; wool, greasy (1944-45) 224,300; maize (1943-44) 70,000; coal (1942) 13,700,000; gold (1942) 77,249 fine oz. Industry and labour 1944-45: factories 11,359; employees (average) 314,678; gross value of output £A387,659,375; unemployment (trade union returns) (Feb. 1946) 1.5%. (W. D. MA.)

Newspapers and Magazines. The year 1946—the first full year of post-World War II reconstruction—was a stormy and difficult period for U.S. newspapers and magazines. Although financial income, in terms of advertising and sales, was unexpectedly high, few periodicals made much profit because of soaring wages and prices, widespread and prolonged strikes of all classes of employees, shortage and rising price of paper, continuing lack of new machinery and materials and much uncertainty over retention of various wartime controls.

Although the outstanding news events of the year were again the disasters, crimes and political or economic crises of peacetime, the general trend of the news continued to be serious and thoughtful, with no evidence of a postwar spasm of sensationalism; most front pages were heavy with economics, government and foreign affairs, giving little space to the postwar wave of crime and juvenile delinquency going on behind the scenes. In the annual listing of the "Ten Biggest News Stories of the Year," the International News service announced the following: (1) The trial, conviction and execution of the top nazi war criminals, including Hermann Goering's suicide; (2) sweeping Republican victories at the polls; (3) United Nations assembly and Big Four foreign ministers' meetings in New York; (4) Bikini atomic bomb tests; (5) wave of strikes, culminating in trial and conviction of John L. Lewis for contempt, with fines of \$3,500,000 for mine workers and \$10,000 for Lewis; (6) elimination of OPA and other governmental controls; (7) Atlanta, Ga., hotel fire, with largest death toll in history in that type of disaster; (8) forced resignation of Secretary of

Commerce Henry A. Wallace; (9) Winston Churchill's Fulton, Mo., speech on east-west split; (10) Paris peace conference. The United Press listed the same stories, placing the Republican victory first and adding the William Heirens murder story in Chicago.

The paper situation for newspapers was more difficult in 1946 than during the war—in both price and short supply. Three increases during 1946 carried the price from \$68 a ton to \$85—including jumps on July 11, Aug. 8 and Oct. 11. Through a series of seven price increases in five years, newsprint had gone up from \$51 in 1943, adding an estimated \$180,000,000 to the annual newspaper paper bill. Argument against retaining OPA price ceilings continued throughout the year, with most newspapers urging decontrol and higher price to prevent diversion of Canadian paper to Europe, but decontrol did not come until Nov. 10. Meanwhile the shortage was further increased by the coal strike in the spring, a strike of woodcutters in the northwest, reduction of shipments of Swedish wood pulp and curtailment of shipping resulting from a threatened rail strike. Most newspapers lived from hand to mouth in paper supply, borrowing from each other, and the chief sufferers were the smaller dailies and weeklies which buy from jobbers rather than from mills. Newspaper trade papers told of many expedients to save paper—rationing or total elimination of advertising from time to time, curtailment of circulation and omission of editions. For example, the *Raleigh* (N.C.) *News and Observer* printed advertisements vertically in margins of news pages. Some small newspapers were printed on kraft wrapping paper, and in October the *Philadelphia Record* appeared on brown kraft—costing \$95 a ton. The *Milwaukee Journal* tried the solution of buying a paper mill. With another coal strike and reduction of shipping, the situation at the end of the year was even more difficult, and another price rise was expected on Jan. 1.

An epidemic of strikes in almost every department kept the newspapers in turmoil through 1946, and regular editions printed with photographed reproductions of typewritten copy became common; many newspapers bought a new typewriting machine designed for that purpose. Most bitter were the many strikes of the International Typographical union which, under new leadership, announced a militant nationwide policy of "ask-for-the-moon" negotiations, cancelling contracts, refusing arbitration, entrusting all strategy to the I.T.U. executive council, demanding wage increases up to 75%, with weekly pay up to \$100-\$135 and hours down to 30. Increased vacation, holiday and sick-leave pay demands were minor irritants. At its August convention, I.T.U. voted a \$1,000,000 defense fund and boycotted, among others, *Time* and *Life* magazines. In defense, a Florida newspaper took the antiarbitration policy to the U.S. supreme court, and a Canadian group sued I.T.U. for \$250,000 strike damages. Suspended newspapers were a frequent occurrence. Seattle, Wash., had no newspapers for eight weeks ending Jan. 13. All newspapers of Cleveland, O., were tied up 32 days ending in February. The four dailies of Springfield, Mass., suspended Sept. 26, had not resumed on Dec. 31. Seven Canadian newspapers during a 10-month I.T.U. strike published in photographic form. Threat of an I.T.U. strike for \$3.02 an hour hung over Chicago printing shops most of the summer. Strikes of shorter duration in newspaper plants were reported from Erie, Pa., Minneapolis, Minn., Columbus, O., Washington, D.C., Beaumont, Tex., Sandusky, O., Rochester, N.Y., Canandaigua, N.Y. and many other cities. A printers' strike in St. Petersburg, Fla., newspapers was a year old on Nov. 20. A truckers' strike in September reduced to adless pamphlet size most newspapers of New York city. For two weeks in August transmission of foreign news was curtailed by a strike of employees of Press Wireless in New York aided by the larger

BRITANNICA BOOK OF THE YEAR

THE PICTURES on these pages were submitted with hundreds of others in the *Britannica Book of the Year* News Photography Contest for 1946. These were selected as the best in each of the three classifications and were awarded first prize.

Congress of Industrial Organizations Communications association.

After several quiet years during World War II, the American Newspaper guild in 1946 launched new aggressive policies to organize all noneditorial newspaper employees. At its 13th annual convention in Scranton, Pa., in June, the guild announced it had 23,558 members, voted \$120,000 for organization to double its membership, pledged its support to the C.I.O. Political Action committee, and set out to obtain a minimum salary of \$100 a week for experienced reporters, plus four weeks' vacation, hospitalization and retirement provisions, refusing to recognize differentials of size in cities or newspapers. During the convention, its president, Milton Murray, was discharged by *New York PM* for refusing orders. Earlier in the year the guild had been successful in gaining contracts with the Associated Press and I.N.S. agencies providing large increases. The first effort toward the \$100-a-week goal was a "guinea pig" strike on the *Los Angeles Herald and Express*, which started on Sept. 4, caused the newspaper to suspend and continued three months until Dec. 2 because the guild refused to arbitrate. Next the campaign shifted to Philadelphia, first in the office of the *Inquirer*, whose negotiations hung fire for months, while on Nov. 7 a strike was called in the *Philadelphia Record* and *Camden Courier and Post*, whose owner, J. David Stern, was the first publisher to sign a guild contract in 1934. Although the Stern papers continued to publish, 500 employees were still on strike on Dec. 31. On Oct. 26 the guild refused an offer of a 20% increase by the *New York Times*, and in Norfolk, Va., attempted to organize Negro mechanical workers.

Shortages of materials and machinery continued throughout 1946 and there was little relief in the demand for equipment that had piled up during the war. Manufacturers of printing presses converted promptly from war production but lacked metals to fill the hundreds of orders that had piled up. Mergenthaler Linotype company resumed production on July 29 after a strike of 20 weeks that delayed reconversion. OPA authorized a price increase on printing equipment in January but that was of little assistance. One unexpected shortage involved silver nitrate for photoengraving, and in New York city engravers melted silver dollars to supply their needs.

General prosperity, however, was reported in the newspaper business offices. After a rise of 5.3% in total daily circulations during 1945—to 48,384,188—a further increase of 4.8% came in 1946, in spite of the end of war news. Also the number of new dailies launched exceeded those suspending in 1945 and on into 1946. Between January and September, 251 more dailies increased sales prices so that few were selling for less than five cents. As more consumers' goods became available, advertising broke 1945 records every month; February linage was up 26%; June linage was up 28%; November was up 16%. But a survey showed small daily costs up 11%. The Advertising Research foundation in September published its 101st analysis in the series of continuing reader studies. A survey in August reported 859 daily newspapers prepared to spend \$250,000,000 in new plants and equipment. A new movement to enlist weekly newspapers in the Audit Bureau of Circulation began the year with 414 enrolled and continued to grow. In October circulation managers prepared to defend their newspaper boy system against impending attack.

After extended argument over use of the A.P. and U.P. reports for a foreign short-wave propaganda service, the U.S. state department finally abandoned the project. For the first time in history, 200 newspapermen were allowed to cover a Vatican consistory, held in February, and filled the newspapers with pictures and reports. A belated war drive resulted in the use of 4,779,720 lines of free advertising for famine relief program in

June. Hugh Baillie, of the United Press, startled the world by interviewing Premier Joseph Stalin of the U.S.S.R. and Emperor Hirohito of Japan. Gen. Dwight Eisenhower in July restored full rights to Edward Kennedy, A.P. man who was penalized for premature reporting of the German surrender on May 7, 1945. On March 2, the *Manila (P.I.) Daily Bulletin* resumed publication suspended by the Japanese invasion on Dec. 7, 1941.

The crusade by U.S. newspapermen for world-wide press freedom continued through 1946 with few gains. The United Nations Commission on Human Rights outlined a four-point press freedom proposal in May. The U.S. state department presented a similar proposal to the United Nations assembly in Paris, also threatening to withhold a loan to Poland because of press censorship. The press was admitted to the Paris peace conference, and free press clauses were inserted in peace treaties of Italy, Rumania, Bulgaria, Hungary and Finland. Controversy with Russia over press freedom reached a high pitch late in August, and in September the American Society of Newspaper Editors submitted another proposal to the assembly, while another U.S. group under State Secretary William Benton added its voice. A Philippine resolution on press freedom was adopted by the U.N. general assembly on Dec. 14, and further plans were announced for making St. Paul's Church, Eastchester, N.Y., into the John Peter Zenger Shrine of the Bill of Rights. But it was noted in the U.N. assembly in November that of the 54 United Nations, only 29 had complete press freedom. Meanwhile, the Commission on Freedom of the Press, financed by Time, Inc., and Encyclopædia Britannica, Inc., and headed by Dr. Robert Hutchins of the University of Chicago, finished the study that it had started in Feb. 1944, with a final meeting in September.

Few important newspaper law suits were recorded during the year. In February, the U.S. supreme court declared daily newspapers subject to the wage-hour law, and in June clarified for the *Miami Herald* the newspaper right to criticize judges. The Jan. 1944 judgment in the Associated Press antitrust suit was slightly modified on Jan. 25, 1946; later Rep. Noah M. Mason of Illinois introduced a bill into the house to free mutual newsgathering agencies from the antitrust laws, but the bill did not reach passage.

Facsimile and frequency modulation radio broadcasting were the most notable innovations in the newspaper world. On May 11, the *Chicago Tribune* began broadcasting a four-page radio-transmitted "Fax" edition by FM process. A New York station in July transmitted facsimile news to passengers on an airplane. The *Chicago Sun* put on a long-distance facsimile show in October, but the general use of the novelty, like television, was limited by the small number of receiving sets.

Schools of journalism experienced a great boom because of the G.I. veterans' education program; enrolments almost doubled everywhere. The year saw further steps in a program of accrediting schools fostered by the American Council on Education for Journalism; meanwhile a group of smaller schools pushed a rival program. The Pulitzer school at Columbia university launched a new program of American Press institutes for working newspapermen, and the first three were held during the fall. A survey showed that 21 schools were developing courses in public relations.

Among the magazines the year 1946 saw little change in the larger publications but was marked by the launching of many small periodicals, some which were of short life. The paper situation was acute although about midyear supplies and quality improved rather more than in the newsprint field. Postwar demand for consumer goods led to much increase in commodity advertising in magazines, and the leaders were back to prewar size. In contents, the space taken by war articles began to be filled up with lighter fiction and especially crime mystery stories. The only large magazine launched was *Holiday*, published by Curtis Publishing Co. of Philadelphia, which appeared on Feb. 20. *Life International* was started by Time, Inc., of New York in July. *World Report*, a monthly of foreign news, was launched by David Lawrence, Washington. The *Chicago Star*, a 16-page tabloid weekly, appeared in July. *America's Crime & Mystery Weekly* was launched in Chicago in March. The *Boston Transcript*, a magazine succeeding the newspaper that died in 1940, was announced in April. Among the many new little magazines were *Business Girl* started in Dallas, Tex., in July, and *Tally* launched in Hartford, Conn. *American Mercury* in January bought *Common Sense*. The postal ban against *Esquire* was finally lifted by the U.S. supreme court in February. Time, Inc., bought a paper mill.

(G. M. Hy.)

Great Britain.—The first full year of peace was a year of encouraging development for British newspapers, whose vitality had been strikingly demonstrated even in the restricted war years by an advance in total circulation of more than 6,000,000 copies. From Sept. 22, 1946, the newspapers received an increased allowance of newsprint which was used partly to extend their size and partly to permit sales to be adjusted to allow the public to buy the papers of their choice. Canada and Newfoundland agreed to increase their exports of newsprint to the United Kingdom from 50,000 long tons a year to 150,000. It was hoped that by 1950 they would be sending 450,000 tons. The majority of the newspapers showed considerable increase in circulation after Sept. 22. Among the largest proportional increases were those of two journals catering to widely differing classes of readers, the *Times* and the *Daily Mirror*. The *Times'* increase was from 233,000 to 276,000, or 20% of the inland circulation; the *Daily Mirror's* was about 750,000 copies.

The *Daily Telegraph* gave its increase on the first day as 166,873. The increase in the sales of the *Daily Express* during the first week averaged 333,249, bringing its total circulation to nearly 3,800,000. The *News of the World* announced that its circulation at the end of October was more than 7,400,000 copies. Periodicals and trade journals were granted more paper as from Nov. 1. Magazines revived, transformed or newly established that consolidated their positions during the year were the *Cornhill*, the *Leader* and the *New English Review*.

In April a resolution of the National Union of Journalists urged the government to appoint a royal commission on the ownership, control and financing of newspapers, and in July a motion to this effect was tabled in the house of commons by Labour back-benchers. The motion came before the house in October and was carried by a majority of 113. In the course of the debate Herbert Morrison said that he thought an inquiry was justified but added that its findings would not commit the government to action.

At the beginning of 1946 it was announced that the National Union of Journalists and the Institute of Journalists had balloted in favour of merging the two bodies. Negotiations to accomplish this end went on throughout the year. The sixth Imperial Press conference (the first after 1935) was held in London in June. The delegates, numbering nearly 100, made a tour of the British Isles and of parts of the continent.

On July 8 the title of the *Daily Sketch* was altered to the *Daily Graphic*, previously incorporated as a secondary title. The *Daily Graphic* was founded in 1890 and appeared independently until 1926; the *Daily Sketch* had been published continuously from 1909. The *Observer* of Sept. 29 announced that by a deed of settlement signed on Feb. 27, 1945, its owners had transferred their property to a body of trustees in whom all the shares were vested. The trustees, Viscount Astor, Dr. Thomas Jones and Arthur Mann, had the duty of seeing that the *Observer* was conducted as an independent newspaper. During the year the *Birmingham Post* placed news on its front page for the first time from its foundation in 1857. The *News-Chronicle*, which first appeared as the *Daily News* under Charles Dickens, celebrated its centenary, and the *Daily Mail* reached its jubilee. (See also ADVERTISING.) (D. HN.)

New York. One of the original 13 states of the United States, popularly known as the "Empire state," New York covers an area of 49,576 sq.mi. of which 1,647 are water. With a population of 13,479,142 (federal census, 1940) and an estimated population of 14,036,065 (N.Y.S. Dept. of Health, July 1, 1946, up 4.1%) it retained its place as the most populous state. The foreign-born population in 1940 was 2,853,530 and the urban population 11,165,893. Albany, the capital, had an estimated 1946 population of 134,123. The 1946 population of New York city, more than twice the size of any other city in the country, was estimated at 7,782,839, up 4.4% from 1940: population of Buffalo, the state's second largest city, increased 7.2% to an estimated 617,492. Rome and Geneva showed the largest increases (24%) to 42,431 and 19,275 (estimated) respectively. Among the large cities, estimated 1946 population and percent changes were: Niagara Falls 91,206 (up 16.9%), Elmira 51,968 (up 15.2%), Schenectady 96,313 (up 10.0%), Syracuse 222,183 (up 7.9%), Binghamton 82,885 (up 5.8%), Utica 105,217 (up 4.7%), Rochester 338,503 (up 4.2%), Albany 134,123 (up 2.7%) Troy 70,259 (down 0.1%), Yonkers 141,091, New Rochelle 57,790 and Mount Vernon 66,649 (each down 1.1%).

History.—With expansion of peacetime production, the state's lighter industries reabsorbed many thousands of war workers: during the year following V-J day, industrial employment in New York rose 2.41%. The state's percentage of manufacturing employment (12.7%) remained the same as in 1939. Of 103 federally financed plants, approximately one year after V-J day, 76 had already been disposed of by sale or lease for the manufacture of civilian goods. In the first ten months of 1946, 32,635 stock companies were incorporated in the state, surpassing the previous full year record of 26,817 in 1928.

Surpluses in 1944, 1945 and 1946 amounted to \$156,000,000, \$163,000,000 and \$188,000,000 respectively at the end of each state fiscal year (March 31). As of April 1, 1946, \$138,000,000 of the latest surplus was transferred on recommendation of Gov. Thomas E. Dewey to the Postwar Reconstruction fund, bringing it to a balance of \$451,480,677. A vast state postwar public works program was in the planning stage during the years of the halt in wartime construction. All but the most essential of these projects were being held in abeyance so that

priority could be given to the State Veterans' Emergency Housing program and so that state building construction would not compete for scarce materials with private home builders. The program, as of July 1, 1946, contemplated the expenditure of \$1,362,000,000.

The subject of housing was dealt with by the 1946 legislature by various measures. The sum of \$80,000,000 was appropriated for loans to municipalities and to housing authorities to augment the scope of providing adequate, safe, sanitary, low-cost housing. In New York city emergency projects were sanctioned, aided by removal of certain tax limits, building restrictions, and regulations relating to bond issuance. An additional \$35,000,000 was appropriated toward conversion of existing structures for emergency living quarters.

Consideration of a bonus for veterans was referred to a special bipartisan joint legislative committee which recommended \$400,000,000 toward that end. This proposal was acted upon favourably by the 1946 legislature but had to be passed again by the 1947 legislature and referred to the voting public in November for referendum before taking effect.

The legislature extended commercial business and store rent controls in New York city for another year as well as providing for regulation of residential rents throughout the state, against the possible lapse of federal controls. Also enacted during this session was the Moore plan providing for state aid to localities on a per capita basis instead of through shared taxes.

Revenue receipts for general purposes for the state fiscal year (ended March 31, 1946) totalled \$667,690,414. Of the \$399,874,299 available for state purposes, \$212,110,110 was expended, leaving a balance of \$187,764,189 for surplus. Of this latter amount, \$50,000,000 was transferred to reserve funds and the remainder to the Postwar Reconstruction fund.

The sum of \$108,000,000 was distributed to localities as their share of personal income, franchise, utilities, motor vehicle and motor fuel taxes, alcoholic beverage taxes and licences. In addition the state paid \$160,000,000 to localities for support of common schools, for relief and welfare purposes and other state aid. Of total tax revenues, 41.4% was returned to localities in the form of state aid or shared taxes. Of this amount, New York city received \$127,500,000.

Excises on consumption including motor vehicle and motor fuel taxes, alcoholic beverage taxes and licences accounted for more than 27% of state revenues. General business taxes amounted to 31.4% and personal income tax to 22.5%.

Taxes on business were lightened by a reduction from 4% to 3% of the emergency unincorporated business tax while the emergency 1½% corporation franchise levy was entirely eliminated. Personal income taxes were reduced by one-third from the level of the previous year.

In the 1946 state-wide elections, Gov. Thomas E. Dewey, Republican, was re-elected by a margin of 687,151 votes over his Democratic opponent, U.S. Senator James M. Mead. Other state officers elected were: Joe R. Hanley (Rep.) lieutenant governor; Frank C. Moore (Rep.) comptroller; Nathaniel L. Goldstein (Rep.) attorney general. For U.S. senator Irving M. Ives (Rep.) polled a majority of 251,253 votes over Herbert H. Lehman (Dem.). The state senate for 1947 would consist of 41 Republicans, 14 Democrats and 1 American Labor; the state assembly of 109 Republicans, 40 Democrats and 1 American Labor.

Education.—During the school year ending June 30, 1945, there were 5,389 school districts in the state. There were 1,000 public high schools with a registration of 578,603 while 1,261,413 were enrolled in public elementary schools. The approximate cost of maintaining public schools (including salaries of 71,806 teachers) was \$352,000,000 excluding moneys raised by bonds. In addition to the public schools there were 110 colleges

and universities including 11 teachers' colleges. These higher institutions had a teaching staff of 14,278 instructing 126,985 students excluding those in summer and extension courses. This number increased rapidly as additional facilities became available and as increased enrolment was sought by veterans. As of the fall of 1946 at least 176,000 full-time students were enrolled while as of Jan. 1, 1947, the number had increased to more than 200,000.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of persons receiving public assistance was 292,153 in Sept. 1946 (as against 239,547 in Sept. 1945 and 244,931 in 1944) for whose relief \$9,781,329 was spent (compared with \$7,195,117 and \$7,012,172 respectively). The amount spent for home relief during Sept. 1946 was \$2,263,520, up 40.7% from 1945; \$4,529,894 for old age assistance, up 17.7%; \$2,838,595 for aid to dependent children, up 75.3%; and \$149,320 for assistance to the blind, up 26.4%. The state operated 26 hospitals, 20 of them for the mentally ill, two for the criminally insane. There were 7 state prisons, 3 reformatories and 3 institutions for defective delinquents.

Communication.—In addition to more than 8,000 mi. of railroads, there were in New York state, exclusive of streets in cities and incorporated villages, 83,496 mi. of highways, of which 70,716 mi. were town and country roads. Of the total, 60,408 were classified as improved. The state maintained a system of more than 450 mi. of canals including the Erie 340; the Champlain 63; the Cayuga-Seneca 27 and the Oswego 24. Including the rivers and lakes which were part of the New York State Barge Canal system, the total length was more than 800 mi. Although no tolls are charged, the canals and waterways yielded a revenue of \$586,000 in 1945 from the use of terminals, the sale of water power and the operation of grain elevators. Air transportation was being developed in New York state with the help of the bureau of aviation in the state department of commerce.

Banking and Finance.—As of Jan. 1, 1946, 131 savings banks had deposits of \$8,292,000,664 and assets of \$9,171,941,067; 117 state banks and 147 trust companies, on June 29, 1946, reported deposits of \$20,433,285,831 and assets of \$22,340,471,774; on the same date the following deposits were listed: 395 national banks \$9,536,070,653, 14 industrial banks \$159,039,657, 5 private banks \$191,316,862.

Agriculture.—Total farm area rose to 17,722,081 ac. under the wartime production program. The 1945 agricultural census listed 153,358 farms. Area of principal crops harvested (excluding orchards—vineyards), although one percent less than that of 1941, amounted to 6,452,000 ac. Milk production was about 8,130,000,000 pounds in 1945—a new high record.

In 1940, New York had 70% of its farms electrified as compared with 33% for the nation.

Table I.—Estimated Cash Receipts From New York State Farm Marketings, 1945 and 1944

	1945	1944
Crops	\$195,035,000	\$220,088,000
Livestock	54,108,000	44,701,000
Dairy products	264,121,000	250,468,000
Poultry	114,833,000	101,474,000
Wool, etc.	3,439,000	2,415,000
	<u>\$631,536,000</u>	<u>\$619,146,000</u>

Manufacturing.—In 1939, according to the biennial manufacturing census (none was taken during World War II) there were 34,506 manufacturing establishments employing 957,844 persons, paying \$1,163,785,198 in wages and producing goods valued at \$7,134,400,147.

Since no later figures on value of manufactures were available than the 1939 census, the status of manufacturing activity is best shown by employment data. Table II (below) compares employment in manufacturing by industry group for Oct. 1946 with that of one year previous, roughly covering the period following V-J day.

Table II.—Estimated Employment in Manufacturing Industries, New York State, 1945-46

	Oct. 1946	Oct. 1945
All manufacturing	1,888,804	1,718,989
Durable goods	652,893	574,992
Lumber and timber	12,121	10,530
Furniture	51,755	45,776
Stone, clay and glass	43,151	36,616
Iron and steel and products	115,639	103,130
Nonferrous metals	70,374	55,054
Machinery except electrical	158,270	129,746
Electrical machinery	106,364	94,825

Table III.—New York State Mineral Production, 1945

	Amount, 1945	Value, 1945
Cement	5,102,160 barrels	\$ 9,009,454
Gypsum	557,902 short tons	1,262,989
Salt	2,862,224 " "	10,327,013
Stone (all kinds)	7,900,560 " "	9,133,781
Emery	7,856 " "	75,977
Ilmenite	220,000 long "	—
Zinc (concentrates)	24,978 short "	5,744,940
Oil	4,648,000 barrels	13,944,000
Iron ore (estimated)	5,000,000 long tons	—

Mineral Production.—The value of the leading mineral products of New York state for the year 1945 are shown in Table III. (H. KE.)

New York City. Unofficial estimates place the 1946 population of New York city at 7,780,000.

When Brig. Gen. William O'Dwyer, Democrat, took office as mayor on Jan. 1, 1946, the city faced many critical postwar problems, most of them the result of or aggravated by conditions arising from the all-out mobilization of manpower and industry during the war years. These problems included labour, salary adjustments, transit rehabilitation, housing, airports, the United Nations, schools, police and budget.

The number of strikes and threats of strikes requiring intervention of the mayor had grown to such proportions that it was necessary to create a separate division of Labour relations. From October to the end of the year it settled 23 disputes. The city provided, on an annual basis, approximately \$56,650,000 for the adjustment of employees' salaries, including increases for teachers and nurses. In addition an annual increase of \$18,500,000 was given to employees of the city's rapid transit system in accordance with recommendations of a special committee. Contracts totalling \$66,041,170 for new subway cars, busses, trolleys, lengthening of stations, remodelling of power plants and other rehabilitation were awarded in 1946.

The city obtained \$80,000,000 in housing loans and \$2,750,000 in housing subsidies from the state for public housing. The federal government, at the city's request for 19,000 units, furnished 8,600 temporary housing units for veterans. Thirteen public housing projects, totalling 18,395 apartments, were in process of construction at the end of the year. Six more, containing 7,618 apartments, were in the planning stage. John Lovejoy Elliott houses, a completely city-aided project was partially completed at year's end. The generous gift of the Rockefeller family and of the city, with respect to the acquisition of property located in mid-Manhattan, was accepted by the United Nations for its permanent site. The city pledged its facilities, resources, talents and efforts to assist in the establishment of a world capital for peace. Plans were begun during the year to complete this project.

Campaigns were successfully waged to stamp out insanitary conditions in food establishments. A ragweed-control program was instituted. The city was sharing the cost of a health insurance plan with its employees. A program was launched to rehabilitate hospitals. Hospital employees' salaries and working conditions were improved.

Provision was made for construction or reconstruction of 22 schools. Expenses for education increased \$15,000,000 because of teachers' salary increases, the hiring of additional teachers and the increase in student enrolment—30,000 school children and 20,000 veterans in the high schools. City colleges had a record enrolment of 51,000, of which 18,000 were veterans. The police force had 15,068 members in Jan. 1946, the lowest after 1926. During 1946, 3,096 patrolmen were appointed, of whom 2,894 were veterans. Many older officers were retired to make room for younger and more aggressive men to increase the force's efficiency.

The tax budget was increased from \$624,303,204 to \$713,867,664. In order to provide funds for salaries of veterans returning to their civil service jobs and to provide long-deferred

U.S. NAVY PERSONNEL manning navy tugboats in New York harbour under a marine guard, when civilian tugboat men were on strike in Feb. 1946

repairs and improvements to city plants, institutions and other facilities, the city was forced to levy special taxes. (See also MUNICIPAL GOVERNMENT.)

New York University. A coeducational institution occupying six centres in various parts of New York city and consisting of two liberal-arts colleges, three graduate schools, seven professional schools and colleges and a division of adult education, with programs of study embracing the liberal and fine arts, business, dentistry, education, engineering, law, medicine and public administration. Although bearing the name of both the state and the city, it is a privately controlled institution with no religious or other affiliations. Its operating revenue in 1945-46 was \$11,695,663.44, derived from student fees, endowments and gifts. The latter exceeded \$2,970,000, with approximately \$660,500 for specialized training and research. A major portion of the year's gifts went toward the projected \$15,000,000 medical centre which the university was undertaking in conjunction with the proposed rebuilding of Bellevue hospital by the city of New York. The largest single gift for this purpose was \$500,000 from John D. Rockefeller, Jr. The year marked the launching of a \$3,000,000 campaign for the development of a new law centre both to house the existing school of law and to expedite the extension of its professional services. The cumulative enrolment of the university for 1945-46, including the summer session of 1945, reached a net total of 47,155 of whom approximately 13,000 were veterans. At the regular commencement exercises in June 1946 degrees and certificates were conferred on 3,327 candidates. The university during the year added to its facilities an 11-story classroom building in its Washington Square centre and opened an emergency collegiate unit in White Plains, N.Y., for 500

veterans and high-school graduates of the area. Dr. Walter W. Wright, professor of prosthetic dentistry and professor of anatomy at the University of Pittsburgh, was appointed dean of the college of dentistry; and Charles M. Edwards, professor of retailing, was named dean of that school. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (H. O. V.)

New Zealand, Dominion of. A British dominion, consisting of a group of islands, lying in the South Pacific to the southeast of Australia. Area: dominion proper 103,415 sq.mi.; other islands, 519 sq.mi.; pop. dominion proper (census 1945) 1,746,319 (including Maoris 98,744); Cook and other Pacific islands (census 1945) 1,289; Tokelau islands 1,388; Western Samoa (mandate) 68,550. Chief cities (pop. census 1945): Wellington (cap., with suburbs 175,189; Auckland (with suburbs, 256,426); Christchurch (112,525); Dunedin City (65,487). Language: English; religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012). Ruler: King George VI. Governor general: Lieutenant General Sir Bernard Freyberg.

History.—The year 1946 opened with the prime minister, Peter Fraser, in London for the general assembly of the United Nations. In the debate at the United Nations assembly Fraser reiterated his belief that the veto remained a blot upon the charter. He had previously stated that New Zealand would be willing to place Western Samoa under the Trusteeship council of the United Nations.

The finance minister, Walter Nash, arrived in London in April for informal discussions with representatives of the United Kingdom, Australia, South Africa and later Canada. On his return, discussing Pacific bases, he said that New Zealand did not propose the transfer of the sovereignty of any British Pacific

islands, but that did not mean there would not be co-operation with the United States. The main points of the budget presented by Nash on his return were: reduction of income-tax surcharges from 33½% to 15%; elimination of excess profits tax; abolition of sales tax on building materials, clothing, and furnishings; removal of 3% primage duty on imported books and periodicals.

Notable in a year of reconstruction were reports on population and licensing. The parliamentary committee on population concluded that New Zealand should not embark on any large-scale immigration policy immediately, mainly because of housing difficulties. It noted, however, a great demand for operatives in secondary industry and suggested immediate inquiries in Scandinavia, the Netherlands and possibly Poland, since it seemed unlikely that the United Kingdom would be willing to part with the younger and more virile elements of its population. The licensing commission's report, after taking 7,000 pages of evidence, was drastic. Public ownership of breweries and sweeping changes in opening hours were recommended.

The dissatisfaction of the farming community with the government led to a "non-co-operation" movement early in the year which was not conspicuously successful. The produce agreements with Britain made later provided for higher prices based on increased farming costs.

Plans for the first New Zealand cotton mill were announced. Government plans to end the electric power shortage included new hydroelectric stations on the Waikato river.

The Labour government, in power from 1935, held 44 out of 80 seats when the general election took place on Nov. 27. The result of the election was: Labour 42, National 38.

Education.—Dec. 1943: state elementary schools 2,090, scholars 204,060; post-primary scholars 47,620. The University of New Zealand has six constituent colleges, including agricultural colleges at Lincoln and Palmerston North, grouped together as the New Zealand School of Agriculture; university students (1946) 10,700. Total cost of education (year to March 31, 1944) £NZ5,221,389.

Finance.—(In £NZ) Revenue, consolidated fund (est. 1946-47), £100,382,000; expenditure £99,465,000. Revenue, social security fund (est. 1946-47), £38,038,000, including increased contribution from consolidated fund of £18,000,000 compared with £7,000,000 in 1945; expenditure £35,788,000. Note circulation (July 1946) £38,265,815. Reserve (March 1946) (in reserve bank): gold £2,801,878, exchange £81,679,838. Net overseas funds (July 29, 1946) £99,692,118 (highest on record).

Deposits in post office and trustee savings banks (March 31, 1945) £136,266,000. Taxation by general government (year ended March 31, 1946): consolidated fund: customs revenue (excluding gasoline and tire taxes) £8,800,016; beer duty £2,308,600; land-tax £937,395; income-tax £26,465,912; racing taxation £1,555,247; motor vehicles taxation, £2,324,068; sales tax, £4,505,443; other, £1,474,037; total consolidated fund £48,370,718; social security taxation £15,167,308; war taxation £51,416,847. Total taxation £114,954,873, or £67:5:3 per head of population including Maoris. Gross indebtedness of general government (March 31, 1946): £624,511,590, or £355:4:9 per head of population. Exchange rate: £NZ125=£100 sterling; £NZ=324.2 cents U.S.

Aggregate private income 1943-44: Salary and wage payments, £175,900,000; social security benefits and pensions £15,700,000; company income £40,900,000; other £59,800,000. 1944-45: salary and wage payments £176,500,000; social security benefits and pensions £17,200,000.

Trade and Communication.—Imports (1944) £NZ86,686,531; exports (1944) £NZ77,786,946. Communication: road, paved or surfaced 44,812 mi. (including main highways 12,398 mi.); not paved or surfaced 8,631 mi.; railways, 3,504 mi.; passenger journeys (year to March 31, 1946) 32,388,000. Civil aviation: passengers carried on internal air lines (year to March 31, 1946) 66,968; on overseas services 6,100. Freight (internal) 353,514 lb. (external) 99,584 lb. Mail (internal) 428,709 lb. (external) 214,792. Shipping (1945) entered 1,830,469 tons, cleared 1,825,217 tons. Motor vehicles licensed (March 31, 1945) 301,154. Wireless licences 395,139.

Agriculture.—Acreage (1944-45): wheat 188,771; oats 228,470; barley 43,200; maize 14,830; linseed for threshing 4,326; peas for threshing 43,970; potatoes 29,774; onions 1,915; perennial rye-grass 47,287; linen-flax 12,686; Italian rye-grass (including western wolths) 17,547; cocksfoot 15,475; tobacco 2,839. Yields, total and per acre (1944-45): wheat 6,992,204 bu. (38.02); oats 4,209,143 bu. (54.18); barley 1,384,957 bu. (37.11); maize 443,151 bu. (52.30); peas 1,037,551 bu. (23.60); potatoes 138,256 short tons (4.68); onions 19,675 short tons (10.27); perennial rye-grass 13,789,983 lb. (292); Italian rye-grass (including western wolths) 7,783,563 lb. (444); cocksfoot 2,171,639 lb. (140). Live stock (1945): horses 217,689; cattle 4,590,926 (including 1,678,943 dairy cows in milk); pigs 593,828 (including 77,202 breeding-sows); sheep 33,974,612 (including 20,865,858 breeding-ewes). Wool production (1944-45): 372,000,000 lb. (greasy); butter-fat production (1944-45): 430,000,000 lb.

Manufacturing.—1943-44: number of establishments 6,202; total number of employees 117,864; salaries and wages paid £NZ34,433,075; value of products £NZ175,686,689; value of land, buildings, machinery and plant £NZ90,740,357.

Mineral Production.—Production in 1944 included: gold 142,287 oz.; silver 328,281 oz.; (in short tons) arsenic 18; talc 28; asbestos 19; scheelite 160; fuller's earth 117; coal 3,086,567; iron ore 6,640; phosphate 21,924. (A. J. H.P.)

NHA (National Housing Agency): see HOUSING.

Nicaragua. A republic of Central America, situated between Honduras on the north and Costa Rica on the south. Area: 57,145 sq.mi., of which 3,475 sq.mi. is water. Pop. (official est. Dec. 31, 1943) 1,048,642; by the 1940 census it was 983,160. Capital, Managua (1941 off. pop. est., 87,620); other urban centres are Chinandega (15,377); Granada (25,530); Jinotepe (9,556); León (31,799); and Masaya (21,070). Language: Spanish. President in 1946: General Anastasio Somoza.

History.—The year 1946 was dominated by preparations for the presidential election scheduled for Feb. 2, 1947. Pres. Somoza announced on Jan. 6 and again in August that the elections would be free and that he would not be a candidate. The president failed in an attempt in June to obtain a reconciliation between his Nationalist Liberals and the Independent Liberal party. In July and August the latter group formed a coalition with the Conservative party, headed by Gen. Emiliano Chamorro, a former president who returned in May from a ten-year exile. The Conservatives pledged themselves to support a Liberal Independent candidate chosen from among six of their own nomination, and on Sept. 1, the Independent Liberal convention at León selected Dr. Enoc Aguado, a professor of law and former deputy, as the standard-bearer of the coalition. Meeting at the same city, Aug. 12, the Nationalist Liberals divided for a time between Dr. Leonardo Guerrero and Alejandro Abaunza Espinosa, but at the instigation of Pres. Somoza agreed unanimously on Dr. Leonardo Argüello as their candidate. As the year ended the administration was faced with the combined opposition of the Conservatives, Independent Liberals, Socialists, the University Student federation and the Nicaraguan section of the Central American Union party, which Aguado declared represented 89% of the total electorate.

Notwithstanding the intense political activity, the country was relatively quiet during 1946. A university student demonstration against the administration, June 27, was dissolved by the national guard. Several demonstrators were injured, and a general student strike was staged in Managua in protest, but the government remained firm. Pres. Somoza cancelled a proposed trip to the United States to attend his son's graduation at West Point, but flew to Boston early in September for an operation. On Sept. 30, the legislature extended until April 30, 1947, the special emergency powers of the executive department, granted in 1939, which suspended certain constitutional guarantees of personal and economic liberties. The death in August of former president Juan Bautista Sacasa, while in exile, had no effect on the political situation. Labour unrest, due mainly to the high cost of living, continued throughout the year, but strikes were warded off by the government.

Education.—In 1942 primary schools numbered 943, with an enrolment of 63,380 students; intermediate schools, 11, with 2,750 students. The government's literacy campaign gained momentum in 1946 when congress made it the obligation of every literate citizen aged 15 to 70 to teach reading and writing to all illiterates between 12 and 50.

Finance.—The monetary unit is the córdoba, officially maintained in value at 20 cents U.S. The provisional budget for the 1946-47 fiscal year recommended expenditures amounting to 77,359,707 córdobas, a record high (70,391,000 córdobas in 1945-46). The public debt on March 24, 1945, was estimated

at \$4,378,000 (U.S. currency).

Trade and Resources.—Exports for 1945 were valued at \$13,962,728 (U.S.) (\$15,412,455 in 1944); imports, \$12,651,615 (\$10,279,451 in 1944). In the first 9 months of 1946, exports were \$14,758,070; imports, \$10,305,215. The United States took 61% of the exports and supplied 40% of the imports in 1945. Gold exports amounted to \$7,117,155 and silver, \$114,450, a decline from the previous year which continued in 1946 because of lack of mining machinery. Heavy spring rains destroyed an estimated 60% of the coffee harvest in 1946, and a summer drought ruined about 75% of the corn and rice harvests. Wild rubber collection, second in volume to Brazil's yield during the war years, was curtailed in 1946.

Communication.—In 1944 Nicaragua had 258 mi. of railway and about 3,000 mi. of highway, largely unimproved. As of May, 1946, asphalt surfacing was complete on 100 mi. of the national sector of the Pan-American highway, leaving only 47.5 mi. unsurfaced. Motor vehicles registered in 1943 numbered 1,172 passenger cars and 312 trucks and buses. Puerto Somoza, midway between Corinto and San Juan del Sur on the Pacific, was opened to international traffic during the year, and the U.S. naval installations at Corinto were turned over to the national government.

Nickel. The production of nickel in Canada declined from 137,299 short tons in 1944 to 122,565 tons in 1945, and an estimated 95,400 tons in 1946.

Almost the entire United States supply is derived from imports, mostly from Canada. The domestic output was 988 tons in 1944 and 1,155 tons in 1945, while secondary recovery was 4,321 tons in 1944 and 6,483 tons in 1945. Imports, including metal, matte and oxide, decreased in gross weight from 134,932 tons in 1944 to 122,528 tons in 1945. Nickel content of the 1945 imports approximated 87,600 tons from Canada, 4,400 tons from New Caledonia, 12,200 tons from Cuba and 3,200 tons from England.

Primary nickel consumption in the United States was reported at 96,252 tons in 1945, with year-end stocks of 10,883 tons at consumers' plants and 399 tons in transit; Metals reserve stocks included 18,956 tons of metal in various forms. Consumption was distributed as follows: steel and cast iron 58,570 tons, nonferrous alloys 26,401 tons, high temperature and resistance alloys 3,951 tons, electroplating 6,368 tons, other uses 962 tons.

During the German occupation the Falconbridge matte was treated by International Nickel Co. in Canada, but before the end of 1945 the matte output was being sent to Norway for treatment.

The Patchange plant (the former Finnish development of International Nickel at Petsamo) was being restored after destruction during the German occupation, and mining operations had been resumed. In New Caledonia the contract for the sale of nickel to the United States expired and postwar matte output would go to the smelter in France. Nickel production in Cuba surpassed that of New Caledonia in 1945, Cuba taking the place of third largest producer, after Canada and U.S.S.R. The Cuban operation was financed by the Reconstruction Finance Corp., though operated by a subsidiary of the Freeport Sulphur Co., and in 1946 its postwar disposition was yet to be determined.

(G. A. Ro.)

Nicola, Eñrico de (1877–), Italian statesman, was born Nov. 9. in Naples. Graduated

from Naples university in 1895, with a law degree, he was admitted to the bar and won renown as a criminal lawyer. He was elected to the Italian chamber of deputies in 1909, and was re-elected in 1913, 1919 and 1921. De Nicola was president of the chamber of deputies from 1920 to 1923. When the fascisti elected him to the chamber on their ticket, he refused to take his seat and retired from politics in 1924. In the summer of 1946, Signor de Nicola was elected president of the new Italian republic by the national assembly, winning 396 out of 504 votes. Pres. de Nicola was slated to hold office until the elections of 1947 when a permanent president would be chosen.

Nimitz, Chester William (1885–), U.S. naval officer, was born Feb. 24 in Fredericksburg, Tex., and was graduated from Annapolis in 1905. During World War I he was chief of staff to the commander of the Atlantic fleet's submarine force. He was promoted to rear admiral, June 23, 1938. On Dec. 17, 1941, after the surprise attack on Hawaii, he was made commander in chief of the Pacific fleet, with the rank of admiral. Nimitz was given command of the Central Pacific theatre and had army and marine units as well as naval forces under his authority. Under his command, U.S. armed forces conquered the Solomons (1942–43), the Gilbert Islands (1943), the Marianas, Marshalls and Palau (1944) and Iwo Island (1945); his naval forces participated in the Philippines campaign (1944–45) and the Okinawa invasion (1945). Nimitz, who was promoted to the rank of admiral of the navy Dec. 15, 1944, attended the Japanese surrender ceremonies aboard the battleship U.S.S. "Missouri" in Tokyo bay (Sept. 2, 1945). Nimitz was of the opinion that the atomic bomb merely emphasized the value of seapower and like the vast majority of naval officers, he opposed the proposed merger of the armed forces. On Nov. 20, 1945, he was named chief of naval operations, succeeding Adm. Ernest J. King. On March 28, 1946, he was named by Pres. Truman to a new military board set up for the purpose of planning national defense. Appearing before the house foreign affairs committee (May 28), Nimitz and Gen. Dwight Eisenhower urged military collaboration with Latin-American countries and Canada.

Nitrogen, Chemical. Chile still remained the only important source of natural chemical nitrogen, but its once dominant position was greatly encroached upon by by-product nitrogen from the coking of coal and by the fixation of atmospheric nitrogen. While this trend had been under way during most of the 1900s it was particularly pronounced during World War II. Of the supply of chemical nitrogen in the United States in 1946, not more than about one-sixth was natural.

The output of synthetic ammonia in the United States increased from 541,079 short tons in 1944 to 548,655 tons in 1945, while by-product ammonia decreased from 236,226 tons to 218,680 tons, leaving the totals substantially unchanged.

Imports of sodium nitrate into the United States increased from 712,434 tons in 1944 to 849,888 tons in 1945, and other forms of imported nitrogen increased in about the same proportion. Chief among other imported nitrogen compounds are calcium cyanamide and ammonium sulphate, but the latter is largely offset by exports.

As of Jan. 1, 1947, there were no data on the amounts of chemical nitrogen going into its various uses. Normally, fertilizers and the chemical industry are the major consumers. During World War II the demand for chemical uses had been

greatly expanded by the large amounts of explosives required for munitions.

NMB: see NATIONAL MEDIATION BOARD.

Nobel Prizes: see PRIZES OF 1946.

Noel-Baker, Philip John (1889–), British statesman, was born Nov. 1. He was graduated from Cambridge university with an M.A. degree in 1913. During World War I, he drove an ambulance for the Friends' ambulance unit, serving in France and Italy, and was cited for valour.

Noel-Baker was a member of the British delegation to the Paris Peace conference in 1919. He joined the faculty of the University of London as professor of international relations in 1924 and was Labourite member in the house of commons (1929–31). Returned to commons in the 1936 elections, he was appointed in 1942 as parliamentary secretary to Lord Leathers, minister of war transport in the Churchill coalition cabinet. Following the Labourite victory in the 1945 general elections, Clement Attlee named Noel-Baker minister of state and to membership in the privy council.

Noel-Baker, who headed the British delegation on the executive committee of the U.N. preparatory commission, defended his government's policy in the London sessions of the U.N., declaring, Feb. 17, 1946, that the discussions strengthened Anglo-Soviet relations and warning that if "we allow the U.N.O. to perish . . . then the pages of our history are numbered." On June 14, he succeeded Harold Laski as chairman of the Labour party executive and on Oct. 4, he was appointed secretary of air in the cabinet.

North Borneo: see BORNEO.

North Carolina. A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union; area 52,712 sq.mi. (49,142 sq.mi. land, 3,570 sq.mi. water); pop. (1940) 3,571,623 of which 974,175 (27.3%) were urban, 2,597,448 (72.7%) rural and 1,005,501 (28.2%) nonwhite. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 3,534,545. Capital, Raleigh (46,897); other cities: Charlotte (100,899); Winston-Salem (79,815); Durham (60,195); Greensboro (59,319); Asheville (51,310).

History.—Like the nation, North Carolina in 1946 experienced high prices and income, economic prosperity, scarcities and industrial unrest. The C.I.O. and A.F. of L. carried on drives to organize the state's industrial workers. North Carolina did not contribute to the national Republican landslide in November. The new legislature which was to meet on Jan. 8, 1947, would have the usual overwhelmingly Democratic majority; and the state's congressional delegation continued solidly Democratic. The voters approved an amendment to make the constitution equally applicable to men and women as to jury service, suffrage and in other respects. There was widespread public agitation for increased teachers' salaries and a good health program involving medical centres in every county, a hospital and four-year medical school at the university, assistance to medical students and to indigent hospital patients—the two chief problems facing the legislature in January. In April was held the final convocation of the sesquicentennial celebration of the university which was chartered in 1789 and opened its doors to students in 1795. In August the State Baptist convention accepted the Z. Smith Reynolds foundation's offer of a \$10,-

500,000 endowment for Wake Forest college on condition that the college be moved from Wake Forest to Winston-Salem. Governor R. Gregg Cherry appointed William B. Umstead of Durham to fill the unexpired term in the United States senate of Josiah W. Bailey who died in office.

State officers in 1946 were R. Gregg Cherry, governor; L. Y. Ballentine, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney-general; W. P. Stacy, chief justice.

Education.—In 1944–45 there were 3,480 public elementary schools with 19,827 teachers and principals and 683,746 enrolled pupils; 978 public high schools with 6,088 teachers and principals and 129,080 enrolled pupils; these were operated at a cost of \$50,088,131, approximately three-fourths of which was contributed by the state government. The state provided bus transportation for 300,904 school children at an average cost of \$11.96 per pupil.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Oct. 1946 public grants amounting to \$496,973 were made to 34,466 persons for old-age assistance; \$192,090 to 6,635 families for aid to dependent children; \$56,561 to 2,667 blind persons; and \$35,799 to 2,685 cases for general relief (by the county governments). During the year ending June 30, 1946, the total amount of public relief funds distributed was \$8,238,689, and during the first 11 months of 1946 unemployment benefits amounted to \$4,091,129. In 1946 the state maintained 9 charitable institutions with 9,608 inmates on Nov. 1; 9 correctional institutions with 783 inmates; and state highway prison camps with 6,161 prisoners.

Communication.—In 1946 the state highway and public works commission maintained 11,298 mi. of state highways, of which 9,936 mi. were hard-surfaced; and 50,126 mi. of county roads, of which 2,612 mi. were hard-surfaced. There were 4,581 mi. of railroads, 324 mi. of city bus routes, 10,277 mi. of passenger bus routes and 11,525 mi. of freight vehicle routes in 1944.

Banking and Finance.—On June 30, 1946, there were 45 national banks with resources of \$477,776,000, and 183 state banks with deposits of \$1,215,364,000 and resources of \$1,295,801,000. On Jan. 1, 1946, there were 147 building and loan associations operating under state charters with total assets of \$102,019,790. In 1945–46 state receipts were \$273,639,057; disbursements, \$249,142,264. On June 30, 1946, the state gross bonded and net debts were \$100,091,500 and \$28,599,890 respectively. The assessed value of property was \$2,884,364.459 in 1945. In the state general fund there was a cash surplus of about \$48,000,000 at the end of 1946.

Table I.—Leading Agricultural Products of North Carolina, 1946 and 1945

Crop	1946 (est.)	1945	Value, 1946
Tobacco, lb.	904,270,000	813,810,000	\$451,119,000
Cotton, bales	420,000	428,000	69,090,000
Corn, bu.	58,914,000	55,100,000	108,402,000
Tame hay, tons	1,256,000	1,366,000	32,028,000
Peanuts, lb.	306,475,000	304,000,000	33,406,000
Wheat, bu.	6,307,000	5,712,000	14,002,000
Sweet potatoes, bu.	7,680,000	6,615,000	18,432,000
Irish potatoes, bu.	12,080,000	8,784,000	14,375,000
Oats, bu.	12,870,000	10,312,000	13,900,000
Soybeans, bu.	2,862,000	2,700,000	8,014,000
Lespedeza seed, lb.	40,900,000	41,500,000	4,049,000
Peaches, bu.	3,160,000	2,172,000	6,478,000
Apples, bu.	1,716,000	252,000	3,861,000
Pecans, lb.	1,433,000	2,504,000	582,000

Agriculture.—The total value of agricultural production harvested from about 9,800,000 ac. in 1946 was approximately \$800,000,000, of which tobacco accounted for \$451,119,000 and cotton \$108,402,000. North Carolina produced 47% of all the tobacco and 75% of all flue-cured tobacco grown in the United States. The cash income of North Carolina farmers in 1945 was \$526,691,000 from crops; \$116,750,000 from livestock and live-

stock products; and \$9,366,000 from government payments. The value of the lands and buildings on the 278,276 farms in 1940, 44% of which were operated by tenants, was \$736,708,125.

Manufacturing.—In 1939 manufacturing establishments numbering 3,225 employed 270,210 wage earners at wages of \$199,289,501 and made products valued at \$1,421,329,578. The principal industries were tobacco products, cotton goods and furniture. Estimated industrial production in 1946 was about \$2,000,000,000.

Mineral Production.—The mineral production for North Carolina in 1944 was \$22,199,000. In quantity production of mica, feldspar and bromine, North Carolina ranked first among the states; but in value of all minerals produced, it ranked 32nd in 1944. The value of gold produced in 1943 was \$4,585.

Table II.—Principal Mineral Products of North Carolina, 1945, 1944, 1943 and 1942

Mineral	Value, 1945	Value, 1944	Value, 1943	Value, 1942
Stone	\$3,044,135	\$5,975,951	\$5,376,600	\$3,774,472
Clay products		2,700,000	3,000,000	4,000,000
Sand and gravel	1,503,422	1,405,917	1,823,516	2,491,820
Feldspar (crude)		778,007	656,182	533,448
Mica	633,250	2,280,910	2,288,691	991,194

BIBLIOGRAPHY.—U.S. census; *Minerals Yearbook*; reports of state agencies. (A. R. N.)

North Carolina, University of. The University of North Carolina at Chapel Hill, provided for in the state constitution of 1776, chartered in 1789 and opened in 1795, completed in 1946 the sesquicentennial celebration of its founding. Enrolment at the beginning of the 1946 fall quarter was 65% above 1941. Construction was begun on three new dormitories and 354 housing units for married veteran students and faculty members. Emergency housing for more than 600 students was also provided.

Gifts during the year 1946 included more than \$1,000,000 from John Motley Morehead for the construction of a planetarium, the income from \$250,000 provided by James A. Gray for a professorship of Bible and related courses, \$75,936 from the General Education board for six special projects and more than \$75,000 from other donors. The Business foundation was formed by private individuals to assist the school of commerce and other university agencies in providing educational services and research for business and industry. A similar Pharmaceutical foundation was also incorporated.

Revisions in the general college curriculum in the spring of 1946 made the foreign language requirement more flexible, introduced the fine arts and reduced elective courses. Important additions to the instructional and research resources of the university included a department of mathematical statistics and a department of regional planning, a bureau of business service and research and a communications centre. The University Research council began participating in a five-year program to stimulate research and creative activities among college teachers. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (F. P. G.)

North Dakota. A west north central state of the United States, admitted to the union Nov. 2, 1889. Popular name, "Flickertail State." Land area, 70,054 sq.mi.; water area, 611 sq.mi. Population (1940), 641,935; rural 510,012; urban 131,923. The bureau of the census estimated population July 1, 1944, as 528,071. Cap., Bismarck (15,496). Chief cities, Fargo (32,580); Grand Forks (20,228); and Minot (16,577).

History.—The Garrison dam was expected to increase the possible resources and population of the state appreciably. The Republican Organizing committee gained majorities in both house and senate of the 1947 legislature in the 1946 election. As

a result of that election the chief state officers were: governor, Fred G. Aandahl; lieutenant governor, C. P. Dahl; secretary of state, Thomas Hall; auditor, Berta E. Baker; treasurer, H. W. Swenson; attorney-general, Nels G. Johnson; superintendent of public instruction, G. B. Nordrum; commissioner of insurance, Otto Krueger; commissioner of agriculture and labour, Math Dahl; tax commissioner, John Gray; public service commissioners, C. W. McDonnell, S. S. McDonald and Ben C. Larkin.

Education.—School teaching positions for the year ending June 1946 were 6,528; elementary 4,986; high school 1,542; enrolment, elementary, 87,173; high school, 27,418; buildings, 2,933 one- and two-room; 240 graded elementary; 415 combinations (elementary-high school); 3,588 schools in session (1946-47). Institutions for higher education (fall of 1946) had teaching staffs, state university, 147; agricultural college, 124; other state colleges, 208. Enrolment, university, 2,683; agricultural college, 2,370; other, 3,362. Total staff 479; enrolment, 8,415.

Social Insurance and Assistance, Public Welfare and Related Programs.—Public assistance, in the year to Nov. 30, 1946 was \$5,174,313; average number aided per month, 11,370; types of aid: old-age, \$3,705,630 with 8,756 persons; care of dependent or foster home children, \$1,205,747 with 1,832 persons; blind, \$50,012 with 117 persons; other, \$212,924 with 665 persons. Cost of operating four charitable and four correctional institutions, biennium to June 30, 1947, \$4,500,000. Average number of patients (1946): feeble-minded, 960; blind, 30; deaf, 90; tubercular, 235; correctional institutions, 2,500.

Communication.—Highway mileage, state, 7,223; rural, 107,377. Spent for construction of state highways, \$2,071,470.72; and for maintenance of state highways, \$2,016,966.65. No additional apportioned to counties. Railway mileage, 5,272.

Banking and Finance.—On June 29, 1946, 1 trust company and 108 state banks had resources of \$284,161,000; deposits, \$270,008,000. Resources, 42 national banks (4 with trust powers) \$227,655,000; deposits \$217,531,000. Six federal savings and loan and 12 state building and loan associations Dec. 31, 1945, had resources of \$23,153,629 and share capital of \$20,486,654. State treasury receipts, year to June 29, 1946, \$38,130,067; expenditures \$34,299,509; bonded debt \$18,949,250.

Agriculture.—Farm acreage in crops (1945), 17,291,445. Gross farm income (1946) of \$587,694,577 averaged \$8,453 for 69,524 farms; of this, livestock and its products made \$206,724,867; crops, \$481,405,710; and soil conservation payments, \$6,816,480.

Leading Agricultural Products of North Dakota, 1946 and 1945

Crop	1946	1945
Spring wheat (other than durum), bu.	107,460,000	129,920,000
Durum wheat	32,364,000	31,968,000
Corn	25,542,000	26,950,000
Oats	62,764,000	82,484,000
Barley	46,600,000	53,760,000
Rye	2,058,000	2,418,000
Flax	5,334,000	13,348,000
Potatoes	17,760,000	23,660,000
Hay, tons	2,736,000	3,438,000

Manufacturing.—Estimated number of employees in non-agricultural establishments in North Dakota, Sept. 1946, was 82,600; and in manufacturing, 6,200 employees, estimated yearly wages in manufacturing in 1946 were \$12,000,000. Value of creamery butter produced (1946), \$34,340,265; in 1945 it was \$22,492,780.

Mineral Production.—Production of lignite coal, to June 29, 1946, was 2,610,544 tons; value, \$4,068,209. Employment, 627 miners, 320 others. New mines, 12; reopened, 6; closed, 39. Natural gas, 16 wells, to Nov. 30, 1946, produced 277,747,000 cu.ft.; yield from 13 wells, calendar year 1945, was 216,773,000 cu.ft. (A. V. O.)

Northern Ireland: *see* IRELAND, NORTHERN.

Northern Rhodesia: *see* RHODESIA, NORTHERN.

Northern Territory OF AUSTRALIA. Area 523,620 sq.mi.; pop. (June 30, 1940): aboriginals, full-blooded 13,901; half-caste 902; white (est. June 30, 1945) 5,223. Capital: Darwin (pop. Dec. 31, 1941, 4,400).

History.—The government announced that its postwar plans for the administration of the territory included the establishment of an advisory council modelled on that of New Guinea. It was to consist of seven official members nominated by the administrator and appointed by the governor general and six elected members. Election of members would take place at the same time as the election of the Northern Territory member to the commonwealth house of representatives.

An expedition promoted by the Northern Territory Development committee and including expert geologists, soil surveyors, botanists and agrostologists began a comprehensive survey of the economic resources of the Territory.

Finance.—Revenue (1943-44), ordinary, £A53,125; from Central Australian ry., £A2,031,250; from North Australian railway, £A875,000. Expenditure (1943-44), ordinary appropriation £A289,062; new works, etc., £A117,187. (£A1=\$3.21 U.S.)

Production and Communication.—Production (1939-40): pastoral industry, £A587,500; gold, £A234,375; wolfram, £A46,875; pearl shell, £15,938. Railways, government (Dec. 31, 1944) 508 mi. (W. D. MA.)

Northrop, John Howard (1891-), U.S. biochemist, was born on July 5 in Yonkers, N.Y. After obtaining his Ph.D. from Columbia university in 1915, he received an appointment as assistant at the Rockefeller Institute for Medical Research, becoming a member of the institute in 1924. He subsequently was Jesup lecturer at Columbia, 1938, Hitchcock professor at the University of California, 1939, and Thayer lecturer at Johns Hopkins, 1940. He served as captain with the U.S. army's chemical war service in World War I. Prof. Northrop was a member of the National Research Council's Committee on Proteins and a consultant to the National Defense Research committee during World War II. His research in enzymes and virus proteins led to his award of the Nobel prize in chemistry, on Nov. 14, 1946. He shared the award with Prof. James Batcheller Sumner, who received half; and with Prof. Wendell M. Stanley who, like Prof. Northrop, received one-quarter.

Northwestern University. An institution of higher learning at Evanston and Chicago, Ill. The university comprises the following divisions: the college of liberal arts, the graduate school, the technological institute and the schools of music, education, speech, commerce and journalism, all located in Evanston (a suburb of Chicago) on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district.

For the academic year ending Aug. 31, 1946, the university awarded 2,600 degrees and diplomas, the faculty numbered 1,724, the bound volumes in libraries increased to 790,000 and the gifts received totalled \$1,269,835.

During the year a new program for the education of teachers was established in the school of education. The purpose of the program is to develop in the student those understandings and skills which are the attributes of the educated citizen as well as the successful teacher. It attempts to do this by a balanced

emphasis upon the following three elements: (1) liberal education, (2) professional education and (3) education in those specialized subjects which the student expects to teach.

The enrolment of the university for the fall of 1946 totalled 22,788 students, consisting of 9,723 students studying full-time and 13,065 studying part-time. Veterans represented approximately 55% of the total enrolment.

To accommodate the large influx of veterans the university erected 146 temporary housing units at a cost of \$700,000. The university was also erecting a \$2,000,000 apartment building to house both faculty and students, and nine houses, out of a total of 75 that were planned, for a faculty subdivision adjacent to the Northwestern university golf course.

The university continued to make plans for its 100th anniversary in 1951. The plans propose a broad development of all schools, including the establishment on the Chicago campus of a \$100,000,000 centre for medical teaching and research. Two new hospitals had already been announced for this centre: the Mercy hospital, to be erected at a cost of \$10,000,000, and a \$10,000,000 veterans' hospital for the study and treatment of cancer. (For statistics of endowment, enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.)

Northwest Territories. The Northwest Territories comprise the mainland portion of Canada lying north of the 60th parallel of latitude between Yukon territory on the west and Hudson bay on the east, together with the islands lying between the mainland of Canada and the north pole, and those in James bay, Hudson bay and Hudson strait. Area, 1,309,682 sq.mi.; pop. (1941 census) 12,028; est. pop. (1946), 15,000; seat of government, Ottawa, Ont. For administrative purposes, the Territories in 1918 were subdivided into the provisional districts of Mackenzie, Keewatin and Franklin. The Northwest Territories act (1927) provided for a territorial government composed of a commissioner, a deputy commissioner and five councillors appointed by the governor in council. The Northwest Territories council in 1946 was composed as follows: commissioner, Charles Camsell; deputy commissioner, R. A. Gibson; members of council: A. L. Cumming, K. R. Daly, R. A. Hoey, S. T. Wood.

Education.—The education of white, native and half-breed children in Mackenzie district was carried on at day and residential schools operated by church missions at the larger settlements, and at public schools situated at Fort Smith and Yellowknife, all of which received financial assistance from the government. A school inspector was appointed by the Northwest Territories administration in 1946 to co-ordinate all educational services in the Territories.

Transportation and Communication.—Inland water transportation on the Mackenzie river system from railhead at Waterways, Alta., to points in Mackenzie district was provided by four companies, two of which maintained passenger services. Regular commercial air services, which also carried mail, were maintained from Edmonton, Alta., to the principal settlements. An air service from Peace River, Alta., to Yellowknife, N.W.T., was also inaugurated. Construction of a new all-weather highway to link Hay River settlement on Great Slave lake with railhead at Grimshaw, Alta., was commenced in May 1946, and good progress had been made at the end of the year. Medical centres, trading posts, etc., in the eastern arctic were served by the annual Eastern Arctic patrol on R.M.S. "Nascopie" from Montreal, Que., which also carried mail. Auxiliary boat services from railhead at Churchill, Man., were also provided. Radio communication was maintained between important settlements and trading posts in the Territories and outside points through government and private commercial radio stations.

PROSPECTORS camping out in a heated tent at Yellowknife, Northwest Territories, during a gold rush in the surrounding bush country in April 1946

Agriculture, Lumbering and Fisheries.—Limited agricultural and horticultural operations were carried on at most of the settlements in Mackenzie River valley. A site was selected at Fort Simpson for the establishment of an experimental sub-station by the dominion department of agriculture. Sawmills in the vicinity of Slave River delta operated to meet the demand for lumber at Yellowknife. Commercial fishing on Great Slave lake—inaugurated in 1945—was continued in 1946. A catch of more than 2,000,000 lbs., principally lake trout and whitefish, was obtained.

Fur Trade.—The trapping of fine furs continued to provide the chief occupation of the native population. Estimated value of pelts harvested for the year ended June 30, 1945, was \$1,743,710. Fur trading was controlled by regulation and was open only to those who had been issued permits and who had established permanent posts. Of the white residents only those who under the regulations were included in an established eligible list were permitted to hunt and trap, and such individuals required an annual licence. Reindeer herding in the Mackenzie delta region was continued in the interests of the native population.

Mineral Production.—Mineral development in 1946 included the production of gold, silver, pitchblende concentrates, from which radium and uranium are extracted, and petroleum. Yellowknife continued to be the centre of gold-mining activity, and an event of interest was the reopening of the mill serving the Con and Rycon mines, where gold production was suspended in Sept. 1943. Gold production was resumed on Aug. 20, 1946, and at the end of October 3,961 fine oz. of gold and 1,138 oz. of silver had been produced. Production at the Negus mine, reopened in 1945, was 12,308 oz. of gold and 3,378 oz. of silver for the 10-month period ended Oct. 31, 1946. Development on a broad scale was continued at Giant Yellowknife and Crestaurum mines, which, with several other properties, were rapidly being brought to production stage. On Oct. 31, about 20,000 mineral claims in Yellowknife district were in good standing, of which 4,000 were granted in 1946.

Development of a hydroelectric power project to serve the Yellowknife mining district was undertaken by the dominion

government on Snare river, about 90 mi. from Yellowknife settlement. At the end of 1946 two diversion tunnels and one coffer dam had been completed by the contractors. Construction of the dam and powerhouse was planned for 1947.

Production of pitchblende concentrates was continued at the mine of Eldorado Mining and Refining, Ltd. (1944) at Port Radium on Great Bear lake. The concentrates were shipped by water and rail to the company's refinery at Port Hope, Ont. for reduction. During the year the company constructed landing strips for aircraft at Sawmill bay on Great Bear lake and on Bear river to facilitate transportation. Operations were undertaken by International Uranium mines with a view to reopening their property at Contact lake, southeast of Port Radium.

Crude oil production was continued by Imperial Oil, Ltd., at Norman Wells on Mackenzie river, and at the end of October a total of 170,198 bbl. had been obtained. Much of this oil was processed at the Norman Wells refinery and shipped by barge to Eldorado mine and to Yellowknife, where consumption of petroleum products, including fuel oil, reached a new high. Explorative drilling for oil was continued by Imperial Oil, Ltd. in the Mackenzie river basin.

(R. A. G.)

Norway. A democratic monarchy of northern Europe, bounded N. by the Arctic ocean, E. by Finland, the U.S.S.R. and Sweden, S. and W. by the North sea. Area 124,556 sq.mi.; pop. (est. 1945) 3,040,000. Capital, Oslo (253,124). Other principal cities, with 1930 populations, are Bergen (98,303); Trondheim (54,458) and Stavanger (46,780). Religion, Lutheran Christian. Ruler in 1946: King Haakon VII. Prime minister: Einar Gerhardsen.

History.—The aftermath of World War II, with its physical distraction and social disintegration, left Norway with a myriad of complex problems. The 9,000 children of German fathers and Norwegian mothers had to be provided for in a way which would not brand innocents as outcasts. Traitors had to be dealt with firmly but fairly. About 60,000 had been members of the Norwegian nazi party, Norsk Samling. Investigation awaited them all, and trial awaited perhaps 16,000. One mass trial in Trondheim of the notorious Rinnan gang resulted in 30 sentences—11 for death, 19 for terms of from 2½ years to life at hard labour. By June about 200 death sentences had been handed down in the country as a whole. Passive members of the party were being let off easily, often with fines. Collaborationists and war profiteers were being fined heavily. The famous author, Knut Hamsun, was fined 500,000 kr. (approximately his entire property) and was sent to a home for the aged. Henry Johansen, husband of Kirsten Flagstad, died in a hospital, but on account of his nazi-earned lumber profits, his estate was fined 16,000,000 kr. Flagstad herself was not permitted to leave the country until the very end of the year.

Rebuilding of devastated areas and bombed cities was proceeding vigorously. In the scorched-earth section of northern Norway shelters were being erected rapidly in a great national effort, and 15,000 evacuees were expected to return to Nord Troms and Finnmark by Jan. 1, 1947. Many workers in the south voluntarily put in an extra shift each week to provide additional materials for the rebuilding. Mines and housing on Spitsbergen had been destroyed, but reconstruction had proceeded far enough that it was expected the island would produce 50,000 tons of coal in 1946 and 300,000 tons in 1947. Televaag, the Norwegian Lidice, was being rebuilt, as were the bombed sections of Bergen, Kristiansund, Aalesund and other towns. Some of the mysterious flying bombs landed in central Norway, but fell harmlessly into Lake Mjoesan.

Food was a continuing problem, but rations indicated that

the Norwegians were living somewhat better than the British.

Norway's world-mindedness was increased through the country's own troubles. It was the Norwegian Carl J. Hambro, president of the assembly of the League of Nations, who presided at the demise of that organization. And it was another Norwegian, Foreign Minister Trygve Lie, who became secretary-general of the United Nations. Succeeding Trygve Lie as foreign minister was Halvard Lange, of the Labour party, who had added to his knowledge of foreign affairs in a German concentration camp. A corps of 4,000 Norwegians was training to take over a section of Germany as the occupying authority. Fully convinced that thorough-going co-operation of all nations large and small was the only hope for world peace, Norway was playing its part as fully as it knew how.

In its economic and social structure Norway was building boldly for the future. In April the American Overseas Airlines established an Oslo-New York service; in November the Norwegian Air Lines, Inc., received permits to fly between Norway and New York or Chicago, with intermediate service to the United Kingdom and other countries. Scandinavian Airlines was in process of opening also direct routes to South America. The famed Norwegian merchant marine was ordering large tankers and other ships to restore its prewar eminence on the seas (*see* the section on trade and communication). Norsk Hydro was expanding its facilities to produce 20,000 additional tons of nitrogen for export. The government also approved a far-reaching plan for building an electro-iron works at Mo on the Rana river, close to the Arctic circle. Before World War II, about 90% of Norway's iron and steel had to be imported, largely from Germany. Oslo's modernistic city hall was being completed and new buildings for the University of Oslo.

A huge increase of 60% in Norway's social security budget was asked by the minister for social affairs, Sven Oftedal. In addition to increased payments for present government obligations the minister hoped to obtain grants of 200 kr. yearly for each child after the first in a family.

Completion of trade negotiations with the U.S.S.R. was announced in December. The agreement provided for the exchange of Norwegian fish for potash and chemicals. During 1946 Norway shipped about 140,000 bbl. of herring and 1,500 tons of whale fat to the U.S.S.R. Earlier negotiations had settled amicably the new Soviet-Norwegian frontier in the north created by the Soviet acquisition of Petsamo from Finland.

Closer Norwegian-U.S. relations were envisaged in both the economic and cultural realm. One of the small but valuable cargoes of 1946 was 842 mink transported from a Michigan farm to Norway by the American Overseas Airlines. U.S. films, on the other hand, were meeting difficulties in Norway (as elsewhere), partly because the Norwegian government was attempting to aid the local film industry to double its output and taxed all foreign films 40%. Of about 800 students abroad, more than 400 were in the United States.

Both right and left political groups in Norway were co-operating to strengthen and improve the country. Unemployment was practically unknown, and labour peace seemed assured by long-term contracts and agreements for cost-of-living adjustments. Wage rates had increased 30% after the liberation in 1945, although neither wages nor profits had become high enough to support the prewar living standard.

Education.—In 1942-43 there were 297,770 students and 10,825 teachers in the elementary schools; 35,523 students and 2,688 teachers in the middle schools and gymnasias. The 11 schools of university rank had a combined enrolment (1937-38) of 4,998. In Sept. 1946 the numbers had mushroomed and 6,000 students appeared at Oslo university alone, 2,700 of them entering freshmen. The total state budget for educational pur-

poses in 1939-40 was 65,364,000 kr.

Finance.—The monetary unit is the krone (20.16 U.S. cents in Sept. 1946). Budgetary income for 1943-44: 1,449,898,000 kr.; expenditures 2,110,682,000 kr. Public debt (1945) 6,544,-836,000 kr. Notes in circulation (1945) 1,478,000,000 kr; (end of Sept. 1946) 1,765,000,000 kr. Gold reserve (end of Sept. 1946) 240,000,000 kr. Commercial bank deposits (1945) 3,447,-000,000 kr.; (end of Sept. 1946) 3,442,000,000 kr. Savings bank deposits (1945) 3,179,000,000 kr.; (end of Sept. 1946) 3,148,-000,000 kr.

Trade and Communication.—In 1945 trade was, of course, in a very abnormal situation with about four months of war and eight months of reconstruction. Imports amounted to 1,206,338,000 kr., and exports 328,017,000 kr. Of the imports 360,750,000 kr. came from Sweden, 211,740,000 kr. from Great Britain, 149,260,000 kr. from Denmark and 142,570,000 from the United States. Of the exports 117,690,000 kr. went to Germany, 83,380,000 kr. to Denmark and 49,675,000 kr. to Sweden.

Norway, on a per capita basis, was the world's greatest seafaring nation. Its merchant marine had been of tremendous service during World War II, but lost 60% of its capital stock. The years 1945 and 1946 saw some of the losses recouped. In 1945 the number of ships was 4,098 and the gross tonnage was 2,727,000. Norwegians had £70,000,000 credit in British insurance firms and were eager to use it for new vessels. Some German ships were granted Norway and many orders were being placed in Sweden, Denmark and Britain, in the hope of building the fleet up to 4,000,000 tons by 1948. In Sweden alone Norway placed orders for 126 ships. During the war the entire merchant fleet abroad was operated by the maritime agency "Nortraship," with headquarters in New York; settlement by the government with the shipowners granted them 3,197,000 kr., plus the profound thanks of the nation to all the seamen.

Telephones (1944) numbered 327,000, and there were 17,-385 mi. of telegraph lines. In 1943 registered automobiles numbered 81,591 (a decline of 26,000 from 1938). Railways had 2,608 mi. of track (all but 85 mi. were state-owned), carried 46,437,951 passengers and 6,253,428 metric tons of goods. Three diesel-electric trains were under construction in 1946. Radio receivers (1938) numbered 400,623.

Agriculture.—Agricultural production for 1944, in metric tons, was as follows:

	1944	Tons		1944	Tons
Wheat		52,806	Wheat and rye mixed . . .		7,678
Rye		3,899	Peas		1,025
Barley		49,697	Turnips and cabbages . . .		731,849
Oats		104,109	Hay		2,113,921

The livestock census for 1939 (prior to the wartime reductions) showed: 203,931 horses, 1,455,016 cattle, 1,743,802 sheep and 361,953 pigs.

Fisheries.—The total catch of fish in 1938 was 1,174,000 short tons, plus 1,089,000 tons of whale oil; of the fish, 763,000 tons were herring of various kinds. The 1944 catch was considerably smaller than normal and the Germans demanded 75%-95% of it. Conditions improved in 1945, with a pack of 340,000 cases and a good market in Britain and the United States.

Manufacturing.—As of 1943 there were 4,928 industrial establishments, with 146,652 workers, which produced goods valued at 2,506,079 kr.

The general production index figure was 106 for June 1946, as compared with 105 for 1938 and 109 for 1939. Production committees, based on a U.S. wartime system, aided in maintaining high outputs. Employment by March 1946 was up to 170,900, only 2,100 less than in 1939.

Mineral production.—Total mineral production, 1943, was valued at 49,575,000 kr. The chief products and the value of each were:

	Weight	Value
Silver ore	12,303,000 kg.	709,000 kr.
Copper	21,216,000 "	9,406,000 "
Sulphur pyrites	808,779,000 "	23,252,000 "
Nickel	15,679,000 "	1,506,000 "
Titanium	285,191,000 "	8,830,000 "
Zinc and lead	9,075,000 "	1,403,000 "
Molybdenum	386,000 "	4,159,000 "

Notre Dame, University of. Postwar transition highlighted 1946, including the announcement in July of Rev. John J. Cavanaugh, C.S.C., as 14th president of the university, succeeding Rev. J. Hugh O'Donnell, C.S.C. The accelerated wartime 3-semester program ended on July 1, with the resumption of the annual commencement exercises and the announcement of a school year of two 18-week semesters and, beginning in 1947, an 8-week summer session.

Enrolment increased from 2,855 in January to a record capacity-taxing 4,500 in December. First provision for married students on the campus came with completion in December of some of the units in the veterans' temporary housing project.

Wartime research began to be revealed, including anti-malarial drug discoveries and vital contributions to bacteriological warfare research. Creation of a mediaeval institute, first of its kind in the United States, was announced in July, headed by Rev. Gerald Phelan, former president of the Mediaeval institute in Toronto, Ontario.

Carlton J. H. Hayes, historian, was named the 64th Laetare medalist.

Fleet Adm. Chester Nimitz visited Notre Dame on May 15 for a special convocation conferring the honorary L.L.D. awarded to him in 1943. Samuel Cardinal Stritch, George Sokolsky and alumnus-columnist Paul Mallon received honorary degrees at the June commencement.

Alumni activity was stressed with resumption of the class reunions at commencement, a new record in both amount and participation in the fourth annual alumni fund; the national conference on the campus in November of the 77 presidents of all Notre Dame alumni clubs in the U.S. and the appointment of Joseph M. Byrne, Newark, N.J., as an alumnus lay trustee of the university. The 23rd annual Universal Notre Dame Night on April 29, and the 9th Universal Communion Sunday on Dec. 8, were successful national alumni programs.

Limited facilities and record early registration caused the closing of enrolment for September of 1947 as 1946 ended. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (J. E. AR.)

Nova Scotia. One of the three maritime provinces of Canada, Nova Scotia entered the union in 1867. The area is 21,428 sq.mi., including 325 sq.mi. fresh-water lakes; pop. 577,962 (1941 census), 621,000 (dominion bureau statistics 1946 est.). The capital is Halifax (70,488 in 1941, 126,480 in 1943); other cities are Sydney (28,305), Glace Bay (25,147). Administered by a lieutenant governor, an executive council and a 30-member legislative assembly, Nova Scotia is represented federally by 12 members of parliament and 10 senators.

History.—During 1946 premier Angus Macdonald continued to lead a Liberal administration. The rural school system was consolidated; a \$250,000 fund was created to make cheap long-term loans to tourist resort operators to increase their facilities; a former army camp at Debert was converted into a provincial agriculture school.

Agriculture.—Nova Scotia apple farmers raised 1,800,000 barrels worth \$7,000,000. A \$250,000 apple cold storage plant,

most modern in North America, was erected at Coldbrook with provincial financial assistance. A fish-packers' strike began in December, but the year's catch was fair. Construction of provincially financed draggers began.

Industry and Communication.—Industrially, however, 1946 was black with strikes and shutdowns. Construction bogged with shortages of bricks, tile, steel, lumber. Unemployment ran high with about three workers applying for each vacancy. The government-sponsored Nova Scotia Research foundation, established in the spring, got into action but produced no early plans to cure the industrial paralysis with technology.

Some employment slack was taken up by the provincial government's highway program: \$11,816,000 were earmarked to pave existing roads, \$4,000,000 to build new ones. The federal government spent \$60,000 on borings as the first concrete step towards constructing the long-delayed \$14,000,000 Canso Strait causeway. Another transportation event of significance was the Royal Dutch Airlines' choice of Sydney as a port-of-call on its Amsterdam-New York city line.

Finance.—By Nov. 30, 1946, the federal government had 15,000 claims for damage from the July, 1945, Halifax naval magazine explosion. On Dec. 31 the federal government discontinued its \$30,000 special annual wartime grant to Halifax to augment its war-burdened health budget. (C. CY.)

Nutrition: see DIETETICS; FOOD RESEARCH; VITAMINS.

Nuts. Pecan production in the U.S. declined 44% in 1946 to 77,155,000 lb. compared with 138,082,000 lb. in 1945 and an average of 105,746,000 lb., 1935-44. The large crops of 1944 and 1945 depleted the strength of the trees, weather was unfavourable and insect damage serious. Production declined in all states except Florida. The Georgia crop dropped more than half. Both improved varieties and seedlings declined—the former 40% and the latter 47%.

Walnut production declined in California to 59,000 tons compared with a crop of 64,000 tons in 1945 and an average of 55,420, 1935-44. The Oregon crop was the largest on record, 8,500 tons compared with 6,900 tons in 1945 and an average of 4,680 tons, 1935-44.

The 2 states, California and Oregon, returned a crop of 67,500 tons compared with 70,900 tons in 1945 and an average of 60,100 tons, 1935-44. The California crop suffered from hot, dry weather.

The California almond crop made a record of 35,100 tons compared with the previous record of 23,800 tons produced in 1945 and an average of 14,700 tons, 1935-44.

The total filbert crop of Oregon and Washington made the high record of 8,950 tons in 1946, compared with an average

U.S. Pecan Production by States, 1946 and 1945

(In thousands of pounds)

State	Improved varieties		Wild varieties	
	1946	1945	1946	1945
Georgia	13,000	30,954	3,000	5,896
Alabama	5,110	7,216	1,614	1,804
Texas	3,400	3,870	19,100	28,380
Florida	2,650	2,371	2,030	1,863
Louisiana	2,250	1,840	245	7,360
Mississippi	2,020	3,300	142	2,700
North Carolina	1,433	2,504	1,876	310
Oklahoma	1,400	1,000	6,750	20,000
South Carolina	1,275	2,961	7,600	443
Arkansas	345	882	1,155	4,018
Missouri	20	60	600	1,800
Illinois	3	21	137	1,029

of 3,896 tons. Most of the crop was grown in Oregon, which harvested 7,800 tons compared with an average of 3,354 tons, 1935-44.

Tung nut production in 1946 was 47,300 tons, 28% more than the previous record of 1945 and 77% more than the crop of 1944. Mississippi led with a crop of 20,000 tons in 1946 with Louisiana second with 14,000 tons. Florida produced 10,500 tons while Georgia was beginning with a crop of 1,500 tons and Alabama with 1,300 tons. A very small quantity was produced in Texas. (See also COCONUTS; PEANUTS.)

Nylon: see RAYON AND OTHER SYNTHETIC FIBRES.

Oats. The 1946 oat crop in the U.S. was the second record crop of this grain, only 1.7% below the high record in 1945. Oat production in 1946 was estimated at 1,509,867,000 bu. compared with 1,535,676,000 bu. in 1945 and the average of 1,129,441,000 bu., 1935-44. The acreage was 3.6% more than 1945 at 43,648,000 ac. compared with an average of 36,711,000 ac., 1935-44. The yield in 1946 was 34.6 bu. per acre compared with 36.6 bu. in 1945 and the average of 30.7 bu., 1935-44.

U.S. Oats Production, 1946 and 1945

		(In bushels)			
State	1946	1945	State	1946	1945
Iowa	220,476,000	204,936,000	Tennessee	6,492,000	6,370,000
Minnesota	192,168,000	242,640,000	Washington	6,144,000	6,450,000
Illinois	168,693,000	155,112,000	California	5,700,000	5,115,000
Wisconsin	124,758,000	152,337,000	Colorado	5,610,000	7,700,000
South Dakota	100,398,000	143,377,000	Alabama	5,537,000	6,526,000
Michigan	71,890,000	60,200,000	Wyoming	4,514,000	4,920,000
Nebraska	71,708,000	76,828,000	Virginia	4,260,000	3,976,000
North Dakota	62,764,000	86,222,000	Kentucky	3,213,000	2,200,000
Ohio	62,235,000	49,385,000	Maine	2,840,000	2,627,000
Missouri	60,884,000	28,709,000	Louisiana	2,640,000	3,668,000
Indiana	56,160,000	57,582,000	West Virginia	1,792,000	1,908,000
Kansas	40,556,000	16,940,000	Utah	1,763,000	2,000,000
Texas	36,366,000	41,332,000	Vermont	1,530,000	1,408,000
New York	32,360,000	19,227,000	New Jersey	1,440,000	1,092,000
Pennsylvania	30,033,000	24,583,000	Maryland	1,254,000	1,110,000
Oklahoma	24,780,000	20,976,000	New Mexico	900,000	946,000
South Carolina	20,097,000	18,921,000	Florida	720,000	900,000
Georgia	16,404,000	17,722,000	Arizona	336,000	372,000
North Carolina	12,870,000	10,312,000	Nevada	308,000	351,000
Mississippi	11,160,000	14,880,000	Massachusetts	259,000	196,000
Montana	10,509,000	9,667,000	New Hampshire	259,000	272,000
Oregon	9,782,000	8,054,000	Connecticut	252,000	180,000
Arkansas	7,650,000	8,208,000	Delaware	155,000	155,000
Idaho	7,216,000	7,353,000	Rhode Island	32,000	31,000

Yields were unusually high in the east north central states, Michigan harvesting 45 bu. per acre, Illinois 43 bu., Wisconsin 44 bu. and Iowa 39 bu. New York had an unusual yield of 40 bu. per acre and Washington made the record of 50 bu. in the west.

The price of oats to farmers was about 70 cents per bushel through 1945 advancing slowly in 1946 to 85 cents in July and then declining to about 80 cents in October to the end of the year. Stocks of oats on Oct. 1 were below those of 1945 but 27% more than average. The use of oats was high because of the scarcity of corn and other feeds.

(J. C. Ms.)

Obituaries. The following is a list of men and women who died during 1946. An asterisk (*) marks those for whom biographical notices are to be found in regular alphabetical position.

Name	Birth date	Death date
ABBOTT, CLINTON GILBERT, U.S. ornithologist	Apr. 17, 1881	Mar. 5, 1879?
ADAM, LAJOS, Hungarian surgeon, educator		Nov. 7, 1879?
ADAMS, JOSEPH QUINCY, U.S. Shakespearean scholar	Mar. 23, 1881	Nov. 10, 1879?
ADLER, ELKAN NATHAN, British international lawyer, historian	July 24, 1861	Sept. 15, 1868
ADSHHEAD, STANLEY DAVENPORT, British town planner, educator		Apr. 12, 1868
AIKEN, ALFRED LAWRENCE, U.S. insurance executive	July 6, 1870	Dec. 13, 1857?
ALBERT, ERNEST, U.S. landscape painter		Mar. 25, 1857?
*ALEKHINE, ALEXANDER, French chess champion	Nov. 1, 1892	Mar. 24, 1884
ALEXANDROV, ALEXANDER VASSILIEVICH, Russian composer		July 8, 1884
ALLEMAN, GELLERT, U.S. chemist	July 23, 1871	Sept. 6, 1874?
ALLEN, CROMBIE, U.S. newspaperman		Mar. 1, 1874?
*ALLEN, SIR HUGH PERCY, British musician	Dec. 23, 1869	Feb. 20, 1890
*ANANDA MAHIDOL, king of Siam	Sept. 20, 1925	June 9, 1890
ANDERSSON, GUNNAR ALBIN, Swedish labour leader		Oct. 19, 1870
ANDRADE, ANTONIO CARLOS RIBEIRO DE, Brazilian statesman		Jan. 2, 1870
ANDREWS, CHARLES OSCAR, U.S. politician		Sept. 18, 1877?
ANGIER, ROSWELL PARKER, U.S. psychologist	Oct. 21, 1874	June 24, 1883?
ANGLESEY, MARCHIONESS OF (MARJORIE MANNERS), British peeress		Nov. 3, 1883?
*ANTONESCU, ION, Rumanian soldier, statesman	June 2, 1882	Jan. 1, 1889?
APPELIUS, MARIO, Italian journalist		Dec. 28, 1889?
ARGÜEDAS, ALCIDES, Bolivian diplomat, writer	July 15, 1879	May 6, 1879

Name	Birth date	Death date
*ARLISS, GEORGE, British actor	Apr. 10, 1868	Feb. 5, 1868?
AROSEMENA, CARLOS CONSTANTINO, Panamanian patriot		July 11, 1868?
ARTHUR, SIR GEORGE ICOMPTON ARCHIBALD, British biographer	Apr. 30, 1860	Jan. 14, 1879
AYRES, LEONARD PORTER, U.S. economist	Sept. 15, 1879	Oct. 29, 1879
*BAGLEY, WILLIAM CHANDLER, U.S. educator, editor	Mar. 15, 1874	July 1, 1870
BAIKOV, ALEXANDER A., Russian metallurgist		Apr. 7, 1870
BAILEY, CHARLES JUSTIN, U.S. army officer	June 21, 1859	Sept. 21, 1859
BAILEY, SIR JOHN MUNIR, son South African mining millionaire	June 15, 1900	Feb. 13, 1873
BAILEY, JOSIAH WILLIAM, U.S. politician	Sept. 14, 1873	Dec. 15, 1873
BAILEY, THOMAS L., U.S. politician	Jan. 6, 1888	Nov. 2, 1888
*BAIRD, JOHN LOGIE, British inventor	Aug. 13, 1888	June 14, 1888
BAIRD, SIR WILLIAM, British surveyor	Apr. 10, 1881	Dec. 29, 1881
*BAKER, RAY STANNARD ("DAVID GRAYSON"), U.S. author and journalist	Apr. 17, 1870	July 12, 1870
BAKER, STEPHEN, U.S. banker	Aug. 12, 1859	Dec. 31, 1859
BAKH, ALEXI NIKOLAYEVICH, soviet biochemist		May 13, 1856?
BALDWIN, LEWIS WARRINGTON, U.S. railroad executive	Feb. 26, 1875	May 14, 1875
BANKES, SIR JOHN ELDON, British jurist	Apr. 17, 1854	Dec. 31, 1854
*BANKHEAD, JOHN HOLLIS, Jr., U.S. politician	July 8, 1872	June 12, 1872
*BANNERMAN, HELEN, British author		Oct. 13, 1872
BANTA, ARTHUR MANGUN, U.S. zoologist	Dec. 31, 1877	Jan. 2, 1877
*BANTOCK, SIR GRANVILLE, British composer	Aug. 7, 1868	Oct. 16, 1868
BARBOUR, THOMAS, U.S. naturalist	Aug. 19, 1884	Jan. 8, 1884

Oceanography. With the termination of military security many additions to knowledge of the oceans appeared, notably the Japanese survey of the western Pacific ocean which covers a hitherto imperfectly known region roughly the size of the North American continent. This huge mass of data composed of approximately 40,000 hydrographic stations is in usable form but lacks interpretation and co-ordination with other observations of the same kind. It was expected that this process would be carried out by the new oceanographic division of the U.S. Navy Hydrographic office. The chief reasons for the establishment of this important co-ordinating agency in oceanography were: the limitations imposed by the thermal structures in the sea on underwater sound apparatus, the necessity of reliable foreknowledge of swell and surf conditions, and the combined meteorological and oceanographic problems of finding aircraft or personnel adrift. Underwater sound, aside from its purely military uses, yielded continuous bathymetric traces from large areas of the oceans and has revealed a number of previously unknown bottom features, especially in the Pacific ocean.

Submarine geophysics, through the employment of seismic methods and much more efficient core sampling devices, was being extended from the land into the margins of the ocean basins.

Marine biology advanced by a successful study of the controlling factors of phytoplankton production which combines the older descriptive approach with the application of biostatistical analysis. The distribution and attachment habits of fouling organisms were also intensively studied, along with the effectiveness of antifouling paints. (See also MARINE BIOLOGY.)

Ohio. A north central state of the United States, popularly known as the "Buckeye state." It officially became a state of the union on Feb. 19, 1803. Area 41,222 sq.mi., including 100 sq.mi. of water; pop. (1940) 6,907,612, of whom 2,294,626 were rural and 4,612,986 urban; native white 6,047,265, foreign-born white 519,266, Negro 339,461, other races 1,620. Capital, Columbus (306,087). Other cities of more than 100,000 were Cleveland (878,336), Cincinnati (455,610), Toledo (282,349), Akron (244,791), Dayton (210,718), Youngstown (167,720) and Canton (108,401). In 1944 the bureau of the census estimated the population of the state at 6,836,667.

History.—Thomas J. Herbert, Republican of Cleveland, was elected governor in the Nov. 1946 election, polling 1,166,550 votes to 1,125,997 cast for Gov. Frank J. Lausche, Democrat of Cleveland. Former Gov. John W. Bricker, Republican of Columbus, defeated Sen. James W. Huffman, Democrat of Columbus, in the race for the U.S. senate seat, 1,275,774 votes to 947,610. Elected at the same time were: Paul M. Herbert (Rep.) as lieutenant governor, Edward J. Hummel (Rep.) as secretary of state, Don H. Ebright (Rep.) as treasurer of state, Hugh S. Jenkins (Rep.) as attorney general and George H. Bender (Rep.) as congressman-at-large.

THOMAS J. HERBERT, elected Republican governor of Ohio Nov. 5, 1946

Before taking office Gov.-elect Herbert announced the following appointments: Chester W. Goble of Columbus as adjutant general, Frank Farnsworth of Waterville as agriculture director, Dale Dunifon of Columbus as commerce director, H. D. Defenbacher of Columbus as finance director, Murray D. Shaffer of Mansfield as highway director, Charles L. Sherwood of Columbus as welfare director and William J. Rogers of Cleveland as industrial relations director.

The general assembly met in special session on June 24 to tackle some of the state's postwar problems. The principal measures it adopted before adjournment on July 8 were those restoring civil service rights to war veterans; appropriating \$5,000,000 for the use of local governments; and making additional appropriations of \$4,469,869 for operation of the state

universities, \$750,000 for poor relief, \$2,577,420 for operation of the welfare department and \$1,150,000 for construction and improvements of state hospitals.

Education.—In 1946 Ohio had 3,127 elementary schools with an enrolment of 693,996 and a teaching staff of 21,810; 1,383 secondary schools, with an enrolment of 435,317 and a teaching staff of 19,580. Voters of the state approved 142 school bond issues totalling \$31,735,000 out of 197 proposed totalling \$46,692,000. Of 635 special school tax levies submitted, 627 were approved. Clyde Hisson was state director of education in 1946.

Ohio has six state universities: Ohio State university at Columbus, Ohio university at Athens, Kent State university at Kent, Miami university at Oxford, Bowling Green State university at Bowling Green and Wilberforce university at Wilberforce.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average number of recipients of general relief in Ohio in 1946 was 15,920 and total relief granted was \$6,749,315. The average number receiving aid for the aged was 117,316 and they received a total of \$46,541,895; aid to dependent children 8,241 cases receiving a total of \$5,887,183; aid to the blind 3,094 cases receiving a total of \$1,099,747. Estimated weeks of unemployment compensated in 1946 were 5,714,239 and the benefit payments were estimated at \$110,103,711. At the close of the year Ohio had a record-breaking fund of \$489,193,000 from which to pay unemployment benefits.

Ohio had 9 hospitals for the insane with approximately 20,500 inmates, 4 institutions for the feeble-minded with approximately 5,850 inmates, 4 penal institutions with a population on Dec. 1, 1946, of 7,166 and 2 industrial schools with a population on the same date of 1,099.

Total cost of operating and maintaining the institutions under the department of public welfare in 1946 was approximately \$17,000,000.

Communication.—Ohio had 86,779 mi. of highways in 1946 outside municipalities. Of this total 16,156 mi. were classified as state, 28,763 mi. as county and 41,861 mi. as township. Total state expenditures on highways in 1946 were \$44,272,964. Of this total \$27,522,964 represented 347 road improvement contracts, \$15,250,000 labour and material provided by highway department employees and \$1,500,000 replacement of obsolete equipment.

The state had 8,400 mi. of railroads, 300 airports and landing fields, 3,116 mi. of airways within its boundaries and 1,800,000 telephones.

Banking and Finance.—There were 439 state and private banks in Ohio with deposits (Sept. 30, 1946) of \$4,013,836,046 and resources of \$4,289,959,834. There were 238 active national banks in the state with deposits (Sept. 30, 1946) of \$2,985,369,000 and resources of \$3,192,638,000. State-chartered savings and loan associations numbered 506 with total resources (June 30, 1946) of \$979,038,713. There were 127 federal savings and loan associations with total assets (estimated as of Dec. 31, 1946) of \$527,200,000.

The state budget for the 1945-46 biennium was \$391,499,969. At the close of 1946 the state surplus was approximately \$160,000,000. Of this \$60,000,000 represented money appropriated by the general assembly but not spent while \$100,000,000 was unencumbered. Sales tax revenue in 1946 went to a record high of \$108,018,679.

Agriculture.—The total harvested acreage of principal crops in 1946 was 10,601,000; in 1945, 10,712,000. Total value of agricultural production in the state in 1945 was \$753,008,000. Of this amount \$514,028,000 came from livestock and livestock products, \$209,387,000 from crops and

\$29,593,000 from government payments. Total value of Ohio crop production in 1946 was estimated at \$553,888,000.

Weather conditions in Ohio generally were favourable to agriculture in 1946. Frequent heavy rains in some sections kept fields waterlogged and delayed planting. Later in the year some dry areas developed in the northern section of the state. These conditions reduced yields of some crops but the lateness of the killing frosts lengthened the growing season and made up for them in part. Soybeans and apples were the crops hardest hit.

Manufacturing.—The total value of manufactures in Ohio in 1939 was \$4,584,665,659, total employment 686,089, total wages and salaries paid \$1,033,426,673. The Ohio bureau of unemployment compensation reports that between Jan. 31, 1945, and Jan. 31, 1946, 4,039 employers either established new businesses or expanded businesses already established. In that period the number of covered employers grew from 50,544 to 54,583.

Mineral Production.—The total value of mineral production in Ohio in 1945, exclusive of pig iron, coke and ferro-alloys, was \$196,663,000. In

Table II.—Principal Mineral Products of Ohio, 1945 and 1944

Mineral	Value, 1945	Value, 1944
Pig Iron	\$258,959,815	\$294,265,267
Bituminous coal	92,911,000	89,699,797
Coke	70,381,885	70,781,105
Natural gas	24,490,000	26,783,000
Clay and clay products	22,657,684	13,340,809
Stone	13,966,710	15,292,705
Lime	11,693,615	11,876,409
Ferro-alloys	11,166,247	14,426,924
Sand and gravel	7,985,018	8,866,549
Cement	7,356,271	5,957,819
Petroleum	7,240,000	6,560,000
Salt	3,997,759	4,076,481

1944 the comparable figure was \$192,052,000. Although total production of coal fell off slightly in 1945 in Ohio, the production by strip-mining methods increased almost 30%. (P. By.)

Ohio State University. An institution of higher education at Columbus, Ohio. Formally established as a land-grant institution in 1870, it opened its doors on Sept. 17, 1873, to a student body of 17. The university admits both women and men. It has ten colleges: agriculture, arts and sciences, commerce and administration, dentistry, education, engineering, law, medicine, pharmacy and veterinary medicine; a graduate school; and eight special schools: aviation, fine and applied arts, home economics, journalism, music, nursing, optometry and social administration. Graduate work is offered through the doctor of philosophy degree. New curricula continued in 1946 to prepare students for work in naval science, dental hygiene, international relations, medical technology, occupational therapy and rehabilitation of the handicapped. Latest additions to the physical plant were a 400-acre airport and a research laboratory. The university operates on a four-quarter plan, enabling most students to complete their studies in three calendar years. (For statistics of endowment, enrolment, faculty, etc., see UNIVERSITIES AND COLLEGES.) (H. L. B.)

Oklahoma. A west south-central state, admitted as the 46th state, Nov. 16, 1907. The name "Oklahoma" is from the Choctaw Indian words meaning "red people" and was first applied to the Indian territory in 1866. The popular name "Sooner state" was from the term "sooner" used in referring to a person who entered and staked a claim sooner than the law allowed when the first public lands in the Indian territory were opened by the run for homesteads, April 22, 1889. Area, 69,283 sq.mi., including water surface, of which 387 sq.mi. are in 188 artificial lakes of more than 10 ac. in size and 71,000 farm ponds of less than 10 ac. Pop. 2,336,434 (1940), of which approximately 62% was rural. Approximately 87% was white, 7% Negro, 4% Indian, 2% foreign-born. On July 1, 1944, the bureau of the census estimated the civilian population of Oklahoma at 2,064,679. Oklahoma City (1940 census) (204,424), the capital, and Tulsa (142,157) are the two largest cities.

Table I.—Leading Agricultural Products of Ohio, 1946 and 1945

Crop	1946	1945	Value, 1946
Corn, bu.	178,409,000	175,134,000	\$240,852,000
Wheat, bu.	48,522,000	57,483,000	95,103,000
Oats, bu.	62,235,000	49,385,000	49,788,000
Barley, bu.	502,000	690,000	678,000
Rye, bu.	289,000	472,000	526,000

Popcorn, lb.	27,495,000	60,000,000	907,000
Hay, tons	3,895,000	3,868,000	64,268,000
Soybeans, bu.	16,254,000	19,386,000	42,585,000
Tobacco, lb.	21,203,000	22,492,000	7,722,000
Sugar beets, tons	224,000	208,000	2,413,000*
Apples, bu.	3,078,000	984,000	8,926,000
Peaches, bu.	533,000	750,000	1,439,000
Pears, bu.	141,000	238,000	338,000
Grapes, tons	15,400	6,400	2,310,000
Cherries, tons	2,480	2,580	673,000
Potatoes, bu.	7,560,000	7,021,000	13,230,000

*1945.

History.—In the state elections, Nov. 1946, the total vote cast for 5 candidates for governor was 494,599 votes, the Democratic candidate, Roy J. Turner, who had a total vote of 259,491, carrying the state by a majority of 32,065 over the Republican candidate, Olney F. Flynn, who had a total vote of 227,426 votes. Other executive officers elected by the Democrats for the four-year term were: James E. Berry, lieutenant governor; Wilburn Cartwright, secretary of state; A. S. J. Shaw, state auditor; Mac Q. Williamson, attorney general; John D. Connor, state treasurer; Oliver Hodge, state superintendent of public instruction; Charles G. Morris, state examiner and inspector; Jim Hughes, commissioner of labour; Buck Cook, commissioner of charity and corrections; Donald F. Dickey, commissioner of insurance; Joe C. Scott, president state board of agriculture; John M. Malloy, chief mine inspector, and Ray C. Jones, member of corporation commission. Holdover members of the corporation commission (both Democrats) were Ray O. Weems and Reford Bond.

ROY J. TURNER, Democratic governor of Oklahoma, was elected Nov. 5, 1946

Education.—The total enrolment in Oklahoma public schools (term of 1945-46) was 517,070 pupils, with 17,863 teachers, including 116,946 pupils in senior high schools. Cost of maintaining elementary and secondary schools in the state amounted to \$44,244,242 for 1945-46. State institutions of higher learning included the University of Oklahoma (Norman), the Oklahoma Agricultural and Mechanical college (Stillwater), the Oklahoma College for Women (Chickasha), an agricultural and mechanical college (Goodwell), a Negro university (Langston), an institute of technology (Weatherford) and five colleges primarily for teacher training (Ada, Alva, Durant, Edmond, Tahlequah). There were 18 two-yr. junior colleges recognized by the state board of education, including 6 state-owned junior colleges, 1 military academy and 4 independent junior colleges with church affiliations. There were also six independent senior colleges with church affiliations.

Social Insurance and Assistance, Public Welfare and Related Programs.—On Jan. 1, 1947, the department of public welfare reported 91,769 persons receiving old-age assistance with an average of \$42.18 each per month; 24,371 families receiving aid, with an average of \$45.08 per family, for 58,941 dependent children; and 2,241 blind persons receiving an average of \$42.83 each. The state department of public health reported that 70% of the state's population lived in 42 counties and 2 municipalities, all of which had made local funds available for matching state and federal moneys in order to maintain full-time health services. State-supported hospitals, eleemosynary, penal and reformatory institutions were two tuberculosis sanatoriums, eight hospitals (including mental), two orphanages, three schools for deaf and blind, four schools of correction, one penitentiary and one sub-penitentiary.

Communication.—Oklahoma spent in the period 1919-47 (ending Dec. 31, 1946) the sum of \$217,520,546 on improve-

ment of approximately 10,062 mi. of highway. Total mileage in 1946 was approximately 101,000. Railroad and electric mileage totalled 6,173 mi., not including sidings.

Agriculture.—Total harvested acreage of crops in 1946 was 13,268,000 ac. compared with 12,999,000 ac. in 1945 and 12,901,000 ac. in the 10-yr. (1935-44) average. The wheat acreage was the largest in history. Commercial truck crops were produced in greater volume, the total value of 6 commodities being \$1,931,000 compared with \$1,890,000 in 1945. The state department of agriculture estimated Dec. 1, 1946, the value of livestock on farms at \$204,523,950, the estimated value the year before being \$193,108,000.

Leading Agricultural Products of Oklahoma, 1946 and 1945

	1946	1945*
Wheat, bu.	88,262,000	73,875,000
Corn, bu.	25,882,000	22,644,000
Oats, bu.	24,780,000	20,976,000
Peanuts, bu.	119,340,000	87,875,000
Broomcorn, tons	16,100	11,600
Grain sorghums (forage and silo), tons	1,439,000	1,398,000
Grain sorghums, bu.	7,314,000	7,632,000
All hay, tons	1,512,000	1,741,000
Cotton, bales	260,000	285,000

*Revised April 1946 by U.S. department of agriculture.

Manufacturing.—Total pay rolls for covered employment in Oklahoma for 1945-46, ending September, was \$129,174,518, with a monthly average of 55,908 persons employed. In addition to the manufacture of petroleum by-products the manufacture of lumber, cement and products from glass sands in Oklahoma were big industries.

Mineral Production.—Minerals produced in Oklahoma include petroleum, natural gas, natural gasoline, liquefied petroleum gases, asphalt, zinc, lead, coal, stone, sand and gravel, clay and salt; the total value of minerals produced in the state for the year ending Dec. 1944 was \$253,284,000. Figures for the year ending Dec. 1, 1946, reported the production of 137,582,295 bbl. of petroleum in Oklahoma. (M. H. W.)

Oldfield, Berna (Barney) Eli (1878-1946), U.S. racing driver, was born on Jan. 29 in Wauseon, O. He was a bicycle racer in his youth but by 1902 was a race driver on the dirt tracks. Shortly after meeting Henry Ford he drove the automobile magnate's famous racing car, the "999," over a 5-mile course for a clocked time of 5.28 minutes. A year later, on June 15, 1903, he piloted the same car to a new world's record, becoming at the same time the first man to travel a mile a minute in an automobile. On March 16, 1910, he drove an imported Blitzen Benz over the sands of Daytona Beach to establish an official speed record of 131.724 mi. an hour. Oldfield was one of the best known speed racers of his day and his reputation lived on long after his retirement in 1918. However, his interest in this hazardous sport did not wane and in 1932, he planned an attempt to race an automobile 300 mi. an hour. This ambition was never realized. He spent his last years as safety adviser and as a campaigner for safe driving. He died at Beverly Hills, Calif., on Oct. 4.

Ontario. One of the two central provinces of Canada, Ontario was admitted to the union in 1867. The area is 412,582 sq.mi., with 12% fresh water; pop. 3,787,655 (1941 census), 62% urban; 1946 off. est. of pop., 4,004,000. The

chief cities (1941 census pop.) are Toronto, the provincial capital (667,457); Hamilton (166,337); Ottawa (154,951); Windsor (105,311). Administered by a lieutenant governor, an executive council and a 90-member legislative assembly, Ontario is represented federally by 82 members of parliament and 24 senators.

History.—Progressive-Conservative Premier George A. Drew continued in office, some cabinet portfolios were switched and Lieut. Gov. Albert Matthews (appointed 1937) retired and Ray Lawson was installed.

Two noteworthy laws passed at the 1946 session of the legislature were the Farm Products and Grades act which licensed all persons engaged in marketing farm produce, and the Minimum Wage act for men. Other reforms included special courses for guards and prisoners to improve conditions in provincial penal institutions and free prenatal examination of expectant mothers by physicians of their own choice. After 2 yr. of operation the department of planning and development announced that 15 planning areas had been approved, 90 new European and American trading agencies established and 18 British manufacturing outlets opened in the province. Two important royal commissions—one on forestry and the other on milk production and marketing—heard briefs and collected evidence.

Industry.—Industrially the year was marred by more than 20 prolonged strikes that lost more than 400,000 man-working days. Major industries affected were steel, brass, rubber, electrical apparatus, logging, shipping. Despite this fact in a year-end survey the provincial government noted that Ontario continued to lead all Canada in production of important goods.

Agriculture.—The biggest Ontario tobacco crop in history drew attention to the increasing importance of that specialized kind of Ontario farming, which in 1946 ranked second to livestock and grain production. Further expansion was forecast with construction of a \$2,000,000 highly modern processing plant at Aylmer, the heart of the tobacco lands. A novelty was air shipment of purebred cattle to Cuba, Puerto Rico and other Latin American countries.

Mining.—Ontario mining also expanded during the year with aircraft continuing to play a stellar role. A \$1,500,000-contract was let to map a large section of northern Ontario by air for the department of lands and forests. An air-borne magnometer, a war-invented instrument to locate submerged submarines, was used to locate buried mineral-bearing ores. (C. Cv.)

Education.—The total enrolment of all educational institutions during the period 1943-44 was 745,923. The total revenue of provincially controlled schools in 1944 was \$55,268,313. The University of Toronto, with its seat at Toronto, is the provincial university.

Communications.—In March 1945 Ontario had 56,768 mi. of surfaced road and 16,235 mi. of earth road. The number of motor vehicles of all kinds registered in 1944 was 675,957. There were 10,479 mi. of railroads in 1944.

Oppenheim, E(dward) Phillips (1866-1946), British novelist, was born in London. He studied at a grammar school in Leicester but left while in the sixth form to help his father. He worked days in his father's leather firm and spent his nights writing fiction. He sold his first short story in 1884; and his first novel, *Expiation*, was published two years later. He then wrote a number of thrillers which caught the fancy of a wealthy New York

businessman. The overseas admirer bought out the Oppenheim leather business at the turn of the century and made the novelist a director at a large salary, an arrangement which left Oppenheim free to devote the major part of his attention to his writing. Between 1900 and 1914, he wrote a number of novels dealing with espionage and intrigue, the most notable of which were *A Maker of History* (1906), *The Betrayal* (1904) and *The Great Secret* (1907). In these works he established a reputation as a top-notch producer of escapist stories of high adventure and international intrigue. In glamorous settings, such as the Casino at Monte Carlo, polished urbane heroes engaged in secret but risky missions and won lovely heroines. The formula was deceptively simple and the novels were ingeniously and artfully written. During World War I Oppenheim served with the British Intelligence, and after the armistice he resumed his writing. His output was prodigious and he produced some 150 books besides many plays. His best-known novel was *The Great Impersonation* (1920). Among his other works are: *The Mysterious Mr. Sabin* (1901), *The Mischief Maker* (1913), *Mr. Grex of Monte Carlo* (1915), *The Great Prince Shan* (1922), *Prodigals of Monte Carlo* (1926), *The Million Pound Deposit* (1930), *The Spymaster* (1938), *The Last Train Out* (1941) and *Mr. Mirakel* (1942). He also wrote a large number of short stories. He died at his home at St. Peter Port on the Channel island of Guernsey on Feb. 3.

Oranges: see FRUIT.

Oregon. A Pacific northwest state of the United States, admitted to the union Feb. 14, 1859, the 33rd state. Area 96,981 sq.mi., including 631 sq.mi. of water; pop. (1940) 1,089,684. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 1,214,226. Capital, Salem (1940 census) (30,908); chief city, Portland (305,394). Governor in 1946, Earl Snell. Secretary of state, Robert S. Farrell, Jr.

History.—The biggest problem during 1946 was the loss of the shipbuilding pay roll in the Portland metropolitan area. In 1944 the Portland-Vancouver shipyards employed nearly 132,000 people. By the end of 1945 the number of employees had fallen to about 31,500 and at the end of 1946 to 3,000. Sound expansion took place, however, in agriculture, stock raising, horticulture and particularly in food preservation and elaboration. There was good development in these allied industries in nearly all parts of Oregon.

The demand for lumber and plywood showed a heavy increase. Many new mills were put in operation and in consequence many new logging operations were established. Of especial significance was the profound interest displayed by government and commercial foresters in the sustained yield program and in tree farms and reforestation.

Pay roll totals, both for Portland and upstate, made a very satisfactory showing when compared with prewar years. It was estimated that the 1946 figure would run to about \$450,000,000 for the state at large, against \$170,000,000 for 1940 and \$581,000,000 for 1944, the peak year of World War II. The 1946 upstate pay roll amounted to more than three times the figure for 1940. In 1946 a great many medium and small industries either established themselves in Oregon or expressed their intention of doing so.

Despite water-front strikes in most of the maritime area of the state, there was a substantial resurgence in water-borne commerce, particularly in the foreign classification. Portland alone shipped nearly 1,000,000 tons of general cargo to foreign countries. Included in the total were such staples as lumber, wheat, flour, processed foods, coal, machinery and phosphate rock. Inbound cargo included copra, burlap, coffee and similar products.

Oregon farmers in 1946 gathered crops from the largest area in the history of the state, and the tonnage of crops harvested also was the greatest on record. According to the U.S. department of agriculture reporting service, crops were gathered in 1946 from 3,184,000 ac. of land. This area produced field crops, tree fruits, forage seed, vegetable and berry crops and is to be compared with 2,677,000 ac. harvested in 1939. In 1946 the farms of the state produced 4,658,000 tons of crops, compared with 3,569,000 tons in 1939. In 1946 record crops were harvested of sugar beets, potatoes, truck crops, pears, sweet cherries, walnuts, filberts and some of the berries.

The state-wide housing shortage was but slightly improved in 1946. More than \$125,000,000 worth of housing permits were issued by the Oregon Federal Housing authority during the life of the housing priority system between Jan. 15 and Dec. 24. These permits were to house 18,200 family units, but shortages in labour and material kept nearly two-thirds of the units from being completed. Nearly 6,800 priorities were issued for the Portland area alone, and of these only about 1,900 units were completed in 1946. However, during the last 60 days of the year there was considerable improvement in construction progress.

At the election on Nov. 5, 1946, Oregon, traditionally Republican, elected the candidates on that ticket by almost a clean sweep. Gov. Earl Snell and Secretary of State Robert S. Farrell, Jr., were re-elected by large majorities. Four Republican representatives in congress were also re-elected and a state senate and house of representatives nearly completely Republican. By popular vote an amendment to the state constitution was adopted revoking a provision in the organic act of 1859 which prohibited Chinese from holding Oregon real estate. An act was passed providing for more liberal public school support, but it was expected that the new law would require additional legislation by the 1947 legislature to make its provisions effective. Efforts of public electric power champions to establish public power districts in eight counties failed of popular approval.

Education.—During the school year 1945-46 there were 254,754 pupils in public schools, including 62,393 in high schools. There were 8,204 teachers. For the school year 1945-46 the value of school properties, including buildings, grounds and equipment, was \$66,494,410. The superintendency of public instruction, an elective office, was held in 1946 by Rex Putnam.

Communications.—As of Dec. 31, 1945, there were 4,806 mi. of primary highways in Oregon, of which 4,612 mi. were improved with various types of surfacing. As of Dec. 31, 1945, there were 3,618 mi. of steam railways, not including second main track, sidings, etc.

Finance.—As of Dec. 1, 1945, Oregon's state gross bonded debt was \$18,517,590, against which there were sinking funds and other applicable assets amounting to \$15,581,391, leaving a balance of debt of \$2,936,199.

Agriculture.—Total cash income of Oregon farmers in 1945 was \$299,357,000, of which \$9,160,000 represented government

entered the city in 1945, moved to Eichstaett, Germany, south of Nuernberg, where he died on April 1.

Osteopathy. The most important advance during 1946 was the implementation of that part of public law 293 (79th U.S. congress) which made osteopathic services available in veterans' hospitals. Under this law osteopathic physicians and surgeons were made eligible for appointment to the department of medicine and surgery of the Veterans' administration. The six osteopathic colleges in Chicago; Des Moines, Ia.; Kansas City and Kirksville, Mo.; Los Angeles, Calif.; and Philadelphia, Pa., and the 58 osteopathic intern-training hospitals were approved by the Veterans' administration as meeting educational standards for the training of doctors qualified to treat veterans.

Another forward step in recognition of the osteopathic school of practice was seen in the provisions of public law 658 which authorizes federal departments and agencies to establish health-service programs with osteopathic physicians expressly eligible to render the professional services involved. This law neither supplanted nor conflicted with an amendment to the U.S. Employees' Compensation act under which, from 1937, employees of the government had been entitled to treatment for occupational injury and illness by osteopathic physicians.

Capacity freshman classes entered osteopathic colleges in the fall of 1946. Approximately 76% of these were veterans seeking professional training under the G.I. Bill of Rights.

During 1946 there was an acceleration of the campaign for funds started in 1942 for the enlargement of the physical plants and providing increased faculties and equipment in all of the approved colleges of osteopathy. Improvements and a few additions were made to the teaching units despite the shortage of materials.

As of Nov. 1, 1946, membership in the American Osteopathic association was 7,852 or 70% of a possible total of 11,145 practising osteopathic physicians. The number of hospitals on the register of the American Osteopathic association was 187, including 58 approved for intern training. These hospitals had a total of 5,490 beds and 1,383 bassinets. (R. E. D.; R. G. Hu.)

Ostland: see UNION OF SOVIET SOCIALIST REPUBLICS.

Osubka-Morawski, Edward Boleslaw (1904?-), Polish government official, was a member of the "P.P.S." (the Polish Socialist party) before the outbreak of World War II. He had been associated with the Warsaw housing co-operative and was active, although not widely known, in the co-operative movement. In 1943, Osubka-Morawski left the P.P.S. to join a more leftist faction, the R.P.P.S. (the Polish Socialist Workers party) and published an underground paper during the German occupation. Later, he left for Moscow and on July 23, 1944, he became head of the Polish Committee of National Liberation, the organization set up to administer the areas of Poland freed by the Red army. He was selected as premier of the Polish Provisional government (Dec. 31, 1944) and was retained in that post in the permanent government formally installed in Warsaw (June 28, 1945). An advocate of government ownership of all industry of "national importance," he favoured encouragement of private enterprise in the new Poland but asserted that all production and distribution should be regulated by the government. With regard to land reform, he was categorically committed to the abolition of all large estates in Poland, except for land owned by the church. Although he had previously opposed a single list of candidates for the national elections, he criticized Vice Premier Stanislaw Mikolajczyk on March 3, 1946,

Principal Agricultural Products of Oregon, 1946 and 1945

Crop	1946 (est.)	1945

All wheat, bu.	25,168,000	20,889,000

(L. A. McA.)

Orsenigo, Cesare (1873-1946), Italian prelate, was born on Dec. 13. He served as apostolic nuncio to the Netherlands, 1922-25, and to Hungary, 1925-30, and in 1930 succeeded Eugenio, Cardinal Pacelli (now Pope Pius XII), as papal nuncio to Berlin. Mgr. Orsenigo, who resided in Berlin until a few weeks before the Red army troops

for refusing to bring the Peasant party into the government bloc. On May 11, Osobka-Morawski declared that the government would outlaw all "fascist groups" within the Peasant party.

Ottawa. The capital of Canada is at the confluence of the Ottawa and Rideau rivers in Ontario and covers 8.3 sq.mi. Pop. (1941 census) 154,951; (1946) 190,985 living in the city, 29,790 in suburbs. The houses of parliament are on a high cliff overlooking the Ottawa river. Other notable public buildings are the National Art gallery, Supreme Court, Parliamentary library, Dominion Archives, Royal Mint, Bank of Canada and Rideau hall, residence of the governor-general. Ottawa had 212 industries in 1946, the chief connected with wood products. L'Université d'Ottawa was in 1946 the only officially bilingual university in Canada.

In 1946 Jacques Greber, French city-planning expert, was engaged with 13 architects to convert the capital area (including the city of Hull, Que., across the Ottawa river) into a World War II memorial. Parliament voted \$3,000,000 over 10 yr. for improvements; plans included the transfer of heavy industries, the building of new bridges and driveways and the addition of 16,000 ac. of Gatineau Valley parkland. Oxford University. At the end of the academic year in June 1946 undergraduates at Oxford numbered 4,147 (3,219 men and 928 women), as against 2,333 in June 1945. The number of men in residence in Michaelmas term 1946 was 5,290, and of women 990. Many of the men were B.A.s who, having taken war degrees, returned to complete normal undergraduate courses. In Oct. 1946 the vice-chancellor, as a result of inquiries made in all the colleges, was able to state that men returning from the services easily readapted themselves to university discipline and showed themselves to be keen and capable at their academic work, although some found the first steps difficult.

An important development took place in colonial studies. To meet modern demands, a committee appointed by the secretary of state, with the duke of Devonshire as chairman, recommended a comprehensive academic study of subjects bearing upon colonial problems over a period of 15 months after selection for the service, followed by a tour of duty in the colony, and then by a further six months' course. All cadets would spend about half the initial course at Oxford or Cambridge and the rest of that course at London university. They would be divided between the three universities for the second course.

Building was begun on new laboratories for forestry and botany, and the enlargement of an old building for geology. On Oct. 24, 1946, the king and

queen opened the New Bodleian library. The building was erected at a cost of £376,500, of which £225,840 was received from the Rockefeller foundation which had contributed a sum of \$2,300,000 for this and other library purposes.

The following heads of houses and professors were appointed: provost of Queen's, Sir O. S. Franks; rector of Lincoln, K. A. H. Murray; provost of Worcester, J. C. Masterman; principal of St. Hugh's, E. E. S. Procter; professor of Italian studies, A. P. d'Entreves; professor of physics, M. H. L. Pryce; professor of natural philosophy, S. N. Chapman; professor of poetry, C. M. Bowra; professor of pure mathematics, J. H. C. Whitehead; professor of Anglo-Saxon, C. L. Wrenn; professor of the history of war, Cyril Falls; professor of music, J. A. Westrup; professor of social anthropology, E. E. Evans-Pritchard; professor of fine art, Sir Kenneth Clark; professor of European archaeology (a newly founded professorship), C. F. C. Hawkes; professor of modern history, K. G. Feiling; professor of American history, W. W. Rostow.

Benefactions included £64,000 spread over eight years for physics, and £5,400 from the Chinese government spread over three years for five scholarships in Chinese studies.

BIBLIOGRAPHY.—*The Oxford University Handbook*; *Oxford University Gazette* (Oct. 1946) containing the vice-chancellor's review of the year; *Oxford* (the magazine of the Oxford society). (D. V.)

Pacific Islands, British. The British Pacific islands are territories of the British empire in the Pacific ocean, of which certain statistics are given in the accompanying table. See BRITISH EMPIRE for population, capital towns, status and governors.

History.—At the conference of commonwealth prime ministers held in London, April 23–May 23, it was agreed that a South Pacific regional commission should be set up by Britain, Australia and New Zealand to develop the area economically and socially; there would be increased participation of natives in administration, improved labour conditions and co-ordination of health and education services in the whole area.

In Fiji there was considerable political friction between the Fijian and European population and the Indians which culminated on July 16 in a debate in the legislative council on the subject of "Fiji for the Fijians," in which the non-Indian members made plain their apprehension at the growth of the Indian population and its consequent political development. An official statement had pointed out in June that any constitutional changes in India would not affect the political rights of Indians in Fiji, which are set out in letters patent.

*Canton and Enderbury Islands, in the Phoenix group, are shared with the U.S.A. under the Anglo-American pact, Aug. 10, 1938.

Pacific Islands, French. The latest statistics available in 1946 for this French colony were: area (Society, Tuamotu, Tubuai and Marquesas islands) 1,545 sq.mi.; pop. (est. Dec. 31, 1939) 45,000 (white, c. 3,700). Capital: Papeete, in Tahiti (pop. census 1941, 11,614). Governor: Col. Georges Orselli.

Finance.—Revenue and expenditure (est. 1944) balanced at 43,449,000 francs. Exchange rate, 1946: 1 franc=.84 U.S. cents.

Trade and Communication.—Foreign trade, Tahiti (1943): imports 97,223,000 fr.; exports 142,645,000 fr. Roads (1937): Tahiti, 48 mi.; Raiatea, 19 mi. Shipping entered (1943): 50 vessels, tonnage 160,943.

Production.—Export (1941): copra 15,000 short tons; national phosphates 212,000 short tons.

Pacific Islands, Mandated. The former German possessions in the western Pacific comprise part of New Guinea with adjacent archipelagos, Western Samoa, the Marshall, Caroline, Palau and Ladrone, or Marianas Islands and the island of Nauru. Statistics for these territories are given in the accompanying table. For capital towns and governors of New Guinea, Western Samoa and Nauru, see BRITISH EMPIRE.

At the general assembly of the United Nations in London in Jan. 1946 it was announced that Australia and New Zealand would put Australian New Guinea and Nauru under U.N. trusteeship. On Nov. 11 Peter Fraser, premier of New Zealand, issued the proposals for trusteeship over Western Samoa which had been approved by the British, Australian and U.S. governments and submitted to the Western Samoa legislative council. (See also MANDATES; NEW GUINEA.)

Pacific Islands, U.S. In addition to such large island possessions in the Pacific as Hawaii, the Aleutians, American Samoa and Guam, the United States possesses a dozen tiny islands in the Pacific, negligible in size and economic value, but important, both in peace and in war, from the standpoint of aviation and naval security. Increasing interest was shown in these formerly neglected islets in the later 1930s, as air flights across the Pacific were organized on a regular commercial basis and as the threat of war with Japan became more evident.

Midway and Kure (Ocean) Islands.—The Midway Islands are a group in the North Pacific, 1,200 mi. northwest of the Hawaiian Islands.

Area of the group: 28 sq.mi. Population (1936) 118. Midway consists of two low-lying islands, Sand (area 850 ac.) and Eastern (328 ac.). These are surrounded by a coral reef five mi. in diameter and by numerous islets. Sand and Eastern Islands are little more than sandspits, but they acquired importance, first, as the site of a transpacific cable station (installed 1903), second, as a stopping point on the Pan American

Airways route from San Francisco to the Philippines via Hawaii, Midway, Wake and Guam (inaugurated 1935), third, as an important U.S. air and naval station in the war against Japan.

One of the first big Japanese naval defeats was sustained in a three-day battle in the neighbourhood of Midway, fought June 4-6, 1942.

Formerly known as Brooks Island, the name was changed to Midway because of the group's position in the mid-Pacific, 2,800 mi. from California and 2,200 mi. from Japan. It was formally declared a U.S. possession in 1867. Kure (Ocean) Island is a coral reef 14.7 mi. in circumference, lying 56 mi. northwest of Midway. It was placed under the control of the navy department by an executive order of Feb. 1936. In 1946 the U.S. navy disclosed that Midway was among its 14 "essential" bases in the Pacific.

Wake Island.—Wake Island consists of three islets, Wake, Peale and Wilkes, and is located in the North Pacific, 2,130 mi. due west of Honolulu. The total land area of the islets is about 2,600 ac. (4 sq.mi.), Wake, the largest, being about 2 sq.mi. Under the Washington naval treaty of 1922, the United States agreed not to strengthen its fortifications on Wake; the treaty lapsed at the close of 1936. Two years earlier (1934) the island had been placed under the jurisdiction of the U.S. navy. Congress voted appropriations in 1939 and 1941 for establishing naval and air bases on Wake and for strengthening its defenses. In Dec. 1941 a Japanese landing force overpowered small defending garrisons on the isle. During their occupation, the Japanese shot to death 98 civilian workers on Wake. After the close of World War II, the Japanese on Wake surrendered to a U.S. landing force, Sept. 4, 1945.

Johnston Island.—Johnston Island consists of two islets on an 8-mi. reef, located 600 mi. southwest of Hawaii. It was discovered by the British naval vessel "Cornwallis" in 1807 and named after the vessel's captain, Charles James Johnston. Competing U.S. guano interests lent some activity to this barren sand bar in the '50s and '60s of the 19th century. The final U.S. assertion of claim to the island was an executive order of June 29, 1929, placing the island under the control and jurisdiction

of the department of agriculture as a refuge for native birds. An appropriation of \$1,150,000 was provided by congress for the construction of seaplane facilities.

Kingman Island.—Kingman reef, 150 ft. long by 120 ft. wide at high tide, is the smallest land area in the world over which the United States claims sovereignty. The reef is about 8 mi. long and 5 mi. wide, counting in submerged shoals. Two other tiny islets in the reef appear at low tide. The strategic importance of this desolate reef lies in the fact that it is the only possible seaplane base between Honolulu (1,607 mi. to the N.) and Pago Pago, in American Samoa (q.v.), 1,797 mi. to the S.W.

Palmyra Island.—A U-shaped atoll, with its 53 islets containing an area of about 500 ac., Palmyra Island is located 960 mi. S.W. of Hawaii. The U.S. supreme court affirmed the U.S. government's title to Palmyra (May 10, 1943) and several weeks later, Palmyra was returned to Hawaii's territorial jurisdiction. During World War II, the atoll was employed as a base by the navy and the marine corps.

Swains Island.—A coral atoll, 1 sq.mi. in area, pop. 150, of Polynesian race, formally brought under the jurisdiction of

American Samoa in 1925 after remaining for a time under the patriarchal rule of a U.S. whaling captain named Eli Jennings, who had himself accepted as a local chief, and his descendants.

Howland, Jarvis and Baker Islands.—Baker and Howland Islands are small coral atolls, located where the international date line crosses the equator. Jarvis Island is 1,150 mi. farther east and slightly below the equator. Rectangular Baker Island is 1 mi. long and 1,500 yd. wide. Elongated Howland Island is 2 mi. long and 750 yd. wide. Jarvis Island is a bare coral plateau, 1.8 mi. long and 1.3 mi. wide. Radio and aerological stations were installed on the islands which were placed under the interior department's jurisdiction in 1936. U.S. personnel were withdrawn from all three islands shortly after the Pearl Harbor attack. Japanese submarines staged nuisance raids on Howland Island in 1941-42. In late 1943 U.S. forces reoccupied Baker and built an important air base on it.

Canton and Enderbury Islands.—Geographically part of the Phoenix group and located 1,850 mi. S.S.W. of Hawaii, Canton (area 8.5 sq.mi.) and Enderbury (2.5 sq.mi.) figured in a prolonged dispute as to ownership between the United States and the British empire. The dispute was settled on Aug. 11, 1938, when the U.S. and British governments jointly announced an arrangement for "the use in common" of the islands, "for purposes connected with international aviation and communication." A combined U.S. civilian-naval force reached Canton in Nov. 1941 and constructed an air strip on the island.

(See also GUAM; HAWAII; PHILIPPINES; SAMOA, AMERICAN.)
(W. H. CH.; X.)

Pacifism. During 1946 the demobilization of conscientious objectors in the U.S. who had been doing alternative service in Civilian Public Service camps and units proceeded rapidly and at the end of the year only about 200 men remained in C.P.S. Only a very few new C.O.s were drafted during the year, partly because after several years of war not many youths on reaching the age of 18 were prepared to take the C.O. position, and partly because all inductions under the Selective Service act were suspended during several months as the army's need for troops declined.

The situation with respect to C.O.s who were or had been confined in federal prisons was not so satisfactory from the standpoint of pacifists and of nonpacifist advocates of civil liberty. During the early months of the year parole was available to C.O.s only to a restricted degree and some of the most consistent opponents of conscription felt that they could not conscientiously recognize the validity of their arrest by submitting to any parole conditions whatever. Largely through the efforts of a Committee for Amnesty, sponsored almost entirely by nonpacifists, a great amount of public opinion was built up in favour of liberalized parole provisions and an early amnesty. The latter would mean not only unconditional release for men still in prison but restoration of civil rights to them as well as to those previously released. The result was that on Dec. 31, 1946, only a little more than 300 men classified as "conscience cases" by the department of justice were still in prison, all except about 25 being Jehovah's Witnesses. (In addition there were 957 other Selective Service violators in prison.)

Furthermore, on Dec. 23, 1946, Pres. Harry S. Truman issued an executive order providing for the appointment of a Presidential Amnesty board to make recommendations for amnesty to him and the attorney general. The chairman of this board was a former associate justice of the supreme court, Owen J. Roberts.

The executive order applied to all Selective Service law violators. According to the department of justice the total

number of violators sent to prison up to Dec. 26, 1946, was 11,551. In addition it was estimated that 3,000 were placed on probation. The latter presumably accepted military service and thus secured restoration of their civil rights. Of those imprisoned, 1,109 accepted noncombatant service in the armed forces, plus 69 others classified as C.O.s or Jehovah's Witnesses, and thus secured restoration of civil rights. The categories to be considered by the Presidential Amnesty board early in 1947 and the approximate numbers in each were, therefore, as follows: those classified as C.O.s by the department of justice (1,000); Jehovah's Witnesses and other claimants to ministerial classification (4,500); Puerto Rican Nationalists (40); Negroes who refused to be drafted into a "Jim Crow" army (20); Japanese-Americans who refused to be drafted from concentration camps into the armed forces (100); American Indians who refused to be drafted either on religious grounds or on grounds of exemption by treaties with the United States (15); aliens or their sons who refused to be drafted to fight against their countries of origin (number not available Dec. 31, 1946); violators who presumably raised no issue of conscience (5,000).

Pacifists took a strong interest in the congressional struggle over the extension of the wartime draft (Selective Service act). Virtually all national church, educational, farm and labour bodies joined them in advocating termination of the act and in opposing also peacetime conscription or universal military training. Congress was apparently reluctant in the spring of 1946 to extend Selective Service and at one point had to vote a temporary extension of a few weeks to prevent automatic termination of Selective Service by default. Eventually extension to March 31, 1947, was voted. During the closing months of the year a "draft holiday" was in effect. As the new congress convened under a Republican majority in Jan. 1947, it seemed likely that the Selective Service act would not be extended beyond March.

The Truman administration gave notice, however, in Dec. 1946 by the appointment of a Universal (Military) Training Advisory committee of its determination to secure the adoption of peacetime compulsory universal military training. There was, however, widespread skepticism about the measure in congress, some of it based on considerations of economy and some on the apparently increasing doubts among military leaders as to the efficacy of such training for defense against atomic war.

Pacifists generally urged vigorous efforts to secure an international agreement to abolish conscription as part of a program of universal disarmament. They hailed with some satisfaction the adoption of a general disarmament resolution in the United Nations assembly in Dec. 1946, though beset with many doubts as to whether such governments as those of the U.S.S.R. and the United States were making this proposal seriously or using it as a screen behind which to carry on the struggle for national "security" and interests at strategic points. Pacifists generally held that the Baruch plan for control of atomic energy should be discussed as part of a program for general disarmament, on the ground that it was not feasible to "outlaw" the use of one type of weapon so long as armed sovereign nations continued to contemplate war as a final resort.

Either directly through their own channels or through support of church and other private agencies pacifists continued to contribute heavily in effort and money to projects of relief and rehabilitation in war-stricken lands. Thus the American Friends Service committee had a budget of more than \$7,000,000 for this purpose.

During the year successful efforts were made to knit together again the pacifist forces in various parts of the world which had been out of touch with each other during World War II. The Friends, Brethren and Mennonites of the United States

contacted their groups in all continents. The International council of the Fellowship of Reconciliation met in Stockholm, Sweden, in March and the Women's International League for Peace and Freedom in Luxembourg, in August. Preliminary steps toward convening a world pacifist conference in India with Mohandas Gandhi, probably early in 1948, were taken.

Painting. During the year 1946 more than ever before, a significant realization was experienced by many who are interested in, and observant of, art trends: U.S. art has become independent, self-reliant, a true expression of the national will, spirit and character. It seems that, in aesthetic character, U.S. art is no longer a repository of European influences, that it is not a mere amalgamate of foreign "isms," assembled, compiled and assimilated with lesser or greater intelligence. It was heretofore commonly accepted that only regional art illustrating the U.S. scene exudes a truly native flavour, and that only such art should be looked upon as authentically American. This theory, however, does not seem to be justified. It falls short of giving a clear and comprehensive picture of the active forces which are generating art throughout the nation.

A circumstantial recognition of the existence of a truly American art was made on the occasion of the U.S. show in London in the summer of 1946. It should be borne in mind that the selection of paintings sent to London (as indeed is the case with all such collections) represented the taste of an arbitrarily appointed jury rather than a selection of "the best the country had to offer," which would always be a matter of discussion. The standards of judgment in art are for the most part haphazard and based on unproven theories, and hit-and-miss decisions are thus practically unavoidable. Nevertheless, the work shown in London gave a fairly comprehensive view of the aesthetic preoccupation of painters in the United States. And the aesthetic preoccupation of these painters met with a decidedly negative response from the British public and art critics. It was not for the first time that U.S. art failed to impress European critics. For instance, the U.S. show in Paris at the Jeu de Paumes in 1937 received a very hostile reception. Strangely enough, the show was assembled by the Museum of Modern Art in New York, which is geared to European taste and guided by European aesthetic standards. Yet the rebuke was severe. The reaction in the U.S. at the time amounted to what might be called lugubrious bewilderment. The U.S. artists and the public were still labouring under the traditionally accepted sense of inferiority with regard to their own art. Lack of self-assurance in matters of international relations had persisted for so long that the Americans were slow to realize that they had long since ceased to depend on importations of foreign art formulas and that they possess something in their own art which is not inferior to the French, but distinctly different. The Frenchmen were confused in '37 by what the U.S. had to offer and the British were equally disconcerted in 1946. Clearly, the professional critics were hard-pressed to find a key to U.S. styles and aesthetic aims, and they could not find an immediate answer to it. It was not the quality of the paintings that offended British sensibilities, but rather the modes of expression. As usual, the unfamiliar was not readily understood or accepted, for hand-in-hand with lack of understanding goes lack of appreciation. The only paintings which met with unequivocal approval by the British were the Sargent's and the Whistlers, and both of these painters, though U.S.-born, are distinctly British in style

and character. By displaying predilection for these painters, the British critic at once revealed his aesthetic allegiances. Characteristically, native allegiance to the art style represented by John Singer Sargent no longer exists—one can even say with certainty that a severe disregard for this type of conventional art prevails in the U.S., and the erstwhile esteem for James Whistler has sunk to a rather low level in the U.S. All these considerations lead to the unavoidable conclusion that American art has moved away from codified European directions and has assumed a life of its own. Of course, on the periphery there are still some loose ties leading directly to Paris, but they are already noticeable as arbitrary imports, distinctly foreign to a new, authentically American art style.

This contemporary American art style displays vitality, originality and a feeling for craftsmanship which is unparalleled in the art world today. The background for such a condition as seen from the perspective of 1946 seems to be composed of forces highly germane to the development of art. Whereas the greatest activity in the field of painting in other countries is found in the principal cities, in the U.S. it is country-wide; even small communities show vital art interest, and art museums, art schools, art societies, are active in every part of the union. Important exhibitions are reaching rural and industrial communities everywhere. The annual purchases of art by U.S. galleries exceed by many times the total amount of purchase by the rest of the world. Universities offering art courses show a steady and rapid increase in the number of students. Thousands of applicants are turned away every month because of overcrowded facilities. It is estimated that names of more than 5,000 applicants were on the waiting lists of New York city art schools alone in 1946. Besides many richly endowed museums and public institutes which support art by purchase and by arranging exhibitions, powerful industrial organizations entered the field of art patronage, without exerting any pressure to influence artists aesthetically or politically. The Standard Oil Company of New Jersey, Pepsi-Cola company, Encyclopædia Britannica, International Business Machines and the Abbott Laboratories are among the most generous of the new art patrons.

The publication of books on painting in 1946 took an unprecedented upswing, and art magazines registered a very substantial increase in circulation. All this seems to indicate that there was in 1946 an ever-growing vital interest in art, and that in spite of the aftermath of the war years a widespread awakening to art as a force in national life was taking place. It is only to be expected that under such favourable conditions art should flourish. To be sure, sponsorship and patronage are not the sole agencies for the fostering of talent, but they go a long way toward activating the energies which develop art.

Aided by powerful sponsors (Guggenheim Foundation for Non-Objective Art, the Art of the Century Gallery and other galleries and art societies) the pre-eminence of abstract art in 1946 was marked, and it appeared that its popularity was steadily gaining ground. New York, Chicago, San Francisco and other large cities have become veritable strongholds of an art direction by now almost 40 years old, which was all but extinct before World War II. For the first time, the Art Institute of Chicago dedicated its regular national exhibition to abstract and surrealist art exclusively. The annual exhibition at the Whitney Museum of American Art was dominated by non-objective paintings, and similar tendencies were noted throughout the country. Many of the best-known museums have been purchasing abstract paintings, thus encouraging and perhaps directing large numbers of the younger painters towards this type of art. It must be said, however, that within the limited

Above: "CLOWN," an oil painting by Walt Kuhn. It was one of several pictures from the *Encyclopædia Britannica* Collection of Contemporary American Painting chosen in 1946 by the U.S. state department, to be included in one of three collections of U.S. paintings which were to be shown abroad

Above: THIS PAINTING, "Maker of Dreams" by Ivan Le Lorraine Albright, was added to the *Encyclopædia Britannica* Collection of Contemporary American Painting in 1946

boundaries of these disciplines, besides a great number of purely academic efforts, some noteworthy talents have come to light.

Remarkable talents, each of a different kind, entered the exhibition scene. Among them were two young men from Boston: the 23-year-old David Aronson and the 30-year-old Hyman Bloom, who impressed art circles as well as the lay public. Aronson, although relying on sources which were highly fashionable in 1946, to wit—Byzantine, Coptic, Primitive and Expressionistic—developed in encaustic technique works of extraordinary accomplishment. Bloom's Expressionism is more independent and mature. It relies chiefly on colour and texture. Both of these painters employ extreme distortions exceedingly well. Other art directions were documented in the work of Mark Tobey from Seattle. His peculiar brand of cryptic calligraphy is more odd than deep, more decorative than vital, but on the whole quite subtle. The work of the German Expressionist, Max Beckmann, also gained top favour with collectors and museums in the U.S. His art, too, is cryptic, employing extreme distortions which often fail to convince because they point to an obvious overdramatization which the subject does not always warrant. His design is mostly good, and his colours and texture have gained force of late. A comprehensive show by Frederic Taubes revealed that this painter has succeeded ultimately in translating the best of the technical achievements of the old masters into an idiom entirely his own, a language which stresses imagination and emphasizes pure paint quality. Primitive Mayan imagery intermixed with modern influences were well-assimilated in the work of Rufino Tamayo, and a particularly successful stylization combined with beautiful technique were seen in the work of Everett Spruce of Texas. These are but a few of a large number of interesting offerings viewed in New York in 1946.

Distinctly marked was the waning influence of the School of Paris. Even in England there were definite signs of the advent of a modern British school which slowly gains freedom from bondage to the academic and leanings on Paris. A number of painters made their debut at a show at the Buffalo Albright gallery which, if not wholly representative of British contemporary art, amounted to a good cross-section study of aesthetic tendencies in that country. Paintings relying on classic traditions yet distinctly contemporary in feeling and rendition were shown by William Coldstream, John Piper, Edward Bawden; modern eclecticism was evident in the work of Robert Colquhoun and Stanley Spencer, and academic abstractionism combining taste and feeling for texture and design, in that of John Tunnard. One of the strongest painters of nonobjective orientation proved to be Graham Sutherland. He, it appears, is one of the few painters who, although eschewing realistic references, retains contact with nature; he is sensitive to form and colour, and his work has none of the bloodless formalism which characterizes most of the nonobjective painters.

In spite of certain evidences of an abundance of talent, a clear picture of the artists' strivings in France can not be gained. There was a general spasmodic and erratic trend followed by the young painters who, perhaps fascinated by the glamorous and spectacular careers of Pablo Picasso and Henri Matisse, could not liberate themselves from the magnetic influences exerted by those painters.

Some of the leading writers on aesthetics tried to explain current trends in French painting by linking them with the new philosophical and literary doctrine—the so-called "Existentialism." However, the attempt to establish a connection between a fashion in philosophy and literature, and an aesthetic expression seems to be far-fetched and unjustifiable. When trying to interpret the picture of aesthetic strivings in Paris, the most obvious conclusion is that the influences of Picasso and Matisse

have hampered rather than promoted the development of original talent in painting. The use of extreme deformations has become a paradigm for a whole generation of painters. More often it seems that deformity is used as an end in itself rather than as a means. Following directly in the path of Picasso, Matisse and some other painters of the Fauve movement were: Leon Grischia, André Marchand, Edouard Pignon, Charles Walch, Francis Pailleux. These are among the best-known names. Various forms of Surrealism attracted many followers among the younger painters; Alfred Courmes, Jean Bertholle, Lucien Coutand—are but a few of a large host. The old *avant-garde*, with the exception of Pierre Bonnard, whose style has become more abstract, and Georges Braque, who maintains unerringly a high level of taste and technical perfection, showed no advance or consolidation of powers. On the contrary, most of their work has taken a stereotyped appearance and impoverishment of ideas is evident everywhere.

The sensation of 1946 was the discovery in the Netherlands that a number of paintings which found entrance into important museum collections as original work by Jan Vermeer, were painted by a Dutch contemporary, Hans van Meegeren. When Van Meegeren was indicted for collaboration with the German occupying forces—he was subsequently rehabilitated—the fraud came to light. (See also SCULPTURE.) (FR. T.)

Paints and Varnishes. United States paint sales in 1946 were approximately 20% more than those of 1945. The total sales rose steadily from year to year and were in 1946 about double that of 1936.

Although the demand for trade sales and industrial paints was great, the paint supply was considerably restricted because of the lack of some raw materials. General shortages of lead restricted the output of lead-containing pigments.

Over-all vegetable oil shortage was primarily the result of foreign requirements for edible oils and fats. The domestic flaxseed crop was estimated to be about 30% less than that of 1945. Even with Argentine production 10% more than 1945 production, the world output was considered to be about 40% less than the 10-yr. average. The search for competitive substitutes for drying oils led to a considerable amount of research and development work with soya-bean oil and tall oil, tall oil being a by-product of the paper industry. Styrene polymers were also the subject of considerable study.

Silicone resins, originally developed as electrical impregnating varnishes, were finding some use in heat-resisting enamels. Their colour and gloss retention were considered to be excellent. Their high price limited rapid adoption. The production of synthetic resins was greatly restricted by lack of certain raw materials—notably, glycerine, pentaerythritol and phthalic anhydride. In the field of lacquers, lacquer solvents and derivatives, the development of a more efficient process of wood treatment increased the yield of methanol greatly.

Although the requirements of military finishes were reduced to a minimum, the demand for housing aggravated the shortage, particularly of house paint, which contains a higher proportion of scarce drying oil. Interior finishes were more available since they require less oil, particularly water emulsion types. The popularity of resin emulsion increased and one major manufacturer announced semigloss paint in addition to the previous flat material.

In England production records toward the end of the year indicated the final count would show a good year, possibly 30% higher than production in 1938. (A. B. Ho.)

Palaeontology. It is exceedingly difficult to portray a fair picture of palaeontological work carried

out during 1946 because of publication delays and difficulties of international exchange of literature.

Palaeobotany.—A *Symposium of Paleobotanical Taxonomy* (T. Just, editor) represents an important contribution to knowledge of fossil algae, vascular plants, mosses and tertiary grasses, primarily of North America. It stresses the value of early palaeozoic algae for stratigraphic correlations in North America, and as indicators of oecological conditions of the past. A study is devoted to the difficult taxonomic problem of symbioses of certain algae with invertebrates that have been described under both animals and plants (M. K. Elias).

A great deal of interest has been focused on the study of fossil seeds. T. H. Hoskins and A. T. Cross published a revision of poorly understood palaeozoic seeds from coal balls of Iowa and other North American localities. A critical study of the taxonomic delimitation of the fern—Pteridosperm complex was given by N. W. Radforth, and W. C. Steere reviewed the fossil bryophytes of North America.

Invertebrates.—A number of contributions to the study of the Ostracoda have come forth, foremost among them a comprehensive treatise of the Pennsylvanian ostracods of Illinois (C. L. Cooper). F. M. Swartz and F. M. Swain described ostracods from the Cotton valley group in northern Louisiana, Morton B. Stephenson discussed an essentially new ostracod fauna from the Eocene Weches formation in Texas and Swain describes forms belonging to several genera from the Palaeocene, Eocene and Oligocene of Florida and Middle Mesozoic, non-marine forms from Brazil and New Mexico. A Cambrian ostracod was described from Oklahoma (E. A. Fredrickson). Franco Rasetti described a largely new early Upper Cambrian trilobite fauna from western Gaspé. All fossils described belong to one fauna of Dresbach age. M. A. Stainbrook reported on corals of the Independence shale of Iowa and C. W. Cooke discussed the echinoids of the Comanche series of Texas. B. L. Clark and J. W. Durham published an extensive account on the Eocene faunas from Bolivar, Colombia.

Vertebrates.—C. C. Young gave a short survey on continental Triassic vertebrates of China. The faunas show affinity to those of South Africa and especially those of the "Knollen mergel" facies of the German late Triassic. A. S. Romer offered a review of the changes that have taken place since the earlier part of the century in the interpretation of the morphological relationships among the early fish groups. D. H. Dunkle and P. A. Bungart discussed the relationships between the dinichthyid arthrodires of the Ohio shales with special interest focused on the adaptive modifications of the jaw mechanisms. E. C. Case wrote a census of the determinable genera of Stegocephalia of the world, giving a bird's eye view of the morphology, adaptive radiation and classification of the group. The highly interesting, Permocarboneous *Limnoscelis* was restudied (Romer). It is considered as belonging to a very primitive reptilian stem-group. At present the only North American representative of the reptilian family Procolophonidae, *Hypsognathus fenneri*, was redescribed by E. H. Colbert on the basis of new materials. The form represents a more advanced side line off the European *Leptopleuron* stock. W. K. Gregory, in an essay on the origin of the turtles, concluded that they can be derived from the Pareiasauria. A new crocodilian suborder, Sebecosuchia, was proposed by Colbert for the reception of two remarkable South American genera, *Baurusuchus* and *Sebecus*.

A popular account of the dinosaurs of Canada (C. M. Sternberg) is well illustrated with photographs of skeletons and collecting grounds. Skeletons of fossil birds are exceedingly rare in the palaeontological record. A very interesting study on fossil penguin remains from Patagonia by G. G. Simpson is based on a partial skeleton and a great many fragmentary finds. The mate-

rials are well described with regard to individual variation, adaptive features and the typical pattern of avian structural organization. Simpson attempted a functional analysis of the penguin skeleton, pointing out that the submarine mode of locomotion is that of flying under water. It is suggested that this type of swimming was achieved directly from aerial flight without an intermediate terrestrial phase. Simpson, in a preliminary study on *Palaeogale* and allied early mustelids found the genera *Bunaelurus* and *Palaeogale* to be synonymous, but *Plesiogale* and *Palaeogale*, previously regarded as synonymous, are recognized as different forms. H. C. Raven and Gregory published a summary of the major conclusions of an unpublished work by Raven on the evolution of the kangaroos. The report is very well illustrated and confirms the general contention that the kangaroos have originated from small, arboreal forest-dwelling phalangers. (R. ZL.)

Palestine. Palestine lies on the western edge of Asia, bounded on the west by the Mediterranean, on the southwest by Egypt, on the south by the Gulf of 'Aqaba, on the east by Trans-Jordan, on the northeast by Syria and on the north by the Lebanon. Area: 10,159 sq.mi.; pop. (est. 1945) 1,750,000. Chief towns (pop. est. 1944): Jerusalem (cap., 155,314); Haifa (125,498); Jaffa (93,493); Tel Aviv (155,277). Languages: English, Arabic and Hebrew; religion: (1944) Mohammedan 1,061,277; Jewish 528,702; Christian 135,547. High commissioner: Lt. Gen. Sir Alan Gordon Cunningham.

History.—In the early months of 1946 the Anglo-U.S. committee of inquiry regarding the problems of European Jewry and Palestine completed its investigations. Events in Palestine and the Palestine question in the international field, revolved throughout the year around the report, which the committee published in Lausanne on March 29. The committee's inquiries (evidence was taken in London, Vienna, Berlin, Prague, Warsaw and all zones, except the soviet, of occupied Germany, as

RESCUE WORKERS digging in the ruins of the King David hotel in Jerusalem, which had been bombed by members of the Irgun Zvai Leumi, a Zionist organization, on July 22, 1946

JEWISH REFUGEES who attempted illegal entry into Palestine in 1946 being shipped to Cyprus

well as the capitals of the Arab countries of the middle east) were undertaken to the accompaniment of a sustained campaign of terrorism by Jewish extremist organizations against the British administration in Palestine, continued pressure by the leading Arab spokesmen against the admission of any more Jewish immigrants and public controversy on the widest international scale. A joint statement by King Ibn Sa'ud of Saudi Arabia and King Farouk of Egypt, issued on Jan. 10, declared once again that, "Palestine is an Arab country," and pledged every effort by the Arab kings, presidents and peoples in supporting the Palestinian Arabs. The declared Zionist purpose, on the other hand, remained the winning of unrestricted immigration rights into Palestine for the Jews and the setting up of an independent majority Jewish state.

In its report, the committee unanimously recommended that 100,000 immigration certificates should be issued at once to Jewish victims of Nazi and fascist persecution and used "as far as possible in 1946." The report recommended the continuance of the mandate, pending the execution of a trusteeship agreement under the United Nations, on the ground that, "Any attempt to establish either an independent Palestine state or independent Palestine states would result in civil strife such as might threaten the peace of the world."

The unanimity of the committee, events soon proved, did not extend to governmental levels. Clement Attlee declared on May 1 that the implementation of the report by Britain would depend first on "the extent to which the U.S. government would be prepared to share the resulting military and financial responsibilities," and secondly on "the active co-operation of the Jewish agency's counterproposal for the creation of 'a Arab countries unanimously rejected the recommendations of the report, and a congress of Arab princes and presidents, convened by King Farouk at Inshass near Cairo at the end of May, threatened the retaliation of the Arab world in the event of the acceptance of the report by the United States and Britain.

Meanwhile the terrorist attacks in Palestine continued, taking almost every conceivable form. Attacks on airfields and radar stations, armouries and military posts, the wrecking of

railway lines and stations, road-mining, ship-mining by saboteur swimmers in Haifa harbour and bank holdups all bore witness to organization on a large, daring and ingenious scale, and were by general admission made possible chiefly by the active or passive support which the terrorists received from the great majority of the Jewish population. On July 22 *Irgun Zvai Leumi*, the military organization of the Revisionists, blew up part of the King David hotel in Jerusalem containing British military headquarters and the civil secretariat, 91 persons being killed and 45 injured.

In the summer the steady trickle of illegal immigrants, which had started to arrive soon after World War II, became a flood, 3,800 arriving in July alone according to British official figures. On Aug. 12 the British government decided "no longer to tolerate this attempt to force its hand in framing a new policy for Palestine" and began to send all new arrivals to camps in Cyprus.

On July 1 Herbert Morrison produced a plan for Palestine on the basis of which Britain would issue 100,000 certificates. He proposed that Palestine should be divided into an Arab province, a Jewish province, a district of Jerusalem and a district of the Negeb, over-all sovereignty remaining, however, in the hands of the high commissioner, who would be responsible for defense, foreign relations and customs and excise. The Jewish agency and the Arab higher committee both refused to discuss the "Morrison plan," and boycotted the Palestine conference which opened in London on Sept. 9. Pres. Harry S. Truman in a cable to Attlee on Oct. 4 rejected the British partition proposal which had been under discussion between Britain and the delegates of the Arab states at the conference, and urged the immediate issue of the certificates on the basis of the Jewish agency's counterproposal for the creation of "a viable Jewish state in control of its own immigration and economic policies in an adequate area of Palestine instead of the whole of Palestine."

Through the autumn discussions continued, however, between the Jewish agency and the British government. Important signs that agreement was being approached were the denouncing "without reservation" by the Zionist inner council of the terrorists on Oct. 29, accompanied by an appeal to the Jewish community to "isolate these groups and deny them all encouragement, sup-

port and assistance," and the release on Nov. 5 of eight leading members of the Jewish agency detained in the Latrun concentration camp from the previous June. This was the condition on which the agency leaders had said that they might be prepared to negotiate with Britain and participate in the London conference which had been temporarily broken off in October to enable delegates to attend the general assembly of the United Nations in New York. A definite decision was postponed, however, until after the World Zionist congress meeting at Basle in December had had the opportunity to discuss future Zionist policy. (S. J. HN.)

Education.—(1942-43): Arab public system maintained by the government: elementary schools 399, pupils 55,725; secondary schools 13, pupils 910. Jewish public schools (*Va'ad Leumi*) 488 (pupils: elementary 51,022; kindergarten 8,778; secondary 4,803, technical, etc., 1,188, training colleges 1,138); other Jewish schools 259, pupils 23,662. Non-government schools other than Jewish totalled 342 (pupils: Moslem schools, elementary 11,864 and secondary 303; Christian and other schools, elementary 16,389 and secondary 2,391). Hebrew university, Jerusalem (1941-42), teachers 132, students 657.

Banking and Finance.—Revenue (est. 1946-47) £P19,781,000; expenditure (est. 1946-47) £P20,484,000; public debt (March 31, 1943) £P3,600,000; notes in circulation (July 31, 1946) £P45,800,000; exchange rate (1946) £P1=£1 sterling=\$4.03.

Trade and Communication.—Overseas trade (merchandise) 1945: imports £P40,691,000; exports £P20,396,000. Roads, 1942: for all weather 1,590 mi., seasonal 950 mi.; railways, 1942: broad gauge 302 mi.; narrow gauge (Hejaz railway) 111 mi.; airways, 1942: passengers 6,740; mail 53 short tons; shipping 1943-44: entered Haifa, 827 (tonnage 2,186,333); motor vehicles, 1944: heavy commercial 2,838; light commercial 848; taxis 1,246; omnibuses 1,234; private cars 3,140; motor cycles 1,371; wireless receiving set licences (1944) 57,362; telephone subscribers (1940) 10,716.

Agriculture and Mineral Production.—Production, 1945 (in short tons): wheat 65,250; barley 83,894; durrah 41,788; maize 5,923; tobacco 861; potatoes 36,753; tomatoes 67,711; olive oil (1945-46) 11,942; grapes 41,110; fish 4,680; other products, value of exports: all fruit £P2,225,000 (oranges £P1,564,000, grapefruit £P503,000); wine (1944) £P42,872.

Palmyra Island: see PACIFIC ISLANDS, U.S.

Panamá. A republic of Central America adjoining South America. It is bisected by the Canal Zone, which is leased to the United States. Area: 28,575 sq.mi.; pop. (1940 census): 631,637 (not including the Canal Zone, which had a pop. of 51,827). The capital is Panamá city (111,893); other cities are Colón (44,393), David (9,222), Chitré (4,790), Santiago (4,253). Language: Spanish; religion: Roman Catholic. President in 1946: Dr. Enrique A. Jiménez (provisional).

History.—The year 1946 saw Panamá moving farther along the road to full nationalization of its resources. On Feb. 28 the constituent assembly adopted a new constitution (the country's third since independence in 1903), reconstituted itself as the legislative assembly and extended the term of the provisional president to Sept. 30, 1948. Pres. Jiménez declared that he would remain in office only as long as "necessity demands." The new constitution, approved March 1, opened the wholesale commerce of the nation to all citizens and foreigners but restricted the retail trade to nationals and registered aliens.

The government took over direct control of all gambling enterprises of the country in March, and on Nov. 2 congress passed an enabling act which permitted the executive department to purchase within five years all of the commercial electricity plants. The United States had returned 72 of the military and naval bases leased during the war by September and was preparing to relinquish 27 more. Negotiations with the Panaman government for the retention of other bases resulted in a flurry of opposition from ultranationalist elements.

Plans of the Liberal Renovation party to elect its leader, Francisco Arias Paredes, to the presidency in 1948 collapsed late in July when the standard-bearer died of a heart attack in Medellín, Colombia. In the same month, former president Arnulfo Arias, leader of the ultranationalists, was acquitted by the supreme court of charges that he instigated the abortive revolt in Colón in Dec. 1945. Arias was released after a seven-

month imprisonment without trial which was dramatized by his hunger strike and by a mass meeting in Panamá city protesting his incarceration. In September the National Revolutionary party was promoting his candidacy for the 1948 presidential campaign.

Public works during 1946 (chiefly construction on the national airport, filling in of the Colón swamps and building of schools throughout the republic) were impeded by shortages of materials. The private building boom continued, with permits for construction amounting to more than \$4,500,000 being granted during the first six months. Work on a new \$1,200,000 electrical power plant in Panamá city was begun in midyear. In September a 25-year contract was let to a foreign company for the exploration and production of oil in an area of approximately 17,900 ac. Owing to a budgetary deficit, amounting to 5,000,000 balboas in November, Panamá was unable to make its second annual contribution of 133,333 balboas to the U.N.R.R.A. In December the government reduced the salaries of public officials in the interests of further economy, Pres. Jiménez taking the most severe reduction, 25%.

Education.—In 1942 Panamá had 670 primary schools, with an enrolment of 74,039; 29 intermediate schools, enrolling 8,407; and a national university, with 857 students. The budget for the 1945-46 fiscal year allotted 5,140,000 balboas to public education.

Finance.—The monetary unit is the balboa, maintained at par with the U.S. dollar. The budget for the fiscal year 1946-47 estimated revenues and expenditures balancing at 38,178,303 balboas. Increased duties were voted on many imports, effective Jan. 1, 1947, to cover increased expenses. In 1945 the Panama canal supplied 37% of the national revenues. The outstanding external debt amounted to \$15,386,000 in 1946. On Oct. 11 the National bank was ordered to increase its capital to 2,000,000 balboas. Bank assets on Dec. 31, 1945, were 116,505,464 balboas; individual deposits, 74,275,932 balboas.

Trade and Resources.—Imports in 1945 were valued at 45,648,125 balboas (37,904,620 balboas in 1944) and exports amounted to 4,507,137 balboas (2,927,229 balboas in 1944). Imports were up 39% and exports rose 55% during the first half of 1946. The United States supplied 62% of the trade in 1945 and received 85%. Imports of cement were at a record high of 63,895 metric tons. Production of bananas (the leading export crop) increased 82% to 2,571,950 stems in 1945; abacá fibre rose 76% to 11,161,731 lb.; coconuts fell 52% to 6,595,515 units. Beer production (the leading manufacturing industry) amounted to 6,959,584 gal. in 1945.

Communication.—Railroads measured 396 mi. in 1942. In 1945 there were 1,097 mi. of transitable highways (399 mi. unimproved). The new national airport was expected to be ready for use late in 1947. Transfer of foreign shipping to Panamá registry (approximately 400 ships totalling 1,600,000 tons) raised the republic's world standing in merchant marine tonnage to fourth place in 1946. (See also CENTRAL AMERICA.)

Pan American Union. For the Pan American union the year 1946 was a period of transition and of adaptation to the changing international situation. The Inter-American Conference on Problems of War and Peace held at Mexico in 1945 provided for a reorganization of the Inter-American system and its central organ, the Pan American union. Some of the provisions were put into effect during 1946.

One of the principal changes in the organization of the Pan American union arising out of the conference of Mexico was that providing for the appointment of special ambassadors to serve on the governing board. Heretofore the board had been composed of the diplomatic representatives in Washington of the 20 Latin American countries and the secretary of state of the United States. The conference sought to make such appointments obligatory, but following an objection raised by a number of governments the designation of special ambassadors was left optional until the Bogotá, Colombia, conference. Special representatives were named by Argentina, Brazil, Colombia, Mexico, Peru, the United States and Uruguay. For a

PRESIDENT TRUMAN addressing the governing board of the Pan American union in Washington, D.C., on April 15, 1946

while Guatemala and Haiti also had special ambassadors, but at the end of the year both countries were represented by their Washington diplomatic representatives.

For the first time also the governing board put into practice the principle of rotation in the office of chairman, which heretofore had always been occupied by the U.S. secretary of state. For the year 1946 the ambassador of Brazil, Dr. Carlos Martins, was elected, thus becoming the first Latin American to hold the office. On his retirement from the board he was succeeded by the vice-chairman, Dr. Guillermo Sevilla Sacasa, ambassador of Nicaragua. At elections held on Nov. 6, 1946, the special ambassador of Colombia, Dr. Antonio Rocha, was elected chairman for 1947.

On Dec. 5, 1946, Dr. L. S. Rowe, director general of the Pan American union from 1920, died as the result of an automobile accident. In considering the procedure to be followed in electing a successor, the governing board decided to put into immediate operation the principle of the Mexico City resolution that a director general should not be succeeded by a person of the same nationality. Feb. 12, 1947, was the date set for the meeting of the board at which, by this decision, the first Latin American director of the Pan American union was to be chosen.

The Inter-American Economic and Social council, created by the Mexico City conference, completed its organization and began to function at the Pan American union during 1946. The Hon. Spruille Braden, assistant secretary of state of the United States, was elected first chairman of the council. On Nov. 7, 1946, the representative of Costa Rica, Dr. J. Rafael Oremano, was elected chairman for 1947.

The Ninth International Conference of American States had been originally scheduled for Dec. 1946, but on motion of the government of Colombia the governing board postponed the meeting for a year to Dec. 1947. In anticipation of the conference the board prepared a series of projects, including a basic convention on the organization of the Inter-American system, a declaration on the rights and duties of American states and proposals for the establishment of an Inter-American

Cultural council and a Council of Jurists.

Because of the unwillingness of the United States to sign a mutual defense pact with the government of Argentina, the Conference on the Maintenance of Continental Peace and Security, scheduled for Rio de Janeiro, Brazil, in April, had to be postponed for the second time. By the end of the year no new date had been set. The conference was expected to negotiate a permanent treaty of continental defense to replace the provisional Act of Chapultepec signed at Mexico in 1945.

In the matter of relations between the Inter-American system and the world organization the governing board at the meeting of Nov. 6 adopted a series of principles, declaring that inter-American agencies should establish the closest co-operative relations with similar world organizations, but that on entering into agreements with world organizations, inter-American agencies should maintain their identity and position as an integral part of the Inter-American system. (See also ARGENTINA; FASCISM; INTER-AMERICAN DEFENSE BOARD; UNITED NATIONS.) (W. Mr.)

Papen, Franz von (1879—), German statesman and diplomat, was born Oct. 29 in Werl, Germany. After attending military schools, he entered the army and was promoted to a captaincy in 1913. The following year (1914), he was appointed military attaché in the German embassy in Washington, where, with Capt. Richard Boy-Ed, the German naval attaché, he directed German espionage and sabotage activities. In 1915 the U.S. state department ordered the immediate recall of both attachés because of their "improper activities." Returning to Germany, Von Papen rejoined the army, but after the Armistice he became a member of the Prussian diet.

Field-Marshal Paul von Hindenburg named Von Papen chancellor in 1932, but the latter resigned in late 1932 and threw his political support to Hitler. On becoming chancellor of the first nazi cabinet, Jan. 30, 1933, Hitler named Von Papen as vice-chancellor.

Von Papen, however, resented nazi failure to consult with the conservatives and criticized the party in his celebrated Marburg speech in June 1934. Enraged, Hitler ordered his arrest.

Von Papen was subsequently released July 3, 1934, and became a special envoy to Austria. He encouraged Austrian nazis, arranged the Schuschnigg-Hitler conference, Feb. 12, 1938, in Berchtesgaden, and on March 10, 1938, the day before Hitler ordered the occupation of Austria, he returned to Berlin.

A year later (April 1939) Von Papen became ambassador to Turkey, holding this post until 1944 when Ankara severed diplomatic relations with the axis. Shortly afterward he returned to Berlin.

Toward the close of World War II, he was taken prisoner (April 10, 1945) by U.S. troops in the Ruhr and was indicted by the International Military tribunal at Nuernberg as a war criminal. The court stated there was no evidence showing that Von Papen had been a party to planning aggressive war and acquitted him Oct. 1, 1946.

Paper and Pulp Industry. The year 1946 was an incredible year insofar as the pulp and paper industry was concerned. For nearly every use of paper there was an insufficient supply and yet, by the end of the year the mills in the United States had produced more than 19,200,000 tons. Adding imports and subtracting exports, the total new supply for the year reached 22,415,000 tons.

The apparent shortage at the end of the year was about 4,000,000 tons. Some of this probably represented duplicate

orders and speculation. For the immediate future the prospects appeared bright. It was evident that during 1946 and 1947 about 2,500,000 tons of new papermaking capacity would come into operation. There were 21 machines installed in the period 1941-45. These increased tonnage by less than 500,000 tons per year. The new tonnage represented by the 54 machines which were to be built in 1946-48 would amount to about 2,000,000 more tons.

Canada.—The 1945 pulpwood cut of 7,500,000 cords was the largest in the industry's history. For 1946, 110% of this was required, with a shortage of labour caused by the withdrawal of prisoners of war. The gross value of products (\$398,-804,515) exceeded any previous year as did the net value (\$180,-401,885). The number of workers employed (39,996) and the power equipment in use (2,082,462 h.p.) reached new peaks. This marked the sixth consecutive year of record breaking increases. The volume of pulp and paper manufactured in 1945 was higher than the previous year, but slightly lower than the record production of 1941.

United Kingdom.—Statistics relating to Great Britain production were not available at the close of 1946. Following the end of the war, limited increases in woodpulp and paper imports helped the local consumption situation a little. Newspapers, for example, were permitted to add two pages to their four-page format. Imported woodpulp replaced some old papers and resulted in brighter paper. Considerable progress was made in the manufacture of containers and packaging material. Shortage of fuel was one of the principal deterrents that retarded paper production.

Papua: see BRITISH EMPIRE; NEW GUINEA; PACIFIC ISLANDS, BRITISH.

Paraguay. A landlocked republic in south-central South America. Area 154,165 sq.mi.: pop. 1,108,040. Racially the people are a homogeneous blend of Spanish, Portuguese and Italian stocks, with a good deal of Guaraní Indian blood discernible especially in the remote thinly populated regions. Official language: Spanish. The Guaraní tongue has survived more than the blood but is secondary and recessive. Capital and chief centre, Asunción, pop. (1945) 172,400. Other cities: Villarrica 30,176, Concepción 16,007, Encarnación 15,610. Official religion: Roman Catholic. President in 1946: Gen. (Marshal) Higinio Morínigo.

History.—As 1946 opened Paraguay adhered to the Bretton Woods agreements, and in the summer signed a recipro-

cal trade agreement with the United States. In June 1946 the president dismissed his quasi-fascist army leader Col. Benitez Vera and was able to suppress the consequent rebellion. In July he granted wide political amnesties, freedom of the press and resumption of political activity. A predominantly civilian cabinet of Colorado and Franquista (Febrerista) members was formed, and in August the Communist party was given legal standing. In September a call was issued for free national elections to be held in December to choose a constitutional assembly. Agitation arising from the return of different exiled politicians resulted in temporary curtailment of political privileges for one party or another at times, and anti-Communist demonstrations took violent forms.

Education.—In 1946 the 2,000 elementary schools had about 65,000 pupils, and there were 6 agricultural (secondary) schools. National normal schools and a national (junior) college were maintained; and the National university at Asunción, founded in 1888, had 1,300 students in 11 faculties.

Defense.—Paraguay's strategic situation beside the frontiers between the two great rival powers of South America, coupled with its conspicuous reputation for military prowess in the two leading wars of South America, give importance to its army of 8,000 men and its policy of universal 2-year military training for all males. As the Paraguay river is the country's life line, a fairly modern navy of about 1,400 men was maintained. About 50% of the national revenue was devoted to defense.

Finance.—The unit of Paraguayan currency is the guarani which in 1946 was continued stable at 32.4 U.S. cents. National expenditures in 1944 were \$9,500,000, and they later increased with indications of a budgetary surplus. Revenue collections in 1946 showed strong increases, with internal imposts promising to reach \$4,000,000 for the year and customs duties nearly as much. At the beginning of 1945 the national debt was \$22,000,000, and it gradually rose as Paraguay availed itself of credits opened by Brazil and the United States—about \$6,000,000 from each. Note circulation increased in 1946 by \$1,000,000 to a total of \$10,000,000. The government also eliminated the last "free-market" transactions in foreign exchange, so that it controlled all foreign currency inward or outward in connection with exports, imports and investments. Interest rates were high, about 8%.

Trade and Communication.—The value of Paraguayan exports in 1945 was \$23,000,000, an increase of \$9,000,000 over 1944. The leading exports in 1945 were canned meat \$4,300,000, quebracho tannic extract \$3,700,000, forest products \$3,650,000, cotton \$3,600,000, hides \$2,900,000, tobacco \$1,250,000 and petitgrain (a perfume base from bitter orange leaves) \$735,000. Also important were yerba maté (Paraguay tea, a holly), meat extract, wild animal skins and vegetable oils. The latter included castor oil, cottonseed oil and peanut oil. The United Kingdom is Paraguay's leading customer, with Argentina second and the United States third. Uruguay took hides and yerba maté in good quantities. Invoice data for 1946 indicated that shipments to the United States had fallen greatly because canned meat for army use was deflected to the United Kingdom and quebracho tanning extract was yielding to other agents. Paraguay's imports in 1944 were \$13,000,000, but they later increased. They consisted of textiles, foodstuffs, manufactures of metals, vehicles and boats, mineral oil, machinery, paints, soap and chemicals. The leading supplier was Argentina, with Brazil, United States, Uruguay, United Kingdom and Peru following in order.

The (Argentine) Dodero line of river steamers connected Asunción with Buenos Aires. A Brazilian subsidized line operated via Montevideo and Asunción to Corumbá (Brazil) on the upper Paraguay. The Paraguayan government organized a

national merchant marine. The standard-gauge Central railway of Paraguay (British) runs from Asunción southeast through the best farm and forest area to join the Argentine railways by car ferry at Encarnación-Posadas, 290 mi. A Brazilian branch railway to connect northeast Paraguay with São Paulo, Brazil, via Campo Grande was nearing completion in 1946. More than 300 mi. of paved roads were built with aid from the Export-Import bank at Washington and aided Paraguay's commerce with Argentina, but the projected Estigarribia highway to permit intercourse with Brazil remained dormant at the end of the year. Pan American World Airways had through north-and-south planes serving Asunción weekly, and Panair do Brasil had two round trips to Rio de Janeiro. An Argentine hydroplane line followed the river to Buenos Aires and returned three times weekly. The number of telephones in Paraguay was less than 4,000 in 1945. The telegraph system had about 200 offices throughout the country and a line to Buenos Aires. There were 5 radio stations and 16,000 receiving sets.

Agriculture.—The 1946 sugar cane crop was estimated at 17,000 tons, permitting some export. The small farmer as distinguished from the cattle rancher depended on cotton for cash, and the 1946 crop attained bumper proportions, probably about 50,000 tons. Extensive agricultural experimentation and collaboration was carried out by United States and Brazilian experts.

Manufactures.—The principal industrial products are derived from the farm and forest, the 1944-45 figures being canned meat 19,000 tons, quebracho tanning extract 50,000 tons, ground yerba maté 16,500 tons, vegetable oils 6,000 tons, with lesser quantities of sugar rum and prepared tobacco. Certain common manufactures are likewise produced to some extent; such as soap 4,000 tons, textiles (mainly cotton, with some wool and silk) 1,200 tons, beer and malt, chemical products, glass containers, matches, footwear, furniture, etc.

Mines and Forests.—The Union Oil Co. of California carried its exploratory developments in the Chaco almost to conclusion in 1946 but the results were not public. While sawmills and plywood manufacture were increasingly active, most of the wood was floated down the Paraná river to Argentina as logs or squared timber. The value of exports in 1945 was \$3,500,000. (W. Fr.)

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers, the P.T.A., was founded in 1897 as the National Congress of Mothers. In 1946, its membership was nearly 4,000,000 parents, teachers and other interested persons, of whom more than 1,000,000 were men. These members were organized into 27,000 local parent-teacher associations, functioning in each of the 48 states, the District of Columbia and Hawaii.

The P.T.A. recognizes no social, economic, political, cultural or religious distinctions among its membership. Anyone can join who is concerned with the best interests of children and pledges himself to promote their welfare.

In the fall of 1946 the national officers of the organization selected four areas for major emphasis during the years 1946-49. This four-point program includes *school education*, *health*, *world understanding* and *parent and family life education*.

As one means of improving the public schools, parent-teacher members worked for the enactment of a measure providing federal aid for education. They were also making a united effort to alleviate the critical shortage of teachers, and to this end many state congresses were establishing scholarship funds for young people who planned to enter the teaching profession.

During the summer and autumn months of 1946 one of the best known among parent-teacher health projects was carried

on by local associations—the summer round-up of the children, an annual medical checkup of children entering school for the first time. As in other years, P.T.A.s also gave support to another major project in the program—the sponsoring of school lunches in order that pupils might have the benefits of a hot meal during the noon hour at school. Safety education, long a part of the parent-teacher work, received special emphasis in 1946, and juvenile protection was also stressed as a means of reducing the alarming delinquency statistics of today.

The National congress for many years conducted a program of parent and family life education. Directed toward strengthening the stability of U.S. homes, this type of education became increasingly important during the transition from military victory to an enduring peace. To maintain a well-informed membership, the National congress conducted an extensive publications program of books, leaflets, pamphlets and other informational material. Particularly significant in 1946 were the *National Parent-Teacher*, official P.T.A. magazine, and a monthly newsheet, the *National Congress Bulletin*. Other publications were *The Preschool Age—A Period of Promise*, an aid to parents of small children; *Looking Toward Tomorrow's Education*, published jointly by the National congress and the National Education association; and *How To Stay Alive as Long as You Live*, a collection of essays for the personal enrichment of adults. During 1946 the National congress again sponsored *The Baxters*, a weekly radio program presented in co-operation with the National Broadcasting company for 52 weeks.

The National congress also extended its interest to community betterment and international affairs, because it believed that the welfare of children and youth is, in the last analysis, dependent upon world understanding and good will. Accordingly, in 1946 parent-teacher units sought to acquaint their members and other interested adults with the structure and purpose of the United Nations organization.

The office of the National Congress of Parents and Teachers was in 1946 at 600 S. Michigan Blvd., Chicago 5, Ill.

(M. W. H.)

Paris. Capital and largest city of France, pop. (1936) 2,829,746; of greater Paris, including the belt of suburban factory towns, 4,962,967.

The year 1946 witnessed important improvements in the recovery of Paris. During the summer the food situation showed definite signs of amelioration. The rationing system was not too rigidly enforced and though the prices for unrationed food were very high, the better class restaurants were well stocked with meat, though pastry was still rare as a result of the shortage in sugar and white flour. Life in Paris was less bare and austere than life in London, especially for those circles who could afford it. The greatest discomfort was caused by the severe shortage of fuel during the winter months.

The transportation system of Paris also improved considerably during the year. The Paris subways, the metro, were not more crowded than in usual rush hours; more and more bus lines were put back into service and even some new buses were to be seen; the number of taxis increased and by the end of the year the streets of Paris offered again the familiar spectacle of traffic jams and of daring dashing drivers.

Communications out of Paris were improved and extended. Commercial air traffic with all parts of the world was resumed on a large scale and Air France, the French air navigation company, opened its regular service with New York in July 1946. In addition to the prewar airport of Le Bourget, a second great modern airport, that of Orly, served as terminal for the international air routes. A central departure station for air lines was opened in Paris at the Gare des Invalides.

Though tourist travel, for the first time after 1939, reap-

VIEW of the Place de la Concorde in Paris before the balloon race, an important event of the annual Easter Sunday celebration, which was revived in 1946

peared in 1946, the number of overseas visitors was still far below the average of prewar years. On the other hand, Paris retained its international character as the meeting place of the Council of Foreign Ministers of the Big Four and even more so as the seat of the Peace conference of 21 nations, whose delegates met in the Palais du Luxembourg in the late summer of 1946 to advise about the peace treaties with Italy, Hungary, Rumania, Bulgaria and Finland.

The artistic and theatrical life of Paris regained some of its prewar brilliancy during 1946. American plays like Steinbeck's *Of Mice and Men* and Kaufman's *You Can't Take It With You* won wide acclaim on the French stage, and translations of U.S. and British authors filled the show windows of the numerous book shops in the French capital. The number of daily papers, weeklies and monthly reviews was astonishingly great to a British or American visitor. Among daily papers some of the famous names of prewar times like *Le Temps* and *Le Matin* were no longer visible. Among the morning papers the new *Combat* and the old *Figaro* held a prominent place, in addition to party organs like *L'Aube*, *Le Populaire* and *L'Humanité*, while in the evening *Le Monde* replaced *Le Temps*.

As the result of the efforts of a woman member of the Paris city council, all the legalized houses of prostitution in Paris were closed. The last of these establishments disappeared in Oct. 1946. Some of their premises had been sumptuous apartments and houses, and these were taken over to combat the great housing shortage of which Paris, though practically untouched by the devastations of war, suffered like all other postwar cities.

Paris Peace Conference. The first step toward calling a conference to consider the treaties of peace with Italy, Rumania, Bulgaria, Hungary and Finland was taken by the three-power conference at Potsdam (July 1945). As armistices were concluded with the

lesser axis states, in each instance by the two or three great powers concerned, numerous protests directed against the denial to other United Nations' governments of a voice in these decisions had been met with assurances that the latter would be consulted in the making of peace. The Council of Foreign Ministers, which was charged with the drafting of the treaties, was, therefore, empowered at Potsdam to convoke a conference of "the states chiefly concerned." The failure of the Potsdam conference to make more specific provision for a peace conference was widely remarked at the time.

During the controversy in the Council of Ministers (Sept. 1945) over the procedure of treaty-drafting, U.S. Sec. of State James Byrnes proposed that the provisions concerning the membership and competence of the future conference be stated more fully in order to avoid a later repetition of these procedural difficulties. His proposal, rejected at London by the soviet delegation, was approved at the Moscow "Big Three" conference (Dec. 1945) and received the assent of China and France. The conference, which was to meet at Paris on May 1, 1946, was to include the members of the council, the European Allies, the British dominions and India, Brazil and Ethiopia, as well as the Ukrainian and Byelorussian Soviet Republics. The conference was to have the right to make recommendations concerning the treaties, but the final decision would remain with the Council of Ministers. In contrast with the traditional concept of a peace conference composed of all Allied belligerents, each theoretically an equal member, the Moscow provisions constituted a frank recognition of the consultative and recommendatory role of the lesser Allied states. In Jan. 1946 an exchange of letters between Georges Bidault and Byrnes made it clear, however, that within these limitations the conference would be free to make recommendations on all matters relating to the treaties, whether included in the prepared drafts or not.

As disagreements within the Council of Ministers continued into May and June, including the disagreement on fixing a new date for the conference, some consideration was given to alternative procedures. It was suggested in Byrnes's radio address of May 20 that the council's continuing inability to agree on draft treaties might be brought before the general assembly of the United Nations, while Ernest Bevin hinted at the possible necessity of concluding a separate treaty, at least with Italy. In the original plans for treaty-making it had not been specified whether the council would present its drafts in completely, or in only partially, agreed form, and for many weeks the soviet delegation appeared determined to postpone the conference until complete drafts had been negotiated in the council. Eventually, after several of the major issues had been resolved or postponed, the council, on July 4, agreed to call the conference of the 21 nations for July 29.

This decision was followed by disputes over the rules of procedure. At first the soviet delegation argued that formal invitations could not be sent until the council had agreed on a mandatory set of rules, acceptance of which would, in effect, be a condition for admission to the conference. The four ministers finally agreed to recommend to the conference an agreed draft of rules and pledged themselves to vote for its adoption. The U.S. and British delegations made it plain that they intended to respect the customary right of a conference to decide by majority vote on its rules and organization. The proposed rules provided for the adoption of substantive recommendations by a two-thirds majority, of procedural decisions by a simple majority, of the conference.

In a discussion of the organization of the conference the soviet delegation proposed to concentrate the principal work in five commissions, one for each treaty, each to consist of representatives of those states which had "actively waged war"

against the former enemy state concerned. This meant that Ukraine and Byelorussia would be members of all five commissions, France of the Italian one and one Allied state, Norway, of none. The other delegations regarded these proposed limitations as inconsistent with the Moscow agreement of Dec. 1945 and the Byrnes-Bidault exchange of Jan. 1946. The council agreed to recommend to the conference the establishment of five political commissions, one for each treaty, and two economic commissions, one for the Italian and one for the Balkan and Finnish treaties, a military commission, a legal and drafting commission and a general commission; France was to be a member of each commission. In this form the draft rules were circulated to the 17 governments invited to the conference.

At the first session of the conference, on July 29, a protest against "great-power dictation" was raised by the Australian delegate, H. V. Evatt, who urged the right of the conference to adopt recommendations by a simple majority. In turn the Netherlands delegation proposed that all delegations be represented on each of the commissions, while the soviet delegation, supported by Ukraine, Byelorussia, Poland, Czechoslovakia and Yugoslavia, tried again to confine effective discussion to the commissions, assigning a largely formal role to the plenary sessions. After many days of debate and recrimination the conference adopted, with certain significant concessions to the views of the smaller Allies, the rules recommended by the Council of Ministers. By a vote of the other delegations against the soviet-led bloc the conference decided that the final recommendations would be those of the plenary conference, not of the separate commissions, and that the conference could adopt recommendations either by a two-thirds majority or by a simple majority. During the discussions of procedure Byrnes and Bevin had stated that recommendations supported by a two-thirds majority would carry great weight for them in the subsequent decisions of the council; Byrnes alone of the Big Four ministers offered to support in the council recommendations of

THE PARIS PEACE CONFERENCE, where representatives of 21 nations met in Luxembourg palace from July to October 1946

PARIS PEACE CONFERENCE

(1946)

SCALE OF MILES
0 50 100 200 300 400

TERRITORIAL ISSUES

FINLAND

- 1A Pechenga (Petsamo) area returned to U.S.S.R.
- 1B U.S.S.R. obtains 50-year lease on Porkkala.
- 1C U.S.S.R. renounces lease on Hangö (Hanko).
- 1D Åland Islands to remain demilitarized.

ITALY

- 2A Five small areas, Little St. Bernard Pass, Mont Cenis Plateau, Mont Thabor, Chaberton and Tenda-Briga ceded to France.
- 2B Austrian claim to South Tyrol rejected.
- 2C French claim to Valle d' Aosta rejected.
- 2D Free Territory of Trieste to be under U.N. supervision.
- 2E Greater part of Venezia Giulia ceded to Yugoslavia.
- 2F Zara ceded to Yugoslavia.
- 2G Adriatic Islands ceded to Yugoslavia. Pelagosa to remain demilitarized.
- 2H Italy to recognize Albanian independence.
- 2J Italy renounces claim to Saseo Island.
- 2K Dodecanese ceded to Greece and to be demilitarized.

HUNGARY

- 3A Hungary cedes trans-Danubian enclave near Rajka to Czechoslovakia.
- 3B Hungary returns Northern Transylvania to Rumania.

RUMANIA

- 4A Cession of Northern Bukovina and Bessarabia to U.S.S.R. confirmed.
- 4B Cession of Southern Dobruja to Bulgaria confirmed.

BULGARIA

- 5A Greek claim to Northeastern Macedonia rejected.
- 5B Bulgarian claim to Western Thrace rejected.
- 6A Greek claim on Albania to Northern Epirus (No decision by Big Four).
- 6B Big Four agree on freedom of trade and navigation on the Danube.

Italy renounces all claim to her former African colonies (not shown on this map). Their final disposition will be determined by the Big Four within one year after the Peace Treaty comes into force.

C.S. HAMMOND & Co., N.Y.

this category even if they ran counter to the previous positions of the U.S. delegation.

Further controversies arose over the requests of other governments to be admitted to the conference with strong support given by the soviet bloc to Albania's request. On Aug. 12 the conference agreed to give hearings to Albania, Egypt, Mexico and Cuba; a similar privilege was extended to Austria and Iran by a decision of Aug. 17. The defeated nations received full-dress hearings in the plenary sessions and, by invitation of the commissions, participated in a number of their meetings without actually being admitted to negotiate around the table.

The commissions established by the conference carried through a great amount of work between Aug. 19 and Oct. 5, the latter date having been set on Sept. 12 for the submission of their reports to the conference. As the weeks wore by and

much ground remained to be covered, the conference adopted more stringent rules limiting both the length of speeches and the number of interventions on each item of the agenda.

None of the major compromises which had been negotiated in the Council of Ministers was reversed by the recommendations of the conference, the Big Four having agreed in early July to support these parts of the settlements, but, as a result of detailed and earnest discussions, many revisions of the agreed provisions were recommended. Among other matters the conference approved the proposed modifications in the Franco-Italian frontier, as well as the economic guarantees which France had offered to Italy. After hearing representatives of Italy and Austria the conference approved the retention of the prewar frontier between the two states, taking note of the Italo-Austrian agreement of Sept. 5, 1946, which provided economic

and cultural guarantees for the population of the Alto Adige, or South Tyrol. The cession of Saseno to Albania and of the Dodecanese Islands to Greece was approved. After long and vehement discussions the conference also confirmed the French line as Yugoslavia's western boundary and approved a French compromise concerning the future organization of the Free Territory of Trieste, both by a two-thirds majority. The Yugoslav delegation expressed its resentment of these recommendations in a letter of Oct. 15 in which it threatened to refuse to sign the treaty in view of the rejection of Yugoslav national demands.

The conference recommended the transfer to Czechoslovakia of 56 sq.mi. of Hungarian territory south of the Danube, as a bridgehead for Bratislava; obviously, possession of riparian rights on both banks would strengthen the Czechoslovak position in any future decision concerning the navigation of the Danube. The conference urged direct negotiation of a solution of the status of the Magyar minority in Czechoslovakia but left the way open for the latter to appeal to the Council of Ministers to find a solution. Despite Greek demands for important changes in the Bulgarian boundary, demands which received mild support from the British delegation, the conference recommended no change. The transfer of the southern Dobruja to Bulgaria was confirmed, as was the retention of the pre-1940 Rumanian-Hungarian boundary. The Rumanian and Finnish treaties reaffirmed the boundaries with the soviet union as established in 1940.

Over opposition of the soviet bloc the conference recommended inclusion in the Italian treaty of a provision denying the benefits of the treaty to any state which failed to ratify it; this was a safeguard against Italy's and Yugoslavia's threats to refuse ratification of the treaty. In the hotly disputed question of the interpretation of the treaties the conference supported by a two-thirds majority the contention of the western powers that either party to a dispute should be free, eventually, to request the appointment of an umpire by the president of the International Court of Justice.

By a two-thirds majority the conference recommended that \$25,000,000 in Italian reparations go to Ethiopia, \$100,000,000 to Greece and that Greece and Yugoslavia receive an equal amount of reparations from all sources combined. By a simple majority it voted that Bulgaria pay \$125,000,000 in reparations to Yugoslavia and Greece. The contentions of the Slav bloc that Yugoslavia receive double the reparations assigned to Greece, that Bulgaria be exempted from payment of reparations and that Albania receive reparations, were rejected by a majority of the conference. There was no change in the provisions for Rumanian, Hungarian and Finnish reparations deliveries to the soviet union, as fixed in the respective armistices, but the U.S. delegation presented a detailed exposition of the various devices by which the soviet authorities had extracted deliveries far greater than those stipulated in the Rumanian armistice, and, on the basis of reservations made at the signature of the armistices, it moved, without success, to reduce by one-third the reparations due from Finland and Hungary. A simple majority supported the British and French proposal that compensation in local currencies be paid up to 75% of the damage suffered by United Nations' property in the former enemy countries, as against the U.S. proposal limiting compensation to one-fourth or one-third of the value of the damage.

Few changes of significance were recommended in the military clauses. Possession by Bulgaria, Rumania or Finland of motor torpedo-boats was disapproved by a two-thirds majority while a simple majority voted for the prohibition of new fortifications on the Bulgarian side of the frontier with Greece. On Aug. 30 the Greek claim to Albanian territory was placed on the agenda, over strong opposition of the soviet bloc, only to be

"THE OBSERVER." Reg Manning of the *Arizona Republic* registered apprehension at the fear of war which seemed to hover over the peace conference in 1946

withdrawn shortly thereafter by the Greek delegation.

The atmosphere of the conference was often affected by events outside the walls of the Luxembourg palace. The crisis over the Yugoslav shooting down of U.S. planes, the plebiscite in Greece and the return of the king, the Ukrainian charges against the Greek government in the Security council, discussions of "atomic diplomacy," Henry Wallace's attack on Secretary Byrnes's policy exerted their pull on the work and groupings of the conference, while the world outside watched the demonstration within the conference of the serious divergences in the aims and methods of the great powers. These stresses were evident in the bloc-voting which made itself felt from the first discussions. The bludgeoning tactics of the soviet-led bloc, its attacks on the motives of other delegations and the evident control exerted over delegations of former enemy states tended to discourage efforts to bridge over divergences which the conference had not created but had brought into sharp focus.

The innovations of public deliberations and public voting on the innumerable recommendations were condemned by some observers as undesirable departures from the traditional conference objective of negotiating unanimous agreements. In fact, it was not in the power of the conference to bring about agreement among the four powers which had, in advance, reserved to themselves the final drafting of the treaties. The conference had enabled the Allied governments to state their views fully, and many of its recommendations were later incorporated into the treaties. If the conference had, in the process, become an arena for airing conflicting claims and philosophies, this had to be accepted as a stage in clarifying the new conditions under which the peace which had been won had currently to be consolidated.

(P. E. M.)

Parks and Monuments: see NATIONAL PARKS AND MONUMENTS.

Parliament, Houses of. No modern British parliament had attempted so all-embracing

a legislative program as that formed by Clement Attlee, first Labour premier, with a majority over all other parties in combination. Opened on Aug. 15, 1945, as the 38th parliament of the United Kingdom, it had passed into law some 80 bills before its first session ended in Nov. 1946. The list included two finance bills (budgets); measures to nationalize the Bank of England, the coalmining industry, the cable and wireless industry (so far as it operated within the British jurisdiction) and British Overseas airways; a national health bill, which assumed control of all hospitals and medical services; a much-enlarged national insurance bill; a bill for the controlled creation of satellite towns; the comprehensive education bill, left over by the coalition government, and a bill for the control of atomic energy. As fiercely fought as any of its acts was a single-clause measure repealing without qualification the Trades Disputes act passed by the Conservative government in 1927. To facilitate the dispatch of business the government availed themselves of a standing order, previously only sparingly used. Under it the great majority of bills were remitted, after second reading, to standing committees, more than one of which could sit simultaneously. Reserved for committee of the whole house were only financial measures and "single clause bills requiring no detailed consideration." The single bill so scheduled by the government was the Trades Union bill. New sessional orders increased the number of standing committees from a maximum of five to "as many as may be necessary" and reduced their membership to 50 with a quorum of 15. Parliament was prorogued on Nov. 6 and the new session was opened in semi-state on Nov. 12 by the king.

Following report by a select committee, the house of commons increased the payment of its members from £600 to £1,000 annually, with adjustments in expenses allowances to ministers salaried under £5,000.

By-elections in the year increased the Conservative opposition strength by three to a total of 201 out of 640 members. One of these gains, however, was of a seat held previously by an Independent Unionist in Ulster and the others, the English universities seat and the Scottish universities seat, both formerly held by Independents. The solitary Commonwealth party member in the house decided to join the Labour party, so increasing the government numbers by one to 394. The Independent Labour party lost one of its three members in November to the Independents.

In cabinet structure an important change was announced on Oct. 5. Places of the three service members in the cabinet were filled by a single minister of defense, a post to which A.V. Alexander was advanced from the admiralty. Jack Lawson (war secretary) and Lord Stansgate (air minister) resigned on health grounds. George Hall, created a viscount, became first lord of the admiralty; Frederick Bellenger war secretary; and Philip Noel-Baker (previously minister of state) air secretary. These three ministers were still members of the Imperial Defense committee over which Mr. Alexander presided. Arthur Creech Jones, succeeding George Hall as colonial secretary, was given cabinet membership, so that the net result of the changes reduced the cabinet strength by only one to 19. Lord Winster left the ministry of civil aviation to become governor of Cyprus and his office went to Lord Nathan. New entrants to the ministry as under-secretaries were Major C.P. Mayhew (foreign office) Major John Freeman (financial secretary, war office) and Thomas Steel (national insurance). All three first entered parliament at the general election, 1945. An earlier change brought John Strachey as minister of food in succession to Sir Ben Smith who resigned in June 1946. Twenty-four new peers (7 viscounts, 17 barons) were created during the year. The viscounts included Admiral Lord Louis Mountbatten and Field

Marshals Alexander and Montgomery. Among the barons were Air Marshal Tedder, Admirals Frazer and Tovey and Sir William Beveridge, on whose report the National Insurance act was based. Viscount Hall, Lord Citrine (formerly secretary to the Trade Union congress) and Lord Shepherd (formerly chief party agent) were recruits to Labour strength in the upper house, but two of the 18 peers who died during the year (Viscount Southwood and Lord Keynes) sat with the government party.

(See also CABINET MEMBERS; GOVERNMENT DEPARTMENTS AND BUREAUS.) (L. DU.)

Parodi, Alexandre (1901—), French government official, was born June 1, in Paris. He studied law, and became master of appeals in the French Council of State and later secretary general of the National Economic council; in 1938 he was named director general of the ministry of labour. During the German occupation, he was active in the underground. He was president of the underground press commission, and one of the guiding spirits of the Paris insurrection in Aug. 1944. As minister of labour and social security in Gen. Charles de Gaulle's provisional government (Sept. 1944–Nov. 1945), he overhauled the social security system, introduced labour-management committees and permitted a "cautious" increase in salaries. In December, he was appointed ambassador to Rome where he also served as delegate to the Allied Advisory council. Parodi was named permanent delegate (April 12, 1946) to the United Nations Security council, replacing Henri Bonnet. On May 17, he became president of the council under the rotation plan. He supported Dr. Oscar Lange's proposal that the U.N. member states break off diplomatic relations with Spain on grounds that the Franco regime was a threat to world peace, but sided with the U.S. and Britain in discussions on Greece and on atomic energy.

Parrado y Garcia, Augustin, CARDINAL (1872–1946), archbishop of Granada, was born on Oct. 5 at Fuentes de Saldana, in Valladolid province, Spain, and was ordained in 1895. He taught at Valladolid seminary, became vice rector and in 1925 was named Bishop of Palencia and consecrated in the Salamanca cathedral. Nine years later, he was consecrated Archbishop of Granada and in Feb. 1946 was created a cardinal. The following April, in an article for an official ecclesiastical publication, he wrote: "Spain's enemies wish to annihilate us, and to do this they wish first to destroy our Catholic and openly anti-Communist state." He urged his people to be on the alert against international plotters who sought to overthrow the Franco regime and then Spanish Catholicism. He died at the Granada Cardinal's palace on Oct. 8.

Patents. In 1946 the U.S. patent office received a larger number of applications for the registration of trademarks than in any previous year. Their aggregate, including 6,658 applications for renewals, was 27,739. In the same period there were registered 8,116 trade-marks.

Applications for patents filed in the calendar year 1946 were 91,994, the greatest number after 1930. Of these, 10,720 were for designs. There were issued 24,775 patents in 1946, including 2,779 for designs, 56 for plants and 121 for re-issues. This was the smallest number granted in any 12 months from 1900.

Receipts of the office from Dec. 1, 1945, to Nov. 30, 1946, were \$4,781,773.24, compared with \$4,098,795.41 in the preceding equivalent 12 months. In the corresponding period the expenditures were \$7,353,684.26, an increase of \$2,364,615.83.

Included in the register of patents in 1946 were 4,536 offered by their owners for licensing or sale to others, including hundreds offered by large corporations. A booklet entitled *Dedicated Patents* designed to inform the public of the numbers and titles of 434 patents covering inventions which are available for free use, was published and circulated.

On July 5, 1946, the price of each printed copy of a patent was raised to 25 cents. The number of copies supplied to others than libraries, federal agencies and foreign governments was 3,849,807. The free exchange of patent copies with foreign governments, interrupted during World War II, was resumed and the task of furnishing the omitted copies was begun.

In July 1946 an accord was entered into at London by the United States, Great Britain, France and the Netherlands for the free use by the nationals of all signatory nations of the patents seized from German owners during World War II. Late in 1946 several other nations joined the accord and it became effective throughout a large part of the world.

(C. W. O.)

Patterson, Joseph Medill (1879–1946), U.S. publisher and editor, was born on Jan. 6 in Chicago, the son of Robert W. and Eleanor Medill Patterson. He interrupted his studies at Yale university to cover the Boxer Rebellion in China as a war correspondent and later returned to the university, graduating in 1901. Shortly after leaving school, he joined the staff of the *Chicago Tribune*; Patterson and his cousin, Col. Robert R. McCormick, later fell heir to the controlling majority of shares of that newspaper. In 1903, Patterson entered the Illinois political arena and was elected to the state legislature.

At the outbreak of World War I, he became one of the *Tribune's* correspondents on the western front. He returned to the United States in 1916, went to Mexico during the Pershing expedition as a private and was commissioned as a lieutenant in April 1917.

After he was mustered out of the service, he started the *New York Daily News*, a tabloid, in 1919. He soon discovered that sex and crime news, liberally illustrated with photographs, sold newspapers, and the circulation climbed steadily. In 1925 Patterson, who had been co-editor of the *Chicago Tribune* with Col. McCormick, broke permanently with the latter and went to New York to assume full charge of the tabloid.

The stock market crash of 1929 led him to shift the emphasis of his paper from sensationalism to social reform, and in 1933 it was an ardent supporter of Franklin D. Roosevelt and the New Deal administration. Patterson, however, broke with Roosevelt over the issue of U.S. intervention in World War II. Meanwhile the *New York Daily News* grew by such enormous leaps and bounds that by 1945 its daily circulation reached 2,250,000 and its Sunday circulation 4,500,000.

Patterson died in New York city on May 26.

Patterson, Robert Porter (1891–), U.S. government official, was born Feb. 12 in Glen Falls, N.Y. He was graduated from Union college, 1912, took his law degree from Harvard, 1915, and practised law in New York city. He saw military action in the Mexican campaign, 1916, and in World War I, during which he rose to the rank of major and was awarded the D.S.C. Patterson was appointed judge of the U.S. district court for the southern New York district, 1930, and became judge of the U.S. circuit court of appeals, 1939. He resigned his seat on the bench in July 1940 to accept an appointment as assistant secretary of war and five months later became undersecretary of war. Following Stimson's resignation, Sept. 18, 1945, Pres. Truman named Patterson as his successor as secretary of war. Throughout 1946,

Patterson pleaded for a strong army, extension of the draft and unification of the armed services. During the senate's war profits inquiry, he admitted (July 9) that Chairman Andrew J. May of the house military affairs committee had sought three favours from him for the Garsson munitions combine; Patterson said he granted two of May's requests.

Peanuts. The 1946 peanut crop in the U.S. was the fifth consecutive year of production exceeding 2,000,000,000 lb. The 1946 crop was 2,075,880,000 lb. compared with 2,042,235,000 lb. in 1945. The 5-yr. average during World War II was 2,009,097,000 lb. This was about 50% more than the prewar average. The 3,168,000 ac. harvested in 1946 was about 2% less than 1945 but compared with 2,243,000 ac. average for 1935–44. The yield was less than the average being estimated at 646 lb. per acre compared with the 10-yr. average of 738 lb. Harvesting was delayed by September rains in the southeastern area and there was heavy insect damage. Larger crops were harvested in Virginia where the high yield of 1,200 lb. per acre was reported. The lower production in Florida, Alabama and Mississippi brought down the total crop, although Texas and Oklahoma had excellent returns.

The price of peanuts held steady through 1945 at about \$8.20 per 100-lb. but advanced during the first half of 1946 to an average of \$8.90 and then declined slightly toward the end of the year. Peanut products other than oil were removed from control Sept. 1, 1946, as not being in short supply. Prices to farmers of 1946 crop peanuts were supported at \$172 per ton which was about \$8 more than 1945 prices. Consumption of peanuts and products were at a high level through to 1945 at 6.3 lb. per capita compared with a prewar average of 4.6 lb. in 1937–41. Peanut butter was in demand as substitute for butter and meat. Peanut candies were required to take the place of those based on chocolate. The United States department of

Pearl Harbor Inquiries. At 7:55 A.M. on Sunday morning, Dec. 7, 1941, more than 300 Japanese planes, launched from 6 aircraft carriers, attacked without warning the island of Oahu and the U.S. Pacific fleet at Pearl Harbor in the territory of Hawaii. Within a short period of less than two hours U.S. military and naval forces suffered a total of 3,481 casualties, including 2,326 killed, fatally wounded and missing, and the loss of or severe damage to: 219 planes of all types, 8 battleships of which 3 were sunk and 1 capsized, 3 light cruisers, 3 destroyers and 4 miscellaneous vessels. The attacking Japanese force escaped with a loss of less than 100 men, 29 planes and 5 midget submarines.

The magnitude of the disaster at Pearl Harbor and the public interest and speculation inspired by it were such that no less than eight separate inquiries concerning it were made over the next four and one-half years. The first of these was the Roberts commission, under the chairmanship of Justice Owen J. Roberts, retired, U.S. supreme court, which was appointed by

Pres. Franklin D. Roosevelt within 11 days after the attack and which made its report in Jan. 1942. There followed two years later the Hart inquiry, conducted at the request of the then secretary of the navy Frank Knox by Adm. Thomas C. Hart, retired, which was concluded in June 1944. Under the terms of an act of congress in that same month, the Army Pearl Harbor board and the Navy Court of Inquiry were constituted and completed their work in Oct. 1944. While these two investigations were under way, the Clarke inquiry was ordered by Gen. George C. Marshall, then chief of staff and Col. Carter W. Clarke conducted the investigation first in Sept. 1944 and then again in July and August 1945.

When the report of the Army Pearl Harbor board was submitted to the then secretary of war, Henry L. Stimson, he ordered the Clausen investigation supplementary to the proceedings of the board. This investigation, made by Maj. Henry C. Clausen, was begun in Nov. 1944 and ended in Sept. 1945. Similarly, Secretary of the Navy James Forrestal, after a review of the reports of the Hart inquiry and the Navy Court of Inquiry, found that the previous investigations had not exhausted all possible evidence, and ordered the Hewitt inquiry conducted by Adm. H. Kent Hewitt from May to July 1945.

The eighth inquiry was undertaken by the Joint Committee on the Investigation of the Pearl Harbor Attack, established on Sept. 11, 1945, by Senate Concurrent resolution 27, 79th congress. This resolution ordered the joint committee to make a "full and complete investigation of the facts relating to the events and circumstances leading up to or following the attack made by Japanese armed forces upon Pearl Harbor." The committee was composed of five members of the senate and five from the house of representatives, of which not more than three members from each chamber could be members of the majority (*i.e.*, Democratic) party. The senators appointed to the committee included: Alben W. Barkley (Dem., Ky.), Walter F. George (Dem., Ga.), Scott W. Lucas (Dem., Ill.), Owen Brewster (Rep., Me.) and Homer Ferguson (Rep., Mich.); the representatives were Jere Cooper (Dem., Tenn.), J. Bayard Clark (Dem., N.C.), John W. Murphy (Dem., Pa.), Bertrand W. Gearhart (Rep., Calif.) and Frank B. Keefe (Rep., Wis.). Sen. Barkley became chairman of the committee and Rep. Cooper vice-chairman.

The joint committee's report and appendices, a 492-page document made public on July 20, 1946, was based on a 10-month inquiry which included 70 days of exhaustive public hearings and a comprehensive examination of all pertinent documents, reports and papers. The extensive nature of the joint committee's activities is indicated by the fact that the testimony presented to it and exhibits received by it—including the proceedings, reports and exhibits of the 7 previous inquiries which the committee examined—comprise 39 printed volumes totalling more than 21,000 pages and approximately 10,000,000 words.

Although there had been demands all during the war that a congressional inquiry be launched and public hearings held, it was not until after the joint committee's hearings began in Nov. 1945 that it became evident to the U.S. people why the complete background of the Pearl Harbor attack could not have been publicly revealed before the surrender of Japan. U.S. army and navy cryptanalytic experts before the war had "broken" the Japanese government's codes for overseas communication and throughout the summer and fall of 1941 had been intercepting and decoding messages between Tokyo and Japanese representatives in Washington, Berlin, Manila and various other points. The fact that such intercepting and decoding continued throughout the war was a military secret of the very highest importance, and, for security purposes, it was referred to by the truthful designation of "Magic." Its revelation early in the

joint committee's hearings created a sensation.

In addition to having access to official records of the U.S. government, including all of the proceedings and records of the seven previous inquiries, the joint congressional committee also had the advantage of information obtained from Japanese diplomatic, army and navy officials through interrogations conducted after the Japanese surrender by officers of the U.S. occupation forces in Japan. This information showed that a surprise attack on Pearl Harbor was originally conceived and proposed early in Jan. 1941 by Adm. Isoroku Yamamoto, commander in chief of the combined Japanese fleet. In the following months detailed plans for the attack were drawn, and early in Sept. 1941 after a war plans conference in Tokyo these plans were incorporated into a secret operation order which was subsequently issued in November when Japan finally decided to make war against the United States.

A great many of the points developed during the joint committee's hearings had previously been made public in reports of the preceding inquiries, notably the Roberts commission and the Army Pearl Harbor board, and covered the many controversial and technical aspects of the diplomatic negotiations preceding the attack and of the detailed military and naval plans for the defense of the Hawaiian Islands. The joint committee's public hearings closed on May 31, 1946, and it made its report to congress one and one-half months later.

In its conclusions the joint committee reported that "the diplomatic policies and actions of the United States provided no justifiable provocation whatever for the attack by Japan on this Nation" and that it had "found no evidence to support the charges" that either Pres. Franklin D. Roosevelt, former Secretary of State Cordell Hull, former Secretary of War Henry L. Stimson or Secretary of the Navy Frank Knox "tricked, provoked, incited, cajoled, or coerced Japan into attacking this Nation in order that a declaration of war might be more easily obtained from the Congress." To the contrary the committee found that "all evidence points conclusively to the fact that they discharged their responsibilities with distinction, ability and foresight" and that Pres. Roosevelt, Secretary of State Hull and high government officials made "every possible effort, without sacrificing our national honor and endangering our security, to avert war with Japan."

However, the joint committee did conclude that the "War Plans Division of the War Department failed to discharge its direct responsibility" to advise the Hawaiian army command that the command was not "properly alerted" to repel a possible attack, and that the intelligence and war plans division of the war and navy departments "failed: (a) to give careful and thoughtful consideration" to certain of the intercepted Japanese messages; and "(b) to be properly on the *qui vive*" to receive and recognize that the Japanese messages intercepted and available on the morning of Dec. 7 indicated that "some Japanese military action would very possibly occur somewhere at 1 P.M." (Washington, D.C., time) that day (7:30 A.M. Hawaiian time).

As its central conclusion the committee reported that "the disaster of Pearl Harbor was the failure, with attendant increase in personnel and material losses, of the Army and the Navy to institute measures designed to detect an approaching hostile force, to effect a state of readiness commensurate with the realization that war was at hand, and to employ every facility at their command in repelling the Japanese." The joint committee found that "officers, both in Washington and Hawaii, were fully conscious of the danger from air attack; they realized this form of attack on Pearl Harbor by Japan was at least a possibility; and they were adequately informed of the imminence of war." While the committee pointed out specific instances in which the army and navy commands in Hawaii at

the time failed to discharge their responsibilities in connection with the attack, it concluded that "the errors made by the Hawaiian commands were errors of judgment and not derelictions of duty."

These general conclusions of the joint committee reaffirmed, in effect, the major findings of some of the earlier inquiries, especially those of the Roberts commission.

Among its major recommendations the joint committee asked that "immediate action be taken to insure that unity of command is imposed at all military and naval outposts" and that "there be a complete integration of Army and Navy intelligence agencies in order to avoid the pitfalls of divided responsibility which experience has made so abundantly apparent." In addition the committee listed 25 types of supervisory, administrative and organizational deficiencies in the U.S. military and naval establishments revealed by its investigation, set forth principles which it believed would correct the situation and recommended that the "military and naval branches of our Government give serious consideration" to them.

The joint committee's report was not unanimous. One member (Rep. Keefe) approved it with the "fundamental" objection that he felt "that facts have been marshalled, perhaps unintentionally, with the idea of conferring blame upon Hawaii and immunizing the blame that should properly be assessed at Washington," and he set forth his reasons for taking this position in a separate 23-page statement. Two other members (Sen. Brewster and Ferguson) filed a separate 80-page minority report since they found it "impossible to concur with the findings and conclusions of the Committee's report because they are illogical, and unsupported by the preponderance of evidence before the Committee."

The "final and ultimate" conclusion of the minority report was that for Pearl Harbor to be "fully alerted and prepared for defense rested upon the proper discharge of two sets of *interdependent* responsibilities: (1) the responsibilities of high authorities in Washington; and (2) the responsibilities of the commanders in the field in charge of the fleet and of the naval base," and that these two sets of responsibilities were "inseparably essential to each other in the defense of Hawaii." With respect to the first, the minority report found the "failure to perform the responsibilities indispensably essential to the defense of Pearl Harbor" rested upon: Pres. Roosevelt, former Secretaries of War Stimson and of the Navy Knox, Gen. Marshall, former army chief of staff, Adm. Harold R. Stark, former chief of naval operations and Maj. Gen. Leonard T. Gerow, former assistant chief of army staff, war plans division. With respect to the second, the report found the "failure to perform the responsibilities in Hawaii" rested upon Maj. Gen. Walter C. Short, commanding general, Hawaiian department, at the time of the attack and Rear Adm. Husband E. Kimmel, then commander in chief of the Pacific fleet. Since former Secretary of State Hull "had no relevant duties in the military chain of responsibility" and because "the diplomatic phase was not completely explored" the minority offered "no conclusions in his case."

Finally, the minority report took the view that the joint committee "was not in possession of the full historical record pertinent to the case before it." It pointed out that "a far less complete record has been written of its diplomatic aspects" than of its military aspects, and "here there is most urgent need of further exploration."

Peat. The chief use of peat in the United States is as a soil conditioner, an abundant supply of coal making it unnecessary as a fuel. Previous production had to compete with imported material, and was never large, but during World War II imports were restricted, and domestic production increased temporarily to 86,503 short tons in 1941, followed by a decline to 57,987 tons in 1944, and a recovery to 78,272 tons in 1945. Imports of peat moss increased from 66,428 tons in 1944 to 77,673 tons in 1945, all from Canada.

Peat moss production in Canada rose from 80,446 tons in 1944 to 83,849 tons in 1945. The production of peat for fuel was 644 tons in 1944 and 125 tons in 1945. (G. A. Ro.)

Pennsylvania. A middle Atlantic state and one of the original 13 states of the Union, popularly known as the "Keystone state." Area, 45,333 sq.mi., including 288 sq.mi. of inland water; pop. (1940) 9,900,180, of whom 8,453,729 were native-born white, 973,260 foreign-born white and 470,172 Negroes. The urban population in 1940 numbered 6,586,877 and the rural 3,313,303. Capital, Harrisburg (83,893). Cities with a larger population: Philadelphia (1,931,334); Pittsburgh (671,659); Allentown (96,904); Wilkes-Barre (86,236). The Pennsylvania State Planning board estimated the state's total population, including its citizens in military service, as 10,172,068 as of Aug. 1, 1944. U.S. census estimate of civilian population July 1, 1945 was 9,193,957, at which date 1,033,415 represented the net loss to the armed forces.

History.—In 1946 the state's financial position was greatly strengthened by the retirement of the general state authority bonds in the sum of \$47,912,000, the largest single debt payment ever effected by any state in a single year. Construction of public improvements and the development of a \$345,000,000 postwar highway program were delayed by labour shortages and rising costs of construction. The state embarked however, on an extensive program for the modernization of its mental and general hospitals and was putting into effect the provisions of a public health law enacted in 1945 providing for complete medical and dental examination of all school children and school employees in the state.

The carrying out of extensive measures for the control of stream pollution, the clearance of the state's waters from silt and coal deposits and the conservation of soil and forests was a main concern of the state government during 1946. An appropriation of more than \$30,000,000 by the legislature for conservation measures made possible the development of a long-range program for the improvement of physical resources of the state.

The November election gave the Republicans a clean sweep of the offices by the largest majorities in 20 years. Governor Edward Martin captured the seat in the U.S. senate held by Joseph F. Guffey. James H. Duff, attorney general, was elected

governor, while Brigadier General Daniel Strickler was chosen lieutenant governor and William S. Livengood, Jr., was named to his third term as secretary of internal affairs. The Republicans elected 28 of the state's 33 congressmen to gain 9 seats in the U.S. house of representatives, and retained control of both houses of the general assembly, taking the senate by 34-16 and the lower house by 171-37.

The principal officers in 1946 included: Edward Martin, governor; John C. Bell, lieutenant governor; James H. Duff, attorney general; William S. Livengood, Jr., secretary of internal affairs; G. Harold Wagner, auditor general; Ramsey S. Black, state treasurer; and George W. Maxey, chief justice.

Education.—The latest figures available showed an enrolment of 1,539,680 pupils in the public schools in 1944-45, including 35,720 in the kindergarten, 939,376 in the elementary division and 564,584 in the secondary schools, with 35,318 teachers in the elementary schools and 24,351 in the high schools. Approximately \$227,032,725 was spent for current expenses, debt service and capital outlay. Of this amount \$181,758,511 was utilized for current expenses.

Social Insurance and Assistance, Public Welfare and Related Programs.—During 1946, expenditures by the department of public assistance totalled \$86,000,000, including \$59,000,000 state funds and \$27,000,000 federal funds. The assistance rolls contained an average of 86,000 old-age assistance cases, 32,000 cases receiving aid to dependent children, 25,000 general assistance cases and 13,000 blind pensioners.

The state maintains eight penal and correctional institutions for the support of which a biennial appropriation of \$10,100,000 was made for 1945-47. In addition, it owns and operates ten medical and surgical hospitals, which received an appropriation of \$4,250,000; four institutions for the feeble-minded and epileptic, \$5,350,000; 18 mental hospitals, \$30,750,000; it contributed \$9,154,000 for the aid of privately operated hospitals and homes.

Communications.—Of the approximately 100,000 mi. of highways in 1946, 40,778 mi. were on the highway system and were under the supervision of the Pennsylvania department of highways. Included in this mileage were 671 mi. in the cities of Pennsylvania and 2,143 mi. in the boroughs. As of Nov. 30, 1946, 35,071 mi. were of improved type, leaving 5,707 mi. unimproved. In addition there were 160 mi. of super-highway operated by the Pennsylvania Turnpike commission.

Banking and Finance.—On Sept. 30, 1946, there were 368 state banks, including 8 savings banks with assets of \$4,795,246,000. These state banks had total deposits of \$4,320,473,000.

In addition there were 823 building and loan associations with assets of \$349,248,830, as of Dec. 31, 1945.

On Sept. 30, 1946, there were 660 national banks located in Pennsylvania with assets of \$7,117,840,000. The demand deposits of these national banks totalled \$4,515,778,000. Time deposits totalled \$1,885,299,000.

Appropriations for the biennium ending May 31, 1947, were \$579,800,000. The estimated receipts from taxation were \$560,500,000. The gross debt Nov. 30, 1946, was \$81,188,000, which securities in the sinking fund reduced to a net of \$44,147,500.08.

Agriculture.—The total gross farm income for 1945 was \$673,603,000, including \$556,734,000 in cash receipts from farm marketings and \$28,488,000 in federal government payments.

JAMES H. DUFF, elected governor of Pennsylvania Nov. 5, 1946, on the Republican ticket

Table I.—Leading Crops of Pennsylvania, 1945 and 1946

Crop	Production 1945	Production 1946	Acreage 1946	Yield per acre 1946	Value 1946
Corn, bu.	59,421,000	59,340,000	1,380,000	43.0	\$97,911,000
All wheat, bu.	20,038,000	19,912,000	885,000	22.5	39,426,000
Oats, bu.	24,583,000	30,033,000	846,000	35.5	27,030,000

Stone	22,516,282	19,855,478

Mineral Production.—The value of the principal mineral products of the state in 1940 and 1944 is shown in Table III. (E. M.N.)

Pennsylvania, University of. An institution of higher learning at Philadelphia, Pa. In 1946 the university, with a record-breaking enrolment of 20,000 students, increased its dormitory accommodations; completed new laboratories for electronics and general research in electrical engineering; began construction of an addition to the school of veterinary medicine, and announced a \$32,000,000 development program designed to increase the university's endowment and expand its physical facilities.

Outstanding in the research field was the completion of the E.N.I.A.C. (electronic numerical integrator and computer), which was designed and built in the university's Moore school of electrical engineering for the army ordnance ballistic research laboratory at Aberdeen, Md. The first large-scale all-purpose electronic computer ever developed, the E.N.I.A.C. contains about 18,000 vacuum tubes and is more than 100 times faster than the most advanced general-purpose calculating machine previously constructed.

Objectives of the university's development program include, in addition to funds for endowment and research, new buildings for the university library, the Wharton school of finance and commerce and the department of physics, mathematics and astronomy; completion of the building for the department of chemistry and chemical engineering; creation of a Philadelphia medical centre through expansion of the school of medicine and the university hospital; a campus for women students, and increased facilities for other schools and departments. The program was to be carried forward as rapidly as funds became available. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Permanent Joint Board on Defense

(U.S. and Canada). Wartime co-operation between Canada and the United States arose from the desperate situation facing the world in 1940 when German power had swept through western Europe to the very shores of the Atlantic. On Aug. 17, 1940, 11 months after Canada declared war on Germany, President F. D. Roosevelt and Prime Minister Mackenzie King signed the Ogdensburg agreement which brought into being the Joint Board on Defense.

It was clearly intended that the function of this board should extend beyond immediate wartime needs and should constitute the permanent advisory instrument for planning the defense of both the United States and Canada in the postwar period. Even before the United States entered the war, joint Canadian-U.S. measures were taken for the defense of the northwestern approaches of the North American continent. After Pearl Harbor a policy of the closest co-operation between all the armed services of Canada and the United States was initiated. The overall plans for the defense of North America were drawn up by the board and implemented by the two governments. Recommendations of the board resulted in the building of the Alaska military road, the construction of a chain of air fields between Edmonton, Alta., and Alaska, and construction of other operations in Labrador, Newfoundland and Alaska by U.S. and Canadian civilian and military forces. There are six U.S. members on the board, four of which represent air, ground and navy forces, with one member from the department of state and a civilian chairman. There are five Canadian members representing the Canadian parliament, air force, army and navy, with one member from the department of external affairs.

The United States and Canada co-operated closely in the liquidating of their joint wartime ventures, particularly the air route between the United States and Alaska and the installations connected with it. The Alaska military road and the telephone lines were taken over by Canada on April 3, 1946, and Canada paid for every permanent air facility installed by the United States. The United States and Canada were still co-operating on joint defense measures against any future attack, particularly across arctic regions.

In any kind of arctic defense scheme, the obvious first step is to know the territory and know how to operate in it. It was understood that Canada had decided to make Churchill, Man., a major military training base and both Canada and the United States were expected to send men there to take part in a program of training and defense research. (W. E. TH.)

Perón, Juan Domingo (1896?–), Argentine army officer and politician, was born in southern Argentina, the son of a rancher. He received a military education and taught for a period in military schools. While travelling in Europe in 1941 he was impressed by the trappings of fascism; on his return to Argentina he launched a vigorous crusade for "spiritual renovation" and became one of the leaders of the G.O.U. (Grupo de Oficiales Unidos), a clique of nationalistic young army officers which was instrumental in the coup d'état that overthrew the regime of Pres.

Ramón S. Castillo, June 4, 1943. When Gen. Edelmiro Farrell became president in Feb. 1944, he promptly raised Perón to the war ministry and then to the vice-presidency and submitted obediently to the latter's "suggestions." Argentina's growing nationalistic trends under Perón's pro-fascist guidance were sharply and bluntly criticized by both U.S. Secretary of State Cordell Hull and President Roosevelt in 1944. In 1945, Perón consolidated his grip on the government, despite a short-lived army coup, staged Oct. 9, which ousted him from power for a two-week period.

On his return he became more strongly entrenched than ever and was elected president (Feb. 24, 1946) on the Labour party ticket. He frequently clashed with Spruille Braden, U.S. assistant secretary of state, because of the latter's insistence that Argentina weed out axis influences in its government. In early 1947, Perón made several moves to re-establish harmonious relations with the U.S., including promulgation of a decree (Jan. 25) under which his government would expropriate 60 nazi firms.

Persia: see IRAN.

Perth, Archbishop of (HENRY FREWEN LE FANU) (1870–1946), British cleric, was born on April 1 in Ireland. He was educated at Keble college, Oxford, where he received his M.A. degree. Ordained in 1894, he served at various posts in Great Britain, later becoming archdeacon and canon residentiary of St. John's cathedral, Brisbane, Australia, 1905, and coadjutor bishop of Brisbane, 1915. Holding the latter position until 1929, he was then named Archbishop of Perth and in 1935 was raised to primate (Church of England) of Australia. His death was announced in Perth on Sept. 9.

Peru. A west coast republic in South America, bounded by Ecuador and Colombia on the north, Brazil and Bolivia on the east, Chile on the south, and the Pacific on the west. Area, 482,133 sq.mi.; pop. (1944 est.), 7,522,684. Racial distribution is estimated at 52.9% white and mestizo and 45.9% Indian, but more than 51% normally speak Indian languages. The capital is Lima (pop., 1945 est., 628,821); other cities (with pop. by 1940 census unless indicated otherwise) are Callao (84,438), Arequipa (79,185), Cusco (1945 est., 45,230), Trujillo (1945 est., 41,589), Iquitos (34,231), Chiclayo (32,646), Huanayo (28,679), Sullana (22,344), Ica (21,437), and Piura (1945 est., 29,674). President in 1946: José Luis Bustamante y Rivero.

History.—Pres. Bustamante reorganized his cabinet Jan. 24, 1946, and for the first time included three members of the long-outlawed Apra (*Alianza Popular Revolucionaria Americana*), renamed the Party of the People, a group which had been instrumental in Bustamante's surprise election in 1945. In elections held June 30, the Apra gained substantially in each house of the congress, winning 2 senators and 11 deputies; the opposition was subsequently left with only 2 senators and 4 deputies. An attack by an Aprista mob on an opposition demonstration and newspapers occurred on April 13. Riots resulting from food shortages took place at various times. A brawl between U.S. army and Peruvian navy personnel occurred at Talara, July 28, and resulted in some Peruvian ill feeling toward the United States. The foreign office on Oct. 18 announced a more positive immigration policy, stressing the admission of agricultural technicians for colonization purposes; it stated that negotiations were under way for admission of Italian labourers.

Education.—The government early in 1946 announced plans to spend 18,420,000 soles within five years, beginning in 1946, on construction of school buildings, 20 of which would be lo-

cated in Lima and the rest in the provinces; 2,000,000 soles were allocated for 1946 expenditure.

Finance.—The monetary unit is the sol, valued on Nov. 15, 1946, at 15.38 cents, U.S. currency. The 1946 budget, with additions made after its original announcement, totalled 716,500,000 soles, of which 633,300,000 soles were included in the ordinary budget and 83,200,000 for special-law expenditures. Delay in passing the budget resulted in extending the 1945 budget to Feb. 28, 1946.

The new budget could be balanced, it was thought, only by passage of new tax legislation; one such proposal adopted was for a progressive and cumulative tax on sugar exports, estimated to yield 120,000,000 soles; excess-profits tax rates were also raised. Important items in the 1946 budget included war, navy, and aviation, 154,300,000 soles; treasury and commerce, 136,600,000 soles; education, 111,000,000 soles; interior and police, 95,100,000 soles. The 1946 ordinary budget did not include allocations for irrigation, sanitation, housing, schools and highways. The government in February introduced a bill to control inflation by governing the operations of the national treasury with the central reserve bank. The government later established extensive gold-control regulations to prevent escape of the metal. A 1946 agreement for settlement of defaulted bonds maintained principal at par of \$92,600,000 but cancelled interest arrearages of \$78,800,000. The congress on Nov. 8 approved a bill for a \$30,000,000 Export-Import bank loan for self-liquidating industrial projects and purchase of machinery and materials; the loan presumably would supplant a previous Export-Import undischarged balance of \$25,500,000. Central Reserve bank total holdings Jan. 1, 1946, were \$16,600,000; total bank deposits on the same date were \$1,108,600,000 soles. The cost-of-living index at the beginning of 1946 was 210 as against 100 for a 1934-36 average.

Trade and Communications.—Exports in 1945 totalled 674,500,000 soles (1944: 547,300,000 soles) and imports 549,900,000 soles (1944: 514,400,000 soles), leaving a visible trade balance of 124,600,000 soles (1944: 32,900,000 soles). Exports for the first eight months of 1946 were 1,130,250 gross metric tons valued at 623,700,000 soles and imports were 360,116 tons valued at 489,100,000 soles. Sugar export in 1946 was estimated at 4,500,000 quintals (quintal equals 101.4 lbs.) of raw and 1,500,000 quintals of white. Anthracite coal was being shipped in November from near Chimbote at the rate of 25,000 metric tons monthly to Chile, Argentina, and the west coast of the United States.

Railway and highway mileage were approximately 2,800 and 18,500 mi. The government planned to inaugurate the new Limatambo airport at Lima, considered one of the finest in South America, on July 28; its passenger-terminal building cost 3,000,000 soles. Taca (Transportes Aéreos de Centro América) was authorized during 1946 to operate in Peru.

Production.—The estimate of sugar production in 1946 was 390,000 metric tons. Cotton production in 1945 was 1,532,357 quintals (1944: 1,459,858 quintals). Estimate of rice production in 1946 was 100,000 metric tons. The government began efforts to improve dairy and beef cattle breeds. Scipa (*Servicio Co-operativo Interamericano Producción Alimenticia*), a co-operative food-production agency, established machinery pools for certain coastal areas. The government on June 9 reported discovery of rich oil resources in the Andean foothills. The International Petroleum company planned construction of a modern industrial town near Talara at a cost of 10,000,000 soles.

Pethick-Lawrence, Frederick William,

1ST BARON, OF PEASLAKE (1871–), British government official, was born Dec. 28, and was educated at Eton and Trinity college, Cambridge. In 1901 he married Emmeline Pethick, a socialite welfare worker, and the two thereafter worked indefatigably in the suffragist movement. In 1923, he was elected to the house of commons as labour member from Leicester West, holding office until 1931. During that time, he was financial secretary to the treasury, 1929–31. He was returned to the lower house in 1935 from East Edinburgh and was leader of the Labour party from 1940 to 1942. He was called into the cabinet after the Labourite victory in Aug. 1945 as secretary of state for India and Burma in the Attlee government and on the same day was created a baron. In early March 1946, he accompanied First Lord of the Admiralty A. V. Alexander and president of the board of trade Sir Stafford Cripps, on a mission to India to negotiate with Indian leaders for Indian independence. However, Moslem-Hindu differences over "Pakistan" (a wholly separate Moslem state) prevented a successful conclusion to the parleys and the cabinet mission announced, June 26, it was suspending negotiations to form an interim government, and returned home.

Petroleum. The world oil production trend was upward in 1946, the demand even exceeding the peak of the war period reached in midyear 1945. In the United States the largest indicated crude-oil production of the war period was for the week ended Aug. 11, 1945, when domestic output averaged 4,933,600 bbl. daily. After the close of World War II, there was a decline of approximately 450,000 bbl. daily by late September, but by midyear 1946, production was averaging 4,776,000 bbl. daily while world-wide oil output was higher by some 200,000 bbl. daily than the year before.

Outside the United States the trend in several countries was upward with no important reductions reported. Output of Venezuela was estimated to be more than 1,000,000 bbl. daily, exceeding the peak war production. There was also a small increase in Colombian production.

Middle east production was estimated to be about 700,000 bbl. daily. The largest gain was in Saudi Arabia where production increased from 75,000 bbl. daily in June 1945 to 170,000 bbl. daily in June 1946. Production in Iran also increased and was reported to exceed 400,000 bbl. daily.

In the far east the rehabilitation of oil properties did not materialize as fast as had been expected but output was greater than when the Japanese conflict ended. European production outside the U.S.S.R. and Rumania is unimportant in world totals. Rumania production was estimated at 100,000 bbl. daily with no information available on U.S.S.R. output. World crude-oil production exclusive of the United States and the U.S.S.R. was estimated to be 2,340,000 bbl. daily.

The trend toward complete national monopolies at the expense of foreign oil interests in many European and Latin-American countries was as pronounced if not more pronounced than it was before World War II, and prospects for restitution of losses suffered in World War II were clouded by the political complexion of successor governments in both victor and vanquished countries, many of whom inclined toward nationalized economies. A further complication was the separate armistices concluded, the terms of which, involving war-loss settlements, were being fulfilled in advance of a general peace treaty.

In many central and southeastern European countries, the soviet Russians made direct bilateral trade agreements which seemed to exclude U.S., British, Dutch and French oil interests from an area of large markets in which they formerly operated. In certain of these countries, joint soviet and national oil companies were formed.

Included under soviet Russian control were Rumania, Poland, Hungary and Austria, accounting for some 120,000 bbl. of oil production daily—practically all the oil of Europe outside of the U.S.S.R. itself except an insignificant amount produced in England, Italy and in the Hanover basin of Germany, which was under British control.

Early in 1946, following soviet Russia's delay in withdrawing its military forces from Iran past the treaty date and the

TOTAL WORLD PRODUCTION OF PETROLEUM and output of the three principal producing countries, as compiled by *The Mineral Industry*

THE ABU ROASH WELL drilled in the desert ten miles west of Cairo, Egypt. This well was the beginning of a drilling program to test the oil potentialities of 6,000,000 acres of land held on exploration permit, in 1946, by the Standard Oil Company of New Jersey from the Egyptian government

United Nations Security council action, the U.S.S.R. and Iran reached a compromise agreement for the formation of an Iranian-Russian oil company controlling a large area for oil exploration and development in northern Iran.

By President Harry Truman's executive order of May 3, 1946, the Petroleum Administration for War was terminated on May 8, 1946. An undertaking called by Deputy Petroleum Administrator Ralph K. Davies one "unparalleled in the annals of government and industry," it was carried to successful conclusion by the "spirited co-operation and harmonious relationship that prevailed between government and industry," and the president indicated that it had successfully discharged its wartime duties.

Organized on a peacetime basis was the National Petroleum council authorized by President Truman to serve as "a channel of communication between the federal government and the petroleum industry."

Under OPA ceilings crude oil and petroleum products prices were virtually frozen throughout the war at 1941 prices. Under the new price control law signed by President Truman on July 25, 1946, crude oil and all petroleum products were entirely free from price control, and future control depended upon future findings of the new Price Control board. The national average price of crude oil on June 30 of about \$1.33 per barrel was increased 25 cents late in July and there was a general increase of slightly more than 1 cent a gallon in the gasoline price.

Following the removal of practically all OPA controls in the United States in October and November, there were crude oil advances in November applying to more than 80% of the United States production. These emphasized discussion among refiners during the year as to whether crude oil price schedules accurately reflected the comparative values of the oil. In the early 1920s gravity price differentials based on yields of gasoline were posted, resulting in more stable and equitable crude oil markets following an era of premium paying for high-gravity crudes in the days when flat prices for crude oils were the rule.

Even before World War II there were complaints that comparative crude oil prices determined largely by yields of straight-run gasoline, often low in antiknock rating, were outmoded by changes in processing methods and quality standards for motor fuels and other products. Conditions partially brought

about by the war and by peacetime developments increased the demands for the intermediate and residual products. Crude oils with wide yields of quality diesel fuels and furnace oils had, in some areas, increased in value in relation to gasoline crudes. Lubricating-oil yields had become of major importance. Catalytic cracking and related operations had, of themselves, changed crude oil values. Changes in transportation conditions had and would continue to have a bearing on the prices of crude oil.

While it is impossible to arrive at posted schedules which will accurately reflect all the varying values of crude oil by fields and leases, there are certain broad relationships, dependent on the properties of crude oil, manufacturing practices, transportation and consumer demands, which are undergoing constant change. It was pointed out that these were being taken into consideration in new crude price schedules as the base for sound market conditions in both raw material and finished products.

It was estimated that advances in the science of petroleum production had added more than 17,000,000,000 bbl. of oil to the recovery ultimately expected from U.S. fields, or 35% of the 49,000,000,000 bbl. of oil discovered up to the end of 1946. Some of this oil had already been produced, and of the 20,000,000,000 bbl. remaining in the fields it was estimated that 11,000,000,000, or 55% was attributable to improved technology.

Added to petroleum reserves are tremendous reserves of coal and shale susceptible of being converted into liquid hydrocarbon. Upon these the U.S. bureau of mines had lately started a \$30,000,000 experimental program.

Although not directly comparable to the scientifically "proved" petroleum reserves of the United States, fairly reliable estimates were made of other areas. They indicate total world oil reserves of 63,300,000,000 bbl. of which 28,900,000,000 bbl. are in the western hemisphere and 34,400,000,000 in the eastern hemisphere. The middle east, credited with 26,800,000,000 bbl., even overshadows the great United States reserves.

There is no danger of the U.S. running out of liquid fuels "for centuries to come," Eugene Holman, president of the Standard Oil company (New Jersey) told the annual meeting of the American Petroleum institute on Nov. 14, 1946, but an important factor on that score will be whether the industry is given the opportunity to do the job cut out for it. No form of centralized control offers an adequate substitute for a system of vigorous, competitive enterprise, he said, adding that if the world is to produce the oil it could and should, research and de-

velopment can not be regimented.

On the subject of conservation, Holman stated that the industry is opposed to waste but that "locking up" natural resources in vast areas "is not our idea of conservation," because "that is the best way not to have oil available for either present or future use." He said that federal and state lands should be open to prospecting and development; that federal efforts to control tidewater lands were not conducive to development of possible oil resources, and that similar consideration applied with respect to the continental shelf. (See also BUSINESS REVIEW.)

Pharmaceuticals: see DRUGS AND DRUG TRAFFIC.

Philadelphia. Philadelphia is the third largest city of the United States, and although the 1940 census gave the population as 1,931,334, it was estimated in 1945 at 2,100,000. Mayor: Bernard Samuel (1944-48).

At the May 1946 primaries electoral loans were approved as follows: for sewers and sewage disposal \$34,000,000, hospitals and health centres \$5,000,000, juvenile house of detention \$1,000,000, reception centre for children \$200,000, improvement of the port \$3,000,000, drainage and flood control \$1,500,000, Pennsylvania railroad agreement \$4,300,000, Broad street subway \$2,000,000, Market street subway \$8,000,000, airports \$10,000,000, highways and bridges \$5,000,000, parks, playgrounds, etc. \$3,000,000, power and signal, etc. \$1,200,000.

About the same time the city council approved councilmanic loans in the sum of \$29,100,000 for the following purposes: water purposes \$11,000,000, Southwest airport \$2,500,000, Northeast airport \$2,500,000, sewers and sewage disposal \$8,000,000, highways and bridges \$1,500,000, parks, playgrounds, etc. \$1,500,000, incinerator and garbage reduction \$1,000,000, voting machines \$1,100,000, thus making available for expenditure a total of \$107,300,000.

The city's debt position at the beginning of 1947 included a total borrowing power of about \$50,400,000. This was because of reduction of net debt and increases in taxable assessments.

At the start of 1946 the city's outstanding bonded debt totalled \$439,350,300 (not including unclaimed matured bonds). Bonds paid during the year totalled \$30,655,000, while new bond issues amounted to \$31,000,000. Thus, there was a net increase of \$345,000 for the year in the gross bonded debt, bringing it to \$439,695,300 at the end of the year.

The 1947 budget called for an expenditure of \$104,520,633.71, as follows: public safety \$28,017,354.63, public works, redevelopment authority and city planning \$20,539,049.75, public health and welfare \$13,049,497.00, civil rights and benefits \$10,801,886.99, city-county administration \$7,760,565.13, funded indebtedness \$22,517,280.21, pensions and workmen's compensation \$1,835,000.

Exact figures were not available late in 1946, but it seemed that the year would end with a net bonded debt about \$18,000,000 larger than it started with—about \$334,000,000, as against \$316,221,410.

It should be noted that the city budget did not include the cost of operation of the board of public education, which is a separate entity. The board's budget for 1947 was about \$38,000,000. (B. SA.)

Philately. Perhaps the most important—and possibly the least well-known—stamp reference collection in the U.S. is the Luff reference collection. It was formed by John Luff, for many years the editor of the Scott publications

and, especially, of the *Scott Standard Catalogue* (the main reference work of U.S. and Canadian collectors). During 1945 the Scott Publications, Inc., owners of the collection and the catalogue, was sold to Gordon R. Harmer, of London and New York, but the collection was presented to the Philatelic foundation, a not-for-profit organization in New York and was to remain at the Collectors club for the use of students.

The change in ownership did not mean a major change in the catalogue, for Harmer had been serving as an associate editor; and Hugh Clark and his wife remained as associates after they relinquished control.

The issues of the war period emerged from the obscurity cast by the prohibition of import of enemy issues into various countries, including the U.S. and British empire. Those which merit recognition were becoming known, and supplies were emerging from various hiding-places.

One of the most interesting groups of the war issues was the series produced in the Channel Islands—Jersey and Guernsey, in particular—British islands lying off the coast of France. When occupied by the Germans, the post offices continued to function without major interference. When the supplies of stamps on hand were used up, they were encouraged to produce local issues, which they did. These would probably become very scarce, since they were produced for use, not for speculation.

Prices.—The prices of all stamps, supposedly inflated, showed rather surprising strength during the year, although there was some recession toward the end of the period. The classic issues seemed impervious to the slight falling-off that affected more recent popular stamps. There was plenty of demand for stamps in good condition, and, in stock-market terms, the market can be said to have held fairly steady, with no important rises and few notable drops.

Exhibitions.—During the war stamp exhibitions were, of course, held to a minimum. The relaxing of travel controls meant new life for stamp exhibitions everywhere. In the U.S. the 60th anniversary of the American Philatelic society was celebrated by a fine display in Chicago, which was only slightly hampered by a fire that destroyed the hall originally selected for the celebration.

The great "Centenary of the Postage Stamp" exhibition, scheduled to be held in London in 1940 was, of course, "destroyed by enemy action"—not the stamps, but the plan. During 1946 plans materialized for another centenary celebration, this time the 100th anniversary of the issuing of postage stamps in the United States. Plans were virtually completed during 1946, although the exhibition was not to be held until May 1947 in New York. British exhibits prepared for 1940 were to participate.

New Issues.—The United States issued only eight postage stamps, one air mail stamp and one air mail envelope during the year. The stamps included the five-cent Roosevelt; and three-cent values commemorated the merchant marine, the centenaries of the states of Tennessee and Iowa, the foundation of the Smithsonian institution and the entry of U.S. troops into Santa Fe, N.M. There was also a three-cent stamp showing the discharge emblem given to all men and women discharged from the armed forces.

The change in air mail rates in October produced a new five-cent air mail stamp and a five-cent air mail envelope.

Other New Issues.—The British empire issued stamps honouring the victory of the Allies. The mother land and the colonies each issued two values, but some of the dominions were lavish. New Zealand, for instance, issued a complete peace set of 11 values. It also issued the customary two health semipostal stamps.

France issued two stamps commemorating the meeting of the foreign ministers to write the peace treaties for axis satellites. Mexico obliged with an issue for the United Nations of 11 values. Haiti issued 2 stamps in honour of Franklin D. Roosevelt, Nicaragua issued a set of 11 and Turkey a set of 6. Turkey also issued three stamps noting the visit of the U.S.S. "Missouri."

Belgium commemorated the Bastogne battle with two air-mail semipostal stamps which did not meet much favour. The usual semipostals showing four leaders of the 11th and 12th century crusades were more acceptable.

The Philippines issued (July 4) a series of three, their first issue as a sovereign nation.

A five-cent stamp from the Canal Zone honoured John F. Stevens. The military governments in Germany issued a set of stamps for all zones of occupation of 27 values from 1 pfennig to 1 mark.

Literature.—Between 900 and 1,000 new stamps were listed in the 1947 catalogues, which appeared in 1946.

A new weekly magazine, *Philately*, started in the U.S. Published in St. Louis, it bid fair to be a permanent addition to philatelic journalism. In France *Cahiers Philatéliques*, appearing bimonthly, offered a thoroughly adult study of various issues, predominantly French, as well as collateral material such as postal markings and postal history.

Other Events.—The Green sales came to an end during 1946, with the amazing total of about \$1,750,000 realized from the accumulations of Col. E. H. R. Green. (M. HA.)

Philippines, Republic of the.

The republic of the Philippines comprises the archipelago ceded by Spain to the United States in the treaty of Paris of Dec. 10, 1898, and proclaimed by the United States as an independent republic on July 4, 1946. The chain of approximately 7,100 islands falls between north latitudes 4° 21' and 21° 10' and between east longitudes 116° and 127°. Lying about 800 mi. off the east coast of Asia, the islands of the Philippines stretch from Formosa on the north to Borneo on the south.

By regular steamship routes, Manila is 631 nautical miles southeast of Hong Kong, 1,757 mi. southwest of Yokohama, 1,370 mi. northeast of Singapore, 4,838 mi. west of Honolulu and 6,929 mi. southwest of San Francisco.

The total area is 115,600 sq.mi. The last official census, 1939, gave the population as 16,000,303, including the following non-Filipino nationalities: Chinese 117,487; Japanese 29,057; Americans (U.S., exclusive of armed forces) 8,709; Spanish 4,627; Germans 1,149; British 1,053. Estimates of the Philippine bureau of census and statistics placed the population in 1946 at 18,400,000. Principal religions according to the census of 1939 were: Roman Catholic 12,603,365; Aglipayan (Independent Philippine Catholic) 1,573,608; Mohammedan 677,903; Protestant 378,361. In addition, about 680,000 were pagans following various animistic cults. The principal cities and their populations were: Manila, the political and commercial capital on the northern large island of Luzon, 623,492 (not including several large suburbs); Cebu 146,817; Iloilo 90,480; Legaspi 41,468.

History.—The outstanding event of 1946 was the granting of independence to the Philippines on July 4.

Philippine Elections.—This event was preceded by the holding of the first general elections in the Philippines after the Japanese invasion in 1941. The Nacionalista party which had dominated Philippine politics before World War II split up into two factions, one headed by the incumbent President Sergio Osmeña and the other faction by Manuel A. Roxas,

AT THE FOOT OF A crazily-tilted ruined building, seen on a shambled street in Manila during 1946, U.S. soldiers and sailors purchased souvenirs and trinkets at makeshift stalls

president of the senate. After a vigorous campaign, Roxas was elected to succeed Osmeña. Elected with Roxas were majorities in the house and senate which were considered friendly to him. Roxas assumed the presidency of the Philippines on May 28, 1946.

Independence.—On July 4, the Philippines achieved independence, a goal which the Filipino people had been seeking for many decades. The voluntary granting of independence to the Philippines brought to a close a historic period of 48 years' relationship with the United States, as a dependency under the U.S. flag. The president of the United States, in a special Proclamation of Independence on July 4, declared that the United States "withdraws and surrenders all rights of possession, supervision, jurisdiction, control or sovereignty now existing and exercised by the United States of America in and over the territory and people of the Philippines . . ." and that the United States does "hereby recognize the independence of the Philippines as a separate and self-governing nation. . . ." A treaty of general relations, charting a new pattern of relationships between the two countries, was also signed in Manila on July 4. The senates of the two countries soon consented to the ratification of the treaty and the treaty was proclaimed as having entered into force on Oct. 22, 1946.

Foreign Relations of the New Republic.—Under the terms of the Tydings-McDuffie act, which governed Philippine-U.S. relations before independence, the United States notified other foreign governments of the independence of the Philippines and invited them to recognize the new republic. By the end of 1946 at least 38 countries had recognized the independence of the Philippines.

Since Philippine foreign relations prior to independence were strictly under the control of the United States, the Philippines at the outset of its existence as an independent nation was compelled to create an entirely new foreign affairs establishment consisting of a department of foreign affairs and foreign service. The first secretary of the department of foreign affairs was Vice-Pres. Elpidio Quirino and the under secretary was Dr. Bernabe Africa. During 1946 the Philippines opened an embassy in the United States and consulate generals in New York and San Francisco.

Throughout 1946 the United States, at the request of the Philippine government, conducted through the department of state a special Philippine Foreign Affairs Training program designed to provide the Philippines with a nucleus of trained foreign service officers. A U.S. adviser, Richard P. Butrick, was, also at the request of the Philippine government, detailed to Manila to assist in the organization of the Philippine foreign service. The first U.S. ambassador named to the Philippine republic was former high commissioner Paul V. McNutt.

The Philippines and the United Nations.—The Philippines, which joined the United Nations in June 1942 and subsequently became a member of the United Nations organization at San Francisco in 1945, continued to give active support to the United Nations during 1946. General Carlos P. Romulo, former resident commissioner of the Philippines, was named Philippine delegate to the United Nations and became a well known figure in United Nations circles. In addition to the United Nations the Philippines also participated actively in other international organizations, and in such regional agencies as the Far Eastern commission.

National Defense.—The Philippines and the United States continued to work together on matters of mutual defense during 1946. Steps were taken to conclude an agreement whereby U.S. public law 380 of June 29, 1944, and joint resolution No. 4 of the Philippine congress of June 22, 1945, authorizing negotiations for the retention of U.S. bases in the islands, were brought into effect. The United States congress in public law 454, approved June 26, 1946, also provided for a program of military assistance to the Philippines.

Collaboration Issue.—The Philippine government through a specially appointed people's court continued to try accused collaborationists during 1946. The court was meeting many difficulties, however, and considerable talk circulated concerning the possibility of a general amnesty for collaborationists. Solicitor-Gen. Lorenzo M. Tanada, in charge of the prosecution for the government, was nevertheless attempting to press forward with indictments against the accused collaborationists.

Economic Reconstruction.—The main problem continuing to confront the Philippines during 1946 was the problem of economic rehabilitation and reconstruction. This problem could be broken down in turn into four main problems: the problem of restoring trade relations, the problem of physically rebuilding the country, the problem of raising revenues and solving a severe budgetary crisis and the socio-economic problem of agrarian unrest in the Luzon provinces.

Trade Relations.—The United States congress in public law 371, approved April 30, 1946, known as the "Philippine Trade Act of 1946," recognized the great dependence of the Philippines on the U.S. trade market by passing this measure which extended the period of free trade between the United States and the Philippines to 1954; after 1954 Philippine products coming into the U.S. market were to be assessed duty at the rate of 5% progressively over a span of 20 years until at the end of this time full duties are assessed Philippine products. This measure was intended to revive the shattered trade economy of the islands. Some of its provisions were considered imperfect and were sharply criticized, but generally speaking, the measure was considered essential to the economic recovery of the Philippines. The agreement to carry out the act was proclaimed by Pres. Harry S. Truman on Dec. 17, 1946.

Rehabilitation.—In a companion measure, public law 370, approved April 30, 1946, known as the "Philippine Rehabilitation act," the United States congress also extended generous economic assistance in the rehabilitation of the Philippines. This measure contained three major provisions: one provision creating a Philippine War Damage commission and providing for

the granting to private property owners of \$400,000,000 in war damages, another provision for the disposal to the Philippine government of \$100,000,000 in surplus property without reimbursement and another provision for the spending of \$120,000,000 in various public works and training projects. Among other things, this last provision provided for the training of some 850 Philippine students and technicians by various U.S. government agencies during the next few years.

Financial Crisis.—In an address delivered to the Philippine congress on June 3, 1946, President Roxas declared that, "We are faced . . . by the fact that our government is without financial means to support even its basic functions, not to speak of the great projects in rehabilitation and economic development, which we contemplate and which are, indeed, vital to our continued existence. . . ." The president described the country as "living through the most crucial period of our life as a nation."

Cut off from its usual sources of revenue as a result of World War II, the Philippine government struggled to maintain its normal services and those additionally acquired with independence. In response to urgent Philippine requests for assistance, the United States congress in public law 656, approved Aug. 7, 1946, provided for the granting of a loan of \$75,000,000 to the Philippine government. This loan was expected to help alleviate the immediate budgetary crisis, but other requests for loans were anticipated.

In addition to obtaining financial aid from the United States, Pres. Roxas also proposed (1) revision of the budget procedure and the establishment of a strong budget bureau, (2) reorganization of the government to reduce unnecessary personnel and inefficient operations and (3) revision of the tax laws including enactment of a war proceeds tax based on taxable income and the increase in capital assets for the period 1941-45.

In the closing months of 1946 a Philippine-U.S. Financial commission was also appointed to visit the Philippines and report on means of improving the financial conditions of the country.

Agrarian Unrest.—Another problem which caused the Philippine government a great deal of concern during 1946 was the problem of agrarian unrest, particularly as it existed in the central Luzon area. The unrest in these provinces was to a considerable degree due to the long-standing, decades-old dissatisfaction of the farmers in these provinces with the conditions of their livelihood. During the war these groups secured firearms and after the end of the war showed little inclination to surrender them and to return to the *status quo*. Pres. Roxas early in his administration declared that "social and economic injustices, especially acute in those areas have been proper soil for the harvest of violence . . ." and proposed that steps be taken at once to remedy conditions in these provinces. An Agrarian commission was appointed to study the problem and a new tenancy law was passed by the Philippine congress.

Despite these reform measures, however, considerable unrest and lawlessness continued to exist in the provinces during 1946. Many illegal firearms were held, and the government made vigorous efforts to regain these firearms and bring the farmers of this area to acceptance of its reform program.

General.—Though 1946 was generally a year of economic trial for the Filipino people, by the end of the year encouraging progress was being made. The Philippine War Damage commission was at last functioning in the islands, the various U.S. agencies participating in the reconstruction work of the islands had their representatives in the islands planning the initial phases of their work, \$25,000,000 of the loan described above was about to be turned over to the Philippine government and the Trade agreement had been proclaimed as being

in force. All these measures were intended to assist the Philippines in its economic recovery. (E. W. ML.)

Philosophy. In 1946, the first full postwar year, philosophy displayed several tendencies. There was, first, a searching for old values, a renewal of attention to principles or statements of faith which had been obscured by the clamour of war. Second, there was a re-examination of the human experience in its crucial phases to see whether a "way out" were possible, either by religion or by its opposite, the recognition of man's impotence and nothingness as ultimate fact. Third, there were serious efforts to interpret the crisis in culture and to find adequate intellectual formulae to undergird the human effort to improve understanding between differing and potentially clashing cultures, thus helping to lay the groundwork for enduring peace. The overwhelmingly dominant note in all these tendencies was that of deep concern about man's condition, his present crisis and his historic fate. In this year of groping toward the light, philosophy moved between the poles of despair and hope.

Old convictions were reaffirmed in collected essays by several world-famous philosophers and other lesser, but notable, critics. Posthumous essays of Miguel Unamuno, *Perplexities and Paradoxes*, (1945), celebrated man's personal struggle to know his own worth in the spiritual agony which is life, a struggle without end and without victory, but intensely real. Henri Bergson, in *The Creative Mind*, posthumously published in English, restated in two new essays, among some older ones, the general position of creative evolution and the intuitive method of metaphysics, though modifying somewhat his earlier view of the relation of science to reality. José Ortega y Gasset, in *Concord and Liberty*, dealt with the problems of government, "thinking" (the invention of techniques of which cognition is but one), history and life, in essays not altogether free of regret and resignation toward history's inevitable present course. John Dewey, in *Problems of Men*, papers on education, democracy, values and thinkers, again recalled philosophy to its proper task of searching for the "ends and values that give direction to our collective human activities," a human wisdom that may guide science in the improvement of life. Morris R. Cohen's diversified essays and reviews in *The Faith of a Liberal* displayed his ceaselessly critical mind at work analyzing presuppositions and arguments of thinkers and schools of thought, whether jurists, scientists, educators or philosophers, thus upholding a liberalism of intelligence as against lapses into superstition, prejudice or cloudy thinking. Lewis Mumford's *Values for Survival* consisted of papers written to stir a sluggish democracy to realize its desperate condition and to rethink and revitalize the spiritual values on which mankind may safely stand.

As France emerged from the darkness of the war years, the philosophy of existentialism, with roots in Søren Aaby Kierkegaard and Johann Heinrich Heidegger, appeared, and received international attention. Jean Paul Sartre, Simone de Beauvoir and Albert Camus, versatile writers of fiction and drama as well as of philosophy, emphasized the absurdity, the failure and the nothingness of man's existence. Freed from illusion, without hope, yet not desperate, the philosopher, they held, may choose a life-style as he wills, act responsibly in his temporal situation and bring thought and action into a genuine unity. The success of existentialism, suiting as it did the mood of the times, momentarily obscured the fact that older philosophical tendencies continued in France under distinguished leadership. Étienne Henry Gilson, Jacques Maritain, Maurice Blondel, Louis Lavelle and René le Senne represented various levels of religious or spiritual philosophy providing more normal answers to the problem of human life than that of existentialism.

R. G. Collingwood's posthumous volume, *The Idea of Nature*, examined the analogies (man, machine, history) by which nature has been understood in the three great epochs of western science (Greek, renaissance, modern). George Santayana, in *The Idea of Christ in the Gospels*, without abandoning his naturalism, sympathetically attempted "to analyse and detach . . . one original element in the inspiration of the Gospels, namely the dramatic presentation of the person of the Christ," that is, the idea of Christ "present, before and after the Gospels were written, to the Christian mind."

The Meeting of East and West, by F. S. C. Northrop, attracted much attention for its constructive effort to reconcile major pairs of opposites: east and west; mediaeval and modern; Anglo-Saxon and Latin cultures; democratic and communistic values. Reconciliation requires a revised theory of knowledge and reality. The old belief in mind, matter and "appearance" is replaced by two terms, the "aesthetic continuum" (directly given) and the "theoretic component" (product of thought). Neither component can be reduced to the other; both are real, and they are correlated.

Many other important books bore upon the contemporary social and moral crisis. *Plato's Theory of Man* by John Wild criticized modernism's inversion of the true order of value which Plato correctly envisioned. R. K. Popper in *The Open Society and Its Enemies* (2 vols.), and Ernst Cassirer in *The Myth of the State*, dealt with myth and reason in society. John Somerville's *Soviet Philosophy* and Karl Kautsky's *Social Democracy Versus Communism* added material to the great debate on the left. Theologians Reinhold Niebuhr in *Discerning the Signs of the Times* and Emil Brunner in *Justice and the Social Order*, commented on man's plight and needs.

U.S. philosophy and faith were explored anew by Herbert W. Schneider's *A History of American Philosophy*, Joseph L. Blau's *American Philosophical Addresses, 1700-1900* and Merle E. Curti's *The Roots of American Loyalty*. Contributions to the theory of aesthetics were made by Stephen C. Pepper's *The Basis of Criticism in the Arts* and Milton C. Nahm's *Aesthetic Experience and its Presuppositions*. Other studies were Charles Morris's *Signs, Language, and Behavior*, Kenneth Burke's *A Grammar of Motives* and James Feibleman's *An Introduction to Peirce's Philosophy, Interpreted as a System*. (E. L. MN.)

Phoenix Islands: see PACIFIC ISLANDS, BRITISH.

Phosphates. Mine production of phosphate rock in the United States rose to 6,159,708 short tons in 1945 from 5,936,002 tons in 1944, and sales increased to 6,503,530 tons from 6,021,840 tons. The excess of sales over production cut stocks from 1,375,400 tons to 949,200 tons. From 1942 stocks had declined by more than half. Exports decreased and imports increased, adding still more to the domestic supply. With the reopening of foreign markets after World War II exports were expected to increase materially, but this movement was not manifest in 1945.

New data were received from few important producing countries outside of the United States; output reported for 1944 was as follows, in short tons, with any 1945 outputs given in parentheses for comparison: Algeria 242,893; Tunisia 575,699 (778,606); French Morocco 1,592,732 (1,802,280); Egypt 350,739; Makatea Island 200,000 tons. (G. A. Ro.)

Photography. Even with a full year of postwar production the photographic manufacturers fell far short of meeting the tremendous demand for all types of photographic materials in 1946. The Eastman Kodak company was producing more sensitized films and paper than in any prewar

year. Yet the shortages in these materials were acute. The same scarcity prevailed for flashlamps, cameras and much of the accessory equipment. However, in spite of shortages important new products were available. Ansco and Kodak brought out new $2\frac{1}{4}\times2\frac{1}{4}$ -in. reflex cameras and also new colour materials. A few additional manufacturers had new flash synchronizers, speedlamp units, tripods, sensitized papers and small accessories. However, no major camera development appeared in England or the United States.

By the end of the year the first shipment of Leica cameras arrived from the Leitz factory in Germany, where German camera manufacturers were just beginning to get into regular production. The British and U.S. armies absorbed most of the camera production in Germany.

Important applications of photography were announced in specialized fields such as the high speed cameras in the Bikini atom bomb tests, the first rocket spectrograph of the sun made 65 mi. above the earth, new developments in electron photomicroscopy and industrial X-ray. All these uses point to an accelerated development in this field of record photography.

Atomic Bomb Photography.—The high point in scientific and record photography was achieved during the Bikini atomic bomb tests in the summer of 1946. The magnitude of these photographic operations may be realized from such facts as: nearly 500 cameras were used, including 8 mm., 16 mm. and 35 mm. movie cameras, high-speed cameras and still cameras with various lenses up to the giant "Big Bertha" camera equipped with the Eastman 48-in. lens. More than 1,500,000 ft. of motion picture film and more than 50,000 still pictures were made during the two atomic bomb tests. Record photographs of the animals placed on the ships were made before and after the blasts. Other photographers made underwater photographs while drone planes carried automatic cameras over the area. Still other automatic cameras were placed in towers on Bikini Island.

Various filters were used over the lenses. For recording the first brilliant flash a 4X neutral-density filter was the most successful. Other automatic cameras without filters had tremendously overexposed films but obtained excellent results as the succeeding exposures were made after the flash. In the case of the motion picture cameras a complete progressive picture was obtained by splicing the best exposures from various cameras.

The high-speed motion picture cameras played an important role. The Bell Telephone laboratories furnished 60 Fastax cameras in 8 mm., 16 mm. and 35 mm. sizes under the direction of J. H. Wadel. They were the only high-speed cameras operated at 1,000 pictures per second. The 24 Eastman high-speed cameras were operated at 600 pictures per second. When at top speeds the Eastman camera makes 3,000, the 8 mm. Fastax 8,000, the 16 mm. Fastax 4,000 and the 35 mm. Fastax 3,500 frames per second. Spectroscopic and photometric cameras recorded the intensity and the radiant energy of the explosion.

The National Advisory Committee for Aeronautics developed and constructed two high-speed motion picture cameras, neither of which was produced commercially. One of these cameras had a speed of 40,000 frames per second and was described in U.S. patent No. 2,400,885. The other camera was capable of a speed of 200,000 frames per second and was described in U.S. patent No. 2,400,887. Both of these patents were granted to Cearcy D. Miller, the inventor. These high-speed cameras could be manufactured by or for the use of the U.S. government without payment of royalties in accordance with the non-exclusive royalty-free licences obtained from the inventor.

New Fairchild Cameras.—The Fairchild Camera and Instrument Corp. made five important camera developments: the

K-25 Sequence camera, Cartographic camera, Camera Transit, Radar camera and the Fluoro-Record camera. The Fairchild K-25 Sequence camera was a special hand-held unit designed for rapid-sequence, two-frames-a-second photography for the professional press photographer who wanted attention-getting pictures. It was a commercial adaptation of the war-tested, electrically-operated, Fairchild K-25 Aerial camera. Any event that had a fast-moving range of dramatic phases could become subject matter for this new press model. The most important use of this camera during the year was for photographing the successive phases of the two Bikini atomic bomb tests in July. Other photographers used this camera to obtain sharply detailed photo sequences of the finish spurt of horse races, the excitement at the one-yard line at football games, the take-off of jet-propelled planes, dancers, diving and skating champions and even the successive stages of street riots. The K-25 Sequence camera made 50 4×5 -in. exposures on a 19-ft. roll of film, which was electrically driven. This camera could be used for aerial photography when required.

To meet government mapping requirements Fairchild designed the new 9×9 -in. Cartographic camera to provide precision aerial photographs for topographic and planimetric maps needed in crop control, soil conservation, flood control, geological exploration, highway expansion, municipal and rural improvements, coastal defense and other aerial mapping programs. This Cartographic camera, which could be operated automatically and semiautomatically had two cones, lying one within the other. The inner cone, or "optical heart," contained the focal plane and the optical system and could be removed as a complete unit for calibration by the federal bureau of standards. The outer cone contained all operating mechanisms. The front and rear lens elements could be removed for cleaning and inspection without disturbing collimation. The film magazine provided for 180 ft. of roll film for making 250 exposures of 9×9 -in. negative size.

To meet the specifications of the U.S. navy hydrographic office Fairchild engineers produced a Camera Transit in co-operation with J. E. King of the U.S. forestry service. This unit consisted of a surveying transit combined with a 4×5 -in. plate camera. This Camera Transit was to be used in obtaining ground control information to supplement aerial photogrammetry. The Fairchild Radar and Fluoro-Record cameras, developed during World War II, were in production for general use in 1946.

Rocket Photography.—This was a new term which was added to the mounting list of photographic applications in 1946. During the V-2 rocket testing at White Sands, N.M., automatic camera equipment was placed in several rockets to obtain photographic records never before made at altitudes up to 90 mi. A sensational motion picture film was made during one rocket ascent, sometimes travelling upward at 4,000 ft. per second, which actually showed the curvature of the earth at a height of 65 mi.

Rocket Spectrography.—This was still another significant new term for 1946. The closest photographs ever taken of the sun's spectra were made from within the war head of a giant V-2 rocket at various distances up to 65 mi. A specially-constructed rocket spectrograph unit was designed and built by the Bausch and Lomb Optical company for these experiments. During the flight successive exposures were made at 20-sec. intervals after the rocket entered the ionosphere. The steel spectrograph unit weighed 150 lb., including the 25-lb. film chamber which survived the terrific impact when it returned to earth. As a result of this work the sun's spectrum was extended many Ångströms into a new ultra-violet region never before seen because of previous atmospheric interference. It was thought that up to a year would be required to analyze fully the spectrographic data obtained. The depth in the ultra-violet to which the rocket spectrograph could reach was limited only by the absorption of the materials used for the optical parts and the sensitivity of the film. The optical parts in this unit were made of lithium fluoride, a synthetic crystalline material, which penetrated deep into the ultra-violet regions, close to 1,200 Ångströms.

New Equipment.—The popularity of the $2\frac{1}{4}\times2\frac{1}{4}$ -in. twin-lens reflex cameras similar to the Rolleiflex was increasing steadily. During World War II all the German camera imports were stopped. However, during 1946 both the Eastman Kodak Co. and Ansco produced twin-lens reflex cameras. The Kodak Twin-Lens Reflex had shutter speeds from $\frac{1}{2}$ to $\frac{1}{200}$ sec., built-in flash synchronization, 80 mm. $f/3.5$ Kodak Anastigmat lens and made $12\ 2\frac{1}{4}\times2\frac{1}{4}$ -in. negatives at one loading. The Ansco Automatic Reflex $f/3.5$ was a precision twin-lens reflex camera designed

to meet the exacting photographic requirements for this type of camera. It had shutter speeds from $\frac{1}{2}$ to $\frac{1}{400}$ sec., 83 mm. Ansco Anastigmat f/3.5 lens and made 12 $2\frac{1}{4} \times 2\frac{1}{4}$ -in. negatives per roll.

The Kodak Medalist II appeared in an improved model with new features such as: built-in Flash Supermatic shutter, Luminized Ektar f/3.5 lens and improved film wind with automatic interlock preventing double exposures. A Kodabromide printer was made by Kodak which provided speed in making enlargements up to $2\frac{1}{4} \times 4\frac{1}{4}$ in. from roll films with various negative sizes down to 24×36 mm.

In the field of flash photography the trend continued toward the increased production of shutters with built-in flash synchronization such as the Ilex, Supermatic (X), Graphex (X) and Rapax. Graflex recommended the use of the solenoid flash-tripper in combination with the Supermatic and Graphex synchronized shutters to provide wider flexibility of the equipment. Kodak provided a new flashholder for use with all Kodak flash shutters on the new Kodak Reflex, the new Kodak Medalist II and other new Kodak cameras with built-in flash synchronization.

One of the notable developments of the year came with the phenomenal development of portable speedlamp units which gave instantaneous flash exposures around $\frac{1}{5,000}$ of a second. These flashing units weighed between 15 and 20 lb. and could be synchronized with the standard between-the-lens shutter. More than 25 different makes were announced during the year. With continued development these high-speed speedlamp units were expected to become cheaper and also lighter in weight. They were already giving the photographer a new freedom in his work. A speedlamp could be flashed more than 20,000 times before it showed any signs of deterioration. This promised an enormous saving in the use of the regular flashlamps which burned out with each flash.

In the field of still projection the Bell and Howell Co. introduced the Duo-Master projector for 2×2 -in. slides with such features as adjustable condensers (to match the lens in use), 300-watt illumination, interchangeable lenses, triple-walled lamp-house and cool operation.

Several developments in the 8-mm. and 16-mm. field were announced by Bell and Howell. One of these was a motion picture projector for 8-mm. film, the Filmo Picture Master. This projector featured a base-up 750-watt lamp, all-gear forward drive and rewind without changing reels and single-frame projection with increased brilliance on the screen.

The methodical application of motion pictures to time and motion study work was furthered by Bell and Howell with the introduction of a complete line of 16-mm. cinematographic equipment designed for this specific use. The camera, the Filmo Electro, took standard 50-ft. 16-mm. magazines; incorporated a 24-volt motor, with transformer built into the power cord; operated at 1,000, 2,000, and 4,000 frames per minute, to conform with the decimal measurement used in job-study work. A 21-mm. f/1.9 lens and positive matching view-finder were standard equipment.

For evaluation of the films made with the Electro camera, Bell and Howell introduced simultaneously a 16-mm. projector fitted with hand-crank and special heat filter for single-frame projection, a frame counter which could be reset at zero when desired and electric-governor speed control to insure optimum accuracy in screening job-study films for time-checking purposes. A further adjunct to the method-study equipment was a special version of the Filmotion Viewer which afforded both single-frame and continuous viewing of the film on a small illuminated ground glass screen. A frame-counter was provided for this device also, to enable the operator to complete a more systematic study of the film being analyzed.

The Kodak Hi-temp hardener was one of the few new developments in photographic chemicals. This is a single bath hardener for use before development, reduction or intensification. It permitted development in regular developers up to 95°F. after this hardening treatment. It was important for use in tropical regions.

The Concentrated-Arc Lamp.—New illumination developments during recent years included perfection of the tungsten spot and floodlights, the flashlamps, photo-flood lamps and speedlamps. With such versatile control of lighting the photographer was no longer dependent upon sunlight as the sole source. A new type of light source from the Western Union Telegraph Co. laboratories known as the Concentrated-Arc lamp had already found immediate acceptance in the photographic field. This new lamp, developed during World War II, produced an intense concentrated spot of light as small as 0.003 of an inch in diameter. It is actually an arc lamp made with permanent electrodes, sealed into a glass bulb filled with an inert gas such as argon. A tiny speck of zirconium oxide is mounted on the negative electrode or cathode. The positive electrode or anode is made of a metal with a high melting point.

In operation an arc is formed and the oxide surface of the cathode is raised to melting tempera-

ture to produce a brilliant white light, brighter than tungsten filament lamps and nearly as bright as the carbon arc. These characteristics made the Concentrated-Arc lamp ideal for narrow beam and high-intensity projection in photographic enlargers and slide projectors. Wire-sharp enlargements of startling detail were produced when this new light was used in the ordinary photographic enlarger. The same results were obtained when the lamp was placed in a lantern-slide projector. The images projected upon the wall or screen were exceedingly sharp without fuzzy edges. In photomicrography the resulting images were equally amazing in clarity of details. Experimental work was also started with many other types of optical equipment.

Colour Photography.—Considerable activity in the field of colour photography took place throughout the year with a number of important developments by Ansco and Kodak. The use of colour materials by amateur and professional photographers was only limited by the shortage of the sensitized products. Ansco started national distribution of Ansco Color film on March 15. This colour film, developed during World War II, was released in 35-mm. size and also in the popular 120 (B2) and 620 (PB20) roll film sizes. This made a reversible colour film available to the users of roll-film cameras for the first time. Like the sheet film Ansco introduced to professional users in 1944, Ansco Color in amateur sizes was the first colour film which could be developed into finished transparencies by the advanced amateur or local colour finishers. Ansco Color Printon for making colour prints from positive colour transparencies in a single step was released nationally at the same time.

The experimental production by Ansco of a colour negative film 50% faster than any previously available was revealed in March. While this colour film was not immediately placed on the market, its production was noteworthy as an indication of the progress that had been made in colour photography.

A further step in the simplification and improvement of colour photography was the introduction of a double-hardening procedure for Ansco Color film. This eliminated to a considerable extent the stringent need for maintaining solution and wash water temperatures at 70°F. or below during colour processing. With the new procedure all solutions except for the first developer and colour developer could be at any temperature in the range of 60°-75°F., while the wash water was satisfactory at temperatures up to 80°F. Ansco also produced a nontoxic colour-developing agent for colour films and colour paper.

Important advances were made in the 35-mm. professional motion picture field with the Ansco Color Type 735 film. This film differed from the regular Ansco Color film by having a considerably softer gradation, finer grain and more neutral colour balance. This new film was designed for exposure in the motion picture camera and then used for printing the final colour release prints on Ansco Color Release Film Type 732. The Ansco Color Type 735 was not used for projection although it was a positive colour transparency.

The first Sovocolor motion picture film was shown in New York city in September 1946. While this soviet colour film was heralded as an important new development it did not measure up to the modern colour films to be seen on the British and U.S. screens.

On Aug. 26 the Eastman Kodak Co. revealed their new Ektachrome

SEGMENT of the earth's horizon, photographed from an altitude of 65 mi. This scene, showing about 40,000 sq.mi., was recorded by a motion picture camera, attached to the fuselage of a German V-2 rocket, which was fired in a test at White Sands, N.M., on Oct. 24, 1946

film at the annual convention of the Photographers' Association of America in Chicago, Ill. Like the Ansco Color film this new Kodak Ektachrome film could be processed by the photographer in his own darkroom. While this colour film was developed during World War II, it was not announced generally until the proper nontoxic developers could be perfected. The soft gradation and brilliance of Ektachrome plus good fidelity to the subject's basic hues gave excellent lifelike results.

Kodachrome Commercial film was a new 16-mm. motion-picture film announced on Sept. 20 to meet the tremendous demand for improved colour originals for the making of numerous release prints in colour. This new film offered greater exposure latitude and gave improved colour quality in the duplicate prints. The originals on Kodachrome Commercial film were not designed for projection. The new film was expected to benefit producers and users of 16-mm. sales, educational, industrial and training films.

Kodak Dye Transfer Color process, announced on Nov. 5, promised to make possible the production of one full-colour print every ten minutes after the first print was made. The new process utilized the principle of dye transfer from matrices made from colour separation negatives. It gave better quality prints than the former wash-off relief methods, improved colour saturation, and gave greater ease of control; its dyes were faster to light and required less time to make the first colour print. The steps in making colour separation negatives and methods of transfer had been simplified.

The speed of Kodachrome Professional film Type B, was increased with the new speed ratings given as Weston 8, G-E 12 and an Exposure Index of Tungsten 10 for meters using A.S.A. exposure indexes. In August Ansco brought out a new Indiatone paper of interest to professional photographers because of its inherently warm-tone emulsion, good toning characteristics and latitude in development.

Pictorial Photography.—The year 1946 saw pictorial photography recovering from the effects of World War II with supplies for the amateur again appearing on dealers' shelves. Certain types of film and equipment were still on the scarce list but enough were available for the pictorialist to nearly equal his prewar output in the United States.

The notable event in London was the opening of the 91st Royal Photographic Society exhibition on Sept. 14. This was the first big postwar exhibition of the society after the six war years. The exhibition was held in larger quarters at the Science Museum, Exhibition Rd., London, instead of at the society's building at Prince's Gate. There were 200 prints in the pictorial section, 164 exhibits in the scientific and technical division and 150 photographs in the natural history section. Other exhibits included lantern slides and stereoscopic photographs. The increased space and more plentiful photographic materials contributed to the success of this exhibition.

In the U.S. exhibition field 837 pictorialists had 2 or more prints accepted in 63 salons with a total of 13,366 prints being exhibited to the public, an increase of 6% over the previous year.

Leading pictorialists, according to the *American Annual*, were Eleanor Parke Custis of Washington, D.C., with 174 prints in 58 salons, and Jon Delton Dodds of Benton, Ky., with 154 prints on exhibit in 53 shows.

More and more colour appeared in photographic exhibitions with a number having separate colour sections. In the colour slide field 392 exhibitors had 2 or more slides accepted in 11 recognized shows with an additional 547 exhibitors receiving only 1 acceptance.

The first postwar convention of amateurs was held by the Photographic Society of America in Rochester, N.Y., at the end of October with more than 1,000 registering. An outstanding exhibition of press, nature, technical, motion picture, colour and pictorial photography, as well as lectures by such prominent workers as Harold E. Edgerton, Charles E. K. Mees and Edward Steichen on the technique and science of photography, highlighted the affair. It was announced that the membership of the society had passed the 6,000 mark with all of the leading camera clubs in the United States being affiliated.

The year saw a marked increase in the number of camera clubs, in their membership and in their activities. Marked interest was noted among high school students with a record number of entries being received in several contests open only to them.

The Museum of Modern Art in New York City continued its photographic exhibitions. Photographs by Edward Weston were shown in three galleries during February and March and proved to be the most successful exhibition of 1946. During the summer months another Museum of Modern Art exhibition featured the work of 17 new photographers. A fellowship of \$1,000 to carry on a new photographic project was granted to Helen Levitt. Smaller exhibitions were shown continually at the Museum of Modern Art.

Microphotography.—Microphotography in 1946 was very much like any other industry, undergoing readjustment and realignment. The prospects for the future were bright but progress during the year was disappointing. Some wartime applications had carried over into peacetime. At least one of the large firms was entering the field on a national basis with branch offices in the principal cities. There had been many small and specialized services developed in insurance, title abstracts and related fields. Equipment was still in short supply and there was relatively no new equipment different from what was available before World War II.

Experimental models of cameras, reading machines, processing machines, etc., had been prepared, demonstrated and, in certain cases tested. Strikes, transportation difficulties and related matters hampered production and research. Film was still more difficult to secure than during the war years. Sensitive paper was also short.

Machine processing for enlarged paper prints from microfilm negatives became big business in several government quarters. The vast technical resources of the axis countries were seized and many documents pertaining to technical processes and developments microfilmed

in Europe. The master microfilms when returned to the United States were being reproduced in the form of enlarged facsimile prints and made available to U.S. industry through the Office of Technical Services, department of commerce. This was probably the outstanding single development in 1946 and was worth potentially many millions of dollars. Similar work was carried out by the British microfilm program.

On the academic side the influx of World War II veterans caused a heavy drain on existing facilities to supply reference and other material. Progress was being made on the preparation of about 6,000,000 pages of valuable historical material reproduced by the American Council of Learned Societies committee as a security measure in England during World War II. These films were to be deposited in the Library of Congress and made generally available to scholars. Techniques of the microcard, miniature facsimile, reduced facsimile and so-called sheet film remained under discussion. The first pieces of foreign equipment used or developed during the war made their appearance in the United States. Of particular significance were certain French reading machines and the newly-developed cameras at the Bibliothèque Nationale. At two international sessions considerable time was devoted to microphotography and related techniques. The first, the session of the International Federation for Documentation, and the second, the plenary session of the United Nations Educational, Scientific and Cultural organization featured exhibits of U.S. and foreign equipment and formal and informal discussions. (See also MOTION PICTURES; NEWSPAPERS AND MAGAZINES; X-RAY AND RADIOLOGY.) (W. D. MN.)

Three-Dimensional Photography.—Three-dimensional pictures, presenting scenes not only in their height and width—the two dimensions of ordinary pictures—but in their third dimension of depth as well, followed four general channels of development during 1946.

Vectographs.—The first nonmilitary book to carry a vectograph illustration, *Descriptive Geometry* by E. S. Watts and J. T. Rule, appeared in March 1946. Similar in appearance to an ordinary glossy photographic print, the vectograph resembled a collection of precise wire models when viewed through the simple polarizing spectacles.

Turning to the same technique, the U.S. army quartermaster corps found a solution for the perplexing problem of supplying identical samples of acceptable and unacceptable defects in fabrics, shoes and other articles to be used as inspection standards by many different manufacturers. They selected one perfect example of each subject, reproduced it vectographically and distributed copies to all manufacturers and inspectors as permanent, identical records.

Several new eye-training devices, the Vectoluminator and the Vectometer, were offered to the optical profession. Like previous devices, these are based upon the principle of presenting independently movable subjects, or targets, for each eye, to provide a kind of visual calisthenics or to permit the accurate observation and measurement of the co-operative behaviour of the two eyes.

Two companies announced a service, using the basic Polaroid materials, for the processing of vectograph prints and lantern slides for scientists, educators and advertisers. The new medium appeared to be well-established.

Lens-type Viewers.—A new stereoscopic viewer, the Colorscope, designed for popular use, was announced during the year. Like the familiar Tru-View and the View-Master devices, it employed two lenses through which the eyes could look straight ahead at the stereograms, which appeared at some magnification. Stereograms for the new viewer are arranged on two parallel, unbroken strips of 16 mm. Kodachrome film, mounted vertically and eye-distance apart upon a card.

The several manufacturers offered a wide selection of full-colour subjects to be viewed in their devices; the library for the View-Master, for example, included more than 310 cards of 7 views each, ranging from an excellent botanical series (e.g., desert flora, the mushroom family), through the more conventional scenic and historical subjects (e.g., Bryce Canyon, Mount Vernon) to three-dimensional fairy tale illustrations for children.

Projected Pictures.—An outstanding development of 1946 was the projector designed by F. Sonne for the U.S. army air forces, for the projection of continuous-strip aerial photographs. These photographs were taken, usually on colour film, by a double camera of the shutterless strip or panorama type, the two lenses being so arranged that one made a continuous record of the ground immediately in front of the aircraft while the other recorded the terrain immediately behind it. Each record occupied one-half of the photographic negative, which was divided longitudinally. The pictures could be made at speeds of more than 300 m.p.h. and at altitudes as low as 200 ft. with definition which easily resolved ground features as small as the individual leaves on trees and shrubs—a feature of great importance in military reconnaissance. The new projector, in effect, reversed the operation of the camera. It projected the two views of the terrain through a pair of lens systems, so that an audience saw the terrain moving by in the most minute detail and with the heights and depths (by design) greatly exaggerated. Separation of the two pictures, which were superimposed upon the screen, was accomplished by placing polarizing filters in the lens systems and equipping each member of the audience with Polaroid spectacles with their lenses so set that they permitted only the desired image to reach each eye.

While military intelligence officers were getting acquainted with this new view of the world, the University of Illinois, Urbana, Ill., was preparing a new way of viewing the human body. Classes of medical students, through their Polaroid spectacles, were to study the complete anatomy of the head and neck in a new and striking fashion: full-colour three-dimensional pictures thrown on a screen by double-lens, polarizing projectors developed by Three Dimension Co.

The colour-anaglyph system of stereoscopic projection was revived during the year in the Keystone Stereo-Motivator, a device designed for treatment of cross-eyes or squint. The device places three images

on the screen simultaneously, in red, green and black, permitting the individual manipulation of each eye, independently, with relation to a fixed reference point.

Parallax Stereograms.—In the United States at least four processes were being developed for manufacturing various forms of the Ives' parallax or grid stereogram: the Winnek (Trivision), Towne (Vita-vision), Marilhet and the Ayres. All produced pictures that appeared genuinely three-dimensional and that required no viewing mechanism beyond the correct positioning of the observer with relation to the picture. Because of the high degree of illumination required by all parallax stereograms, they were usually shown as transparencies. Some progress was made in combating the limited definition inherent in the parallax system. The U.S. navy promised a public demonstration, to be made early in 1947, of cameras and printers developed for the Winnek process.

Physics. General.—The major research activities of physicists were concentrated on various phases of radioactivity and upon new developments in electronics. From the latter came the new tools with which the atomic nucleus could be attacked. Modern studies in radioactivity grew to such grand proportions that only governments or their subsidiary organizations could supply the necessary financial backing, an aspect of nuclear research which was emphasized by the establishment of new national laboratories. Some of these were outgrowths of organizations set up during World War II for the development of nuclear energy for military purposes. Four were set up in the U.S.A. and one in Great Britain. Undoubtedly something of the same kind was done in the U.S.S.R.

In spite of, or perhaps because of, this seemingly inexorable trend toward nationalization, many physicists had misgivings concerning the future freedom of science. They viewed with alarm in the U.S. the probable expenditure of nearly \$100,000,000 annually for army- and navy-controlled scientific research, as compared with some \$30,000,000 budgeted for research in universities; and they feared that the right of free and immediate publication might be so long denied to a large proportion of investigators that, partly by habit and partly by acquiescence, the rights and liberties of their profession might be permanently curtailed.

Some physicists, like many other scientists and laymen, were apprehensive concerning the possible future abuse of nuclear energy. While this was actually a problem of a political and sociological nature, its impact on physics could not be ignored by reason of the essential part which physicists must play in any utilization of such energy. On the purely technical side the consensus was that the industrial use of nuclear energy would not be achieved quickly and that many entirely new problems of engineering would have to be solved first. One consideration which inevitably led to this point of view was that costs of distribution were a very large part of the total cost of power and that nuclear fuel was still an expensive commodity. Prospects of rapid progress in the medical and biological sciences were extremely promising by reason of the immediate availability from national laboratories of considerable quantities of rare isotopes for use as tracer elements.

On all sides the shortage of high-grade physicists was acute, mainly because of the increased importance of physics in governmental, industrial and educational planning. Educational institutions, because of their limited funds and large enrolments, were the chief sufferers. Nevertheless, the average economic status of the physicist showed considerable improvement.

Neutrons.—A sufficiently accurate knowledge of the properties of neutrons was the key to the successful manufacture of atomic bombs. Until the end of World War II such knowledge was of military value, and its appearance in the regular scientific literature was prevented. In several numbers of the *Physical Review* issued during 1946 were original papers dated 1941 or 1942 which were "voluntarily withheld from publication until the end of the war." Other papers published during 1946 contained reports of researches on the behaviour of neutrons carried out some years earlier under government auspices. The release of this information made meetings of professional physicists very interesting to those who were not connected with military research projects. But the release of a small part of the results of wartime research served only to discourage many physicists by emphasizing how wide was the gap between what was actually known and what was freely published.

The nuclear chain-reacting pile, perfected at the University of Chicago in 1942, produces a stream of neutrons thousands of times as intense as that from any prewar source, thus permitting the investigation of some of the more delicate of the neutron's properties. W. H. Zinn and others reported that a narrow beam of neutrons could be reflected from the face of a crystal as in the case of X-rays. Since there is no such thing as a neutron lens, a narrow beam was selected by slits placed a few metres apart.

This beam was found to be reflected only at certain angles from a crystal face, the angles corresponding in a special way to the velocity make-up of the beam. No new theoretical ideas were involved here; the advance was one in experimental technique. It had been known for 20 years that particles possess wave properties, just as light waves possess some of the properties of particles. There is, in fact, a relation between the speed of a particle and its effective wave length, stated usually in the form $\lambda = h/mv$, where λ is the wave length, h is Planck's constant, m is the mass of the particle and v its velocity. The relationship was verified in 1927 for electrons. Zinn verified it experimentally for neutrons, which are nearly 2,000 times as massive. The algebraic relation just quoted shows that the wave length is inversely proportional to the mass of the particle. Hence, a massive neutron has a very short wave length unless it is nearly at rest. The shortness of the neutron's wave length was chiefly responsible for the experimental difficulty in measuring it. E. Fermi and Zinn, in another experiment, also showed that neutrons, again like X-rays, could be reflected from polished surfaces of many substances, provided the glancing angles were below a certain very small value. The behaviour here was analogous to the total internal reflection of light.

Accelerating Machines.—The components of a typical atomic nucleus are definitely known to be protons and neutrons, but the forces which hold them compactly together are not well understood. Evidence from many nuclear phenomena indicates that the key to the puzzle is in the behaviour of the meson, sometimes called mesotron, a particle intermediate in mass between the electron and proton. Mesons occur randomly in cosmic rays and are known to accompany nuclear disintegrations.

Mesons are themselves unstable, disintegrating after a life of a few millionths of a second into electrons and neutrinos. Progress can not be rapid toward the solution of this problem until mesons are brought under control in the laboratory. It is to achieve this control that physicists are interested in the construction of machines which will accelerate subatomic particles to extremely high energies. The cyclotron and the betatron are examples of these machines. During 1946 a step forward was taken in the design of a new machine, the synchrotron, whose output was predicted as likely to be between 250,-

VIEW through the window in the 20,000,000 volt betatron at the University of Illinois showing the "peeler," a new device disclosed in 1946, which causes the electrons to shoot out into the air in a free beam. The new electron beam was said to open new ways to (1) study the inside of the atom, (2) study the behaviour of electrons, (3) artificially create radioactive substances and (4) attack deep-seated cancer

000,000 and 1,000,000,000 volts, depending on the conservatism or optimism of the designer. The synchrotron principle was first announced by V. Veksler in the U.S.S.R. and was independently discovered by E. M. McMillan in the United States. Modifications of the original design were later proposed by several researchers, and a trial 30,000,000-volt machine was known to be under construction in the U.S.S.R. In the United States, at least two machines of this kind were being built, one in California, the other in Michigan. With them it was hoped to accelerate particles to 200,000,000 or 300,000,000 volts, but at the end of 1946 neither instrument had reached the final test stage.

Mesons and Cosmic Rays.—The kind of result which may be achieved in the future by the use of the synchrotron is suggested by experiments carried out with the General Electric company's betatron. This machine accelerates electrons to nearly 100,000,000 volts. X-rays produced by these electrons, the hardest X-rays ever created in the laboratory, were passed into a Wilson cloud chamber in which any ionizing particles could be photographed. As expected, enormous numbers of free electron tracks appeared. Only a few tracks because of heavier particles were found. These heavier particles were probably, but not certainly, mesons. Thus, there appeared to be a possibility of producing, with a synchrotron, a beam of mesons of known energy; and if this can be done, a new attack can be made on the nucleus.

Scattered information concerning mesons is available from a study of the disintegration of nuclei caused by cosmic rays. A few items of interest were added to the picture, but they make it more complex, rather than simpler. Donald J. Hughes, for example, reported, among other facts, that mesons occurred with a range of masses, from about 25 to 200 times the electron's mass, and that they were produced copiously in the upper

reaches of the atmosphere by some more primitive form of cosmic ray. It was known before that mesons might be positively or negatively charged, but no more than a guess could be made in 1946 concerning the part played by mesons of different masses in the structure of a nucleus.

An experiment of topical interest was performed during the tests of captured German V-2 rockets at White Sands, N.M. The warhead of one was filled, not with ballast, but with cosmic ray apparatus which transmitted by radio to observers on the ground several simultaneous sets of data. Satisfactory records, obtained between 40 and 70 mi. altitude, showed that cosmic ray showers there were a few hundredfold as frequent, and penetrating particles were 20 times as numerous, as at sea level. These results were in general accord with earlier observations made by sounding balloons at heights below 20 mi.

Effects of Atomic Bombs.—The question was often asked: what are the radioactive effects of atomic bombs at places far distant from the explosion? It is safe to conjecture that all existing knowledge on this subject was not freely published, perhaps because no definite answer was available. Of the half-dozen short notes which appeared in the literature about half reported an increase of about 70% in atmospheric radioactivity, measured in terms of the weak background intensity, at times which made such increases plausibly attributable to a distant atomic bomb explosion. The other half reported no significant effect. It may be that the divergence of these observations was because of local meteorological conditions such as rain or wind. In any case, even if the positive result were accepted, there would be no need for apprehension because the normal background count of radioactivity is so far below the danger level that the world would have to be fairly thickly populated with nuclear power piles before the intensity over a very wide area could rise high enough to have even a nuisance value.

Superconductivity.—Another subject upon which divergences of opinion caused a flurry of scientific excitement was superconductivity. The commonest example of this phenomenon is the vanishing of the electrical resistance of certain metals when they are cooled to near the absolute zero of temperature. The implications of the subject are, however, much deeper. A thorough understanding of superconductivity will probably lead to quick advances in the theory of liquids and of metals and alloys. Richard A. Ogg, Jr., reported experiments which demonstrated that certain solutions containing metallic sodium became truly superconducting at temperatures far above absolute zero. This was alternately confirmed and denied by other physicists who repeated Ogg's experiments, sometimes with crucial variations in technique. To be able to create the superconducting state at easily attainable temperatures would be a great step forward, but the validity of Ogg's experiments was not established beyond doubt.

Along the same lines, J. G. Daunt and K. Mendelssohn of Oxford established the interesting fact that liquid helium below two degrees above absolute zero flows from one vessel to another without the aid of gravitational potential energy, a unique property. This behaviour was likened to the flow of electrons in a metal without benefit of a potential difference, which is another way of describing superconductivity, and led to the suggestion that liquid helium ought to be able to transport heat by conduction without a temperature gradient and should maintain circulation by convection without any apparent Newtonian cause. When these ideas have been put in quantitative form by reliable experiments, the properties of liquids and solids at very low temperatures will be a tempting study for theoretical physicists.

Physiology. The researches of many investigators in various fields led to the conclusion in 1946 that there was widely distributed in natural products (including liver, yeast and many green vegetables) a group of interrelated substances which were variously referred to as vitamin M, vitamin B₁₂, folic acid, Lactobacillus casei factor and SLR factor depending upon the source of the material and the species of organism used for test purposes. In certain bacteria these substances promoted growth, in chicks, mice and monkeys they prevented anaemia and favoured normal growth. The belief that these substances were interrelated was substantiated when the chemical structure of one of these substances, folic acid, was ascertained and the synthetically produced chemical was shown to be effective in both bacteria and animals.

Because of the similarity between the anaemia which developed in the experimental animals and certain anaemias which are encountered in human patients, including pernicious anaemia, synthetic folic acid was tried in the treatment of these patients and was found to be effective.

Dietary Protein and Fibrinogen.—Fibrinogen, the immediate precursor of fibrin, which forms the meshwork foundation of the blood clot, is a protein constituent of normal blood plasma.

Studies on chicks showed that the level of plasma fibrinogen can be influenced by the nature of the diet much more readily than can that of the other blood proteins. In general, the fibrinogen increased on a low or on a deficient plane of dietary protein intake to concentrations greater than normal. When the protein content of the feed was increased, the fibrinogen level of the plasma dropped.

Strepogenin.—It was shown that strepogenin was involved in mammalian nutrition as well as in bacterial nutrition. Mice fed hydrolyzed casein supplemented with the necessary vitamins and amino acids showed evidence of suboptimal nutrition and growth. When small amounts of unhydrolyzed casein were added to the basal diet, good growth resulted. The addition of equal amounts of proteins poor in strepogenin, such as egg albumin, produced no improvement in growth.

Knowledge of the role of strepogenin in nutrition was expected greatly to aid studies on maintenance of alimentation by intravenous feeding, a field of great importance in human therapeutics.

Blood Circulation in Athletes.—In order to attempt to determine whether exceptional athletic ability was the result of innate physical attributes or primarily because of special training measures, a detailed study of the blood circulation was made in two men, Arne Andersson and Gunder Hägg, both holders of world's records in long-distance running. Both exhibited a greater than normal sized heart which expelled a greater than normal volume of blood with each stroke. The volume of blood pumped per unit volume of heart size was normal in each case. The studies tended to indicate that training was the most important factor but further studies were needed before a final conclusion could be drawn.

The Mode of Action of Insulin.—After the discovery of insulin biochemists and physiologists devoted much attention to attempts to elucidate the intimate mechanism of its action in the body.

An important discovery concerning the way in which insulin acted to produce its "antidiabetic" effects in the body was announced from C. F. Cori's laboratory. It was demonstrated that the action of the enzyme hexokinase, which catalyzed the conversion of glucose into a reactive phosphate of glucose, was inhibited either in vivo or in vitro by anterior pituitary extract and that this inhibition could be counteracted by insulin.

Physiologically it had long been recognized that an antagonism

existed between the actions of the hormones produced by the anterior pituitary gland and the islet cells of the pancreas. For instance, one of the means of producing diabetes experimentally was the repeated injection of anterior pituitary extract. Furthermore, when the anterior pituitary gland was removed from an animal rendered diabetic by the removal of the pancreas, the metabolism of glucose became fairly normal. The discovery of a biochemical basis for these interrelations was expected to accelerate the understanding of the fault in metabolism which occurs in human diabetes.

Postural Factors in Apical Tuberculosis.—Tuberculosis in the adult shows a remarkable preference for the apical regions of the lungs. Previous theories which had been offered to explain this localization were not satisfactory. Physiological data were provided which constituted the basis for a convincing theory of pathogenesis as well as a physiologic basis for therapy.

When an adult of medium height is standing or sitting, the weight of the column of blood rising from the heart to the apex of the lung may be as great as or greater than the pressure exerted by the fully contracted chamber of the heart which supplies the lungs. Thus, in the erect posture the blood flow to the upper parts of the lungs may be very low if the cardiac output is at basal level. When the subject lies down this resistance to blood flow is removed.

The decreased blood flow to the apical regions of the lungs during assumption of the erect posture rendered these areas more susceptible to infection by tubercle bacilli. This theory explained the higher incidence of tubercular infection of the right apex, the arterial supply of which takes a longer and more tortuous course than that of the left. It also accounted for the low incidence of tuberculosis among patients having stenosis of the mitral valve of the heart, a condition which produces a marked increase in the pressure in the arteries to the lungs.

The use of bed rest in the treatment of tuberculosis, long recognized as being of proven value, was given a physiological rationale, namely improvement of the circulation of blood to the apices of the lungs.

Inhibition of Iron Absorption by Inflammation.—It was demonstrated that the absorption of iron from the gastrointestinal tract was greatly diminished in dogs by producing a sterile abscess by means of turpentine. During the period of the development of the abscess, iron absorption fell to one-tenth of the normal value. Healing of the inflammatory process was accompanied by resumption of the normal capacity to assimilate iron. The importance of this observation in the management of human patients with anaemia is evident.

Radioactive Iodine for Thyrotoxicosis.—Biologists and medical scientists made new applications of the radioactive elements produced by the physicists. By taking advantage of the high selective avidity of the thyroid gland for iodine, it was possible, by the use of radioactive iodine, to place radiation directly within the cells which it was desired to irradiate. When administered to patients suffering from hyperthyroidism the radioactive iodine depressed the activity of the thyroid gland cells and produced a remission of symptoms. It could not be decided up to 1947 whether or not this method of treatment would prove superior to other forms of therapy available for the treatment of this malady.

Pigeon Racing. The year 1946 saw a great forward move in the pigeon racing sport. Fanciers of the British Isles, the United States and other countries united into a world fraternal and pedigree registration organization known as the International Congress of Pigeon Fanciers. British offices opened at Belmont, Surrey, England, and U.S. offices at Washington, D.C. The military use of pigeons by the army created a great increase in the sport in the U.S., which had grown from 1,200 members in the year 1910, with a hatch of 10,000 birds, to more than 16,000 in 1946, with a hatch of 1,060,000 birds. In 1946 a group of fanciers, officers of the American division of the I.C.P.F., organized the first two-way racing club, which was expected to change completely the *modus operandi* of pigeon racing. The older method of shipping birds to a distant point from which each bird flew to his home loft at speed calculated for comparison, in yards per minute, was antiquated through the discovery by Maj. John K. Shawvan of a new method of training racers. All birds now can be taught to finish their race at a central cage before they go home. This eliminates handicaps, calculations of yards per minute speed and time clocks. (J. K. SN.)

Pike, Sumner Tucker (1891—), U.S. government official, was born on Aug. 30 in Lubec, Me., and was graduated from Bowdoin college, Brunswick, Me., in 1913. A geologist, he prospected for oil, learned about industrial power from operating his own utility plant and became an expert on transportation. He made his fortune in Wall street. Although he is a Republican, he was pressed into government service by the New Deal administration and held a variety of posts. In 1939, he was business adviser to Secretary of Commerce Harry Hopkins. In 1940, Pres. Roosevelt named him a member of the Securities and Exchange commission, where he helped to enforce the Public Utility Holding Company act. Later (1942), he became head of the Oil Price Section of OPA where he curbed exorbitant profits by keeping prices down. He resigned from the SEC on March 21, 1946. Pike was named by Pres. Truman, Oct. 28, 1946, to the U.S. Atomic Energy commission, whose responsibility was to direct and control the development of atomic energy in the U.S.

Pittsburgh. Despite prolonged strikes in the coal, steel, electric manufacturing, electric power and hotel industries industrial production in Pittsburgh, Pa., in the first 11 months of 1946 was 151% of the 1935-39 average—the decline of 11% from 1945 being somewhat less than that shown by the federal reserve board's national index. Steel production averaged 73.4% of capacity or 9% below 1945, and coal production was down 6%.

Employed persons in the Pittsburgh district were reported by the Bureau of Business Research of the University of Pittsburgh for the first 11 months at 114% of the 1939 average, 5.6% less than the corresponding period of 1945. Pay rolls were 193% of the 1939 average or 6% less than in 1945.

Retail trade in 11 months reported 34% higher dollar volume

than in the preceding year while department stores reported volume 27% higher.

Two notable bank mergers created the Peoples First National Bank and Trust company and the Mellon National Bank and Trust company, the larger, which had total resources of \$1,140,000,000 and deposits of \$980,866,000.

Advances were made in education, cultural and civic activities. A 3-day forum, marking the centennial of the birth of George Westinghouse, was attended by more than 600 of the nation's foremost scientists, educators and industrialists. The Carnegie Institute of Technology received \$8,000,000 for its capital funds from the Carnegie Corporation of New York after raising \$4,000,000 locally. A 2-month summer season of open-air civic light opera was attended by 270,000 persons.

Eighty communities joined the Allegheny County Sanitary authority in attack upon stream pollution. Voters approved a county bond issue of \$34,000,000 for highway, bridge and airport improvements. The Pittsburgh Redevelopment authority was organized to promote rebuilding of blighted areas. The Regional Planning association proposed a municipal parking authority to expend \$34,000,000 for erection of multilevel garages with capacity for 22,000 motor cars. Ground was broken for a high-speed parkway to bring U.S. routes 22 and 30 and the Pennsylvania turnpike into the city from the east.

The outstanding event in philanthropy was the decision of the A. W. Mellon Educational and Charitable trust to expend a major portion of its remaining assets, approximately \$50,000,000, in the Pittsburgh area.

Population was believed to have increased little above 671,659, as enumerated in 1940, slightly less than half that of Allegheny county, including 3 other cities, 68 boroughs and 53 townships. City area was approximately 54.3 sq.mi. and county area 747 sq.mi. Real estate was assessed for taxing purposes in 1947 in Allegheny county at \$1,885,000,500, of which \$958,080,935 was in Pittsburgh. (C. F. Ls.)

Pius XII (1876—), the 262nd successor of St. Peter in the see of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned as pope on March 12. (For details of his early life, see *Encyclopædia Britannica*.)

Consolidation of the peace and reconstruction of the world, particularly Europe, on humane and Christian lines continued to be the foremost concerns of the pope during 1946. On Feb. 20, addressing the cardinals after the new members of the sacred college had received the biretta, the pope once more stressed the universal and supranational character of the church. The pope rejected the idea that the church has imperialistic ambitions and said that for permanent peace basic rights and institutions must be safeguarded, notably those of the free individual, the family, the state properly conceived. Deportations and forced dislocation of peoples were condemned.

In line with his work for peace, the pope, on Jan. 6, issued an encyclical on the need of caring for youth in the world crisis. Relief to children was urged as a special duty. In March the pope conferred with former president Herbert Hoover on food relief needs, and on April 4, in a special broadcast, warned of political disorders unless immediate steps were taken to avert famine. He appealed to nations with food surpluses to co-operate. Receiving some U.S. immigration officials in March, the pope pointed out the need for lifting of immigration barriers to provide for refugees as the humane alternative to forced repatriation.

The Christmas message contained a strong plea for peace. Hostilities had ceased, the pope said, but peace was still in the future. That mankind might be spared this uncertainty, three

conditions would have to be fulfilled: (1) definite treaties must be signed promptly; (2) efforts for peace should be characterized by justice; (3) amendment and revision of agreements must be possible. The pope also urged continued aid to the hungry and needy peoples.

The pope's solicitude for the oriental churches was manifested in a number of ways. On Jan. 19 he issued an encyclical, *Orientales omnes Ecclesias*, commemorating the 350th anniversary of the Ruthenian church's reunion with Rome and lamenting the persecution of the Ukrainian clergy and people aimed at driving that church into schism. At the time of the consistory in which the cardinals received the red hat, the pope appointed eight cardinals to the congregation for the Oriental church, among them Cardinal Samuel Stritch. On the seventh anniversary of his coronation the pope was vested in accordance with the ancient Armenian liturgy at a solemn celebration of the Divine Liturgy in the Armenian rite, offered by Cardinal Agagianian, patriarch of Cilicia.

During 1946 Pius XII showed concern over the trend of events in Italy. He asked that the constituent assembly make provision for Catholic Christian teachings. On April 2 he urged the Italian Catholic Action Youth to fight anti-Christian forces in politics as well as in private life. When provisional President Enrico de Nicola and Premier Alcide de Gasperi visited the Vatican in July, the pope expressed hope that the Lateran pact would be observed and that the peacemakers at Paris would provide a just peace for Italy. On Dec. 22 a demonstration of loyalty to the pope, attended by several hundred thousand persons, was staged before the basilica of St. Peter's.

To better safeguard secrecy in the papal elections Pius XII drew up a revised Apostolic constitution, eliminating the provision that in a conclave for election of a new pope the ballots must be signed by the cardinals. This constitution was made public on March 9.

On Aug. 16 it was announced that Pius XII had sent notices to the bishops throughout the world asking that they gather views on the doctrine of the assumption of the Blessed Virgin, with a view to definition. On the occasion of the eighth national congress of the confraternity of Christian doctrine the pope addressed the delegates in Boston by radio, urging the need for lay participation in religious instruction. On Nov. 24, to the New York celebration of the 300th anniversary of the North American martyrs, he addressed the gathering by radio, stressing the need for U.S. missionary activity. (See also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.)

(J. LAF.)

Plague, Bubonic and Pneumonic. Though plague has not occurred as outbreaks of serious proportions during recent years it is endemic among rats and field rodents of areas which are widely scattered throughout the world. During 1946, infection of man or rodents was reported from these countries: Italy, Malta, Portugal (Azores); Algeria, Bechuanaland, Belgian Congo, Egypt, Kenya, Madagascar, Uganda, Union of South Africa; Palestine; Burma, China (north and south), French Indo-China, Formosa, India, Siam; Hawaiian Islands, Netherland East Indies; Bolivia, Brazil, Ecuador, Paraguay, Peru; Canada, United States of America (California, Kansas, Oregon, Texas).

Sharp outbreaks occurred in southern China with 293 cases and 104 deaths reported in Amoy between April 21 and July 31; 1,498 cases, 533 deaths in Foochow, Jan. 1 to July 30; 965 cases, 488 deaths in Hweian, Feb. 1 to May 20; 39 cases of pneumonic plague with 36 deaths between Feb. 25 and March 25 from Manchuria. The recovery of three such cases is exceptional in Manchuria and worthy of note.

The persistent endemicity of the disease with its recurrent sharp eruptions in areas which are brought closer to one another and to other centres of population through the facilities and speed of transportation were considered by national sanitary authorities as a threat of grave potentialities. Cognizance of these possibilities was recorded officially by the renewal and amendment in 1944 of international sanitary conventions establishing, until July 1946, provisions for quarantine procedures against plague in the practices of maritime and aerial navigation. In March 1946 these provisions were extended by protocol to an undetermined date of future conventions.

The prevention or suppression of plague may be attacked through destruction of the rodent host or the insect vector, or by immunizing exposed people, or by curative treatments of the afflicted patient. Heretofore the attack has been directed at the rodent in preventive methods, but with the development of insecticides of greater practical efficiency attention is being focused on the rodent flea. Dichloro-diphenyl-trichlorethane (DDT), the anti-house-fly-mosquito agent, was used in outbreaks at Dakar, South Africa, in 1944, and at Taranto, Italy, in 1945 under circumstances which made it difficult to assess its efficacy.

During Nov. and Dec. 1945, a sharp outbreak occurred at Tumbes, Peru. DDT was applied to all dwellings (1,357) of the town and to its public buildings with the reported results of a cessation of the epidemic four days later and a reduction of 81.6% in the number of fleas on collected rats, and 87.9% of the number in rat burrows of the principal focal areas.

The role of the flea in the indirect transmission of the disease through the soiling of clothes by its dejecta was the subject of study because of the development of cases in which the infection was contracted apparently by such contact analogously to the circumstances under which typhus sometimes occurs. It was found that the dejecta of plague infected fleas will produce the disease in animals when introduced by inoculation 18 months after collection and storage.

The prevention of plague in people exposed to the infection has been attempted for years through inoculating them with suspensions of the aetiological micro-organism (*Pasteurella pestis*), which have been killed by heat or chemicals, or of live but avirulent strains. It was believed by capable investigators that the use of live organisms for this purpose is attended with unnecessary risks. On the other hand the prophylactics made of dead organisms have not been conclusively satisfactory. A preparation has been made which under experimental conditions protects the very susceptible guinea pig against infection by inoculation or flea bite transmission better than prophylactics manufactured by some other methods. The bacterium is grown at a temperature, 39° Centigrade, which fosters the development of an envelope or capsule on the micro-organism; the growth is suspended in cold carbolized salt solution after which precipitation is brought about with ethyl alcohol, or with alcohol and alum. It is hoped that but one inoculation of this latter precipitate will suffice for adequate protection.

The prevention or cure of the disease has been sought also by the development of antiplague sera, and a difficulty in determining their probable value has been that of evaluating their effects in experimental animals. A study of the reactions of the blood cells of immune Bombay rats and of white rats to which the antiplague serum was administered against induced plague, indicated that the sera which are prepared from large proportions of the envelope of the bacterium are the better sera.

The treatment of experimental animals with streptomycin, an antibiotic made from *Actinomyces griseus* saved a large percentage of mice which were inoculated with a virulent strain of plague bacteria, and also guinea pigs which had developed the

disease from bites of infected fleas. The drug did not appear to be a better remedy than sulfadiazine.

Plastics Industry. Production of plastics raw materials in the United States in 1946 exceeded all the expectations of the experts, many of whom predicted that there would be a surplus after the close of World War II. This increased production took place despite handicaps such as 90-day strikes among leading suppliers and other general strikes, such as the strike in the coal and steel industries which cut down the production of coal tar acids, from which are derived such chemicals as benzol, cresol and naphthalene, all of which are basic materials used in the production of plastics raw materials.

The production estimates of some of the most generally used plastics materials for the years 1939, 1945 and 1946 are given herewith to show the industry's expansion:

Production of Typical Plastics in Pounds

	1939	1945	1946
Cellulose acetate	21,000,000	76,000,000	103,000,000
Nitrocellulose	13,000,000	15,000,000	18,000,000
Urea and melamine, moulding powder only	12,000,000	30,000,000	35,000,000
Polystyrene	750,000	22,000,000	60,000,000
Phenolic moulding powder	65,000,000	115,000,000	140,000,000
Vinyls	1,200,000	122,000,000	140,000,000

Despite these increases in major plastics materials production, the supply in 1946 was far from sufficient to meet demand. Moulders in the industry asserted that they received less than 70% of the quantity they needed to fill orders. The reason was an intense consumer demand and increased capacity of the processors. In addition, injection presses were gradually increasing in size and thus required more material. They were able to operate faster and more efficiently than the prewar machines. Compression moulders widely adopted electronic preheating and transfer moulding which made it possible for them to double or redouble capacity by increasing speed of operation.

The number of extruders coming into the industry for handling thermoplastic materials was also significant because these machines could handle material at a much greater rate than injection presses.

The number of machines in the industry compared with previous years is as follows:

	1941	1944	1945	1946
Injection	1,000	1,450	1,720	3,275
Compression	8,000	11,500	12,065	12,975
Extrusion	—	650	850	1,150

Practically all raw material manufacturers announced expansion plans which if completed in 1947 would increase the capacity of the industry by at least 50%, but it was doubtful that their plans would reach fruition for several years. Most of the increased production in 1946 was the result of a more plentiful labour supply, improved technique and in thermosetting resins, particularly, producers were able to concentrate upon all-purpose

formulations rather than special formulations which were required for military use in wartime. Most companies had expected to increase their facilities and enlarge their plants in 1946 but were delayed for about six to nine months and it was expected to be at least the middle of 1947 before expansion plans announced in late 1945 would be ready for capacity operation.

The two most closely watched plastics raw materials in 1946 were polystyrene and vinyls. Their expansion from 1939 was a significant factor in the plastic industry.

Polystyrene polymerized from styrene monomer had already become a potent factor because of its all around usefulness and low cost. Styrene monomer production in the United States was at a rate of about 400,000,000 lb. per year according to the best obtainable sources. Most of it, however, was in 1946 used in the synthetic rubber program where it was combined with butadiene in a ratio of about 75% butadiene to 25% styrene to produce GR-S. During World War II, there was not much styrene available for polystyrene but shortly after V-J day styrene became available in increasing quantities for polystyrene and monthly production increased from around 2,000,000 lb. in Dec. 1945 to more than 9,000,000 lb. in Oct. 1946. In addition to its use as a moulding powder, both polystyrene and styrene showed other potentialities such as being blown up for an insulation material, extrusions, sheeting, emulsions and in protective coatings. It was expected that the production rate in 1948 might go to more than 200,000,000 lb.

Vinyl chloride was important during World War II particularly as an insulation material for coating wire where, because of its electrical qualities and water resistance, it became particularly useful in combat both on land and on sea. Wire insulation continued as the greatest outlet. It was just becoming known as a material for rain wear, shower curtains, etc., before World War II. Production at that time was little more than 1,000,000 lb. a year. But so versatile was this material that demand for it in many lines increased to such an extent that the 140,000,000 lb. produced in 1946 was nowhere near enough to meet demand. It was anticipated that several other companies would come into production in 1947 and that from 230,000,000 to 250,000,000 lb. might be produced in 1947. One authority said that the market could absorb 400,000,000 lb. for sheeting, fabric and paper coating alone. Vinyl resin, however, must generally be plasticized and the shortage of plasticizers was a severe handicap to the industry because many processors used inadequate substitutes with the result that much vinyl material reached the market in a degraded form and brought forth considerable complaints. The prospect for enough plasticizer to compound with vinyl resin in 1947 was even worse than it was in 1946.

The vinyls are so comparatively new that processing methods had in 1946 by no means reached perfection. But during the year progress was made in improved printing and embossing methods, heat sealing and other methods of fabricating. It was believed that 1947 would see the development of improved four-colour printing on vinyl, and possibly a method for permitting the material to breathe which would improve its qualities as rain wear and in shoe uppers. A great expansion in the use of vinyl as latices was also expected in 1947.

Cellulose Acetate.—Cellulose acetate, the thermoplastic with the greatest prewar production, moved forward from a figure of 76,000,000 lb. in 1945 to 103,000,000 lb. in 1946 without the addition of increased plant space because producers were unable to finish construction of their new buildings and facilities in operation.

Shortage of cotton linters, pigments and plasticizers handicapped the producers' ability to increase production. It is significant that cellulose acetate sheets, rods and tubes increased from

a 12,000,000 lb. total in 1939 to 19,000,000 lb. in 1946.

Phenolic Moulding Powder.—Production increased from 115,000,000 lb. in 1945 to 140,000,000 lb. in 1946. Yet moulders complained about inability to get this material more than any other. From a prewar production of about 6,000,000 lb. monthly a production rate of almost 15,000,000 lb. was reached in Aug. 1946. This particular branch of the industry was perhaps more affected by strikes than any other, by a critical shortage of wood flour used as filler and chemical shortages such as phenol and formaldehyde. The improved rate of production was the result of improved technique and ability of the producers to concentrate on all purpose formulations.

Urea and Melamine Moulding Powder.—Because of its particular adaptability for such things as radio cabinets, clock cases and other mouldings where colour is desirable, this material was in great demand in 1946. Producers were unable to come into production in new plants which had been planned but not completed. It was doubtful that the new facilities would be completed until the middle of 1947. A critical lack of urea crystal also hampered the industry in 1946 and was expected to be even more serious in 1947.

Ethyl Cellulose.—This thermoplastic is limited to specialty uses because it is slightly higher in cost than most other thermoplastics. It won a reputation in World War II as the nose-piece housing for the proximity fuse. The same characteristic that made it adaptable for that application, resistance to heat and dimensional stability, made it particularly desirable for specialty applications where nonwarping and dimensional stability, such as in boxes, is required. Ethyl cellulose was also used as a strip-pable coat for metal parts, as a lacquer for insulation over wire to be used in high altitudes. Production rose from a rate of about 800,000 lb. monthly in 1945 to a rate of 1,400,000 lb. in June 1946.

Acrylics.—This material which became important during World War II for its use as glazing for aeroplane cockpits and blisters continued in great demand during 1946 as a fabricating material for art work, jewellery, lamp stands, tables, etc. It was believed, however, that much of the scrap material used for this purpose and which was available in large quantities as the residue from aeroplane fabrication had already been absorbed and that fabricators from 1946 on would have to depend on virgin material. Moulding powder from this material which was only available at a rate of from 300,000 to 400,000 lb. a month during World War II was considerably increased and was in considerable demand for such end uses as toilet ware, high-grade ornamental boxes, jewellery, lighting effects, auto parts, etc.

Polyethylene.—Another plastic, originally developed in England, and which won great fame in World War II because of its use in radar, was particularly noted for its electrical properties. It was also being widely experimented with in sheeting for packaging, could be produced as a moulding powder and had great possibilities as a monofilament, which can be used as brush bristles and certain types of fabric. In addition to its development in England, two U.S. companies were producing it and both announced large expansion plans for 1947.

Nylon.—In addition to its wide usage as a fabric, Nylon was also breaking into other parts of the plastics industry as a moulding powder, for sheeting and brush bristles. Its high cost limited the field somewhat, but its characteristics of strength and dimensional stability made it peculiarly adaptable for some purposes, among which were zippers. It was also being made available for extrusion purposes.

Polyesters.—These comparatively new resins are used primarily as a laminating medium with glass mat or glass fabric as well as other materials to impart rigidity and strength. They may be either flexible or rigid. The resins used have most versa-

PREPARING a piece of equipment for storage or export shipping by covering with a cross-hatching of tape and then spraying with a cobweblike covering of plastic resins. This method was widely used by the U.S. navy in 1946 for storing surplus war equipment

tile characteristics and when used to impregnate glass cloth, glass floss, fabrics, paper or other materials may result in either flexible or rigid laminations with a wide range of usefulness extending from shock-resistant Doron body armour to thinly coated, flexible marquisette. Radomes were a typical wartime example. The better-known applications in 1946 were aeroplane fuel cell separators, kick plates on doors, luggage lining, lamp shades, templates, table mats.

The continuous laminates application made with little heat or pressure may have untold uses. The "moulding" of materials impregnated with these resins offers a different group of markets, but most applications involved the use of considerably higher pressure than suggested when the material was new.

The art of low-pressure moulding was in development stage. Rubber bags and blankets were part of the standard equipment used in this process; the situation, however, was about to be reversed with low-pressure laminated moulds, because of their dielectric property, serving in the electronic vulcanization of rubber products. This development promised to cut processing time up to 80% to 90% in that industry, just as it had in plastics moulding.

Attention was also being called to the growing usage of synthetic resins and cellulose in the adhesive and textile-treating field. More than 20,000,000 lb. of phenolic resin were used in plywood laminations during 1946 and even more urea was consumed. In addition great quantities of these materials plus certain vinyls were used as a glue in fabricating such articles as furniture, handbags, shoes and other items. The same producers claimed that the new adhesives would bond anything to anything. One producer announced that he expected to demonstrate successfully that an adhesive could be used in the manufacture of shirts to replace sewing.

At least 15,000,000 lb. of synthetic resin and cellulose were used in treating textiles during 1946 to eliminate shrinking in wool, glazing and wrinkling in all fabrics, preserve crispness, give a permanent glaze, improve furs, improve the pile in fabrics, give a softer, better hand and other similar attributes. It is possible that this development might be responsible for a tremendous increase in synthetic resin production in 1947.

A new industrial resin polytetrafluoroethylene was announced during the year. This material is inert to all types of chemicals excepting alkali metals and does not have a true melting point.

PLASTIC AUTOMOBILE BODY, manufactured from glass fibre and synthetic resin, was one of the features of this experimental automobile, exhibited by its designer, William B. Stout, in 1946

Suggested applications include coaxial cable spacers, valve packings, gaskets, and plug cocks and tubing for chemical plant equipment. The silicon polymers which had been coming along for several years appeared to be headed toward applications in many branches of the industry including laminates, electrical insulation, radios, protective coatings, lubricants and rubberlike products.

World Situation in Plastics.—World War II completely upset plastics production in parts of the world other than the United States and statistics were in 1946 unobtainable. It was known, however, that in 1939 Germany was second to the United States when it consumed about 100,000,000 lb. of plastics raw materials. The greatest portion of that industry was destroyed. The U.S.S.R. was known to have employed plastics on an impressive scale during the war but there were no statistics available with which to estimate their general applicability. Japan made wide use of nitrocellulose and phenolics but that industry too was probably destroyed.

Canada in 1946 had plants producing cellulose acetate, polystyrene, phenolic and vinyls but their production was small in comparison with that of the United States.

The United Kingdom was third to the United States and Germany in 1939. It consumed approximately 600,000 lb. This amount increased considerably, largely as a result of the introduction of thermoplastics. Unavailability of certain raw materials hampered production. For example, the lack of a carbide industry through the later war years inhibited manufacture of vinyls. The lack of ethyl alcohol and certain high aliphatic compounds meant that such compositions as ethyl cellulose and cellulose acetate butyrate as well as some plasticizers had to be imported. Despite these handicaps the industry made substantial progress. Polyethylene, as noted before, came into production on a fairly large scale. A new polyvinyl chloride plant assumed great importance when supplies of natural rubber became difficult to obtain during the war, and in 1946 won a market, particularly in the insulation field.

Nylon production too was increased to a sizable extent. Methacrylates were manufactured in 1939 in considerable amounts but the tonnage made six years later was out of all proportion to the earlier figure. Great Britain was particularly interested in the development of plastics that would help to utilize waste products. One that they had already announced was a resin bonded sawdust timber for conventional wood applications. Another was a honeycomb core aluminum face panel proposed for

use in prefabricated housing. (See also CHEMISTRY; ELECTRICAL INDUSTRIES; MACHINERY AND MACHINE TOOLS; MUNITIONS OF WAR; PAINTS AND VARNISHES; RAYON AND OTHER SYNTHETIC FIBRES; RUBBER.) (C. A. BN.)

Platinum Group Metals. Palladium, iridium, osmium, rhodium and ruthenium are so closely associated with platinum that world production must be reported as a group.

Total		100,266	344,719	336,851

The removal of restrictions on the use and price of platinum caused such a boom in demand, especially for jewellery, that early in May 1946 the price was raised from \$35 per ounce to \$56, continuing to \$90 in October and dropping back to \$70 in November. (G. A. Ro.)

Plutonium: see ATOMIC ENERGY; CHEMISTRY.

Pneumonia. One of the greatest problems in pneumonia was the determination of the cause of certain types of cases particularly prevalent. The common pathogenic bacteria do not seem to be concerned in the causation of these pneumonias and for that reason the modern antibacterial agents had little or no effect on their course except, perhaps, to prevent or eliminate secondary infections with susceptible bacteria. Two important series of studies bearing on this problem were published during 1946. One of these was the report of the Commission on Acute Respiratory Diseases on the transmission

to human volunteers of the kind of pneumonia which has been called primary atypical pneumonia and is generally known as virus pneumonia. The other was a series of reports by several groups of workers, most of them in the U.S. army, on a number of outbreaks of Q fever, a disease associated with pneumonia and caused by a filter-passing rickettsial agent.

The Commission on Acute Respiratory Diseases performed two experiments using groups of conscientious objectors. These subjects were kept under quarantine restrictions for about two months after which they were sprayed directly into the respiratory tract with pooled sputa and throat washings obtained from characteristic cases of primary atypical pneumonia. The inocula in both experiments consisted of autoclaved, filtered and untreated material. The volunteers were closely observed before and after inoculation by clinical, laboratory and X-ray examinations. In the first experiment the material for inoculation was provided by hospitalized soldiers and in the other it was obtained from six experimentally induced cases of pneumonia.

Respiratory illnesses having all of the features of the naturally occurring disease recognized as primary atypical pneumonia were observed in individuals in both experiments who received either the untreated or the filtered materials. The infection was thus transmitted through two successive groups of well persons. When the precautions taken during the inoculation were rigid, no cases of pneumonia developed in any of the individuals who received the autoclaved inoculum.

The results of these experiments indicated that bacteria-free filtrates, which presumably contained a virus, can induce primary atypical pneumonia in man. The incubation period of the experimental disease was approximately one week in subjects who received the untreated inoculum and about two weeks in those who inhaled sprays of the filtrate. Minor respiratory illnesses occurred in some of the subjects inoculated with both the untreated and the filtered material. This was interpreted as suggesting a relationship of that group of diseases to atypical pneumonia.

Q fever is an influenza-like disease which was first described in 1937 by E. H. Derrick in Queensland, Australia. There the disease was first noted among slaughterhouse workers and foresters. The causative agent of the disease was discovered by F. M. Burnet of Melbourne and proved to be a filter-passing agent which became known as *Rickettsia burneti*. The tick (*Haemophysalis humerosa*) and the bandicoot (*Isodon torosus*) might constitute an important vector and host reservoir, respectively. The association of this disease with pneumonia was not recognized in Australia. A similar agent was found in ticks collected from Montana and Wyoming by workers in the Rocky Mountain laboratory of the U.S. public health service and a disease similar to Australian Q fever is known to occur in that region. A laboratory outbreak of atypical pneumonia resulting from Q fever was described in 1940 among workers at the National Institute of Health. The various groups of workers in the U.S. army studied new outbreaks of Q fever associated with pneumonia that occurred in the Mediterranean area with secondary outbreaks in the United States. They were also able to isolate and identify a similar agent from a case in Panama.

An opportunity arose in Feb. 1945 to investigate one of these outbreaks that occurred in a British parachute regiment. The infection in this organization had been acquired in Athens, Greece. Although the outbreak was subsiding when the studies began, sufficient data were obtained to suggest that the disease differed in certain features from primary atypical pneumonia and the nature of the outbreak was subsequently identified by the laboratory examination of the serum specimens from the patients. Four similar outbreaks were investigated among U.S. troops stationed in northern Italy near Florence and Bologna. In the 15th medical general laboratory which was serving that area, a rickettsia similar to that of Q fever was isolated from the blood of some of these patients and shown to be the cause of the outbreaks. At the same time it was demonstrated serologically that 29 of 40 sporadic cases of atypical pneumonia in Italy were actually Q fever.

At about the same time it was also learned that there had been an outbreak of an illness resembling influenza in and around Athens during the preceding winter. The disease there differed from common influenza in that it lasted more than ten days and specific lesions of pneumonia were found in radiograms of the lungs. There were no deaths. The Germans who seemed to be more severely affected than the natives, presumably because they lacked immunity to the disease, referred to it as the "Balkan gripe." Dr. J. Caminopetros of the Pasteur Institute of Greece established a transmissible febrile illness in guinea pigs by inoculation of blood from one of these patients. The agent of Q fever was later identified from one of these guinea pigs in the laboratory of the Commission on Acute Respiratory Diseases at Fort Bragg, N.C.

During May and June 1945 other outbreaks occurred among troops in transit from southern Italy to Camp Patrick Henry, Va., and other ports of debarkation in the United States. Studies of the outbreak at Camp Patrick Henry indicated that it was probably the result of an agent similar to that of the "Balkan gripe."

In the course of these investigations outbreaks of atypical pneumonia

occurred among the personnel of the 15th medical general laboratory and the Respiratory Diseases commission's laboratory where all of these studies were being carried out. These outbreaks were shown both by isolation of the agent and by tests for the development of immunity in the blood of patients to be caused by the Italian and Balkan strains of rickettsia, respectively. Each of these strains and the one from the case in Panama closely resembled that of U.S. Q fever but were shown to have some distinct antigenic differences.

There was also a preliminary report of an outbreak of Q fever that occurred among civilians in Amarillo, Tex., in March 1946. More than 40 cases, mostly in men, were found and there were also some inapparent infections. There were two deaths in this outbreak. The cases occurred among employees of a stockyard and meat-packing company and in railroad workers around the stockyards. The illnesses varied from attacks of mild influenza-like infections to severe atypical pneumonia. The preliminary studies seem to indicate that cattle were the source of the human infection. All of these studies and the discovery of a new rickettsial agent as the cause of an outbreak of an influenza-like infection associated with a rash that occurred during July 1946 in New York city bring out the increasing significance which rickettsial agents are assuming in the field of respiratory diseases.

With respect to the therapy of pneumonia, two advances were made during 1946. The introduction of streptomycin widened somewhat the scope of specific antibacterial therapy. This antibiotic was effective against most of the gram-negative organisms which were not significantly influenced by sulfonamides or penicillin. Two of these gram-negative organisms in particular, namely, *Haemophilus influenzae* (the so-called influenza bacillus, not the influenza virus) and the Friedlander's bacillus (*Klebsiella pneumoniae*) may give rise to bronchopulmonary infections. The former occurs most often in infants and young children and causes severe laryngotracheobronchitis or pneumonia that may be highly fatal especially in the infants. It may also be associated with chronic bronchitis and bronchopneumonia in old people. The Friedlander's bacillus causes a very severe and highly fatal pneumonia particularly in older persons who have chronic respiratory or urinary tract infections. Streptomycin like penicillin must be given by injection. Good results were reported in the treatment of pneumonia caused by these two organisms.

The use of penicillin by inhalation of a nebulized spray has been gaining acceptance among the medical profession. The method, which was usually referred to as aerosolization, consisted of passing a stream of oxygen through a capillary tube into a solution of penicillin placed in a small glass container within a glass bulb. As the oxygen under pressure from a tank passed through the penicillin solution, it produced a spray of finely divided particles of the solution. It was then conveyed by a tube to the patient who then inspired the penicillin-laden oxygen. This offered an opportunity to get a high concentration of the antibiotic all through the structures of the respiratory tract. The method was most useful in the treatment of lung abscesses, bronchiectasis and other chronic bronchopulmonary infections in which penicillin-susceptible organisms are often involved. It might also be useful in the treatment of some types of pneumonia and their complications, particularly those involving the tracheal passages. Streptomycin was also used in this manner where organisms susceptible to that agent were causing the infection.

Poland. A republic in northeastern Europe between the U.S.S.R. in the east and Germany in the west, the Baltic sea in the north and Czechoslovakia in the south. Area: 119,703 sq.mi. (Sept. 1, 1939, 150,486 sq.mi.); pop. (Feb. 14, 1946, census) 23,911,172; (est. Sept. 1, 1939) 35,339,000. The "recovered lands"—former German territories and the free city of Danzig—represent 39,120 sq.mi.; their pop. in 1939 was c. 8,300,000 including c. 1,000,000 Poles. The 1946 census disclosed there a population of 5,012,126, but a tremendous migratory movement continued after that time. 1,289,193 Germans left Poland from Feb. to Sept. 30, 1946; c. 1,500,000 Poles coming from former Polish eastern provinces took their places; other Poles (986,578 till July 31, 1946) were repatriated from Germany, Austria and western Europe; finally, up to July 1,

WOMAN WALKING through the ruins of a desolate street in Warsaw, Poland, in the spring of 1946

1946, 515,998 Ukrainians, Byelorussians and Lithuanians had left Poland to settle in their respective soviet republics. Warsaw, capital of Poland, had on Sept. 1, 1946, a pop. of 522,945 (est. Jan. 1, 1939, 1,289,000). Other chief cities (first figure est. Sept. 1, 1946; second figure est. Jan. 1 1939): Lodz (596,000; 672,000); Cracow (305,000; 259,000); Poznan (268,000; 272,000); Wroclaw (Breslau) (168,000; 625,000); Katowice (128,000; 134,000); Gdansk (Danzig) (118,000; 235,000); Szczecin (Stettin) (103,000; 272,000); Lublin (99,000; 122,000); Gdynia (79,000; 120,000). Acting president (1946): Boleslaw Bierut, chairman of national home council (provisional parliament); prime minister: Edward Osobka-Morawski.

History.—In 1946 the Polish people had shown once more their extraordinary resilience and powers of recuperation. It was a year of undeniable economic recovery despite a limited degree of real independence and the fact that the political tension, already acute in the previous year, had rather increased. There was no specifically Polish foreign policy. Polish representatives at the international conferences had no more freedom of movement than their Ukrainian or Byelorussian colleagues. After an experience of a year and a half it was obvious to any impartial observer that Poland had a totalitarian government controlled by a small Communist minority. The other political parties belonging to the "national unity," Socialist, Democratic, Peasant and National (Christian-Democratic) Labour, acted as agencies under Communist supervision. Well-known Socialist, Democratic, Christian-Democratic and National party leaders were still in the underground, or in prison or abroad. The only party allowed to fight openly for true democracy was the Polish Peasant party led by Stanislaw Mikolajczyk who joined the provisional government formed in Moscow in June 1945, but insisted from the beginning that free and unfettered elections should be quickly held. The Communist rulers—Boleslaw Bierut, Wladyslaw Gomolka (deputy premier) and Jakob Berman (undersecretary of state in the prime minister's office)—gave Mikolajczyk to understand that either his party would join a government bloc and accept a single list of candidates in every constituency or he would be crushed.

Meanwhile, in order to gain time, to train its own political machinery and to test the mood of the people, the Communist triumvirate suggested a referendum in which the Polish electorate would answer the three questions: (1) Are you for abolition of the senate? (2) Are you for making permanent, through the future constitution, the economic system instituted by land reform and nationalization of basic industries, with maintenance of the rights of private initiative? (3) Are you for the Polish western frontiers as fixed on the Baltic and on the Oder and the Neisse? The Polish Peasant party decided to take part in the referendum but, in order to count not so much its own supporters but all the Poles opposed to the Communist regime, asked the nation to vote "yes" to the second and third questions, but "no" to the first. The referendum took place on June 30 and, according to the Polish Peasant party, 83.5% of the electorate voted "no" to the first question. The regime, however, published on July 12 (after a delay of 12 days) completely different results. It alleged that the answers to the first questions were 7,844,522 "yes" and only 3,686,029 (32%) "no." The answers to the second question were given as 8,896,105 "yes" and 2,634,446 "no"; to the third—10,534,697 "yes" and 995,854 "no."

On Aug. 19 the British and U.S. ambassadors presented to the Polish provisional government sharp notes protesting against oppressive acts which prevented normal democratic political activity in Poland. The British note said, for instance, that "it is widely believed in Poland that grave irregularities occurred in connection with the referendum." Both notes insisted that the Polish government should make as soon as possible the necessary arrangements for the "free and unfettered elections." As Maj. C. P. Mayhew, undersecretary for foreign affairs, said on Oct. 18 in the house of commons, this was not a Polish domestic affair; it was "an international bargain" agreed upon at Yalta. But the regime continued to consider the Polish Peasant party as enemy No. 1. At a foreign press conference on Oct. 20, Mikolajczyk disclosed that 13 members of his executive and 797 other party members were imprisoned by the security police; he further alleged that 95 members of his party were killed during the preceding five months.

Finally, on Nov. 13, Bierut signed a decree fixing the Polish

elections for Jan. 19, 1947. On Nov. 22 Victor Cavendish-Bentinck, the British ambassador, and Gerald Keith, the U.S. chargé d'affaires, again delivered strongly worded notes in Warsaw pointing out that both the governments could not regard the assurances of the Polish provisional administration as having been fulfilled unless all democratic parties in Poland had equal facilities to conduct a campaign freely and without intimidation, and unless all parties were represented on all the electoral commissions concerned with the elections at all levels.

Although the Poles are mainly Roman Catholic, only 64.9% of the inhabitants of pre-1939 Poland belonged to that religion. In the new Poland 97% are Catholic. When the Polish provisional government was organized in Warsaw the Catholic Church adopted a policy of neutral expectation. With the elections forthcoming, the Polish episcopate had to take a stand. It chose a form of a pastoral letter signed by August Cardinal Hlond, primate of Poland, which was read in every church in the country on Oct. 20. The letter declared that Catholics must not vote or be candidates on lists associated with a program or methods of government which were against Christian morality and the Roman Catholic concept. For the first time Cardinal Hlond also told Catholics that they must not belong "to organizations or parties whose principles are contrary to Christian teachings and whose activity aims at undermining Christian ethics." On Nov. 23 Bierut said in a press interview that whether the Catholic Church would continue to "enjoy its present rights in Poland depended entirely on whether or not the Polish clergy was prepared to accept the new state of affairs in this country."

Education.—In the school year 1945-46 there were 18,423 primary schools (as against 28,881 in 1938-39) with 3,004,007 pupils (4,953,000 in 1938-39). No figures were published for the secondary schools which in 1938-39 were 784 with 197,500 pupils. In 1938-39 Poland had 25 universities and other schools of higher education with a total of 48,000 students enrolled. The three pre-1939 state universities of Warsaw, Cracow and Poznan and the private (Catholic) university of Lublin, which were closed by the Germans in 1939, reopened in the autumn of 1945. New universities were founded at Lublin, Gdansk, Wroclaw, Torun and Lodz. Besides the old school of engineering, reopened in Warsaw, new colleges were founded at Cracow, Gdansk and Gliwice. The total number of students enrolled in 1946 was estimated at 60,000.

Banking and Finance.—Budget est. (from April 1 to Dec. 31, 1946) revenue \$358,680,281; expenditure \$393,266,083. Bank notes circulation (Aug. 31, 1946) \$442,179,000. Exchange rate (Aug. 1946) 1 zloty = 1 U.S. cent. In December the U.S. government announced the unfreezing of Polish gold to the nominal value of \$27,000,000 and of \$10,200,000. The Polish assets in Great Britain (mainly £7,000,000 of gold) continued to remain frozen.

Trade and Communication.—Foreign trade (first six months of 1946, in thousands of dollars): imports 45,141 (78% from the U.S.S.R.); exports—68.6% of which was coal—41,875 (72% to the U.S.S.R.). Railways, main lines (1946) c. 16,000 mi.; rolling stock (Aug. 1, 1946) locomotives 5,647 (43% under repair), wagons 118,750 (24% under

repair), passenger carriages 7,852 (50% under repair). Monthly average of freight traffic (first half of 1946) 1,278,210,000 short ton-miles; corresponding figure for passenger traffic 15,840,000 persons. Est. turnover of the ports of Gdansk and Gdynia (1946) 8,500,000 tons (50% of 1938); shipping (July 1946) 140,000 gross tons.

Mineral Production and Manufacturing.—(In short tons) average monthly production (1946): steel 104,500 (75% of 1938); crude oil 10,700 (22%); cement 163,900 (109%); artificial fertilizers 15,211 (97%); cotton yarn 3,821 (64%); woollen yarn 337 (33%); electric energy 446,000,000 kwt. (134%). Total output of coal in 1946 was estimated in December at 51,700,000 short tons (123%).

Food and Agriculture.(In short tons, 1945): grain (rye, wheat and barley) 6,359,000; potatoes 1,392,000; sugar beets 114,000. In other words, Poland's crops in 1945 were 563 lb. of grain and 128 lb. of potatoes *per capita*, as against 741 lb. of grain and 2,393 lb. of potatoes in 1938. Therefore, without the help of the United Nations Relief and Rehabilitation administration a serious famine would have been unavoidable. In March 1946 Herbert Hoover stated that Poland's food situation was among the worst in Europe. In October General Charles Drury, head of the U.N.R.R.A. mission in Poland, said that the 1946 harvest had produced only 4,400,000 short tons of grain—1,959,000 less than in 1945. Other deficits for 1947 were: 78,100 short tons of edible fats, 71,500 short tons of meat and 170,000 gal. of milk. Reliable mortality figures from cities showed that independently of war casualties the death rate in Poland rose during the years 1939-45 to a figure ten times higher than in England; at least 250,000 persons with open, infectious tuberculosis lived in the same room with others. Poland had never been dependent on food imports, but wartime devastation and loss of equipment and livestock had evidently caused a considerable drop in production. Cattle were in 1946 about 40% of 1938 level (10,554,000), horse numbers were down to 30% of the 1938 figure (3,910,000) and pigs to 23% (1938: 7,525,000). (K. S.M.)

Police. In democratic governments throughout the world the year 1946 brought major changes of police structure and administration. Largest single development was represented by the Police act (1946) passed by parliament for the further consolidation of police forces in England and Wales. While the process of integration had been under way for many years, this action was especially significant because it seemed to forecast an ever-declining number of municipal police establishments. In effect, the long-range outlook was for fewer and larger police forces. Chief feature of the 1946 act was the requirement that most of the noncounty borough forces be consolidated with the adjoining county constabularies. As a consequence, 47 local police forces, some of considerable size, were expected to disappear entirely as independent police agencies. The net result of these and earlier consolidations would be that only 133 police forces would remain in the service of some 490 counties, cities and boroughs.

Also of striking character was the apparent trend toward a shorter work-week for English police. The five-day week had become pretty well established in many industries, although the 48-hour week still prevailed in police employment. The necessarily long hours of emergency duty during the war years had brought reaction in the form of agitation for a 40-hour week. Although this admittedly would involve considerable increases in the police establishment, without any enlargement in the number of police on duty at a given time or place, the point was made that the increased number of police who would be "off-duty" under the scheme for a shortened work-week, would in effect increase the amount of reserve manpower, thus adding at least to police resources in times of emergency. In a land where the preceding six or seven years had been marked by an almost continuous state of critical emergency, such arguments might well be persuasive. Should they prevail, the effect upon police employment policies would be felt far and wide in many parts of the world.

Almost coincident with the foregoing proposals however was the announcement that the number of regular police in England and Wales had steadily declined from the outbreak of World War II to a point 20% below that of 1940. While the gaps thus left in the regular ranks were more than filled by temporary constables, the immediate outlook was for large-scale

POLISH BOY carrying home two loaves of bread made from wheat supplied by U.N.R.R.A.; two loaves was the daily ration in 1946 for a family of six persons

recruiting of regular personnel. Despite such dislocations, the total strength of police in England and Wales averaged slightly more than 2 per 1,000 of population—not by any means a grossly inadequate quota for the protection of both urban and rural areas.

As a direct result of the centralizing influences of the war period, eight district boards were established to co-ordinate recruitment for all police forces, thereby making a surplus of qualified recruits in any given area readily available to other areas where the response might be less favourable. Also significant was the installation of training centres in each of the eight districts, to the end that a uniformly high standard of recruit training might be maintained throughout the decentralized police system.

As the year 1946 opened in the United States, many police forces were confronted by industrial strikes that threatened to disturb the public peace but the most ominous of these were less violent than had been feared and even the simmering racial issue produced no large scale disturbances. Considering the early indications of serious trouble in both of these fields, U.S. police could congratulate themselves upon the generally satisfactory record they compiled in such activities during the year.

Less gratifying was the anticipated postwar increase in crime and traffic accidents which gave the impression that police everywhere were being overwhelmed. This in turn led to demands for quick replacement of wartime losses in police strength, but since these last were of moderate degree, restoration of prewar levels of crime and traffic accidents were employed in many jurisdictions to raise police man-power quotas to a point never before reached. Indications were that these increases in police personnel would be projected into 1947 and thus add still further to the police establishment. Whether U.S. cities could assume these enlarged burdens of police manpower and at the same time meet the necessary or desirable increases in police compensation seemed unlikely, once the postwar boom had spent its strength.

Table I.—Numerical Strength of U.S. Municipal Police Forces, 1941–46

Population groups of cities	(Number per 1,000 inhabitants)					
	1941	1942	1943	1944	1945	1946
Group I—Over 250,000	2.12	2.13	2.07	2.02	1.94	2.14

Meanwhile the re-equipment of U.S. police departments was proceeding slowly because of the slowdown in the production of motorcars and other mechanical aids of modern police. In many forces deferred replacement during the war period had been joined with deferred maintenances in the confident expectation that industrial production schedules would be stepped up rapidly at war's end. Despite such apparent handicaps, it appeared that U.S. police had returned to their prewar levels of performance, and if these were not satisfactory in some instances, the fault did not lie with equipment shortages.

The proportion of crimes that were cleared by arrest in 1,422 U.S. cities having a total population in excess of 47,000,000 inhabitants, showed declines as to some crimes and increases as to others, but none of these changes were large enough to be significant.

Since the police record of accomplishment in clearing cases depends in part upon the burden of investigations imposed by the number of crimes committed, it is pertinent to point out that the war years showed many declines in crime frequency with the higher prewar levels tending to be restored as the nation returned to a peacetime basis. Hence the 1945 clearances shown in Table II reflect the return of U.S. municipal police to a more normal level of crime frequency and a more normal

Table II.—Per Cent of Crimes Cleared by Arrest in U.S. Cities 1941–1945

Offenses	1941	1942	1943	1944	1945
Murder and nonnegligent manslaughter	88.1	90.6	90.5	90.8	86.9
Negligent manslaughter	86.6	86.1	84.0	81.5	82.7
Rape	76.2	81.2	74.0	74.8	74.1
Robbery	40.4	43.3	38.1	38.7	36.2
Aggravated assault	75.0	80.5	73.7	75.7	76.2
Burglary; breaking or entering	32.0	31.5	30.7	31.6	31.3
Larceny (except auto theft)	22.7	25.0	24.1	23.6	22.8
Auto theft	24.4	24.6	26.5	24.4	26.4

level of success in dealing with it.

In all countries the year was one of readjustment of the police services from a wartime to a peacetime basis, although under the authoritarian regimes the clear indications were that close police controls would be tightened rather than relaxed. Symptomatic of this condition was the announcement late in Dec. 1946, that the Communist party in Poland had taken over control of the *Urzad Bezpieczenstwa* (forces of security). This body numbered 170,000 full-time police operatives, or about 20,000 more than the strength of the regular army. Hence it was likely that party control of such a police agency would prove far more important in determining Poland's political future than the decisions made through constitutional conventions and popular elections.

The Nuernberg trials of major war criminals held special interest for those concerned with police and policing, since the International Military Tribunal declared certain police groups of the nazi regime—viz., the SD or Security Service and the Gestapo—to be criminal organizations. Thus all former members of such police agencies became subject to summary trial and punishment. Conclusion of the Nuernberg trials was marked by the conviction of Ernst Kaltenbrunner, head of the nazi secret police under gestapo chief Heinrich Himmler. Kaltenbrunner suffered the death penalty by hanging in the large-scale executions of outstanding nazi leaders.

The annual congress of the International Association of Chiefs of Police was held in Mexico City in Sept. 1946. Its discussions tended to cluster around questions relating to interforce collaboration among police of North, Central and South America. If early plans for the next meeting of the association were to be followed, the 1947 police congress would be held in Duluth, Minn. Pollock, Channing (1880–1946), U.S. playwright, was born on March 4 in Washington, D.C., and in 1897 was graduated from Bethel Military academy (Warrenton, Va.), subsequently continuing his studies at the Polytechnique in Prague. When he was 16 years old, he obtained a job on the *Washington Post*, becoming drama critic for the newspaper two years later. At 19, he was the drama critic for the *Washington Times*. In 1900 he went to New York and became the general press agent for William A. Brady. Shortly thereafter his plays, *The Pit* (1900), *Napoleon the Great* (1901) and *The Little Gray Lady* (1903), made their appearance. Three of his most famous dramas, *The Sign of the Door* (1919), *The Fool* (1925) and *The Enemy* (1926), were hits in New York

and London. Pollock was an indefatigable and prolific producer of plays, books, reviews and essays, as well as being a crusading lecturer in the interests of the theatre. A harsh critic of literary censorship, he maintained that it stifled endeavour, and he once delivered the opinion that state censorship boards "would have obliterated Shakespeare, buried Balzac, smashed Shelley, mutilated Molière, destroyed Dante and rendered impossible the publication of the Holy Bible." His books include *Star Magic* (1933), *Synthetic Gentleman* (1934), *The Adventure of a Happy Man* (1939), *Guide Posts in Chaos* (1942) and *Harvest of My Years*, an autobiography (1943). Among his other plays are *The House Beautiful* (1931) and *Stranglehold* (1932). He died at Shoreham, Long Island, N.Y., on Aug. 17.

Polo. Polo staged a remarkable comeback after four years of inactivity caused by World War II with approximately 25 centres of the game resuming play throughout the United States. The first international polo after 1939 highlighted the season at Meadow Brook on Long Island, N.Y., when a high-goal Mexican team played a two-out-of-three game series against a picked United States four for the General Manuel Avila Camacho cup. The United States won in two straight matches, but the Mexicans were victorious in the national open championship, highest polo honours of the U.S., in the series that followed.

The first annual meeting of the United States Polo association after 1941 took place in the fall with delegates attending from all over the country as well as from Hawaii and the Philippine Islands. Robert E. Strawbridge, Jr., Elbridge T. Gerry and George C. Sherman were elected governing officers and plans for revivals in 1947 of sectional, national and collegiate tournaments were made. (R. F. K.)

Popcorn. The 1946 United States crop of popcorn was estimated at 266,752,000 lb., compared with the record 1945 crop of 427,780,000 lb. and an average of 116,300,000 lb., 1935-44. The 1946 acreage was 163,300, a little less than half the 311,900 ac. harvested in 1945, but double the average of 87,156 ac., 1935-44. The yield was 1,634 lb. per acre compared with 1,372 lb. harvested in 1945 which was near the average. The quality of the crop was unusually good in 1946. Iowa led with a crop of 81,900,000 lb.; Indiana 36,290,000 lb.; Illinois 34,650,000 lb.; Ohio 27,495,000 lb.; Missouri 24,000,000 lb. and all other of the 12 states less than 20,000,000 lb. each. Hybrid seed was used on a larger portion of the acreage in 1946. The market for popcorn expanded rapidly from 1941, when the first crop of more than 125,000,000 lb. was harvested. The farm price was about \$1.50 per 100 lb. except in years of short crops, then rose to more than \$4 in 1943 and continued at about that level through 1946.

Porter, Paul Aldermandt (1904-), U.S. government official, was born Oct. 6, in Joplin, Mo. A graduate of the University of Kentucky Law school, he practised law and also worked as city editor of the *Lexington Herald*. He entered the government service in 1932 as special counsel to the department of agriculture. Two years later (1937), he left the AAA to become Washington counsel for a broadcasting chain. In 1942, he was deputy administrator in charge of rent control in the Office of Price Ad-

ministration, and became associate administrator in the War Food Administration in 1943.

Porter handled Democratic publicity in the 1944 presidential campaign and on Dec. 21, 1944, he was appointed by Pres. Franklin D. Roosevelt to the chairmanship of the Federal Communications commission.

He became director of OPA by appointment of Pres. Harry S. Truman on Feb. 14, 1946. The new administrator pledged himself to hold down prices until the "tide of inflation passed." He barred increases in rent ceilings and clashed with Secretary of Agriculture Clinton Anderson on food price controls. He resigned Nov. 29, 1946, after the OPA had been shorn of most of its powers, and on Dec. 11, 1946, the state department disclosed that he was named to head a U.S. economic mission to Greece with the rank of ambassador.

Porto Rico: see PUERTO RICO.

Portugal. A republic of western Europe, forming part of the Iberian peninsula and bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira): 35,413 sq.mi.; pop. (census Dec. 12, 1940) 7,722,152. Chief towns: Lisbon (cap. 709,179); Oporto (262,309); Coimbra (35,437). Language: Portuguese; religion: predominantly Roman Catholic. President: General Antonio Oscar de Fragozo Carmona; premier in 1946: Dr. Antonio de Oliveira Salazar.

History.—An unsuccessful military revolt broke out on Oct. 10, 1946, in the Oporto cavalry barracks. The rebels, marching on Lisbon, surrendered to superior forces at Coimbra without a fight. Their aim was the establishment of a Republican military government to hold free elections. In January the government sanctioned socialist meetings but closed the offices of the other chief opposition party, the Democratic Union movement, both in Lisbon and in Oporto. In August three leaders of that movement were arrested and in October widespread criticism followed the dismissal of two Republican university professors by the minister of education.

In February, despite help from the United States and Canada, bread rations had to be cut by from 14% to 18½%. Inefficient distribution of meat and fish caused street rioting in Lisbon in March and discontent continued throughout the summer.

Portugal led the world in aviation by opening all its territory to civil aircraft; Pan American Airways reduced flying time between New York and Lisbon to less than nine hours. An air transport agreement was signed between Portugal and Belgium.

(E. A. P.)

Education.—In 1942-43: elementary schools 7,714, scholars 542,925; secondary schools 42, scholars 15,346; universities 3, students 9,927.

Trade and Communication.—External trade (1945): imports 3,952,500,000 escudos; exports 3,265,000,000 esc.; re-exports 1,107,500,000 esc. Communications and transport (1945): roads, first and second class, 9,180 mi.; railways open to traffic 2,191 mi.; vehicles licensed (1944): cars 47,469; motorcycles 4,604; cycles 141,872; shipping (Jan. 1, 1943) 313,534 gross tons.

Banking and Finance.—Revenue (est. 1946) ordinary 3,018,000,000 escudos; extraordinary 1,363,000,000 esc.; expenditure (est. 1946) ordinary 3,017,000,000 esc.; extraordinary 1,363,000,000 esc.; public debt (Dec. 1944), domestic and foreign, 9,389,000,000 esc.; notes in circulation (June 1946) 8,039,000,000 esc.; gold reserve (June 1946) 6,057,000,000 esc.; exchange rate (1946) 1 escudo=4.03 U.S. cents.

Agriculture and Other Production.—Production, 1945 (in short tons): wheat 325,110; maize 243,012; rye 132,944; oats

81,344; barley 73,224; potatoes 692,000; beef 31,700; pork 6,100; mutton 3,500; wet-fish 4,537; cement 24,000; wine 276,957 gal. (See also PORTUGUESE COLONIAL EMPIRE.)

Portuguese Colonial Empire. Total area (approx.): 803,833 sq.mi.; total population (1940 census): 10,879,415 excluding metropolitan Portugal, the Azores and Madeira. Certain essential facts and figures relating to the colonial possessions of Portugal are given in the accompanying table.

History.—In April 1946, a contingent of 1,000 Portuguese

legs." In order to control and limit the use of the penalty mail privilege, congress passed the "penalty mail law," effective July 1, 1944, which provided that departments and agencies (except the war, navy and post office departments) account for all matter bearing the penalty indicia and pay into the treasury as miscellaneous receipts, and not as postal revenue, the cost of handling such matter. The records disclosed that during the fiscal year ended June 30, 1946, there were mailed 1,694,994,749 free pieces, weighing 251,940,174 lb., a decrease of 213,784,213 pieces and a decrease of 58,236,407 lb. from the 1945 fiscal year.

troops was sent to Timor to receive the Japanese surrender, returned from there to Lisbon after a voyage of exactly six months. (E. A. P.)

Portuguese Possessions in Africa: see PORTUGUESE COLONIAL EMPIRE.

Post Office. The audited revenues of the post office department for the fiscal year 1946, as stated in the records of the comptroller general of the United States, amounted to \$1,224,572,173.34.

There was also reported to the treasury department the items stated in the act of June 9, 1930, indicating the estimated postage that would have been collected if the services had been on a regular pay basis, in the case of penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind. These amounted to \$100,246,983.

The expenses of the department for the fiscal year as audited amounted to \$1,353,653,679.31, of which amount \$35,990,700.82 was on account of prior years. There was \$54,992,030 unpaid on account of the 1946 fiscal year. This left a total expense for the fiscal year 1946 of \$1,372,655,008, resulting in a gross operating deficit on an accrual basis of \$148,082.835.

The tremendous increase in the volume of mail handled by the post office department for other branches of the government had been a matter of concern to congress and the department for a number of years. Thousands of tons of forms, pamphlets, circulars and supplies were sent by government departments and establishments free of postage under the "penalty privi-

The intensive bond and stamp sales program, inaugurated May 1, 1941, in co-operation with the treasury department, was greatly expanded after U.S. entry into World War II. On June 30, 1946, war savings stamps were on sale at 41,751 post offices. Sales from July 1, 1945, to June 30, 1946, amounted to \$92,117,543.40.

From March 1, 1935, when the U.S. savings bonds were placed on sale at post offices to June 30, 1946, there were sold through the postal service 158,355,685 bonds, having a sale value of \$9,163,683,281. During the fiscal year ended June 30, 1946, 13,484,517 bonds, having a sale value of \$619,509,000 were sold. At the close of 1946 bonds were on sale at 26,954 post offices, including 1,346 branches and stations, a net increase of 1,574 over the preceding year.

Through the 41,751 post offices and 3,324 stations being conducted under contract agreement as well as 1,994 classified stations and branches, there were received, transported and delivered 36,200,000,000 pieces of mail matter during the fiscal year, having a weight of 3,500,000 tons, representing a decrease from the previous fiscal year of 1,700,000,000 pieces of mail and 200,000 tons.

On June 30, 1946, there were 3,324 stations being conducted under contract agreement. The average cost per contract unit was \$776, and the total cost of operation during the fiscal year amounted to \$2,579,638, whereas the receipts from the sale of stamps at these contract stations amounted to \$46,423,736 during the calendar year 1945.

During the fiscal year, city delivery service was established in 199 additional cities, thereby increasing to 4,083 the number

of cities in which this service was in operation. Of this number, 140 were changed from village delivery to city delivery service. Village delivery was in operation at 111 post offices.

Postmasters.—During the fiscal year there were made 3,795 presidential appointments of postmasters at offices with salaries of \$1,800 to \$12,400 per annum. Fourth-class postmasters were commissioned to 1,148 offices during the year as vacancies occurred through various causes.

Dead Letters.—During 1946, 18,676,852 letters were impossible of delivery, an increase of more than 32.04% from the previous year. This number was due mainly to the large number of incorrectly addressed letters for the military and naval forces and for civilians who moved incident to changes in location due to war work. A total of 3,157,745 were returned to the senders, of which 405,879 were found to contain valuable enclosures; 83,648 of them contained money, amounting to \$213,079. There were also 871,849 unclaimed parcels and articles found loose in the mails. These parcels were sold at public auction and \$245,023 realized.

Air Mail.—On June 30, 1946, there were 57,377 mi. of domestic air mail routes, an increase of 528 mi. over June 30, 1945. During 1946 four new domestic air mail routes were established. On Oct. 1, 1946, the domestic air mail rate was reduced to five cents an ounce. This includes not only the United States and its territories and possessions, but wherever the United States postal service is in operation. The new rate also applies to Canada and Mexico.

In the foreign field air mail rates were reduced Nov. 1, 1946, from a previous high of 70 cents a half ounce to a maximum of 25 cents. To South America the new rate is 10 cents per half ounce; to Europe and North Africa, 15 cents per half ounce; the rest of Africa, near east, Asia and South Pacific, 25 cents per half ounce.

The air mail service, established as one of the most vital postal services, owing to the need it filled in connection with the demand for speed in the transportation of mail, performed a total of 102,000,000,000 pound miles of service during the fiscal year 1946.

Rural Delivery.—The rural delivery routes in operation on June 30, 1946, required a total daily travel of 1,441,538 mi. by rural carriers in providing service to approximately 29,641,722 patrons. The policy of consolidation of rural routes to absorb vacancies was continued. Operation of the rural delivery service resulted in an expenditure of \$117,335,322 for the fiscal year as compared with \$107,046,080 for the previous year, an increase of \$10,289,242 over 1945. The amounts saved through consolidation of routes were utilized to establish new routes and provide extension of existing routes. Thereby 6,479 more miles were covered by rural carriers at the close of the fiscal year 1946 than in 1945.

Postal Savings.—The postal savings system continued to merit a widespread public demand for its services; the depositors numbered 4,135,565 for 1946, an increase of 5% from the preceding year. The balance due depositors represented by outstanding certificates of deposits was \$3,119,520,810, an increase of \$460,211,876 or about 17.3%. In addition there was held in trust for depositors accrued interest of \$87,346,227 and unclaimed deposits of \$135,486, making a total of \$3,207,002,523.

At the end of the year, postal savings certificates were on sale at 7,187 depositories, including 902 branches and stations, but savings stamps were on sale at all post offices and practically all branches and stations.

Buildings.—During the fiscal year ended June 30, 1946, the post office department operated 3,261 government owned buildings. Because of World War II and the cessation of the public

building program, no new buildings were completed during the fiscal year. Through reassignments of space within these buildings, agencies of the government which were occupying or had intended to occupy commercial quarters were accommodated, with a saving of \$197,769.

Expiring leases numbering 522 were renewed in the year 1946. The square foot cost of renewing leases was increased from 88.7 cents in 1945 to 92.8 cents in 1946. There were 118 new leases made, including 67 for offices previously occupying space on a monthly rental basis, the new contracts providing improved quarters and in many instances complete new equipment.

(I. Gc.)

Great Britain.—The total of post office transactions with the public during the year ended March 31, 1946, reached the record figure of £3,157,945,000. Savings bank deposits increased from £428,388,000 in 1944-45 to £647,588,000 (including release benefits to service personnel) in 1945-46 and savings certificates purchased amounted to £204,211,000, a drop of £84,777,000 on the previous year. The number of separate deposit accounts in April was 22,000,000, representing a capital value of £1,800,000,000.

The number of letters and packets delivered was 6,230,000,000 as compared with 6,250,000,000 in 1945, but this figure was still below the prewar level. On the other hand the figure for parcels handled dropped from 284,000,000 to 257,000,000. There was a marked growth in both branches of the telegram service: 64,939,000 inland telegrams were handled in 1945-46 and 10,453,000 overseas and to ships, an increase of 1,976,000 and 2,453,000 respectively on the 1944-45 figure. There were also large increases in the number of effective telephone calls. Early in 1946 70,000 telephones were being installed a month (twice the prewar rate), while the demand was 100% higher than in 1939. The total number of exchanges in use was 5,800, 60% of this total being automatic exchanges. The development program for improving the telegraph and telephone services of the country involved the expenditure of £10,000,000 in the financial year 1945-46, and an estimated figure of £17,000,000 in 1946-47.

In 1946 air mails were made available to 200 countries. By the end of the year a daily service was in operation over the North Atlantic and air mails reached New York and Montreal two or three days after dispatch from London. British South American Airways service conveyed mails twice weekly to Brazil, Uruguay and the Argentine, and linked up with a network of air services in South America. Regular services were also started to Australia (thrice weekly) and to South Africa (twice weekly), bringing both postally within five days of London.

Land-line communications were reopened with France, Belgium, the Netherlands, Denmark, Norway, Sweden, Luxembourg, Switzerland and Italy. Further expansion was hampered by lack of plants on the continent. In January the post office completed for the war department the longest submarine telephone cable in the world (between Lowestoft and Borkum, northwest Germany). Public radiotelegraph services to ships at sea and radiotelephone services to 26 countries were restored.

Several improvements were made in the inland postal and telegraph services. By October the entire network of travelling post offices had been restored, giving a latest posting time of 6 p.m. in town areas throughout the country for first delivery the following weekday morning. By the prewar method of scheduling parcels to specific trains the interval between posting and delivery was reduced by as much as 24 to 48 hours. Telegraph transmission times were speeded up by the installation at a number of telegraph offices of the manual switching system which made it possible for the teleprinter offices to communicate directly with one another, and it was planned to have about 70

of the largest offices joined to the system by 1947. To expedite still further the postal services the post office was considering use of night-flying aircraft for conveyance of inland mails.

In addition to other extra-departmental business the post office assumed in August the function of paying out family allowances under the Family Allowances act (1946).

In June 1946 post office personnel numbered 338,000 with a wage bill of £77,900,000 per annum. There were still some 55,000 experienced post office staff with the forces, or on loan to other government departments.

The victory celebrations in June were marked by a special commemorative issue of postage stamps known as the Peace issue. The denominations were 2½d. and 3d., of which 300,000,000 and 42,000,000 respectively were issued. (See also PHILATELY; PHOTOGRAPHY.) (C. Ns.)

Postwar Planning: see RECONSTRUCTION PLANNING.

Potash. The potash industry of the United States made a new record high in 1945, for the 12th successive year. Output increased to 874,245 short tons of contained K₂O in 1945 from 834,568 tons in 1944, while the corresponding sales rose to 870,370 tons from 817,892 tons. During 1939-42 inclusive sales were in excess of production, and stocks declined almost to the vanishing point, but improved slightly in 1943-45.

The only European producer from which late data was received was Spain, where the gross output increased from 744.981 short tons in 1944 to 792,231 tons in 1945 but K₂O content decreased from 127,870 tons to 126,765 tons. Both French and German plants were handicapped by lack of fuel, power and transportation. The U.S.S.R. had added to its own reserves the former Polish fields and much of the German producing area. (See also FERTILIZERS.) (G. A. Ro.)

CARNALLITE, valuable source of potassium, was brought by barge during 1946 from evaporation pits at the north end to the south end of the Dead sea. Here it was unloaded for drying and final processing

Potatoes. The 1946 potato crop of the United States was estimated by the U.S. Department of agriculture at the new record of 474,609,000 bu., compared with the crop of 1945 of 418,020,000 bu. and the ten-year average of 372,756,000 bu. (1935-46). This big crop was due primarily to the high record yield of 184.1 bu. per ac. which compared with

155 bu. harvested in 1945, a record to that time, and 125.8 bu. the ten-year average for 1935-44. The acreage harvested in 1946 was 3.5% below that of 1945 and also less than the average; 2,578,000 ac. in 1946, 2,696,000 ac. in 1945 and 2,968,000 ac. average. While the U.S. as a whole made new records in production the 30 late potato states failed to reach their record of 1943, although their average yield was 195.1 bu. per ac. higher than the national average. The 18 leading potato states produced more than 325,000,000 bu. of the total crop of 474,000,000 bu. The weather was favourable for harvest without frost damage except in Idaho and Colorado where some freezing was reported.

Potato consumption was estimated to have increased to 130 lb. per capita in 1946 which was about the prewar level. Potatoes were abundant at moderate prices. Prices to growers ranged from \$1.47 per bu. in July to \$1.23 in November and were not affected by the OPA decontrol. Price support buying by the government continued through the year and several million bushels were accumulated by the government and dumped for feed and alcohol-making in early fall. Exports were small, amounting to only about 9,500,000 bu. The goal for 1947 was set at a slight reduction from the crop of 1946. Legislation required that prices of potatoes be supported at not less than 90% of parity through 1947. Individual farm acreages were established for 1947 plantings beyond which price support benefits would not be given. Loans by the government were made between Sept. 15 and Dec. 15, 1946, to support late potato prices at 75% of the support price announced for the respective areas. The government had large stocks of potatoes at the end of the year which were to be destroyed as they could not be sold.

Sweet Potatoes.—The 1946 sweet potato crop was estimated at 66,807,000 bu., slightly more than the 66,665,000 bu. crop of 1945 and only about 300,000 bu. above the ten-year average of 66,422,000 bu. The acreage was almost the same as in 1945 at 679,300 ac. and 10% below the average for 1935-44. The yield in 1946 at 98.3 bu. per acre compared with 96.3 bu. in 1945 and an average of 85.4 bu. Of the leading states, Louisiana and Georgia had smaller crops while North Carolina and New Jersey made notable increases. A government price support program was in effect for the 1946 crop which provided for buying from Sept. 1 to Nov. 15 and for loans from Nov. 16 to Jan. 15, 1947. The market was strong and prices were at \$2.80 per bushel in August and continued above \$2.00 through the marketing season. These prices were well above parity, which was \$1.86 per bushel in November. Consumption of sweet potatoes was estimated at 19.2 lb. per capita in 1946, compared with 20 lb. in 1945 and the prewar consumption of 23.5 lb. Sweet potatoes are not processed to any ex-

tent except for some canning. The crop of the last few years was not regarded as adequate, and the U.S. department of agriculture asked an increase to 799,000 ac. for 1947 which would be above the prewar average. Considerable quantities of sweet potatoes were used for relief work in 1946. (See also VEGETABLES.)

(J. C. Ms.)

Poultry. The poultry industry continued through 1946 at near the high-record level of 1945. The number of chickens on farms on Jan. 1, 1946, was estimated by the U.S. department of agriculture at 525,536,000 compared with 510,939,000 in 1945, the record of 576,441,000 in 1944 and the ten-year average of 433,638,000 in 1934-43. The total chicken meat output in 1946 was estimated at 3,150,000,000 lb. or 15% below 1945. Broiler production was reduced 22% from 1945. Civilian consumption of chicken was about 23 lb. per capita compared with 25.3 lb. in 1945, 28 lb. in 1943 and a prewar consumption of about 18 lb.

Commercial broiler production, while smaller in 1946 than in 1945, had grown rapidly in the previous few years. In the early 1930s the broiler output of the U.S. was less than 30,000,000 birds, while in 1945 it made the high record of 312,000,000 birds and amounted to 22.4% of the total dressed poultry production. The total chicken meat production in the form of broilers was estimated at 3,150,000,000 lb. in 1946, of which 650,000,000 lb. were commercial broilers and 2,500,000,000 were farm-raised chickens.

Egg production declined slightly from the high level of 1945 and the record of 1944. Total egg production in 1946 was estimated at 4,900,000,000 doz., compared with 5,050,000,000 doz. in 1945 and 3,335,000,000 doz. in prewar years. The average output per hen was 114 in 1946 compared with 118 in 1945, although weather conditions were favourable through 1946. Egg prices increased steadily but were lower during the first half of the year than in 1945. When ceilings were removed, prices advanced until late fall.

Prices of chickens were steady through 1945 and up to May 1946 at around 24 cents per pound to producers. The price rose to 29.4 cents in July and then to 34.4 cents in October and declined to 27 cents in December. In the retail market poultry declined when red meats were freed from price ceilings on Oct. 15. Stocks of poultry, not including turkeys, were higher than in 1945 on the average, fowl being more plentiful than young chickens. The demand for poultry meat was so strong in September that about 19,000,000 lb. of frozen chicken were withdrawn from storage, which had not occurred after 1925. The number of chickens hatched during the first five months of 1946 was about the same as in 1945 but declined in May and June as feeds advanced in price. Prices of chickens were more than 90% of parity throughout the war period.

The steady betterment of poultry under the National Poultry Improvement plan continued to increase. More than 24,000,000 birds were included during the 1945-46 season, an increase of more than 10,000 flocks from 1944. These birds produced eggs for hatcheries with a capacity of more than 250,000,000 eggs.

Turkeys.—The number of turkeys on farms increased to a new record on Jan. 1, 1946, of 8,734,000 birds, compared with 7,323,000 a year earlier and only 5,731,000 ten years earlier in 1936. Production in 1946 was estimated at about 600,000,000

lb. compared with 677,000,000 lb. in 1945 and 350,000,000 lb. in 1935-39. While the production in 1946 was below that of 1945, the large carry-over from 1945 and the reduction in military demands made more turkey meat available to civilians. Per capita civilian consumption was about 4.5 lb., compared with 4.3 lb. in 1945 and 2.6 lb. in 1935-39. Prices of turkeys to producers held steady from 1942 to July 1946 at an average of around 34 cents per lb. The price advanced in late summer to 40 cents in October and to an average of 35 cents in December.

The National Turkey Improvement plan begun in 1943 made a rapid increase. More than 2,000,000 breeding birds were listed in 1945-46, compared with only 756,000 a year earlier. The death loss of young turkeys, formerly a serious handicap to the business, was reduced from about 28% in 1941 to 22.5% in 1945. The increasing use of commercial hatching and more careful disease control also reduced losses and made the growing of turkeys more profitable. (See also EGGS.)

Precious Stones: see GEMS AND PRECIOUS STONES.

Presbyterian Church. The Reformed Churches holding the Presbyterian system, within the United States of America were 12 in number in 1946 and included 18,351 ministers, 18,569 churches and 4,126,878 communicant members, with approximately 8,000,000 adherents.

The year was marked by a concerted effort for a closer unity in the Presbyterian and Reformed Churches. The Evangelical and Reformed Church after several years of negotiation with the Congregational Christian Church adopted a basis of union which was to be submitted to its synods for final approval or disapproval. If the vote were overwhelmingly in favour of a union, a meeting was to be called in June 1947 for its consummation. The United Presbyterian Church and the Reformed Church in America drafted a plan of union which was to be printed and mailed to judicatories and officers of both churches for their joint study and suggestions so that a revised plan might be presented to the supreme judicatory of each church in 1947. Negotiations between the Presbyterian Church in the United States (Southern) and the Presbyterian Church in the United States of America (Northern) continued and a revised plan of reunion was to be referred to the general assemblies of both churches. The movement for the union of the Protestant Episcopal Church and the Presbyterian Church in the United States of America proceeded to the point where proposed articles for a basis of union, prepared by the Commission on Approaches to Unity of the Episcopal Church and the Department of Church Co-operation and Union of the Presbyterian Church were submitted to the Episcopal general convention in Sept. 1946. The commission's recommendation was rejected by the general convention which then voted to continue negotiations toward a closer fellowship.

The distressed peoples and devastated areas of the world presented a challenge to the churches of the U.S. Many missionaries returned to their fields of labour. Special efforts to provide funds for relief and restoration abroad through yearly collections were instituted by Presbyterian and Reformed churches. These funds were usually turned over to the Committee on Overseas Relief and Reconstruction. The Presbyterian Church in the United States of America launched a \$27,000,000 restoration fund for relief and restoration in Europe and the far east. By Dec. 2, 1946, the returns had reached \$18,191,271.

Europe.—A renewed emphasis was placed upon evangelization as a result of the experiences of World War II. The general assembly of French Protestantism, meeting at Nîmes from Oct. 23 to 26, 1945, and expressing its gratitude for the return of the Lutheran and Reformed Churches of Alsace-Lorraine

along with the other churches of the Protestant federation of France, summarized its conclusions in four affirmations: "God is faithful," "Jesus is merciful," "The Church is the Body of Christ" and "Jesus is Lord of the nations." The national synod of the Reformed Church of France, held at Lyons in May 1946, emphasized the nature and responsibilities of the pastoral ministry in the call to evangelism. The status of the Protestant church in Italy remained somewhat uncertain because of undefined relations between the church and state. Religious broadcasts, however, were permitted from stations in Rome, Turin, Milan, Florence, Venice and Cagliari. In various communities of Italy, evangelistic centres were established to make known the attitude of evangelical Christians on vital problems of the hour by conferences and publications such as the journal called *Protestantesimo*.

In Hungary the work of evangelization was confronted with a lack of ministers to carry on the parish work. It was estimated that 30% of the clergy left their parishes. Lack of security, of food and of financial resources, loss of property and inflation handicapped the work of the Protestant Church. But willing workers and large contributions from some of the congregations overcame some of the handicaps. The synodical council of the Hungarian Reformed Church stressed the need for an evidence of faith by an exemplary life and for greater unity among the churches. In line with this movement toward unity the Evangelical Church of Austria accepted the invitation to join the World Council of Churches. (See also CHURCH MEMBERSHIP.) (W. B. Pu.)

Presidents, Sovereigns and Rulers.

The following list includes the names of those holding chief positions in their countries as of Jan. 1, 1947.

Country	Name and Office	Accession
Afghanistan	Mohammad Zahir, Shah	1933
Albania	Dr. Omer Nishani, President of the Presidium of the People's Assembly	1946
Arabia, Saudi	Col. Gen. Enver Hoxha, Prime Minister	1924
Argentina	Abdul-Aziz ibn Abdurrahman al-Faisal Al-Sa'ud, King	1926
Australia	Gen. Juan Domingo Perón, President	1946
Austria	Duke of Gloucester, Governor General	1945
	Joseph B. Chifley, Prime Minister	1945
	Karl Renner, President	1945
	Leopold Figl, Chancellor	1945
Belgium	Leopold III, King (in exile)	1934
	Prince Charles, Regent	1944
	Camille Huysmans, Prime Minister	1946
Bolivia	Dr. Tomás Monje Gutiérrez, President	1946
Brazil	Gen. Eurico Gaspar Dutra, President	1946
Bulgaria	Vasil Kolarov, President of the Grand National Assembly (Provisional)	1946
	George Dimitrov, Premier	1946
Burma	Sir Hubert Elvin Rance, Governor	1946
Canada	Field Marshal Lord Alexander, Governor General	1946
	W. L. Mackenzie King, Prime Minister	1935
Ceylon	Sir Henry Monck-Mason Moore, Governor	1944
Chile	Gabriel González Videla, President	1946
China	Generalissimo Chiang Kai-shek, President of the National Government	1943
	T. V. Soong, President of the Executive Yuan	1945
Colombia	Mariano Ospina Pérez, President	1946
Costa Rica	Teodoro Picado Michalski, President	1944
Cuba	Dr. Ramón Grau San Martín, President	1944
Czechoslovakia	Dr. Eduard Beneš, President	1940
	Klement Gottwald, Premier	1946
Denmark	Christian X, King	1912
	Knud Kristensen, Prime Minister	1945
Dominican Rep.	Gen. Rafael Leónidas Trujillo y Molina, President	1942
Ecuador	José María Velasco Ibarra, President	1944
Egypt	Farouk I, King	1936
	Mahmoud Fahmy el-Nokrashy Pasha, Premier	1945
Eire	Seán T. O'Kelly, President	1945
	Éamon de Valera, Premier	1932
Ethiopia	Haile Selassie I, Emperor	1930
Finland	Juho K. Paasikivi, President	1946
	Mauno Pekkala, Prime Minister	1946
France	Léon Blum, Premier of the Provisional Government	1946
Germany	Allied Control Commission:	
	Lt. Gen. Joseph T. McNarney (U.S.);	1945
	Marshal Sir Sholto Douglas (Gr. Brit.)	1946
	Marshal Vasily D. Sokolovsky (U.S.S.R.)	1946
	Lt. Gen. Pierre Koenig (Fr.)	1945
Great Britain	George VI, King	1936
	Clement R. Attlee, Prime Minister	1945
Greece	George II, King	1922
	Constantin Tsaldaris, Premier	1935
Guatemala	Juan José Arévalo y Bermejo, President	1945
Haiti	Dumarsais Estimé, President	1946
Honduras	Gen. Tiburcio Carías Andino, President	1933
Hungary	Zoltán Tildy, President	1946
	Ferenc Nagy, Prime Minister	1946

Country	Name and Office	Accession
Iceland	Sveinn Björnsson, President	1944
	Olafur Thors, Prime Minister	1944
India	Field Marshal the Right Honourable Viscount Wavell, Viceroy	1943
Iran	Mohammed Riza Pahlavi, Shahinshah	1941
	Ahmad Gavam-es-Salteneh, Premier	1946
Iraq	Faisal II, King	1939
	Abdul-Ilah, Prince Regent	1941
Italy	Enrico de Nicola, Provisional President	1946
	Alcide de Gasperi, Prime Minister	1947
Japan	Hirohito, Emperor	1926
	Shigeru Yoshida, Premier	1946
	Gen. Douglas MacArthur, Supreme Commander for the Allied Powers	1945
Lebanon	Sheikh Bishara el Khoury, President	1943
	Riyad bey el-Solh, Premier	1946
Liberia	William V. S. Tubman, President	1944
Liechtenstein	Franz Joseph II, Sovereign Prince	1938
	Alexander Frick, Chief of Government	1945
Luxembourg	Charlotte, Grand Duchess	1919
	Pierre Dupong, Premier	1937
Mexico	Miguel Alemán, President	1946
Monaco	Louis II, Prince	1922
Morocco	Sidi Mohammed ben Youssef, Sultan	1927
	Erik Labonne, French Resident General	1946
Nepal	Tribhuana Bir Bikram, King	1911
	Sir Padma Shumshere Jung Bahadur Rana, Prime Minister	1946
Netherlands	Wilhelmina, Queen	1898
	Louis J. M. Beel, Prime Minister	1946
Newfoundland	Sir Gordon MacDonald, Governor	1946
New Zealand	Gen. Sir Bernard Freyberg, Governor General	1946
	Peter Fraser, Prime Minister	1940
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King	1905
	Einar Gerhardsen, Prime Minister	1945
Oman (Muscat)	Sir Sayyid Sa'id bin Taimur, Sultan	1932
Palestine	Lt. Gen. Sir Alan Gordon Cunningham, High Commissioner	1945
Panamá	Enrique A. Jiménez, Provisional President	1945
Paraguay	Gen. Higinio Morínigo, President	1940
Peru	José Luis Bustamante y Rivero, President	1945
Philippines	Manuel A. Roxas, President	1946
Poland	Boleslaw Bierut, President of the National Council of the Homeland of the Polish Provisional Government	1945
	Edward Osobka-Morawski, Prime Minister	1945
Portugal	Gen. Antonio Oscar de Fragoa Carmona, President	1928
	Dr. Antonio de Oliveira Salazar, Prime Minister	1932
Rumania	Michael I, King	1940
	Peter Groza, Premier	1945
Salvador, El	Gen. Salvador Castañeda Castro, President	1945
Siam	Phumiphon Aduldet, King	1946
	Thawan Thamrong Nawasawat, Premier	1946
South Africa	Maj. Gideon Brand van Zyl, Governor General	1946
	Field Marshal Jan C. Smuts, Premier	1939
Spain	Gen. Francisco Franco, Chief of State, Prime Minister (President of the Council of Ministers)	1936
Sudan	Lt. Gen. Sir Hubert Huddleston, Governor General	1940
Sweden	Gustavus V, King	1907
	Tage Frihof Erlander, Prime Minister	1946
Switzerland	Philipp Etter, President	1946
Syria	Shukri el-Quwatli, President	1943
	Jamil Mardam Bey, Premier	1946
Trans-Jordan	Abdullah ibn Husayn, King	1946
Tunisia	Sidi Mohammed Lamine Pasha, Bey	1943
	Gen. Charles Mast, French Resident General	1943
Turkey	Ismet Inönü, President	1938
	Recep Peker, Premier	1946
Union of Soviet Socialist Republics	Nikolai Mikhailovich Shvernik, President of the Presidium of the Supreme Soviet	1946
	Generalissimo Joseph V. Stalin, Chairman of the Council of People's Commissars	1946
United States	Harry S. Truman, President	1945
Uruguay	Juan José Amézaga, President	1943
Vatican City	Pius XII, Pope	1939

¹Greece was a republic from 1924 to 1935.

Price Administration, Office of.

The Office of Price Administration, created by the Emergency Price Control act of 1942 to stabilize prices of goods and services and the rents of dwellings, became part of the Office of Temporary Controls in Dec. 1946 under the terms of an executive order establishing the latter agency in a consolidation of the remnants of the wartime programs, which by then had been liquidated in substantial part.

The course of prices during the first half of the year reflected a number of policy developments, which included liberalization of the use of wage increases as basis for price adjustments, the adjustment of prices to remove any threat that reconversion might be held back and the decontrol of commodities where supply and demand were found to be in reasonable balance or where resulting price increases would be insignificant for living or business costs. Although the over-all rise of prices was modest, amounting by June to 2.6% in the case of consumers' prices and 5.4% in the case of wholesale prices, it contrasted sharply with previous stability. In turn, however, these in-

creases were outstripped by those that took place during the latter half of the year.

Between June and Dec. 1946, consumers' prices rose 15%, with food prices up most sharply—by 30%. At wholesale, prices rose on the average 24%, with foods up 40%. At the close of the year the consumers' price index stood 55.5% above the level of Aug. 1939, as against 31.7% at the end of 1945.

These sharp increases resulted from the progressive abandonment of price control, beginning with the expiration of the stabilization statutes on June 30. Following a presidential veto, June 29, of the original extension act, there was a lapse of price and rent control lasting nearly a month, until the Price Control Extension act of 1946 was approved. The new act seriously weakened the authority of the agency to restrain price increases. In addition, it required immediate decontrol of certain commodities and set up a mechanism for expediting decontrol generally. A Price Decontrol board was established with final authority to decontrol and recontrol prices, and a method was provided whereby industry advisory committees could petition for decontrol. Decision as to continuance of control over prices of agricultural commodities was transferred to the secretary of agriculture. New limitations were placed upon the use of government subsidies to producers, which from May 1943 had been a key element in the program to hold prices stable.

The new act became effective July 25, with June 30 ceilings reinstated on most products and services that remained under control. Price increases were granted very promptly in order to conform with the provisions of the new act. Particularly important in requiring these increases was the provision that ceiling prices for distributors must reflect average current costs of acquisition plus the average percentage markup in effect March 31, 1946. Previous to enactment of the new legislation,

OPA INVESTIGATOR (features censored) clutches a Los Angeles automobile salesman by the throat and appears about to strike him with a blackjack. Salesman allegedly attempted to flee investigation of violations of used car price ceilings, in Sept. 1946

OPA had required distributors to absorb all or part of the increase granted to producers.

OPA at once proceeded to expedite the decontrol process as intended by the congress, but still endeavored to avoid a cumulative unstabilizing effect. Prior to June 30 a very large number of products had been decontrolled, so that as of that date roughly 70% of the economy remained under price control, as compared with 80% at the wartime peak. In addition, a total of 840 industry-wide price increases had been allowed following V-J day without permitting the consumers' price index to rise more than 3%. Continuation of this record of holding prices in leash proved impossible under the new legislation.

During the second quarter of the year, the prospect that price control would not be continued made itself felt in the withholding of goods from market. This was particularly true in the case of livestock and meats. Upon the ending of price control, these prices rose sharply, meats as a whole increasing nearly 70% with livestock up more than 20%. At these prices, livestock and meat began once more to flow. The price rise slackened off immediately prior to the signing of the new act, but upon approval of that legislation, with its mandatory decontrol of livestock and meat prices, the rise was resumed and by the end of August, when control was reimposed, wholesale meat prices had risen on the average by nearly 90%.

Reported slaughterings, which had declined far more than seasonally during the second quarter, turned up sharply in July and August. They fell short, however, of offsetting the earlier withholding. Meantime, stocks, which had been shrinking from the end of meat rationing in Nov. 1945, reached the lowest point in several years. Upon the restoration of price controls, reported slaughterings approached the vanishing point and retail shortages rapidly spread. This renewed withholding contributed substantially to breaking price control of meats. It persisted despite the fact that increases in meat prices, averaging 12% at wholesale and 14% at retail over June 30 levels, had been allowed, when controls were restored, at the direction of the secretary of agriculture. On Oct. 14, in an effort to salvage the rest of the stabilization program, which was jeopardized by the campaign against meat controls, controls over meat prices were, by presidential directive, permanently lifted.

This action resulted in a rise of prices even sharper than before, wholesale meat prices increasing 93% the first week. These increases were moderated in the following weeks and at the close of the year meat at wholesale was 40% higher than when last controlled and 65% higher than at the end of June. Following decontrol, reported slaughterings spurted up from their abnormal low, but were restrained by the record feed supply from equalling fourth-quarter records of prior years.

Removal of control over meat prices hastened decontrol of other products, and by the end of October virtually all food and a long list of other products had been returned to a free economy. Selective decontrol had led, however, to general withholding of goods from the market as sellers waited for decontrol of their own products. This became so serious as to threaten paralysis to key segments of the economy. At presidential order, therefore, all control over prices was removed, as of Nov. 10, except that necessary to implement the allocation and rationing programs for rice and sugar, and except for control over dwelling rents. (See also CANADA, DOMINION OF; CIVILIAN PRODUCTION ADMINISTRATION; PRICES.)

(M. MH.)

Prices. Prices in the United States during the war were under a substantial inflationary pressure because the total pay rolls of the country were increased tremendously at the

same time that the supply of civilian goods was declining. The workers were being paid on the basis of total production and could buy only a fraction of that production. The difference was the so-called inflationary gap. In a free economic system prices probably would have risen until the gap was closed and all of the workers' income was used to purchase the goods available to them.

The social consequences of such inflation were certainly not desirable and the government's economic stabilization program was designed to combat this potential inflation. One of the chief methods was the use of price ceilings with accompanying allocation and rationing of scarce goods.

Victory in Europe and Asia did not bring an end to the inflationary pressures on prices. It had appeared earlier that at the end of the war all productive facilities would be turned to the production of civilian goods and that with a matching of pay rolls and available consumers goods the inflationary gap would be closed and the upward pressure would drop. This was not the case. With final victory there were many large cancellations in war production. It was necessary to maintain some in order to provide food and other necessities for the troops in the demobilization period and for those required for occupation of enemy territory. There was also need for large shipments of supplies to the devastated countries. These were mostly in the form of food, but considerable quantities of machinery were sent in an effort to restore the countries to a basis of self-sufficiency as soon as possible. The magnitude of these requirements was, of course, far below the requirements of total war. Another factor retarding the production of civilian goods was the necessity of reconverting the war plants into efficient machines for the production of consumers' goods. Though individual companies converted more rapidly than expected, the resulting over-all production machine was not in balance. Production in many factories was curtailed because of the shortage of component parts and the unfavourable labour situation. This set a lower level on the supply side of the equation than had been expected. On the demand side there was the normal demand plus the deferred demand for the durable goods not produced during the war. This deferred demand was not merely desire, but desire backed up by willingness and ability to pay from the accumulated savings of wartime.

In view of these circumstances, it was decided not to drop wartime price control upon the surrender of Germany and Japan. Prices of a few of the uncontrolled commodities such as cotton and rye advanced markedly after victory and indicated the temper of the underlying situation. Farm and residential urban real estate also rose markedly in price. Prices received by farmers rose gradually during the war months of the year and then weakened slightly, but the gain in November and December left the wholesale price index of farm products 4% above the level prevailing in Dec. 1944. Foods rose 3% and all other commodities 1% during the year 1945. This combination of rises resulted in a net rise of 2% in the combined wholesale index, leaving it at a level of 107.1 in Dec. 1945, as compared to 75.0 in Aug. 1939, the month before the start of the war in Europe, and 98.7 in April 1942, the month before the promulgation of the General Maximum Price Regulation.

The various subsidy programs in effect during the war were, in general, continued throughout the year. Some subsidies were removed, such as that on butter, and the ceiling price was raised by the amount of the cancelled subsidy. Gradually during the latter part of 1945 and the early part of 1946 ceilings were removed from various products if they were not essential to the cost of living and if supply was becoming adequate

to answer demand at but a small increase in price. Some of the more important commodities decontrolled were fish, white potatoes and automobile parts.

In addition to the ceiling and subsidy removals there were also substantial upward revisions of ceilings in the postwar months of 1945 and in the first half of 1946. Under these revisions the combined wholesale price index increased from 105.2 in Sept. 1945 to 112.9 in June 1946, about 7%. The prices of goods other than farm and food products had held fairly constant during the war with the index showing a rise of about five points, from 99.8 in Sept. 1945 to 105.6 in June 1946; this rise in a period of ten months was greater than the rise during the whole time the United States was at war. It was almost entirely accounted for by ceiling revisions made in an effort to stimulate production of strategic materials in short supply and to compensate for wage increases given in settlement of the large wave of strikes called in this ten-month period (discussed below). Increases of \$5 a ton were granted for steel and 75 cents a ton for pig iron. These raised the prices of finished products in this industry 11% whereas the increase to this point had amounted to about 4% from Aug. 1939 just before war started in Europe. Similar increases were granted for copper, lead, brass and bronze products in May. The next month increases were granted for products made from these materials.

Prices of building materials also advanced about 10% in these first postwar months. This was, in part, an effect of increases in metal prices; and lumber prices rose markedly as shown by the index of these products which rose from 155.0 to 176—14%.

This placed the price of lumber in June 1946 about 90% above the Aug. 1939 level.

Many of the increases in these industrial products were allowed in the hope that they would bring out materials needed to start the large new-housing program.

Prices of cotton goods and clothing increased 16% from the end of the war to June 1946. This increase appeared at all levels in the cotton goods industry and was required by terms of the Stabilization Extension act of 1944 which specified that all cotton ceilings were to reflect parity to the grower. Prices of household furnishings according to the official indexes rose about 5%.

Prices of household furnishings purchased by the consumer, however, rose much more rapidly because of the disappearance of low-cost goods and the substitution of new and better grades of products.

Farm and food products prices were far less stable in this

WHOLESALE PRICES in the United States, 1937-46 (1926=100). (Source: U.S. department of labour, bureau of labour statistics)

JUSTUS of the *Minneapolis Star* saw inflation ahead in 1946 in his "Pussy's Only Choice"

immediate postwar period than the prices of industrial products. These took a sharp dip at about the end of the war, partly because of a bountiful harvest. After that they rose about 10% through June 1946. Again, most of this increase represented ceiling adjustments and subsidy cessations. In meats a large part of the ceiling increase was permitted in order to cover the rise in labour costs of meat packers which resulted from the settlement of the strike in 1946.

An important problem that had to be solved by the Office of Price Administration was the establishment of ceilings for products the production of which had stopped during the war. There was a considerable group of manufacturers and business men who contended that the abandonment of price controls on these products and on products which had been available in short supply would result in greater production, now stifled by distorted price relationships, and that prices would decline as adequate supplies became available. But this point of view was not accepted. As these products came back onto the market the prices were subject to control and, in general, set on the basis of the 1941 prices plus amounts to cover increases in basic material costs and wage rates that had occurred since that time. Profit was to be allowed equal to that percentage of profit on sales which had been earned in the 1936-39 base period.

With the end of the war there was a cessation of overtime and night shifts and a reduction in working hours for labour. Though not reducing the straight-time wage rates, it did reduce the amount of take-home pay. Downgrading of labour classifications was also important. On top of this there was the series of price rises discussed above, which increased the cost of living. This combination of factors brought about a period of labour demands for higher wages centered in the spring of 1946. These demands were supported in many cases by serious strikes. During the period a general pattern of settlement emerged. Prior to this the policy had been to hold

the price line and allow only such wage increases as could be absorbed by the manufacturer. This did not meet labour's demands and a new policy began to appear in Oct. 1945. Conformity to a set pattern of wage increases was encouraged by requiring prior approval of the new wage rate by the National Wage Stabilization board if the wage increase was to be used as a basis of price relief. The criteria for wage increases were broadened to allow for correction of gross inequities both within an industry and between industries. Under the new policy wage increases of approximately 17% were granted in certain prominent cases, such as steel and automobile production. The increases ran between 5% and 15% in the furniture, clothing and building-material industries.

The pressure for price increases during the ten months from the end of the war (about Sept. 1, 1945) and the end of June 1946 thus came from three sources: increases granted in prices of basic commodities, gradual elimination of subsidies and the further time required to achieve balance in the demand-supply relationship. During this period the inflationary gap of the war years had been reduced to a considerable extent, but consumers' disposable income was running 70% above 1941 whereas production of consumers' goods was only about 40% higher. In addition to this inflationary factor there was less willingness on the part of individuals to save from current income and to maintain the large savings balances built up during the war period. It was difficult to continue to resist the purchase of the small supply of long unseen goods when it was generally feared that there would be more price advances. Consumers were urged to exercise caution on the ground that soon the supply of goods reaching them would increase tremendously (1) as the inventories of merchants reached a normal level in relation to sales and (2) as reconversion problems including labour and parts shortages were resolved.

The existing price control act was scheduled to expire on June 30, 1946. For several months congress had been considering legislation to extend controls, but marked differences in philosophy were emerging. One school of thought felt that controls with the attendant unwise pricing, unrealistic regulation and long delays in obtaining relief were hindering reconversion and fostering the black markets and that they should be substantially relaxed. Another felt that the tight controls of wartime should be continued. A compromise bill was passed and sent to President Harry S. Truman for his signature late in June. In his opinion the bill was not sufficiently strong, and, in vetoing it just before the expiration of the existing act, he asked congress to extend the existing bill a few days until new legislation could be passed. Congress did not oblige, and price control in the United States expired June 30, 1946. It was not until July 25 that a new bill became law extending price control until June 30, 1947.

During the four-week period without price control, prices of foods and many industrial materials advanced, but certain stabilizing influences were felt at once. One factor was the unwillingness or inability of consumers to pay the inflated prices. A second factor was the restraint of manufacturers and distributors. There were several reasons for this. Most important were the fear of a buyers' strike, the fear of strengthening the demand for a strong price control bill and the desire to maintain good will and competitive positions, especially if price controls were reinstituted with the consequent reductions in price. Also important was a feeling of individual responsibility for helping to maintain the economic system intact. Increased supplies were brought to market by the prospect of better prices. Under ordinary circumstances this would have been a stabilizing influence but, with the prospect of reconrol, some markets were demoralized by efforts to reap the reward

of high prices while possible and by an attempt on the part of consumers to buy while possible regardless of prices.

During the first two weeks of this period without price control the bureau of labour statistics index of 28 basic commodities compiled daily from spot quotations showed a 25% rise. After that, however, the index levelled off. The 25% rise was not so disastrous as it first appeared. The cessation of all subsidy payments at once had to be reflected by an increase in price. The end of the black markets, which some observers said were patronized by a substantial per cent of the people, made an effective price reduction even though the official figures showed a rise. The *New York Journal of Commerce* made a survey and concluded that more than 60% of the increase in the 28 basic commodity prices was attributable to the elimination of subsidies and the ending of black markets. The bureau of labour statistics index showing a 25% rise, was also questioned because of its inclusion of a figure for raw silk for which a normal market had not been maintained throughout the war. Because of the construction of this index, single isolated transactions in this commodity had a disproportionate effect.

The passage of the new price control act was reluctantly received by many. It was generally felt that the cessation of price control inevitably would bring a marked adjustment in the economic situation. Now that the adjustment had been partially completed, two more adjustments were necessary: an adjustment back to controls and eventually an adjustment to a free market. The new bill set up machinery for and expressed the intent that all price controls were to end with the expiration of the act on June 30, 1947. The plan called for orderly decontrol throughout the year according to a schedule written into the law. The Price Decontrol board had authority to accelerate this program when the demand-supply relationship warranted. The decision to control prices on grains and animal products, cotton seed and soy beans, tobacco and petroleum and their products was deferred by law until Aug. 20.

Under the new act, a three-man Price Decontrol board was established. This board had review powers in cases of dispute about specific ceilings and was responsible for deciding whether any decontrolled commodities should be placed under ceilings and what action should be taken with respect to subsidy payments. This board was also given control over the decision to control or not to control various farm prices, which by terms of the act became eligible for recontrol on August 20. The criteria for the decision to recontrol these or any other products were three-fold: that the price had risen unreasonably after the expiration of the former act after making allowances for cessation of subsidies, that the supply was short and that regulation was practical and enforceable and that such recontrol was in the public interest. The first major decision of this board was that livestock, meat and oilseeds were to be recontrolled but that grains, dairy products and other farm products were to remain free. By the terms of the act this board had the power to order the recontrol of these latter products at any time such action was deemed necessary.

Another provision of the act required that all subsidies (reduced by the act to a level approximately half that of the preceding year) be eliminated by April 1, 1947, except subsidies on copper, lead and zinc which might extend until the expiration of the act on June 30, 1947. In addition, the act specifically directed the president to recommend to congress legislation along monetary and fiscal lines which would aid in the control of prices before and after the termination of the price control act, in order to minimize the danger of inflation during and after the decontrol period.

Immediately after the act went into effect, the June 30, 1946 ceilings were reimposed in most cases not prohibited by law.

ALEXANDER

IN "PLENTY OF UMPIRES" Alexander of the *Philadelphia Evening Bulletin* indicated some of the government agencies which supervised the control of prices in 1946

Many of those reimposed were revised promptly. Some were in process of revision at the time of the expiration of the former act and other revisions were made necessary by developments during the free period. New rules for ceilings on manufactured products were made in the act. Presumably these were directed to the stimulation of production. One of the most important was the provision requiring ceilings on manufactured products to be equal to the base period price for the product plus a percentage adjustment. This percentage was to be the average cost increase on the product to the industry as a whole. The base period was also changed from the 1936-39 average to 1940, thus providing larger profits and a greater stimulation to produce. Relief was also provided for distributors by allowing increases in their ceiling prices to compensate for increased prices from manufacturers instead of requiring distributors to absorb these increases as they were required to do under the regulations of the previous act. Wage stabilization controls were also maintained through the provision that price increases need not be allowed to compensate for unauthorized wage increases.

In the first three months after passage of the act, prices of manufactured goods were rising to compensate for the increased costs and production was proceeding more smoothly. A few items increased markedly in price, but the majority of prices remained the same or increased but slightly. The bureau of labour statistics index of wholesale prices of manufactured products increased from 107.3 in June to 117.2 in September. Labour, of course, had the opportunity to make new wage demands to compensate for the increased cost of living. Most of the strikes during the third quarter of 1946, serious though they may have been, were local in character. The only ones of broader proportions affected ocean shipping by tying up U.S. ports. These strikes did not directly affect the price of manufactured products.

With respect to food prices the situation was quite different. Prices of a few farm products did not rise greatly. These were products in which bumper crops were expected. The recontrol of meat prices on Aug. 20, 1946, was accompanied by a drying

up of the huge meat supplies brought to market in the "free" period. The shortage of these products diverted demand to other products, the prices of which were not controlled. Dairy products were among this little group; their price at wholesale increased 68% between June and September. Price rises in this class and the severe shortage of meat under the reimposed ceilings, accompanied by strong public demand for action led to a presidential directive on Oct. 14, decontrolling meat prices and accelerating the whole decontrol time table.

On Nov. 9 President Truman removed practically all remaining controls over prices and wages. He pointed out that a large proportion of the economy had already been freed of controls under the decontrol provisions of the new act and that continuance of price control regulations would bring with it disadvantages of lack of balance in the economy more serious than any price increases likely if prices were freed from controls. Since most farm products had already been freed, price changes in these as a result of the presidential order were minor. The major changes occurred among certain basic industrial commodities and manufactured products. Many of the industrial raw materials showed marked increases in prices, but the price quotations were not wholly accurate because of the partial elimination of the practice of upgrading which had been carried on under OPA regulations. These price increases were expected to work their way through to manufactured products, but for the remaining two months of 1946 manufacturers were trying to maintain their former prices. There were some notable exceptions, especially when in one day the General Motors corporation announced a flat \$100 increase in the price of their automobiles and the General Electric company announced an increase in the price of their products averaging 30%.

The work stoppage in the bituminous coal mines from Nov. 20 to Dec. 7 added to the inflationary tendencies by retarding the availability of still-scarce goods. However, the remaining three weeks of the year did not allow sufficient time to show clearly the effects of this strike on prices.

At the end of the year only residential rents, rice, sugar and sugar syrups remained under price ceilings. Sugar and rice controls were expected to be removed in 1947, but the need for continued, but possibly revised, ceilings on rents was generally recognized. Transfer of the rent controls to state administration was under consideration. (See also AGRICULTURE; BUSINESS REVIEW; CONSUMER CREDIT; INCOME AND PRODUCT, U.S.; PRICE ADMINISTRATION, OFFICE OF; STOCKS AND BONDS; WAGES AND HOURS; and articles on individual commodities.)

(F. E. C.; J. H. Ms.)

Primary Education: see EDUCATION.

Prince Edward Island. Smallest province of Canada, Prince Edward Island lies in the Gulf of St. Lawrence 9 mi. from the mainland. The 2,184 sq.mi. crescent-shaped island is 130 mi. long; average width 21 mi. Population was 95,047 (1941 census), 71% rural. The dominion bureau of statistics estimated a population decline to 92,000 in 1946. Largest centre is the provincial capital Charlottetown, 14,821 (1941). Administered by a lieutenant governor, an executive council and a 30-member legislative assembly, the island is represented federally by 4 members of parliament and 4 senators.

History.—Liberal Premier Walter J. Jones remained in office during 1946. Two by-elections were held—the Liberals winning one and the Progressive-Conservatives the other, leaving the assembly standing unchanged.

Transportation with the mainland was a topic of interest. A \$5,000,000 ferry terminal improvement program got under

way, mostly dredging to increase winter service by reducing ice hazards. A third ferry line from the western tip of the island, supplementing the central and eastern ferries, was approved by the department of transport. A new and larger ferryboat capable of carrying 19 railway cars, 60 autos and 950 persons, was launched at Sorel, Que. Air services to the island expanded slightly, with freight planes running for the first time.

A bumper potato crop for a time threatened a glut. Shipment of purebred registered Yorkshire swine to western Canada for breeding purposes was a new and successful enterprise. A record \$2,000,000 lobster harvest was offset by heavy winds in December which smashed expensive lobster catching equipment. Collection of Carrageen (Irish moss) from the beaches netted cash returns higher than any previous year. (C. Cy.)

Education.—For the school session, 1943-44, enrolment in all educational institutions was 19,142; the total revenue of all provincially controlled schools in 1944 was \$612,488. The two chief educational institutions of the island are Prince of Wales college and St. Dunstan's university, both situated at Charlottetown.

Agriculture and Industry.—In 1944 the estimated gross value of agricultural production was \$27,240,000; income of farmers \$13,800,000. In 1943 the value of fur production was \$1,588,037. In 1945 the value of field crops was \$18,755,000 (1944, \$18,248,000). In 1944 the value of the fisheries was \$1,762,000.

Princeton University. An independent institution, devoted to the liberal arts and sciences, situated in Princeton, N.J. In the fall of 1946, Princeton opened a year-long celebration of the 200th anniversary of its founding. Among the formal events was the Charter day convocation in October, in observance of the granting of its royal charter, at which honorary degrees were conferred upon 23 eminent scholars.

The first 8 of a series of 15 bicentennial conferences were held during the closing months of the year. International leaders met together to apply, in the words of the invitation, "our common skills, knowledge and wisdom to the reconsideration of the fundamental obligations of higher learning to society." Individual conferences were devoted to such subjects as "The Future of Nuclear Science," "The Development of International Society," "The Humanistic Tradition in the Century Ahead" and "University Education and Public Service."

Princeton announced plans for the third century of its existence, estimating the cost of fulfilment at \$57,000,000. Its objective was not expansion, but improvement, of existing program and facilities. Included was the further development of the school of public and international affairs which Princeton named during the fall in honour of Woodrow Wilson, 13th president of the university.

In common with other educational institutions, Princeton's capacity was overextended by the postwar demand for higher education. Undergraduate enrolment was half again as large as the prewar normal; graduate school registration doubled. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (H. W. Do.)

Principe: see PORTUGUESE COLONIAL EMPIRE.

Printing. Outstanding development in the graphic arts for 1946 was the announcement of a machine for composing type photographically. The machine was designed to produce composed type matter from a keyboard of many different sizes and kinds of faces in negative film form already

photographed and ready for the final step of transferring by vacuum printing to a lithographic plate. An automatic computing mechanism calculates the space for each line in advance of the photographing operation. The corresponding letter character is not photographed on the film immediately but is "stored up" by an electrical selector system until the entire line has been composed. Upon completion of the line the operator depresses a keybutton and the device automatically spaces the words in the line. The photographing mechanism then automatically exposes the letters one by one on the sensitized film. While the camera mechanism is exposing the previously justified line, the operator composes the next line, and so on. A removable and readily interchangeable master character plate in negative form is used for the complete alphabet, figures and points from which the corresponding characters are reproduced in the actual composition. Speed of composition is comparable to a standard typesetting machine.

Announcement was made of the Letouzey method of letterpress printing. The Letouzey process is a system of printing letterpress without makeready, interlay or overlay. Victor Letouzey, Letouzey and Co., Paris, France, was the developer. The system was based on varying heights of type characters, the height regulated according to printing density of each character, that is, its surface printing area. As universally practised with all type at 0.918 in. high, a period on the press does not require so much impression as a capital M. In the Letouzey system the height of the type is cast according to the area of printing face, thus eliminating press makeready. Variance from type high is graduated from 0.914 in. to 0.920 in. with perhaps certain characters grouped together in five different heights. The varying heights are obtained by punching the characters in the matrix at different depths. A special cylinder covering is used on the press. The method entails precision operations from typecaster to press but are too lengthy to describe in detail here. Letouzey reported the engineering control method results in obtaining 82% of the total theoretical production capacity of the press.

Magnesium (obtained from sea water) was available in photoengraving plate form. Its chief advantages were: It could be etched with diluted acid solution and was from four to five times lighter in weight than standard zinc or copper plates. A photographic film manufacturer announced a new colour film which enabled photographers to finish films immediately instead of sending them to out-of-town processing stations. The Murphy halftone screen was announced; with this screen a line and halftone negative could be combined by simply changing filters.

Newspaper full-page three-colour process reproduction speed record was achieved by the San Francisco *Call-Bulletin* in taking a three-colour picture with a one-shot camera of the Shrine convention parade at 10:35 A.M. and reproducing it on three presses within 3 hr. 45 min.

A machine was developed for the *Boston Herald and Traveler*. It automatically tips with adhesive flat preprinted four-colour process enamel-paper inserts on the newspaper page. The attachment keeps up with the newspaper web on presses operating at 50,000 copies per hour. Inserts are attached to web before paper is folded.

In co-operation with the *Milwaukee Journal* a manufacturer announced development of a machine for automatically feeding, wire-tying and ejecting newspaper bundles into a chute connected with a delivery truck. Heretofore, all operations except the wire-tying were manually performed. (M. St.)

Printing Office, U.S. Government. The office was established by congress in 1860 and was in continuous operation from that time.

In addition to doing all of the printing and binding ordered for congress, the office executes all the printing and binding required by the various executive and judicial departments, all independent establishments and emergency war agencies of the U.S. government.

The total area occupied by the government printing office proper in 1946 was 1,396,973 sq.ft. or 32.1 ac. In addition, the office occupied seven warehouses in various sections of the United States, all of which were closed by June 30, 1946, with the exception of one in Alexandria, Va., and one in Baltimore, Md. During the fiscal year 1946 it was necessary to place orders with outside contractors for printing in the amount of \$13,706,307.29, as the government printing office was unable to handle the volume of printing ordered. The value of the office buildings in 1946 was \$9,634,825; machinery and equipment \$6,471,750; making the total value of the plant \$16,106,575. During the fiscal year 1946, there were 6,928 employees on the rolls with a pay roll of approximately \$20,200,000. The office made charges for 710,418,936 copies of publications of all classes. This total included 9,144,234 copies of the *Congressional Record*, 5,327,308 copies of the *Federal Register*, 3,088,414 copies of specifications of patents, trademarks, designs, etc., and 309,138 copies of the patent office *Official Gazette* and annual indexes. The number of postal cards printed amounted to 2,309,892,200 and money orders 284,196,930. The stores division and warehouses handled 4,196 carloads of paper weighing 167,428,434 lb. The division of public documents mailed out 138,812,000 publications and forms; its receipts from the sale of government publications during the year amounted to \$2,156,379.60. The total charges made to congress and all other government agencies during the fiscal year were \$47,224,867.36. (A. E. Gr.)

Priorities and Allocations. The Civilian Production administration, the agency charged with facilitating the reconversion of U.S. industry, operated under the broad policies laid down by the Office of War Mobilization and Reconversion in the executive office of the president. Policies set by the director of the OWMR and actions of the administrator of the CPA were almost constantly in the direction of curtailing the number of commodities governed by priorities and allocations, the quantities of supplies distributed by government regulation and the number of users granted preference ratings for their orders.

With the goal of rapid withdrawal of government from industrial management CPA reduced the number of regulations in effect to 61 controls at the beginning of 1946 and 32 at the end. The wartime high of the War Production board was 650. Most of the year, the agency worked with 40-50 controls. Some of these were inactive but were kept on the books in case of emergency. In this group were some of the utilities orders which imposed "dim-out" schedules and provided for orderly curtailment of other utilities services during the two coal strikes.

After V-J day CPA's predecessor, the WPB, and then CPA itself launched a vigorous program of liquidating priorities and allocations controls in the belief that there would be "enormous stocks of idle and excess materials and components of all kinds." These predictions, however, proved inaccurate. Although there were larger quantities of most materials available than ever before, with the exception of certain imported materials such as tin, the volume of production undertaken was even higher. Serious and widespread shortages developed.

Although CPA issued 19 new orders during the year, these centred principally around the housing program. Revocation of 35 other orders carried the decontrol trend along steadily.

No attempt was made to restore a comprehensive network of distribution regulations, although some general measures were taken to alleviate

the impact of shortages on the economy. One was the limitation of exports of goods in inadequate supply within the United States. Action was taken in co-operation with the department of state, the Office of International Trade and other interested governmental agencies. Another measure involved orders regulating inventories of scarce materials at both wholesale and retail levels. These orders not only spread supplies but prevented speculative hoarding and thus aided the stabilization program.

However, the use, production or distribution of some materials and products were controlled if supplies fell far below demand and if essential needs were not being met.

Under complete allocation control (*i.e.*, where the entire supply was distributed under CPA regulations) were: gypsum liner, lead chemicals, ethyl fluid, lead, tin, burlap, molasses, strategic imported materials, cans, manila and agave fibre and cordage, antimony, cinchona bark and alkaloids, uranium, penicillin, streptomycin, potash, hides, skins and leather, tapioca flour and rubber.

A second group of materials and products was partially distributed by means of CPA allocations and priority ratings. These included cadmium, iron castings, merchant pig iron and steel, lumber and other building materials, kapok, phenolic resin moulding compound and certain fabrics for processing in Puerto Rico and for low-cost and work-clothing programs and industrial uses.

Other shortage commodities which had been under specific allocation control around V-J day were controlled to some extent under the "bottleneck-breaking" priorities regulation. Priority ratings were given for the purchase of items whose lack constituted a bottleneck in the production of important reconversion goods. This aid also was extended to small businesses, new firms and businesses operated by veterans to enable these producers to operate at a minimum economic rate.

Wherever possible, CPA preferred to rely on voluntary co-operation by private industry to solve reconversion problems. The voluntary quota system adopted by the steel and plastic-moulding-powder industries to distribute unallocated supplies was regarded as fair and equitable inasmuch as the shortages which continued were general. When insufficient freight-car capacity began to hinder distribution toward the end of 1946, the agency set about expediting the construction and repair of freight cars. Much of this expediting was informal, through requests to steel and lumber companies to give preference to car builders' orders and through discussions with car builders to give preference to domestic over foreign orders.

The Veterans' Emergency Housing program required the greatest utilization of CPA powers to make industrial readjustments. The agency's full powers were used to route materials and equipment to producers of building materials, so that supplies could support the maximum amount of home and other construction. CPA also co-operated with other government agencies to adjust price ceilings, recruit labour, raise wages and arrange transportation of materials.

To minimize the competition for scarce building materials the agency limited construction other than housing to the most urgent projects and required that certain percentages of some of the scarcest building materials be reserved to meet priority-rated orders placed by builders of veterans' homes.

In December the housing program too was placed, in the words of Pres. Harry S. Truman, "within the framework of the government's announced policy of relaxing controls." Issuance of priorities to builders of veterans' homes was ended and at the beginning of 1947 measures limiting other types of home construction were relaxed. Thus U.S. industry neared the end of an era and, as 1946 closed, stood closer to a laissez-faire economy than at any time after the depression days of NRA. (See also BUSINESS REVIEW; CIVILIAN PRODUCTION ADMINISTRATION; PRICE ADMINISTRATION, OFFICE OF.) (K. KR.)

Prisoners of War and Displaced Persons.

The rapid repatriation of axis prisoners of war held in the United States begun in 1945 was concluded by mid-1946. Approximately 100,000 German prisoners of war were still in U.S. hands in Europe at the end of the year, some retained as war criminal suspects, some serving sentences for criminal acts and others for miscellaneous reasons. A residue of 200 axis prisoners remained in the U.S. on Dec. 31, 1946, and 400 were held by the U.S. in the far east. Illness, criminal convictions and other reasons caused their continued retention.

There was comparatively little repatriation by the other Allied powers during 1946. Great Britain held approximately 700,000 and France 1,250,000 axis prisoners at the year's end. An unknown number of German prisoners continued to be held by the U.S.S.R. Unofficial estimates of the number ran as high as 3,000,000.

Technically the holding powers were not required to repatriate prisoners until the signing of the peace treaties, but the long delay in negotiating the treaties prompted appeals for their early repatriation. The International Red Cross committee formally urged the Allied governments to repatriate prisoners as soon as possible. The Vatican on a number of occasions publicly called for their return without waiting for the conclusion of treaties. Various other groups called attention to the desira-

bility of early repatriation.

The first of several meetings to consider revisions of the Geneva Prisoners of War convention of 1929 was convened by the International Red Cross committee at Geneva, Switz., in August. At this meeting representatives of national Red Cross societies submitted recommended changes designed principally to increase the protection of prisoners in enemy hands. There was much discussion of ways in which to extend the protection of the convention to civilian internees, a group not formally protected by the convention but which during World War II had been generally assimilated to prisoners of war. A further meeting bringing together representatives of governments was scheduled for March 1947, also to be held at Geneva.

Displaced Persons.—Although occasionally used loosely to apply to all refugees, the term "displaced persons" as used during 1946 by the Allied military and by the United Nations Relief and Rehabilitation administration (U.N.R.R.A.) was applied to civilians of foreign nationality found in territories liberated or occupied by the Allied forces. They consisted of United Nations displaced persons and ex-enemy displaced persons depending upon their nationality. Persons of enemy nationality and stateless persons who because of race, religion or political activity had been held by the enemy in concentration camps were described as persecuted persons and given special assistance by the Allies. During 1946 these distinctions began to mean less than they did immediately following the conquest of Europe and the term "displaced persons" without qualifications was usually applied to all of them.

Efforts to repatriate or find new homes for displaced persons continued during 1946 but, in spite of the repatriation of approximately 500,000 persons during the year, the census of displaced persons in Europe stood at approximately 1,000,000 people at the end of the year. More than three-fourths, or 771,500, were in camps operated by U.N.R.R.A. in Germany, Austria and Italy. The remainder consisted of those living outside of camps and about 130,000 living in other countries such as Denmark and Sweden.

At the end of the year U.N.R.R.A. operated 251 camps in Germany with 656,000 in the camp population, 33 camps in Austria with 93,000 population and 11 camps in Italy with 22,-

GERMAN PRISONERS OF WAR studying American history at Fort George G. Meade, Md.; by midyear of 1946 all but a few hundred German P.O.W.'s in the U.S. had been returned to their homeland

500 population. The bulk of the D.P. camps in Germany were in the U.S. zone of occupation. In addition to the U.N.R.R.A.-operated camps in Germany, 42 camps were operated by the military and 15 were operated by private agencies.

The largest single group among the D.P.'s were the Poles, numbering approximately 285,000 in U.N.R.R.A. camps. Jews (principally stateless) constituted the next largest group, approximately 200,000 and persons from the Baltic states had nearly the same number. In much smaller numbers many other nationalities were represented, including Yugoslavs, Russians, Greeks and Czechoslovaks.

Repatriation.—By the end of 1946 it was estimated that D.P. repatriations in Europe from the time of the surrender of Germany had totalled 7,000,000 persons. Most of these repatriations were accomplished in mass movements during the last six months of 1945. Approximately 500,000 were repatriated from Germany in 1946. Repatriations from Austria and Italy were in relatively small numbers during 1946. More than half of the 1946 repatriations, viz., 337,000, were of Poles, principally from the U.S. and British zones of occupations. No figures were available, but reports continued to be made during 1946 that Poles once repatriated to Poland were returning in substantial numbers to the U.S. zone of occupation in Germany. Other nationalities repatriated from Germany in 1946 included approximately 4,000 each of Yugoslavs, Russians, Dutch, Belgians and Czechoslovaks. Among the 110,000 ex-enemy nationals repatriated during the year were 64,600 Hungarians, 25,000 Austrians and 3,000 Rumanians.

D.P.'s in the Far East.—Both because of the numbers and the political problems involved, the D.P. problem in Europe received much more attention than in the far east. U.N.R.R.A. and the occupying military authorities provided assistance. Voluntary organizations extended considerable help to Jewish refugees in China. U.N.R.R.A. reports in Oct. 1946 showed 14,600 European D.P.'s in the far east, mostly Jews and White Russians. Oriental D.P.'s in China at the same time were reported as numbering 42,000, the largest single group consisting of 15,000 Malaysians. Other nationalities represented were Filipinos, Burmese, Siamese and Indonesians. Substantial movements of

ONE-LEGGED GERMAN PRISONER OF WAR presenting his papers to Russian officers at the entrance to the reception camp at Frankfurt-on-the-Oder in Russian-occupied Germany, where he was to be processed for return to his home in 1946

MILITARY POLICE challenging a German in nazi uniform about his insignia in 1946. He would be released when he could prove to their satisfaction that he had not yet been discharged from the German army

Koreans from Japan and China to their homeland were arranged by the U.S. military authorities, and there were large numbers of Koreans infiltrating from northern Korea into southern Korea.

"The Hard Core."—There remained in Europe at the end of 1946 a "hard core" of D.P.'s of approximately 1,000,000 persons who would not or could not be repatriated. Many were from Poland, Yugoslavia or the Baltic states who feared to return to their homelands and who, according to Allied policies, could not be forced to return. Included in the "hard core" were 200,000 Jews in Germany and Austria, most of whom were seeking permission to proceed to Palestine.

The Soviet Union reiterated many times in 1946 its position that the D.P.'s of eastern European nationality should be forced to return, claiming that propagandists among them distorting the facts about home conditions were influencing them to remain. On the other hand, the Americans and the British were equally emphatic in holding that these persons should not be forced to accept repatriation.

The International Refugee Organization.—Late in 1946 the general assembly of the United Nations approved the constitution of the International Refugee organization, a nonpermanent specialized agency affiliated with the United Nations, to identify, register, classify, assist, transport, protect legally and politically, repatriate and resettle refugees or displaced persons.

Agencies of the United Nations were engaged throughout 1946 in the development of plans for the I.R.O. and in bringing its constitution to the point of acceptance by the general assembly. A special committee appointed in February by the Economic and Social Council had extended deliberations in London during April and May. Its report, dated June 1, was adopted by the Economic and Social Council on June 21. At the same time the council appointed a committee on finances for the proposed I.R.O. The council gave final approval to the constitution of the I.R.O. on October 3, approved a budget for its first financial year and adopted an arrangement for a preparatory commission for the I.R.O. These proposals came before the general assembly in December and were adopted with a reduction of the proposed budget from \$260,000,000 to \$160,000,000.

The constitution was then presented for ratification to the member governments of the United Nations and to other states qualified to sign. It was to become effective when 15 states had

become parties to it. In the meantime the preparatory commission was to work out arrangements for taking over the D.P. responsibilities of U.N.R.R.A. by June 1947. (See also FEDERAL BUREAU OF INVESTIGATION; INTERNATIONAL LAW; RED CROSS; REFUGEES.) (P. E. R.)

Prisons. Because of a continued shortage of vital materials, no new buildings were erected in any state or federal prisons during 1946. But some states completed plans for erecting new institutions, construction of which would start shortly. And some local communities, announced that they would erect new jails, welcome news, indeed. For while there were some modern, well-managed jails, the majority of the 4,000 throughout the United States, were wretched holes, hardly fit for human habitation. They were old, dilapidated buildings with tiny barred windows that shut out fresh air and sunlight. Inside they were dark, damp, crawling with vermin. Cells, just wide enough for a cot, didn't even have one, and inmates, some as young as ten, had to sleep on thin, dirty mattresses on hard cement floors. What is more, some of those inmates, the bulk of whom were awaiting trial, were often beaten so unmercifully because of the operation of Kangaroo courts that they were permanently injured.

Some communities, too, announced plans for the erection of modern, well-staffed detention homes for juvenile delinquents awaiting disposition of their cases. Such homes were a vital necessity. For if a delinquent is placed in a jail pending trial, he is immediately made worse. Generally, he comes in contact with older offenders awaiting trial or serving short sentences, alcoholics, sex delinquents, even the diseased, all habitués of disgraceful jails.

During 1946 there was a noticeable improvement in the educational setups of many state prisons. More vocational courses were provided and civilian teachers added to staffs. Likewise, more attention was paid to modernizing prison libraries and obtaining suitable books and periodicals. In too many institutions, however, libraries still had books so old, that they were of little use to the inmates, the majority of whom craved good reading matter since they spent so much time in their cells.

The problem of providing work for inmates was a vexing one. During World War II, when inmates were kept busy producing matériel for the armed services their morale increased. But with the termination of the war, idleness again became rampant in many prisons. As a result, every effort was made to place penal industries on a firm peacetime foundation. As previously suggested, the most practical way to create inmate jobs was to have prisons produce food, clothing and other articles for state institutions (e.g., hospitals, asylums, etc.) under what was known as the state use system. And there should also be exchange of products between states. In this way, inmates would be kept busy, an essential element for their rehabilitation. (See also CHILD WELFARE; CRIME.) (L. E. L.)

Private Schools: see EDUCATION.

Prizes of 1946. The literary prizes for the year 1946 were as follows:

ACADEMY OF AMERICAN POETS, \$5,000 fellowship to Edgar Lee Masters.

AMERICAN ACADEMY OF ARTS AND LETTERS.—\$1,000 grants to nine writers "to aid in furthering creative work by American artists and to honour them for past achievements": Gwendolyn Brooks, Kenneth Burke, Malcolm Cowley, Peter de Vries, Langston Hughes, Arthur Laurents, Marianne Moore, Arthur Schlesinger, Jr. and Irwin Shaw.

NATIONAL INSTITUTE OF ARTS AND LETTERS, \$1,000 "for distinguished achievement" to Ralph Hodgson, English poet living in the United States.

ANISFIELD-WOLF AWARD (*Saturday Review of Literature*) for the best books on the subject of race relations, \$500 each to Wallace Stegner and editors of *Look* magazine for *One Nation* (Houghton) and to St. Clair Drake and Horace R. Cayton for *Black Metropolis* (Harcourt).

ATLANTIC MONTHLY AND METRO-GOLDWYN-MAYER AWARDS for "Atlantic Firsts," \$1,500 to Cord Meyer, Jr., for "Waves of Darkness" (Jan. 1946) and \$750 to Thomas Heggen for "Mister Roberts" (April 1946) (Houghton).

JAMES TAIT BLACK MEMORIAL AWARDS (British) for the best biography to D. S. MacColl for his *Life, Work and Setting of Philip Wilson Steer*; for the best novel to L. A. G. Strong for *Travellers*.

CANADIAN GOVERNOR-GENERAL'S AWARDS, silver medals for the best books by Canadian authors. To Hugh MacLennan for *Two Solitudes* (fiction) (Duell); to Earle Birney for *Now Is Time* (poetry) (Ryerson); to Ross Munro for *Gauntlet to Overlord* (academic non-fiction) (Macmillan); to Evelyn M. Richardson for *We Keep A Light* (creative non-fiction) (Ryerson). Also to runners-up: Charles Bruce for *Grey Ship Moving* (poetry) (Ryerson); G. Joy Tranter for *Plowing the Arctic* (academic non-fiction) (Longmans); Captain Leo Heaps, M. C., for *Escape From Arnhem* (creative non-fiction) (Macmillan).

CAREY-THOMAS AWARD for the most distinguished example of creative publishing to Alfred A. Knopf, Inc., for *The American Language* by H. L. Mencken, of which the first supplement was issued in 1945. Honourable mention to Simon & Schuster for the handling of *General Marshall's Report* (paper and cloth editions) and to Lothrop, Lee and Shepard for the publication of *One God: The Ways We Worship Him* by Florence Mary Fitch, a book explaining to children the three great religious groups, Jewish, Catholic and Protestant.

COMMONWEALTH CLUB OF CALIFORNIA.—GOLD MEDAL FOR GENERAL LITERATURE to Adria Locke Langley for *A Lion is in the Streets* (Whittlesey House); GOLD MEDAL FOR SCHOLARSHIP AND RESEARCH to Laura L. Hinkley for *Charlotte and Emily* (the Brontës) (Hastings House); SILVER MEDALS to John J. Espey for *Minor Heresies* (Knopf); to Idwal Jones for *High Bonnet* (Prentice-Hall); to Victor Wolfgang von Hagen for *South America Called Them* (Knopf); to Margaret Leighton for *The Singing Cave* (best juvenile) (Houghton).

DODD, MEAD PRIZES.—DODD, MEAD-REDBOOK FICTION PRIZE, \$10,000 for the best novel to Loula Grace Erdman for *The Years of the Locust*; RED BADGE DETECTIVE STORY PRIZES, awarded semi-annually, \$1,000 each to Franklyn Pell for *Hangman's Hill* and to Lee Wilson for *This Deadly Dark*; INTERCOLLEGIATE LITERARY FELLOWSHIP, to Hilda D. Osterhout for a novel about modern Mexico, *Field of Old Blood*.

DOUBLEDAY, DORAN NOVEL PRIZE, \$20,000 to Oswald Wynd of Edinburgh, Scotland, for *The Black Fountains*, a story of Japan.

FEMINA-VIE HEUREUSE PRIZE, 5,000 francs to Anne-Marie Monnet for *Le Chemin du Soleil* (Editions du Myrtre).

FRIENDS OF AMERICAN WRITERS, \$750 for a book about the middle west, to Dorothy Langley for her novel, *Dark Medallion* (Simon).

GONCOURT PRIZE, to Jean-Louis Bory, the youngest writer ever to receive the prize, for *Mon Village à l'Heure Allemande*. The 1940 prize, delayed until after the liberation, to Francis Ambrière for *Les Grandes Vacances*.

JOHN SIMON GUGGENHEIM MEMORIAL FOUNDATION POST-SERVICE FELLOWSHIPS, \$2,500 each to Dr. Herbert Aptheker, John Bakeless, Sam Byrd, Paul Horgan, Everette Howard Hunt, Jr., Oliver La Farge, Dr. Stephen Addison Larrabee, Caroline Backe McMahon, James R. Newman, Dr. Donald McGranahan, Bradford Smith, Dr. Ernest Robert Tinkham.

O. HENRY MEMORIAL AWARD PRIZE STORIES, \$300 first prize to John Mayo Goss for "Bird Song" (*Atlantic Monthly*); \$200 second prize to Margaret Shedd for "The Innocent Bystander" (*Harper's Magazine*); \$100 third prize to Victor Ullman for "Sometimes You Break Even" (*Atlantic Monthly*); \$100 to Cord Meyer, Jr., for a first published story, "Waves of Darkness" (*Atlantic Monthly*).

HARPER PRIZE NOVEL CONTEST, \$10,000 to Jo Sinclair for *Wasteland*.

W. H. HEINEMANN FOUNDATION FOR LITERATURE, £200 divided between Dormer Creston for *In Search of Two Characters* (Macmillan in England, Scribner in U.S.) and Andrew Young for *Prospect of Flowers* (Cape).

AVERY HOPWOOD FICTION AWARDS, to Andrina Iverson for *The Gifts of Love* (Duell); to Peggy Goodin for *Clementine* (Dutton); to Josephine Eckert for *The Practicing of Christopher* (Dial).

HOUGHTON MIFFLIN LIFE IN AMERICA AWARD, \$2,500 to Russell Lord for *The Wallaces of Iowa*; \$2,500 to James Thomas Flexner for *First Flowers of Our Wilderness*, a social history of colonial America in terms of its paintings. HOUGHTON MIFFLIN LITERARY FELLOWSHIPS, \$2,400 each to Jacqueline Shohet Margolish for *The House of Jacob*; to Helen Mears for a book about postwar Japan; to Donald MacRae for his novel, *Dwight Craig*.

INTER-ALLIE PRIZE for a novel by a practising newspaper man, first award after 1940, to Roger Vailland for *Drole de Jeu* (Correa in France; Houghton in U.S.).

IOWA LIBRARY ASSOCIATION AWARD.—The JOHNSON BRIGHAM MEMORIAL PLAQUE to Darrell Garwood for *Artist in Iowa*, a life of Grant Wood (Norton).

LEAGUE OF AMERICAN PEN WOMEN AWARD, to Taylor Caldwell for *This Side of Innocence* (Scribner).

JULIAN MESSNER, INC., \$5,000 for the best book combating intolerance in America to Shirley Graham for her *There Was Once a Slave: The Heroic Story of Frederick Douglass*.

METRO-GOLDWYN-MAYER ANNUAL NOVEL AWARD, \$125,000 to Mary Renault (pseudonym) for *Return to Night* (Mortow).

HARRIET MONROE POETRY AWARD (University of Chicago), \$500 to Wallace Stevens for *Notes Toward a Supreme Fiction*.

NEW ENGLAND WOMEN'S PRESS ASSOCIATION MEDAL, to Elisabeth Ogilvie for *Storm Tide* (Crowell), judged the most outstanding novel by a New England woman.

W. W. NORTON & COMPANY MEDICAL AWARD, \$3,500 to Dr. Edward H. Hume for *Doctors East, Doctors West*, a U.S. physician's life in China.

OHIOANA LIBRARY AWARDS.—Medals for outstanding books by Ohio authors: Dorothy James Roberts for *A Durable Fire* (Macmillan); Arthur M. Schlesinger, Jr. for *The Age of Jackson* (Little); James Thurber for *The White Deer* (Harcourt); Carl Frederick Wittke for *Against the Current* (Univ. of Chicago); Alice Monk Mears for *Brief Enterprise* (Dutton); Louis Bromfield (special medal).

THEOPHRASTE RENAUDOT PRIZE, one of three major French prizes, to

Henri Bosco for *Mas Théotime* (Charlot). The 1940 delayed prize to David Rousset for *L'Univers Concentrationnaire*.

SCRIBNER PRIZE IN AMERICAN HISTORY, in commemoration of the 100th anniversary of Charles Scribner's Sons, 1846-1946: \$10,000 to Allan Nevins for *Ordeal of the Union* (2 vols.).

SHELLEY MEMORIAL AWARD (Poetry Society of America) to Karl Shapiro for *Essay on Rime* (Reynal).

CONSTANCE LINDSAY SKINNER AWARD (Women's National Book association), a bronze plaque to Amy Loveman, associate editor of *Saturday Review of Literature*.

SOUTHERN AUTHORS AWARD, \$150 to Josephine Pinckney for her novel, *Three O'Clock Dinner* (Viking).

SEWANEE REVIEW AND PRENTICE-HALL AWARD, \$200 to Malcolm Cowley for his essay, "William Faulkner's Legend of the South"; \$200 to Andrew Lytle for his short story, "The Guide"; \$100 to Sergeant Randall Jarrell for his poem "Marchen."

WALT WHITMAN SOCIETY OF AMERICA AWARD, to Robert Payne for *Torrents of Spring* (Dodd) and to Louis Adamic for *A Nation of Nations* (Harper).

YALE SERIES OF YOUNGER POETS, 1945 award to Eve Merriam for *Around the House*; 1946 award (posthumous) to Joan Vincent Murray for *Poems*, edited by Grant Cole.

Children's Books.—CALDECOTT MEDAL for the most distinguished picture book to Maud and Miska Petersham for their illustrations to *The Rooster Crows* (Macmillan).

JULIA ELLSWORTH FORD FOUNDATION, \$1,250 to Genevieve Torrey Eames for *A Horse to Remember* (Messner).

JUNIOR SCHOLASTIC GOLD SEALS, to Marguerite Henry for *Justin Morgan Had a Horse* (Wilcox and Follett).

HERALD TRIBUNE SPRING BOOK FESTIVAL, \$200 each to Clayton Knight for *The Quest of the Golden Condor* (Knopf); to Jean Bothwell for *The Thirteenth Stone* (Harcourt); to Gustav Tenggren (illustrator) and Kathryn and Byron Jackson (authors) for *Farm Stories* (Simon).

JOHN NEWBERY MEDAL, to Lois Lenski for *Strawberry Girl* (Lippincott).

YOUTH TODAY CONTEST, \$3,500 to Phyllis Whitney for *Willow Hill* (Reynal).

Pulitzer Prizes.—The Pulitzer prizes in journalism and letters, awarded by the trustees of Columbia university acting on the recommendation of the advisory board of the graduate school of journalism were given their 30th annual award in 1946. The prizes in letters were as follows: \$500 drama award to Howard Lindsay and Russel Crouse for *State of the Union* (Random House); \$500 history award to Arthur M. Schlesinger, Jr., for *The Age of Jackson* (Little); \$500 biography award to Linnie Marsh Wolfe for *Son of the Wilderness*, a life of John Muir (Knopf); \$500 music award to Leo Sowerby for his "Canticle of the Sun."

Prizes in journalism were as follows: \$500 for meritorious public service rendered by a U.S. newspaper to the *Scranton Times*; \$500 for distinguished editorial writing to Hodding Carter of the *Delta Democrat-Times* (Greenville, Miss.) writing on racial, religious and economic intolerance; \$500 for distinguished correspondence to Arnaldo Cortesi of the *New York Times* for his Argentine exposures; \$500 for a distinguished cartoon to Bruce Russell for his cartoon, "Time to Bridge That Gulch," a plea for better U.S.-soviet relations; \$500 for reporting national affairs to Edward A. Harris for his series on tideland oil resources; \$500 for reporting international affairs to Homer Bigart for his Pacific war coverage in 1945, in the *New York Herald Tribune*; \$500 for domestic reporting to William L. Laurence of the *New York Times* for his atom bomb stories, including his eye-witness account of the bombing of Nagasaki.

Nobel Prizes.—Four of the Nobel prizes went to U.S. citizens in 1946 and the fifth to a naturalized Swiss. They amounted in 1945 to about 130,000 Swedish krona (\$36,205) each. They were as follows:

The physics prize went to Dr. P. W. Bridgman of Harvard university for his production of extremely high pressures which duplicate those prevailing in the interior of the earth.

Half the chemistry prize went to J. B. Sumner of Cornell university for his distinguished research in the field of enzymology. The other half was divided between Dr. W. M. Stanley and Dr. J. H. Northrop of the Rockefeller Institute for Medical Research in Princeton for their preparation of virus proteins in pure form.

The prize in medicine and physiology went to Dr. Herman J. Muller of Indiana university for his work in discovering that mutations, or biological changes in a species, may be produced by X-rays.

The peace prize was divided between John Raleigh Mott (aged 81), a Methodist layman, leader in international religious movements, who in World War I headed the Y.M.C.A.s canteen and prisoner-of-war work, and Emily Greene Balch (aged 79), a Quakeress, once a professor at Wellesley and a founder of the Women's International League for Peace and Freedom at The Hague in 1915.

The literature award went to Hermann Hesse, a German who became a naturalized Swiss citizen. (For prizes in other fields see ART EXHIBITIONS; CANADIAN LITERATURE; MATHEMATICS; MINERALOGY; MOTION PICTURES; RED CROSS; SCULPTURE; SOCIETIES AND ASSOCIATIONS; THEATRE, etc.) (B. Gm.)

Protestant Episcopal Church. In the Episcopal Church the year of 1946 was marked by efforts toward the relief of the suffering

people in war-devastated countries, by a deepened interest in the world-wide missionary work of the church, and by a fervent desire for the establishment of just and lasting world peace with the realization that this was absolutely imperative in view of the possibilities of atomic and modern scientific warfare. The organization of the United Nations was a great forward step and demands the support of all men of good will, but the church knows that only the power of Christ can meet the world's need and bring brotherhood and peace to mankind.

The triennial meeting of the general convention was held in September in Philadelphia and important work was accomplished. A notable event was the presence of the archbishop of Canterbury, the Most Reverend and Right Honourable Geoffrey Francis Fisher, whose visit made a great impression upon the whole church and was most warmly welcomed.

The statistics reported for the year show an increase in the number of baptized members of the church, the number being 2,300,575, and a slight increase in the number of communicants, the number reported for 1946 being 1,583,338. An especially important gain was that shown in the number of church school pupils and teachers, the total number of pupils reaching 402,253 and the number of teachers 48,407. The total contributions for the work of the church reached the all-time high of \$53,011,393 an increase of \$6,841,356 over 1945.

The presiding bishop of the church, the Right Reverend Henry St. George Tucker who had held this office for nine years, retired at the end of 1946 and was succeeded by the Right Reverend Henry Knox Sherrill, bishop of Massachusetts, who was elected to the office of presiding bishop at the meeting of the general convention. Psychiatry. The bulk of the psychiatric literature for 1946 contained the final war report from observers under combat conditions, both on land and sea, the preliminary studies on rehabilitation of the demobilized soldiers and sailors and a growing volume of discussion on industrial psychiatry. No discoveries in psychiatry were known to have originated in the axis countries that were not recognized, at least in large part, by the Allies during the war period.

Psychiatry and the War.—*Psychiatric Casualties.*—Reports clearly indicated that the actual incidence of psychiatric casualties was significantly higher in World War II than in World War I. The increase was due, in part, to more alertness on the part of army psychiatrists in World War II than in the earlier conflict and to improved diagnosis. In active theatres of war the rate of psychiatric casualties for World War II was two or three times that of World War I. This higher incidence was not attributed to inferior screening of recruits, for the examinations in general were much more rigid in 1942–43 than they were in 1917–18. The chief cause of the increase appeared to lie in the fact that warfare was more terrifying in World War II than ever before and the mental hazards were considerably greater than those encountered in the trench warfare of 1918. New weapons of intricate pattern, such as the Flying Fortress, the tank and the amphibious landing crafts, meant great responsibilities for those entrusted with their operation and the additional requirements in mechanical skill and knowledge needed in modern battles were important factors in bringing about psychiatric casualties. All these, however, did not fully explain the increased rate in nervous breakdowns, and stress was put upon a re-evaluation of the emotional conviction contained in the concept, “why we fight.” The spirit of fighting a war “to end all wars” was conspicuously absent in World War II. Men were often drafted in a spirit of resignation in World War II and soldiers frequently expressed a feeling of resentfulness that they, rather than someone else, were selected. Competent observers concluded that an absence of the will to fight, the lack of a sense of immediate threat to home or country and the failure to engender a true spirit of anger at the enemy were predisposing causes that lead to an increased incidence of psychiatric casualties in World War II, particularly in the European theatre of combat.

Demobilized Servicemen.—With psychiatric casualties two or three times as great in active theatres of war in 1945 as in 1918, it was expected that the stress of war would lead to an increase also in the number of demobilized soldiers with psychological problems on returning home. This proved not to be the case, at least as far as the U.S. army was concerned. Only 257 men out of 10,000 examined, all of whom had seen combat service or who had had 3 or more years of service overseas, showed sufficient signs to warrant a diagnosis of a psychiatric disorder and only 51 of these had symptoms severe enough to cause some degree of incapacity. The mentally and physically ill were not included in this study so that the figure of slightly over a half of 1% incapacitated as the result of their prolonged and strenuous service represented the reaction of the general soldier who did not break down in warfare or battle conditions in World War II. The “adjustment problems” and the frank neuropsychiatric disorders in the returned serviceman were shown to be greatly overemphasized by the popular press. Most of the disorders, moreover, did not require hospitalization. Many soldiers learned to accept psychiatry as a special form of medicine while in the army. The same skilled professional assistance was easily available to them when they returned home.

Misconceptions.—An enlightening experience regarding human behaviour occurred in the medical corps of the army of the United States. Attempts were made to reject the unfit recruit at the induction centres. By further screening at training centres, others who slipped through the first examinations were detected and discharged. It was thought by some observers that by this method the U.S. army might be made relatively free from insubordination, “A.W.O.L.ism” and indifference to duty on the part of the soldier, thus increasing the morale and fighting efficiency of all units. Furthermore, an effort was made to assign every man to duties that best suited him and his total personality. Pressure was thus exerted, particularly after Dec. 1942, to try to rid the army of the medical, legal and military misfits, without complete realization that in any group there is always 10% who are the lowest in efficiency, motivation and ability. Being the bottom tenth, this group is always dissatisfied, unable to compete with the more competent and frequently showing signs of escape and rebellion in one form or another. The problem of separating the noneffective was tackled vigorously but as soon as thousands of misfits were released thousands more poorly motivated soldiers took their places, filling the dispensaries, casualty stations, hospitals and guardhouses. Another 2,000 were discharged but again there were thousands more who filled the lower ranks of the unstable and inadequate. When these, too, were separated, the avalanche did not stop but grew bigger; rumours were rampant that a soldier was a “sucker” to stay in the army. Men talked freely of building up an impressive record of sick calls to indicate that they were noneffective soldiers. Morale in all organizations suffered and psychiatrists began to have consultations with soldiers who were known to be moderately well-adjusted to military life a few months before and had suddenly begun to show evidence of anxiety.

After an adequate trial of this rejection experiment, it became evident that there was a misconception in the psychiatric formula. Some important factors in human behaviour had been overlooked. Finally, in Nov. 1943, the orders were changed. As a result of this experience, re-evaluation of the principles of psychiatry was undertaken by the army. A new, more thorough understanding of the aetiology and treatment of psychiatric disorders was recognized with an acute awareness of limitations. A strong motivating force as a basis and code for living was accepted as one of the greatest defenses against the development of psychiatric disorders, this force often transcending the destructive effects of bad environment and genealogy. A soldier was considered not only as the sum total of his genealogy and his past performances but to these must be added his present incentive. It was thus shown that pure psychiatric disorders, as well as attitudinal disorders, were contagious, especially when secondary gains resulted. A large group of soldiers was found which had latent potentialities of psychiatric disorder. Within limits this section of the army functioned satisfactorily under heavy stress so long as no escape from that stress was readily available.

Psychiatric Problems at Oak Ridge.—The release from secrecy of the activities at Oak Ridge, Tenn., where the atomic bombs were made, led to appraisal of the psychiatric problems connected with this mushroom city. From a mudhole, a city of 75,000 with all the usual conveniences of a well-organized town was rapidly organized. All the employees had high wages and were provided with a place to live. At first it was thought by some that there would be no need for any social service organization. It was soon found, however, that all the usual problems of the ordinary city were present. There were difficulties arising from the transplanting of people, particularly when the new inhabitants could not find the usual resources that they were accustomed to. There was never enough of anything to go all

the way around; not enough stores, not enough finished roads and never enough finished houses. The large number of young people living in dormitories presented a special problem and it was necessary to inaugurate a system of dormitory counsellors.

Few examples of major psychoses were seen by the psychiatrists, the greatest problem being the care of patients with acute anxiety neuroses, comparable to battle fatigue encountered in overseas units. This resulted in a serious situation. Because there was a big job to be done hurriedly and under pressure, with a good many handicaps, the presence of acute anxiety states was of considerable importance. The population had a curious range from top-flight, world-renowned scientists down to local hill folks. Oak Ridge was predominantly a young people's town, the median age being 26; consequently it had the highest birth rate of any city in the United States. Fatigue reactions with associated tension states were most prevalent in the executive group. The scientific group, used to laboratory research in a university city, were prone to become irritated by the more practical engineering group and vice versa. One sort of frustration to many of the minor scientific groups was that they were required to spend months of repetition of a single chemical analysis without knowing what had gone on before or what was to happen afterward. Most of them were equipped to do work of a broader character and they often felt thwarted that their activities were so limited. The mounting tension that resulted frequently led the workers to the psychiatric department, via the medical department where the patients had reported with vague symptoms of a psychosomatic nature.

Many workers knew that they were dealing with an unknown toxic material. Safeguards against accidents were effective but the constant watchfulness in checking laid the ground for anxiety and subsequently to acute panic states in the more unstable. Employees with basic paranoid tendencies found much to accentuate suspicion; no one knew who belonged to the intelligence force or when he or she was under surveillance. The surprising thing was the lack of curiosity by the average worker as to what was really going on. Everyone surmised its importance. At the same time each was so busy with his job that the rest of the vast undertaking seemed relatively unimportant. Many felt more comfortable inside the barricade around Oak Ridge than outside, for there were many more attempts at prying into secrets outside the reservation than inside.

The psychiatrist was forced to keep most of his patients in the hospital. Only those who were working in non-critical categories, meaning that they had no intimate contact with secret procedures, could be transferred out. It was necessary therefore to create a closed treatment unit. Several patients who were acutely psychotic never once broke secrecy or discussed secret work even in the depths of their psychoses.

The need for secrecy made it necessary for every military transfer from one department to another to be supervised by the psychiatrist. Other developments had to do with child guidance, the problem of juvenile delinquency, some adult delinquency and the usual emotional problems that go with any accentuation of strenuous living conditions. On the whole the Oak Ridge community emerged as a rather successful venture apparently far more wholesome and smoothly functioning than most uncontrolled wartime communities that sprang up around many newly-hatched industries. Oak Ridge proved to be a reasonably comfortable and satisfactory place to live considering the hurry and the atmosphere in which it developed.

Industrial Psychiatry.—During the period of about 30 years that industry and psychiatry have been co-operating a few major gains were made, but much of the progress was slow and often uneven. In most cases, the utilization of the concepts of psychiatry and mental hygiene in the present industrial scene was not

advanced beyond the pioneering and exploratory stages. World War II finally laid the foundation for a more rapid and more extensive development in this field than had occurred in the previous three decades. Stimulation to industrial psychiatry was given by the concern over the placement and readjustment of men discharged from military service with neuropsychiatric conditions, and from the recurrent deeply seated problems in the human relations field growing out of unresolved conflicts between individuals and groups representing the opposing point of view of management and labour. Dearth of psychiatrists with adequate industrial experience and orientation was still present in 1946, for there was a lack of training facilities for psychiatrists in industry. This, and also the absence of established precedence for initiating psychiatric programs, were practical obstacles which stood in the way and prevented the appreciation and acceptance of contributing possibilities of psychiatric understanding and technique to industry. Some programs failed because the psychiatrist narrowed his field and identified himself with purely medical or clinical activities. Collaboration and adaptation of psychiatric technique to those of other departments within industry dealing with human relations, such as personnel counselling, psychological services, employee research and various industrial relation activities which are sometimes grouped under the term "human engineering," were found to be essential. The psychiatrist could not work in isolation but had to act as a catalyst to all activities which have to do with the handling of people and the prevention of damaging interpersonal relations.

Some of the broader consulting and educational functions in which the industrial psychiatrist played a leading part concerned the correlation of techniques for improving the selection, placement and promotion of employees presenting some degree of emotional, mental or intellectual disorder, the elucidation of techniques for uncovering actual as well as potential "problem employees" and for the handling of such individuals by supervisors, medical and personnel consultants. The participation in training programs for counsellors and supervisors in respect to understanding and handling the psychological factors influencing the productivity of both normal and problem workers, and the checking of effectiveness and developing techniques for improving all employment, medical and personnel functions involving interviewing and counselling were also undertaken. Provision was made by the psychiatrist in industry for a consulting service open to both management and labour union officials as well as others who voluntarily request interviews, and for the organization of research projects to throw light on causes and remedies of personality problems in both employees and at the supervisory level.

In general, industrial management became open-minded about the application of psychiatry in industry, providing the psychiatrist was willing to learn about industry and its problems. Top management in industry was increasingly asking for psychiatric help in personnel problems. It was felt that the basic causes of all functional mental disease existed, grew and caused some manifestations in normal people, that normal people were the hosts or carriers from whom unfortunate individuals contract the more serious recognized form of this group of ills. Industry offered the psychiatrist a unique opportunity to explore this important area of a cycle now vaguely known. (See also PSYCHOLOGY.)

Psychology. The trend in psychology for more than a decade was away from a simple mechanical conception of man. During 1946 there was a further realization of this movement in many specific areas of psychological investigation. The basic change in point of view comes from two main sources: Gestalt psychology with its devastating attack upon the machine theory of mind and Freudian doctrines with their emphasis upon the dynamics of personality formation. Though the general shift was toward the recognition of mind as a creative force, capable not only of reacting to stimuli but of organizing its experiences and imposing its own interpretation, the older concepts of stimulus-response psychology held on tenaciously for much of the specific content of U.S. psychology. Their replacement was a gradual process and was facilitated by the increasing practical contacts of academic psychologists with problems of human relations outside their laboratories.

Advances In Dynamic Psychology.—The wholistic, dynamic approach made the following advances: (1) More humanistic concepts were emerging in the field of the social behaviour of children. H. H. Anderson showed the inadequacy of such constructs as dominative leadership, fear, maladjustment, conflict and repression to account for the nature and development of social behaviour. Integrative leadership and co-operative activity are in fact more common among preschool and kindergarten children than dominative behaviour, and concepts like social integration, spontaneity and harmony are necessary for accurate description.

(2) Client-centred, nondirective therapy, based upon the individual's own capacities for self-realization, was being developed as a therapeutic and research instrument of wide application. Freudian theory had always assumed the significance of the patient's attaining insight into his own basic conflicts, but psychiatric and even psychoanalytic practice gave the therapist an important directive role. Carl Rogers and his school in their nondirective approach, however, radically changed the part played by the counsellor or psychologist. Instead of making direct, positive suggestions, the counsellor creates a warm and permissive atmosphere for the free expression of the patient and conveys to the patient his deep understanding of the attitudes expressed. Experimentation with this procedure established the fact that there exists in most individuals, growth forces for adjustment which can operate spontaneously under proper psychological conditions. In addition to its success in counselling and mental therapy, the nondirective method became one of the principal tools by which public-opinion and survey interviewing could get at the personal values and motives of respondents.

(3) Allied to the client-centred approach of Rogers was the work of K. Lewin, R. Lippitt and A. Bavelas in effecting changes in group habits and group relationships. They found that external pressure in changing group-ways succeeded only temporarily. Sooner or later the old behaviour pattern reappeared. When, however, the group itself made the decision to adopt new ways, the changes were permanent and in some cases progressive. For example, workers given added incentives to speed their production rates tended in time to resume old work rates. But when the workers were given the problem to solve themselves with assurance that wage rates would not be cut back, the increased productivity was permanent. Similarly, in the field of race relations, the community which on invitation investigated its own racial problems and devised plans for improving the situation had more continuing success than the community upon which the program of reform was imposed from above. The Lewinian group also had excellent results with role-

playing techniques in which individuals modify their behaviour not because of threats or exhortation but through the voluntary assumption of new behavioural roles. The same use of spontaneous internal motivation is to be found in the psychodramatic technique of J. L. Moreno. In this method individuals act out their difficulties and problems with limited direction from the psychologist. In the creative acting process they objectify their conflicts, obtain fresh insight and accordingly restructure their behaviour.

(4) Projective tests for personality diagnosis and evaluation were replacing the paper-and-pencil item-tests of personality traits. Projective tests present unstructured or incomplete material to the subject who in his imaginative constructions reveals his own motives and mental processes. The specific-item test which sought to measure single traits in personality by summing self-reports on particulars of behaviour were found wanting in validity. Studies indicated its inability to differentiate behaviour-problem children from normal children, delinquents from nondelinquents and neurotic from nonneurotic subjects. On the other hand, the Rorschach and Thematic Apperception tests, both projective instruments, were used successfully in identifying personalities and in predicting behaviour difficulties.

(5) The older description of popular thinking as the blind tying of old stereotyped labels to superficially related facts was being revised because of its over-emphasis upon the passive and irrational aspects of social attitudes. The present formulation in terms of assimilating material to frames of reference makes allowance for the organized and rational pattern of prejudices. Experiments showed that social fictions to be accepted must make some sort of sense even to the gullible and must fit into a larger framework of belief. The nature of productive thinking, moreover, was brilliantly examined in Max Wertheimer's posthumous work, *Productive Thinking*. Rational solutions arise when the problem situation is conceived in terms of its intrinsic structural interrelationships. The problem solver selects the relevant characteristics and relations and restructures the situation with a regrouping of parts in accordance with the requirements of the needed solution. In this process the rearrangement goes on as gaps and inconsistencies appear until an organization is found which meets the significant and implicit demands of the problem. Productive thinking is not blind trial-and-error with accidental success, but a grasp of the inherent relationships of the situation and a succession of patternings that are sensibly related to the important dimensions of the problem.

The Growth of Clinical Psychology.—The largest single development in the whole field of psychology after the end of World War II was the growth of clinical psychology. The war years brought about a *rapprochement* between psychology and the medical profession, as the diagnostic tools and research skills of the psychologist gained recognition. The concept of the psychiatric team made up of neuropsychiatrist, clinical psychologist and psychiatric social worker became widely accepted. This acceptance broadened the area of operations for the psychologist to include individual or group therapy for minor psychoneurotic conditions and new research opportunities on the relative efficacy of various therapeutic techniques.

Though there had been a growing awareness of the need for more adequate clinical-psychological services in the nation generally, the expansion was in good part in answer to the immediate requirements of the Veterans' administration. The neuropsychiatric patients in Veterans' administration hospitals were expected to outnumber all other types of illness; on April 1, 1946, there were about 44,000 neuropsychiatric cases as against only 30,000 cases of other kinds of illness. Then, too, there were the psychological problems in the re-education of the crippled and physically handicapped. Finally, the federal laws pro-

vided a guidance and advisement program for all veterans which included educational, vocational and psychological counselling.

To implement its objectives the Veterans' administration set up a division of clinical psychology in the neuropsychiatric services under Dr. James Miller and was employing clinical psychologists in these five types of installations: mental hygiene clinics, neuropsychiatric convalescent centres in general medical and surgical hospitals, neuropsychiatric hospitals, paraplegia centres and aphasia centres in general hospitals. The mental hygiene clinics attempted preventive psychiatry. In the paraplegia and aphasia centres the work of the psychologist was to be largely retraining and re-education. To staff these services the Veterans' administration initiated a training program in which the trainees, mostly veterans themselves, were taken on as part-time workers while they pursued their graduate training at co-operating universities.

The Veterans' administration also embarked upon the most ambitious guidance program ever undertaken in creating facilities for vocational, educational and personal counselling for all veterans. The work was done through guidance centres organized in hundreds of colleges and universities all over the U.S. The Veterans' administration contracted with the educational institution for the types of services furnished but directed the procedures to be followed. Moreover, research was conducted by the central offices on the effectiveness of the various counselling and psychometric services.

Even after the peak of the veteran load was expected to be past, the rising morbidity rate for mental disease in the U.S. would call for expanded psychological and psychiatric services. The United States public health service was already planning for an extension of public mental health clinics.

Research Findings.—Prefrontal lobotomy, the surgical severing of the nerve tracts connecting the frontal lobes and the thalamus of the brain, was used as a treatment for psychosis with considerable apparent success. Many schizophrenic patients after this operative treatment lose their psychotic symp-

toms and resume their place in community activities. Before its use as a therapy, prefrontal lobotomy had been tried in animal experiments to discover the functions of the prefrontal lobes, and it was established that infrahuman primates with frontal lobe destruction suffered definite loss of the faculty of immediate memory. The first reports from the testing of human patients after the operation showed little intellectual impairment. More careful, systematic testing by M. F. Robinson, however, indicated that the operation does affect the capacity for prolonged attention and deliberativeness, a finding similar to the earlier work on animals. It seemed that the success of the operation is the result of a simplification of total neural organization with the knocking out of some of the higher nervous controls. The withdrawn, schizophrenic patient becomes more emotionally extraverted but also less capable of intellectual deliberation.

Behaviourism overgeneralized John B. Watson's epoch-making experiments on the conditioned nature of emotional reactions in children. Research evidence had accumulated to indicate that fear and rage are evoked in new situations in which learning is not involved. D. O. Hebb demonstrated such spontaneous fear in chimpanzees when presented with mutilated and dismembered bodies and other unusual stimuli with which the laboratory-bred animals had had no experience. The explanation was not that these fears are innate but that situations which disrupt the existing sequence-patterns of neuropsychological organization are emotion-arousing. Pain because of the intensity of the stimulation may have a direct disrupting effect. Dead and mutilated bodies and similar "weird" stimulus patterns upset the normal organization of responses because they call out incompatible perceptual and intellectual processes.

The superiority of the whole to the part method of learning was confirmed in studies of concept formation. Where material can be logically organized by the learner there is a relative saving in time by increasing the amount to be learned at one session. Research on incidental learning has had important implications for the psychology of testimony. People under no specific set or intention to observe will be able to report correctly on the general trend of events but not on specific details. Thus, the witness to an accident may not be necessarily unreliable about major happenings because he is inaccurate about the details.

The development of a sense of time in the young child was at last studied systematically. Spontaneous verbalization indicates that children first use words which refer to the present, then words denoting future time and finally words which refer to the past. There are marked individual differences in children's orientation in time. Some children develop an excellent temporal frame of reference at an early age; others never seem to be well oriented in terms of temporal perspective. As a rule, however, words implying duration do not appear until about three years. As to general divisions of time, the child knows whether it is morning or afternoon before he knows what day it is; days of the week are named correctly by five years; months of the year not until eight years.

Since the suggestion theory of hypnosis was formulated it had been common to explain the results in the hypnotic state as the result of expectancy. In a set of experiments, W. R. Wells demonstrated that the strength of grip could be increased under hypnosis although the hypnotically-induced belief was one of weakness. The suggestion theory apparently over-simplifies the real facts of dissociation.

Public Health Engineering. **Water Supply.**—The U.S. public health service, under its authority over interstate quarantine matters, issued four successive standards of quality for the water used on interstate carriers. Three of these were issued in 1914, 1925 and 1942. The fourth appeared in 1946. The standards were intended to be used in evaluating the quality of water furnished or made available to passengers on railroad trains, steamships or other forms of transportation across state lines.

For the first time these federal standards were officially accepted in 1946 by the American Water Works Assn. for application to all public water supplies, whether used in interstate traffic or for intrastate purposes. They thus became by implication professional standards commanding a broad and general acceptance usually accorded to such professional specifications. The standards for 1946 differed in certain essentials from those promulgated in 1942, with particular reference to administrative responsibilities of official state and local health agencies and of local water departments. The bacterial and chemical requirements, except for clarification, remained approximately the same.

In this connection increasing search was being made for more rapid techniques for the examination of drinking waters for evidence of sewage pollution. The measurement of the fluorescence of drinking water was reported as an index of pollution. Those and other techniques for rapid indirect determination of sewage pollution were still in the investigative stage.

The use of chemicals for the economic control of weeds in and around reservoirs made large advances. Understanding and availability of improved compounds had progressed sufficiently far to give some promise of ultimate success in controlling or even eliminating the ever-present objectionable weeds, the sources of tastes and odours in water and of general interference with the operation of reservoir and river channels. The new 2, 4-D compounds are among the most effective materials of this type. Chlorinated hydrocarbons, with dosages as high as 50 gal. per ac. and with long contact periods, gave successful results with submerged aquatic weeds. Extensive field operations had taken place in the Los Angeles, Calif., and in the Tennessee Valley authority areas.

Sewage.—The importance of poliomyelitis virus in sewage still offered one of the debatable issues in the field of public health engineering. Claims as to the importance of the transmission of this disease through water or through flies naturally reached a high point during 1946, because 1946 showed one of the highest incidences of epidemic poliomyelitis in U.S. history. Sensational press reports linked sewage pollution with polio and a few engineers at least attached the label of "filth disease" to polio. The most careful investigations of epidemics of polio, however, did not record any instance of its spread by a common water supply. Small groups of cases were associated with a common milk supply. No instance was at hand in which any

other common food had been definitely incriminated as the medium of transportation of an explosive outbreak.

Considered epidemiologic opinion suggested that there was no reason to believe that improved methods of sewage treatment and disposal, more rigid standards for the purification of water supplies or the dusting of DDT over a city from aeroplanes would have any measurable effect on the incidence of infantile paralysis. Such a judgment, however, did not mean that careful and continuing field and laboratory studies were not essential for the ultimate clarification of the relationship of environmental structures and their control to this and other virus diseases.

Food.—The control of food continued to offer one of the major challenges to public health engineering practice. The literally filthy conditions disclosed by the detailed New York city enforcement program during 1946 could probably be matched throughout the U.S. and other countries.

A report of an outbreak of infectious hepatitis in 1944 among the students at Western Reserve university school of medicine (Cleveland, O.) merely gave additional emphasis to the necessity for this eternal supervision. The outbreak consisted of 24 cases, involving only members of one fraternity house and primarily those who ate regularly at the fraternity dining table.

Similar circumstantial incrimination of milk occurred in Georgia in 1945 with an outbreak of infectious hepatitis. There, too, the direct incrimination of a single dairy was significant, if not complete.

Air.—Interest in the control of air for the purposes of prevention of disease continued at the usual high level. A critical review of studies on disinfection of air in military establishments was prepared by the Committee on Sanitary Engineering of the Division of Medical Sciences of the National Research council. The committee concluded that, although both ultraviolet light and glycol had their merits and demerits, knowledge was too limited to make any definite claims or predictions concerning their ability to reduce air-borne infection. The design and operation of apparatus for air disinfection was still on an empirical basis and the use of these disinfection agents was not without danger to the user. Extravagant views for promotion of sales of disinfecting apparatus might well retard progress and injure the industry. The committee did not recommend the general use of these disinfecting devices. Much research and development work by qualified personnel remained to be done.

Insects and Rodents.—A hitherto unknown type of spotted fever affecting nearly 100 persons in Queens borough of New York city during the summer of 1946 was identified as a new disease spread by the bite of a mite. The mite lives on the bodies of mice. The disease was named rickettsial pox.

The mite which spreads the disease was found in storerooms and around incinerators of apartment houses in which the disease occurred. The new disease follows the pattern of the other seven known rickettsias depending upon the bite of an insect.

In Baltimore, Md., during 1946 several cases of typhus fever were traced to insect-bearing rats. For several years a rodent oecology study had been under way in Baltimore under the joint auspices of Baltimore city, the Johns Hopkins university school of hygiene and public health and the Rockefeller foundation. The study was directed toward a detailed investigation of the habits of rats, their adaptation to the physical environment and the use of rodenticides as a control measure.

(AB. W.)

Great Britain.—Plans were afoot in 1946 for the renewal of old plants and the construction of new installations for water

supply. The Metropolitan Water board, London, drew up a comprehensive program, estimated to cost £37,250,000, of which replacement of worn-out plants would account for £6,750,000, improvement to existing works for £8,250,000 and new works for £22,250,000. Worthing town council, Sussex, received approval for a 2,000,000-gal. reservoir at Patching Hill, with a new electrical pumping plant (cost £150,000). Purification plant at the Tees Valley waterboard's works at Broken Scar, near Darlington, Yorkshire (for Middlesbrough), was to be superseded by a modern gravity-filtration plant, the cost of the whole scheme being £235,000. A number of large water undertakings were projected in very remote rural districts, hitherto largely dependent on wells or rain water, such as Skye and the Outer Hebrides (£1,400,000), Orkney county council (£1,000,000) and Perth and Clackmannan (£1,695,000) in Scotland and north Cornwall (£678,627) in England.

Sewage.—A report submitted to Middlesex county council late in 1946 dealt with the subject of sewage disposal at the Mogden works and remarked on the extent to which the capacity of the works was tested by heavy rainfall, especially by the two great storms of July 26 and Sept. 8, when the total rate reached 365,000,000 gal. per day. Full pumping capacity, which had not been used from 1937, was thus required twice in six weeks. Mogden, which had the largest sludge beds in the British empire, was still regarded by engineers as a model and served as such for the Nottingham sewage disposal committee's new works at Stoke farm (estimated cost £1,250,000). The ministries of health and of town and country planning, in considering new sites for housing, gave their attention to questions of sewage and drainage; a report on the proposed £1,353,000-scheme for water supply, outfall sewage and sewage disposal for the new satellite town of Stevenage was submitted to the Hertfordshire county council. Several other authorities applied for sanction to proceed with new schemes, among them Witney rural district council, Oxfordshire (sewage and sewage disposal undertaking to serve 34 villages; estimated cost £350,000), Havant and Waterloo urban district council, Hampshire (scheme for constructing trunk sewers and for sewage disposal works at Dudd's Farm, Brockhampton, estimated cost £371,000) and Norwich city council, Norfolk (proposed scheme involving 6½ mi. of pipes at an estimated cost of £246,240). A number of large draining schemes also were contemplated, the biggest being the £10,000,000 North Surrey project. Fife county council proposed to spend £700,000 on various drainage schemes, including purification of the waters of the River Leven.

Smoke Abatement.—The problem of smoke abatement received much attention among local authorities, and in reply to a question in the house of commons, Aneurin Bevan, minister of health, stated that the possibility of granting general powers to take measures for smoke abatement was being examined with a view to introducing the necessary legislation.

Public Opinion Surveys. **Elections.**—The election record of the polls during 1946 was not distinguished. Errors of 4% or more were common in the forecasts made of the general elections in France and Australia and in the U.S. congressional and state governorship contests. The *New York Daily News*, using a massive rather than a strictly representative sample, erred by nearly 10% in predicting the outcome of the governorship election in New York. The Texas poll, re-established early in the year after a wartime lapse, made a useful contribution to polling knowledge by publishing a careful analysis of its errors in the first Texas primary election of the year. The difficulty of estimating the turnout of the voters and especially the difficulty of finding out to what degree the Negroes would use their franchise seemed to be at the root of the errors recorded.

New Organizations.—The trend toward the establishment of new surveying organizations, noted in 1945, continued during 1946. International Public Opinion Research of New York city reported operations established in nine countries of Latin America. An Italian poll, with the title of *Doxa* and with headquarters at Milan, made reasonably accurate forecasts of the plebiscite held on Italy's royal family and went on to publish a variety of political and marketing reports thereafter. A Norwegian Institute of Public Opinion, affiliated with the International Gallup Polls, published its first reports in Feb. 1946. Releases were also issued during the year by new polling organizations in the Netherlands, Belgium and Hungary.

Public opinion surveying received important new academic recognition with the opening late in 1946 of a Survey Research Centre at the University of Michigan under the guidance of Dr. Rensis Likert, professor of sociology and former director of the division of program surveys of the U.S. department of agriculture. He was accompanied by Dr. Albert A. Campbell and other members of his Washington staff. The new centre was to study survey methods, give college courses in opinion surveying and undertake survey work on special grants.

Applications and Findings.—The year was notable for the widespread application of opinion surveying to the acute labour problems that disturbed the U.S., especially the strikes and the high turnover of labour that afflicted many of the mass production industries. Surveys were in some cases able to forecast the severity and duration of strikes and nearly always were able to reveal the principal causes of high labour turnover. Most of these surveys, made for private corporations, were not published. Toward the end of 1946, as commodity prices in the U.S. began to fall and the restoration of normal markets seemed imminent, many corporations began to expand their surveying work as a preparatory measure.

The *Fortune* Survey of Public Opinion, having established a sample of army and navy veterans, discovered that those who had been in Europe liked the British for their bravery, the Germans for their cleanliness and efficiency and the French for their friendliness. On balance the veterans preferred the Germans over the French, but those who had fought the Germans in many campaigns in the Mediterranean and northern European areas retained a dislike for the Germans.

The French Institute of Public Opinion reported that most French people believe money to be about the most important thing in life. Those, however, who believe that love is more important than money also reported themselves to be happier people than those who put money first.

Public Roads Administration: *see* FEDERAL WORKS AGENCY; ROADS AND HIGHWAYS.

Public Utilities. The dominating influence during 1946 in all sectors of the public utility field in the U.S. was the readjustment of relations between management and labour which came with the transition from war to peace economy. Not all strikes and threats of strikes with their unsettling effects upon employment, income and public services were intraindustry disputes. The worst, notably the steel and coal strikes, came from the outside; the latter particularly, in its spring and fall phases, threatened to restore and to some extent actually restored once more a few of the aspects of service curtailment so characteristic of wartime. A 27-day strike in the Pittsburgh, Pa., area of strategically placed employees of the Duquesne Light Co., ultimately effected curtailment of all the public services of the region. Similar, if less advanced, local stoppages in New York, Virginia, California and in practically all the states showed how the strike problem in essential industries was and remained the nation's paramount problem. Many believed, therefore, that the War Labor board was scrapped too soon.

Another problem arising out of wartime, which had some influence upon public utility affairs, was that of the War Assets administration on how best to dispose of the "Big Inch" and "Little Inch" pipe lines. These facilities, in part, were leased temporarily to the Tennessee Gas and Transmission Co. to carry natural gas to Indiana, Ohio and Pennsylvania, areas greatly in need of a supplementary supply. The availability of this alternative was having some influence upon negotiations in the soft-coal controversy. While 16 bids were received, one from a mutual co-operative association, to carry either oil or gas, the problem remained unsettled at the close of the year.

Related to the above was the general problem of energy supply for manufacturing and domestic and commercial use in the United States. One phase of this was involved in the natural gas investigation carried out during 1946 by the Federal Power commission in natural gas producing and consuming areas. It was estimated that a surplus would be available for about 30 yr. The hearings were closed and a report was to be transmitted to congress disclosing the full nature of the problem of the natural gas industry and its proper regulation in the public interest. Meanwhile the Federal Power commission authorized the extension of the pipe-line transmission network in all directions. The most important of these was the authorization in June of 1,202 mi. of main pipe line from Dumas, Tex., into the Los Angeles, Calif., area at a cost of about \$70,000,000. World War II had accelerated the gradual depletion of California gas supplies so that this region, which knew nothing of coal and whose oil supplies were likewise diminishing, had to look elsewhere for energy supply if it would maintain its record of employment and population growth.

Another phase of the energy-supply problem was treated in the reports made by the bureau of reclamation of the department of the interior. Such a report covering the development of water resources of the Colorado River basin was submitted on June 6, 1946. This report showed that 134 potential projects or units of projects could be developed for irrigation, power production, flood and silt control and other beneficial uses in the basin states. Estimated current construction costs for upper basin projects would equal \$1,471,227,200 and for lower basin projects \$1,989,270,000, or \$3,460,497,200 as a total. Potential hydroelectric power developments for the upper basin states were estimated at 1,713,000 kw. of installed capacity representing an annual firm kw.-hr. output of 9,241,000,000. The lower basin states would show respectively

1,945,400 kw. and 10,205,000,000 kw.-hr. Irrigation development of new lands or supplemental irrigation for old lands would affect in the upper basin 1,734,980 ac. and in the lower basin 921,250 ac. Unfortunately there was not enough water available to fructify all these projects and, therefore, a selection and apportionment had to be made, which was the main reason for making the report. Since the Mexican treaty required the delivery of 1,500,000 ac.-ft. at the border, only 16,220,000 ac.-ft. were available for uses in the United States out of the total average estimated supply of 17,720,000. Since current uses depleted the virgin supply by 7,120,000 ac.-ft., only an average of 9,100,000 ac.-ft. were available to meet expanding uses. Since all existing and potential projects would require 20,200,000 ac.-ft. there was an estimated deficiency of water resources of about 25%.

The Colorado River basin report was a part of a general plan to cover all of the area within the reclamation bureau's jurisdiction. The so-called "Sloan" report covered the Missouri River Valley authority. This report was combined with the so-called "Pick" report of the corps of engineers, U.S. army, in outlining a \$2,000,000,000-plan for 100 dams with 20 associated power plants and transmission lines and 150 irrigation projects to develop the Missouri river watershed for flood control, navigation, irrigation, power and other beneficial uses. Similar reports were prepared for the Central valley of California and the Columbia river watershed.

In November the directors of the Omaha Public Power district signed a contract to purchase the properties of the Nebraska Power Co. This gave them the unique distinction of purchasing the only segment of the electric-power industry in and around Omaha, Neb., still remaining in private hands in that state. After disposing of certain Iowa properties, the net cost to the district was expected to be about \$37,750,000.

The year's end also saw the complete decontrol of utility rates by the Office of Price Administration which had never been more than on an intervener basis. Price stabilization during World War II was the work of regulatory authorities. Available indexes showed that, all told, electric, gas and telephone rates continued to decline. From all indications, however, the level of rates in urban transit was beginning to rise, just as railroad rates had to be increased because of the major importance of the labour cost factor. A similar rise impended in the tele-communications field.

In Jan. 1946 the U.S. supreme court rendered an opinion which might have an important effect in destroying the tax-exemption privileges enjoyed by publicly-owned utility enterprises. After 1933 the state of New York, through an agency known as the Saratoga Springs authority, had been developing a health resort which, incidental to these activities, was bottling and selling mineral water throughout the United States at substantial profits. When the internal revenue department attempted to collect a 2-cents-a-gallon tax levied on all bottled waters according to the Revenue act of 1932, the state contended that these operations constituted a governmental function and hence were immune from federal taxation. In the trial of the suit to collect the tax the federal district and circuit courts had upheld the power to tax because the sale of bottled water by an instrumentality of the state was not the performance of a governmental function. On appeal by the state to the supreme court, the constitutional power to levy this excise tax was upheld. If the principle of this decision should be extended to other forms of revenue-producing enterprises, particularly to power utilities operated by municipal, state and federal agencies, an end might be made of the discrimination in tax policy between publicly and privately owned utilities, which had been a heavily laboured point in the argu-

ments of the opponents of public enterprise. (See also TENNESSEE VALLEY AUTHORITY.) (M. G. G.)

Great Britain.—The gas and electricity industries were severely handicapped in 1946. Shortages of coal and transport and the problems of renewing outworn equipment made it hard to meet the increasing public demand; in the winter periodic cuts were made in supplies to both homes and factories as well as occasional lowerings of pressure and power to domestic consumers. In February Emanuel Shinwell, minister of fuel and power, received a report from the electricity commissioners on standardization of voltages and agreed that the standard voltage should be 240. Both the gas and electricity industries were opposed to nationalization, and in June the electricity industry issued a five-point program as an alternative to the government's plans; the points were: (1) electricity supplies to be available for 90% of premises in the companies' areas; (2) prices to be the lowest possible consistent with costs of coal, wages and materials; (3) forms of tariff to be standardized; (4) standardization of voltages to be completed; (5) direct current for domestic supplies to be abolished.

In September Thomas Johnston, chairman of the North of Scotland Hydro-Electric board, gave details of the £4,800,000 project to use natural resources in Inverness-shire, the catchment area being 124 sq.mi. and the estimated yearly output about 250,000,000 units. This would not only provide fuel for new industries but would also bring electricity to domestic users in hitherto inaccessible areas. National weekly average production of gas for Sept. 1946 was 39,100,000 therms as against 29,000,000 weekly average for the year 1938, and the monthly average of electricity for the first 9 mo. of 1946 was 3,244,000,000 kw. as against 2,031,000,000 monthly average for the year 1938.

The Water act which came into force on Oct. 1, 1945, gave the minister of health specific statutory responsibility for promoting and conserving the proper use of water, and on June 6, 1946, Aneurin Bevan announced the formation of a central advisory committee for this purpose. Improved supplies to a number of midland and northern cities resulted from the opening of the Ladybower reservoir, Derbyshire, in 1945.

Europe.—Domestic supplies of gas and electricity in France improved considerably. Both industries were put under state control, and under the government's economic proposals it was intended to step up total production of electricity from its annual level of 23,000,000,000 kw. to about 37,000,000,000. An important new project was the Donzère-Mondragon barrage on the Rhône river expected to produce 500,000,000 kw. yearly. Prices of gas and electricity for lighting in Aug. 1946 were 5.24 francs per cu.m. and 5 francs per kw. as against 1.54 francs and 1.82 francs for the same month of 1939.

Improvement also took place in the majority of other liberated countries; production in Belgium touched 517,000,000 kw. in Sept. 1946, as against a monthly average of 377,000,000 in 1945; Czechoslovakia produced 413,000,000 kw. in July 1946 against a monthly average of 166,000,000 for 1945; and production in the Netherlands was 203,000,000 kw. for July 1946 as against 122,000,000 (monthly average) for 1945. (See also ATOMIC ENERGY; DAMS; ELECTRICAL INDUSTRIES; LAW; RURAL ELECTRIFICATION.) (J. LN.)

Publishing (Book): see BOOK PUBLISHING.

Puerto Rico. A United States insular dependency in the West Indies; area 3,423 sq.mi.; pop., 1946 est. 2,100,000 (1940 census: 1,869,255). Whites comprised 76.2%, Negroes, 23.8%. The chief cities (with 1945 est. populations) are San Juan, the capital (208,055); Ponce (114,007); Mayagüez (84,766); Caguas (59,136); Arecibo (76,678); Río Piedras (87,851). Languages: Spanish and English; religion: predominantly Roman Catholic.

History.—The appointment of Jesús T. Piñero by President Harry S. Truman in 1946 marked the first time in the 400-year history of the island under either Spain or the United States that a Puerto Rican had been governor. Prior to his appointment as governor, Piñero was resident commissioner to Washington, an office to which he was elected by the people of Puerto Rico in 1944.

Various proposals for a change in Puerto Rico's political status, long unsatisfactory to Puerto Ricans, were made during the 79th congress. President Truman recommended in a special message to the congress Oct. 16, 1945, the enactment of legislation which would authorize a plebiscite to indicate preference as to statehood, complete independence or a dominion form of government. The president reiterated his recommendation in his message to the congress on the state of the union in Jan. 1946. Bills were introduced, but the congress adjourned without having taken any action thereon.

During 1946 the island was relatively prosperous. The resumption of normal shipping after World War II, the beginning of postwar construction and the soldier's unemployment bonus were the principal sustaining factors. However, the coal and

shipping strikes had nearly disastrous effects during the latter part of 1946 and serious suffering was narrowly averted. Shortages of supplies and materials in the United States hampered progress on the industrialization program and delayed construction of important projects.

Rapid price rises that occurred following the abandonment of wartime controls caused great concern, particularly so because sugar, the island's principal export, remained under price control.

The number of different persons employed on emergency projects during the year totalled 47,254. The daily average employed was 13,166. As in prior years the construction and improvement of highways, roads and streets ranked first among the activities of the program.

Education.—A total of 360,635, or 54.36% of the population between the ages of 6 and 18, was enrolled in public and private day schools. The grand enrolment in public schools and private day, vocational, evening and adult schools was 380,469, which represented an increase of 6.91% in excess of that of 1945. In the public day schools, the enrolment was 349,959, an increase of 19,089 or 5.77% in excess of that of 1945. The total number of teachers, principals and assistant superintendents in the public schools was 8,881, of whom 44.42% were normal school or college graduates. Expenditures for public educational purposes totalled \$19,909,657 and for private schools \$908,767.

Finance.—Bank deposits in June 1946 were \$298,100,000; debts were \$212,700,000 and loans \$70,700,000.

Revenues for the fiscal year ended June 30, 1946, totalled \$132,185,700, of which \$82,249,600 was received in the general fund and \$49,936,100 in special funds. The greatest single source of revenue was the tax on rum exported to the United States, which produced \$35,407,700. Disbursements during the fiscal year 1946 were \$177,231,000 leaving a balance in the treasury of \$129,500,100. The bonded debt of the insular government on June 30, 1945, was \$13,064,000; the municipal debt on that date amounted to \$15,756,747.

Funds were appropriated for the budget for the fiscal year 1947 as follows: Operating expenses \$48,585,842; public debt \$39,525; War Emergency program \$3,600,000; public service enterprises \$8,427,918; capital improvements \$15,323,575; a total of \$78,326,413.

Trade.—In 1945 Puerto Rico imported goods from the United States valued at \$160,969,421, an increase of \$40,470,215 over the value of similar imports during the calendar year 1944. Exports to the United States from the island during 1945 amounted to \$144,675,224 as compared with \$123,747,071 during 1944.

Agriculture.—On April 24, 1945, the legislature created the Agricultural Development company, with authority and funds to develop to the utmost the commercial possibilities of the island's agriculture. Various other federal and insular government agencies were at work on the problem of making the best use of the land. Three research centres—the Agricultural Experiment station of the University of Puerto Rico, the Federal Agricultural Experiment station and the Institute of Tropical Agriculture—were carrying on research to develop better plant strains and improve production techniques. In March 1946, the legislature passed the Soil Conservation Districts act, providing for the creation of soil conservation districts to work for the protection of land against soil wastage and erosion.

Through June 1946, the Land authority had acquired nearly 62,000 acres of land. There were 16,851 parcels distributed to *agregados*. There were 18 proportional profit farms in operation that showed a net profit of \$400,000 for the year. In 1946 the Land authority acquired the Cambalache sugar mill, which was operated on a proportional profit basis, showing a profit of more than \$175,000 for the year.

The 1946 sugar production was 909,074 short tons, or 55,457 less than the 1945 production. Tobacco, which in 1945 was overproduced, was decreased in acreage. In 1946 Puerto Rico's 23,745 tobacco growers voted to establish a quota on production. To overcome the threat of hurricanes, which in 1928 and 1932 practically demolished the coffee plantations, the insular government in 1945 set up a plan of insurance, for both crops and plantations. In 1946, the Coffee Industry Relief commission was created to study and put into effect a general plan for the rehabilitation of the coffee industry. Sales of forest products in the fiscal year 1946 amounted to \$14,483, the demand being chiefly for stakes and posts, fuel and charcoal wood and saw timber.

Manufacturing.—The Puerto Rico Industrial Development company was created by the insular government in 1942 to establish and operate industries on behalf of the government and to help finance and assist private industry. In 1946 three factories were in operation under this company's direction—glass-container and cement plants, which used native sand, clay and limestone, and a paper plant which manufactured paperboard from waste paper. Under construction were a clay-products plant and a shoe and leather factory.

Rum production for the calendar year 1945 amounted to 7,568,831 proof gal., of which 2,909,143 gal. valued at \$10,164,574 were shipped to the United States. Needlework shipments to the United States during 1945 were valued at \$23,307,793. The island produced 140,763,000 cigars during 1945. (E. G. A.)

Purdue University. Indiana's link in the great chain of land-grant colleges and universities was established formally May 6, 1889, when the Indiana general assembly accepted \$200,000 in cash and 150 acres of land from John Purdue and other citizens of Lafayette, Ind. Prior to World War II, Purdue had the largest enrolment in engineering of any university in the U.S. and during the war was devoted largely to the training of men for the armed services, civilian enrolment dropping to less than 1,500 students at one time, from a high of 7,121. With the end of the fighting, enrolment began to mount and at the Sept. 1946 semester was up to more than 13,000 including about 7,500 returning veterans. The 1947 fall semester enrolment was to be held to 14,000. Housing facilities for almost twice the prewar enrolment had to be provided and class room and laboratory facilities were greatly expanded as in all institutions of learning.

Dr. Frederick L. Hovde, who headed the rocket bomb development program in the United States during World War II, became president of the university Jan. 4, 1946. The university's department of aeronautical engineering was organized as a separate school in the engineering group and offered a new degree in air transportation. The university granted degrees in agricultural engineering, and also in naval science as a result of establishment of a naval R.O.T.C. on the campus. Schools of the university in 1946 were: agriculture, science, home economics, pharmacy and the following in engineering: civil and engineering mechanics, electrical, aeronautical, mechanical, chemical and metallurgical. Degrees also were offered in education and applied psychology, in trade and industrial education, in physical education and engineering law. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Pyrite. The production of pyrite in the United States decreased from 883,154 short tons in 1944 to 809,308 tons in 1945 and the sulphur content decreased from 372,700 tons to 331,800 tons. Imports increased from 202,455 tons to 208,888 tons, mostly from Canada, but with the greatest amount from Spain that had been received after 1941. Imports declined after 1939, and Spain, the source of 92% of the 1937 imports, contributed only 8% in 1944, rising to 26% in 1945.

All told, world output declined about 40% from prewar years, to 6,600,000 tons, as compared with 11,000,000, and 9,900,000 in 1942 and 1943 respectively. Few figures were received for 1945 outside of the United States; Canada declined from 250,069 tons in 1944 to 227,732 tons in 1945, and France from 189,437 tons to 161,625 tons, but Portugal increased from 145,384 tons to 188,459 tons. Quebec. The province of Quebec, Canada, occupies the lower basin of the St. Lawrence, north of New York and New England to Hudson bay and strait. Area 594,534 sq.mi.; pop. (1945 off. est.) 3,580,000. The cities (1941 census) are: Montreal (903,007), the largest city in Canada; Quebec (150,757), the provincial capital; Trois Rivières (42,007); Sherbrooke (35,956); Hull (32,947). The French language predominates, 80.9% of the people being of French origin. The government is affiliated with the Roman Catholic Church, as are 86.9% of the people. The government differs from those of most Canadian provinces in having a legislative council (senate).

The legislative assembly has 91 members. The lieutenant governor in 1946 was Sir Eugene Fiset; the premier, Maurice Duplessis. The budget in 1945 balanced with a surplus of \$96,455,703, with a provincial debt of \$328,362,569.

History.—In the national (Canadian) parliament the great majority of the members from Quebec continued in 1946 to be Liberals, under the leadership of Adelard Godbout and Louis St. Laurent. The provincial government, on the other hand, remained under the opposition *L'Union Nationale*, led by Duplessis; and the Liberals lost three by-elections at Pontiac, Compton and Bagot, although winning at Richelieu-Verchères as the year ended. Communist influence appeared in the "squat-ter" movement for the seizing of dwelling places by ex-soldiers in the autumn, while Fred Rose, the Communist member of parliament from Montreal, received a penitentiary sentence for atom-bomb espionage. The dominion's plans for consolidating its sources of revenue were frustrated by the Duplessis government, which insisted on retaining its inheritance-tax prerogatives. The joint Canadian-American Defense commission met at Quebec in January, and the provisional International Civil Aviation organization met at Montreal in May. The provincial government with church impulsion pressed its activities in settling young couples on wild lands in the north.

Education.—Continued growth in 1946 brought the number of schools to 10,078 with 32,580 teachers and 724,397 pupils. In 1942 there were 7 normal schools with 3,549 pupils and 31 academies with 11,798 pupils. The two Catholic universities (Laval university at Quebec and l'Université de Montréal at Montreal) had 21,882 pupils, while the two Protestant universities (McGill university at Montreal and the University of Bishop's college at Lennoxville) had 5,285 pupils.

Agriculture.—The value of agricultural production in 1944 was \$371,275,000. In 1945 the acreage cultivated was 6,758,000, and the value of field crops \$153,765,000, with hay leading at \$85,488,000, followed by oats \$24,241,000 and potatoes \$21,367,000. Livestock in 1945 was valued at \$204,407,000; the butter output was \$28,217,256 and cheese \$12,739,277. Buckwheat, maple syrup and tobacco continued to be characteristic Quebec products.

Minerals, Hydroelectric Plants.—The total mineral production in 1945 was \$88,751,614, the two leading products being gold \$25,572,701 and asbestos \$21,405,391. Hydroelectric plants had an installed capacity of 5,848,572 h.p. and sold current worth \$87,264,990.

Forests, Fisheries and Furs.—The 1944 production of lumber was 653,989,310 cu.ft. valued at \$114,918,046, wood-pulp 2,767,081 tons valued at \$105,042,991 and paper 2,152,956 tons valued at \$134,617,241. Three-fourths of the paper goes to the United States, and in 1946 this trade was active at high prices. Fishery products had a value of \$5,361,872 in 1945, and the development of fishermen's co-operatives in Gaspé was important in 1946. The fur take in 1945 was worth \$5,059,995.

Manufacturing.—The gross value of manufactures in 1944 was \$2,929,685,183, the number of employees 424,115 and the wages \$668,156,053. The latest figures for groups of industries (1942), leaving aside farm and forest industries already treated, were: textiles \$431,293,769, iron and its products \$446,133,739, nonferrous metal products \$336,491,281, chemicals and allied products \$219,104,671 and nonmetallic mineral products \$87,298,386. The Arvida aluminum plant on the Saguenay river is said to be the largest in the world and produced most of the 460,000 tons of aluminum made in Canada in 1944. A Quebec provincial law was passed in 1946 looking to the development of the vast iron ore deposits in Ungava territory, now part of Quebec. The creation of new industries in the province was active in 1946, no less than 97 plants having been set up in Montreal and its large industrial suburb Verdun. The tourist traffic rates as an industry in Quebec, and 1946 was its largest season.

(W. Fr.)

Queensland. A state of the Australian commonwealth lying in the northeast and occupying 670,500 sq.mi.; pop. (est. June 30, 1945) 1,078,622. Chief cities (pop. Dec. 31, 1943): Brisbane, cap., 370,500; (Dec. 31, 1940) Rockhampton (35,500); Townsville (31,450). Governor: Lieut. Gen. Sir John Laverack.

History.—In March 1946 the premier, F. A. Cooper, resigned on the grounds of age and was succeeded by Edward Hanlon, the deputy premier and treasurer. In September it was announced that Lieut. Gen. Laverack had been appointed governor-designate to succeed Sir Leslie Wilson. He was the first Queenslander to hold this post.

Severe drought conditions were experienced over the whole state which caused the complete failure of the winter-sown grain and considerable diminution in the sugar crop. Good rains fell late in September and many fruit and dairying areas were

expected to recover.

Education.—In 1941: schools 1,898; scholars 178,893.

Finance.—Revenue (1944-45) £A26,446,875; expenditure (1944-45) £A25,877,812. Debts outstanding (June 30, 1945) £A131,433,125. (£A1=\$3.2 U.S.)

Communication.—Roads (1940) 125,095 mi.; railways (June 30, 1945) 6,497 mi. Motor vehicles licensed (Dec. 31, 1945): cars 70,000; commercial vehicles 57,605; cycles 7,452. Wireless receiving set licences (Dec. 1945) 185,948.

Agriculture, Manufacturing, Mineral Production.—Production (in short tons) 1943-44: maize 135,360; sugar cane 700,000; wheat (1945-46) 240,000; gold (1939) 145,667 fine oz.; silver (1942) 3,100,000 oz.; coal (1942) 1,913,000. Industry, manufacturing (1944-45): factories 2,783; employees 64,135; gross value of output £A92,718,750; unemployment (trade union returns) (Feb. 1946) 0.8%. (W. D. MA.)

Quicksilver: see MERCURY.

Quo Tai-Chi (1888-), Chinese government official and diplomatist, was born in Kwang-tsi, Hupeh province. He won a scholarship offered by the Chinese imperial government to study in the United States and attended the University of Pennsylvania (1908-11), graduating with a B.S. degree. Returning to China in 1912, he joined Sun Yat-sen's movement, becoming secretary to Dr. Sun. In 1919, he was a technical delegate to the Paris peace conference. In May 1932, he went to London as Chinese minister to Great Britain. He represented his country at the Disarmament conference and the World Economic and Monetary conference in 1933 and at the assembly of the League of Nations (1932-33). In 1934, he became Chinese representative on the League council and the following year, his status in London was raised to that of ambassador. He left London in 1941 to return to Chungking as foreign minister in Chiang Kai-shek's government. In Feb. 1946, Quo was named China's permanent delegate on the U.N. Security council. During the Iranian dispute, he voted with the majority on the security council who rejected the soviet request to remove the controversy from the agenda. His appointment to the Atomic Energy commission was disclosed May 3. On June 29, Dr. Quo voiced his disapproval of what he called irresponsible use of the veto and predicted it would be abandoned.

Radar: see ASTRONOMY; ELECTRONICS.

Radio. **Growth and Developments.**—Throughout the world approximately 4,865 long-, medium- and short-wave broadcasting stations, including relays or boosters, were in operation on a more or less regular basis in 1946, according to a midyear compilation prepared by the Foreign Broadcast Intelligence service (FBIS) of the U.S. war department.

Approximately one-third of these stations were located in the United States. Counting short-wave stations, the U.S. total exceeded 1,600. Totals for other nations, on the basis of the FBIS list, included 310 in Russia; 249 in Mexico; 173 in Japan, Korea and Formosa; 162 in Australia; 159 in Canada; 128 in Brazil; 119 in Chile; 114 in Colombia; 103 in Cuba; 90 in Great Britain; 75 in Spain; 72 in Argentina; 61 in France; 46 in Germany; 39 in Italy; 30 in the Union of South Africa and 21 in Norway. It should be remembered that these totals represented all types of broadcasting stations, including relays (but not frequency modulation [FM] and television).

U.S. Stations.—The year brought to the United States the

greatest increase in radio stations in history. The number of amplitude modulation (AM) stations, operating or authorized, passed the 1,500 mark late in the year for a gain of 50% over the 1,004 reported as of Jan. 1, 1946. In addition, there were about 132 short-wave stations, including relays. (For FM and television totals, see *Frequency Modulation and Television*, below.)

This unprecedented upsurge in the number of AM stations resulted from the fact that licensing virtually ceased during World War II, and from a desire on the part of many FM station applicants to set up AM operations to help pay the cost of FM in its not too profitable infancy.

Listening.—Radio receiving sets in use throughout the world numbered at least 125,000,000 in 1946. Almost half of these were in the United States: about 60,000,000 compared with 56,000,000 in 1945. The following summary of receiver totals was provided by Caldwell-Clements, Inc. and *Tele-Tech* magazine:

U.S. homes with radios	35,000,000
Secondary sets in these homes	15,000,000
Sets in business places, etc.	4,000,000
Automobile radios	6,000,000
Total sets in United States	60,000,000
Total sets in rest of world	65,000,000
Total sets in world	125,000,000

The ten leading nations in point of receiving sets in use in 1946 were as follows, according to Caldwell-Clements, Inc.:

United States	60,000,000
Great Britain, Northern Ireland	10,673,000
Russia	10,551,361*
France	5,576,000
Germany	5,500,000†
Japan	4,500,000‡
Sweden	1,858,614
Canada	1,754,351
Italy	1,500,000
Australia	1,479,802 (1945)

*Includes 6,110,000 loudspeakers connected to relay exchanges.
†14,000,000 in 1944; in all battlefield countries, effect of war on receiver totals should be considered.
‡7,000,000 in 1943.

Frequency Modulation.—For the first time, FM broadcasting in 1946 began to realize, so far as number of stations was concerned, the promise that was held out for it during the war and prewar years. Approximately 500 stations were authorized outright or conditionally during 1946, and about 100 were in operation as the year ended. Counting a handful of prewar grants and those authorized conditionally during the last two months of 1945 after normal licensing was resumed by the Federal Communications commission (FCC), almost 700 stations were on the air, under construction or conditionally authorized as of Dec. 31, 1946. A year before, some 60 had been authorized to operate and 250 others authorized on a conditional basis. Between 500,000 and 750,000 FM sets were in use throughout the United States in 1946.

Television.—The long-awaited boom in television stations developed in 1946. From 9 licensed or authorized in 1945, the number exceeded 50 at the end of Dec. 1946. The number in operation remained unchanged—six—but a majority of the grantee companies indicated in a poll conducted by *Broadcasting Magazine* that they would be on the air by summer or fall of 1947, and some planned to start during the early months of the year. In addition, there were 67 experimental television stations operating or authorized to operate at year's end.

With the year's advances in television authorizations, however, came a cooling of enthusiasm among many other applicants. Approximately 75 applications, or about half of those filed with the FCC, were withdrawn in a surge of apparent disinterest generally attributed to (1) the continuing debate over the relative merits of low-band black and white television as against the proposed high-band colour transmissions, and (2) the cost of television generally, which was estimated to

range between \$350,000 and \$750,000 for station construction alone.

The unsettled attitude regarding the form television would take in the immediate future was expected to be allayed as the result of a hearing started by the FCC in Dec. and continued into the early months of 1947. The hearing was to decide the fate of a petition filed by the Columbia Broadcasting system (CBS), developer of a sequential (mechanical scanning) colour television system, asking that the 480-920 megacycle (mc.) band of ultra-high-frequencies, currently set aside for experimental television be reallocated for commercial colour operations. This band, under the CBS proposal, would supplement rather than supplant the existing "split" band ranging between 44 and 216 mc. and used for commercial black and white television.

Facsimile.—Although technically still an "experimental" operation, this method of record transmission by radio, similar to radiophoto or wirephoto, made substantial strides in 1946. Transmission speeds reached 28 and later 45 sq.in. per minute, with laboratory speeds up to 88 sq.in. per minute reported late in the year.

Facsimile authorities generally agreed, however, that more experimentation was needed to determine the exact types of service that the public would find most desirable.

Stratovision.—Tests of this new system of air-borne relays for television, FM and other broadcast services were continued by Westinghouse Electric and Manufacturing corporation, which developed it, and Glenn L. Martin company, which assisted in the development. Utilizing transmitter-bearing planes flying anchored courses at 30,000 ft. and interlacing transmissions from plane to plane, stratovision was able, according to Westinghouse officials, to provide coverage of a 211-mi. area with one-fiftieth of the amount of power which a 50-kw. transmitter on the ground needed to cover a 100-mi. radius.

Commercial Broadcasting.—Countries in which radio stations sold time for advertising in 1946 numbered about 40, representing no material change from 1945.

U.S. Radio Bill.—The annual bill for radio in the United States, which remained by far the dominant example of "free" commercial radio, was estimated in 1946 by Caldwell-Clements, Inc., publishers, and their *Tele-Tech* magazine, to be as follows:

Sales of time by broadcasters, 1946.	\$325,000,000
Talent costs	55,000,000
Electricity, batteries, etc., to operate 60,000,000 receivers.	200,000,000
14,000,000 home receivers, at retail value	700,000,000
65,000,000 replacement tubes	82,000,000
Radio parts, supplies, etc.	80,000,000
Phonograph records, 300,000,000	230,000,000
Radio set repairs, servicing	60,000,000
Total.	\$1,732,000,000

Revenues and Expenses.—Figures on U.S. radio's financial operations in 1945¹, released by the FCC in Nov. 1946 (since the information is compiled annually from reports filed with the FCC by stations and networks, 1946 data would not be available until late 1947), showed radio revenues at their highest peak in history: \$299,338,133 compared with \$275,298,611 in 1944.² But expenses climbed at an even faster rate, reaching \$215,753,845 as compared with \$185,025,760 the previous year. As a result, total broadcast income (revenues less expenses, before payment of federal income taxes) dropped from \$90,272,851 in 1944 to \$83,584,288. It was the first slump in broadcast income from the start of the wartime boom, and the third in ten years.

¹All figures refer to amplitude modulation (AM) operations and do not include frequency modulation (FM) and television, which generally did not yet enjoy profitable returns and, especially in the case of television, created costs which made the income seem infinitesimal by comparison.

²Broadcast revenues represent income after deductions of commissions paid to agencies, representatives, brokers, etc.

Of the 1945 totals, covering the operations of 4 nation-wide and 6 regional networks and a total of 901 standard or AM stations, the 4 national networks and their 10 key stations reported broadcast revenues aggregating \$85,151,875, a gain of 7.75% over the 1944 figure of \$79,030,449; broadcast expenses totalling \$67,001,351, or 14.05% more than the \$58,746,703 reported the previous year and broadcast income (before taxes) of \$18,150,524, a 10.52% decline from the 1944 total of \$20,283,746.

Receipts From the Sale of Time.—U.S. radio's chief support, the sale of radio time, representing 90 to 95% of all broadcast revenues, rose in 1945 to the unprecedented figure of \$310,484,046 (before payment of commissions to agencies, etc., which broadcasters counted as an expense of sale). This was a gain of more than 7% over the 1944 total of \$287,642,747. The 1945 figure was composed of \$133,973,536 in network time sales, \$76,696,468 in nonnetwork time sales to national and regional (spot) advertisers and sponsors and \$99,814,042 in nonnetwork sales to local advertisers.

Industry Balance Sheet.—The 1945 revenues, expenses and income of 10 network and 901 AM stations are summarized in Table I, taken from FCC records.

Table I.—Revenues and Expenses of Radio Industry, 1945

Time sales:		
Network	\$133,973,536	
Nonnetwork.	176,510,510	
Total.		\$310,484,046
Deduct: Commissions to agencies, etc.		43,923,466
Net time sales		\$266,560,580
Incidental revenues:		
Sale of talent; fees, etc.	\$16,686,213	
Other	16,091,340	
Total.		\$32,777,553
Total broadcast revenues		299,338,133
Total broadcast expenses		215,753,845
Broadcast income (before federal income taxes)		\$83,584,288

Average Station's Finances.—Financial data for the average U.S. station in 1945, with comparable figures for 1944, were

TRANSMITTER for the reproduction of printed or pictorial matter by radio, a technique called Facsimile. This machine broadcasts printed matter over frequency modulation and a receiving set picks it up and prints it on a roll of specially treated paper at a constant speed. This equipment under the trade name "Faximile," was first demonstrated publicly on April 17, 1946

reported by FCC as indicated in Table II. Operations of the ten key stations of nation-wide networks were excluded in preparing the totals from which the averages were taken, because the networks' reports did not make adequate segregation between network and station operations.

Table II.—Average Station's Finances, 1945

Item	1945	1944	% Increase (Decrease in parenthesis)
Number of stations	891	865	
Total time sales less payments to networks and stations	\$244,897	\$232,326	5.41
Net revenues from time sales*	220,425	209,270	5.33
Total broadcast revenues	238,321	224,541	6.14
Total broadcast expenses	164,766	144,275	14.20
Broadcast income†	73,555	80,266	(8.36)

*Total time sales after deduction of commissions paid to agencies, representatives, etc.
†Revenues less expenses, before federal income taxes.

Broadcast Expenses.—Among 856 reporting stations which had time sales amounting to \$25,000 or more during 1945, the principal items of expense reached the following totals: program department, \$52,528,797; general and administrative, \$48,478,068; technical department, \$22,683,819; sales department, \$22,532,936. Including \$582,694 in expenses reported by 35 stations with time sales of less than \$25,000 each, 1945 expenses for 891 stations (excluding the networks and 10 key stations) aggregated \$146,806,314.

Losses.—Out of 901 reporting operators 50 experienced overall financial losses in 1945. Their combined loss was \$643,006, an average of \$12,860 per losing station. These figures compare with 41 losing stations out of a total of 875 in 1944, when the aggregate loss was \$154,310 and the average per losing station was \$3,764.

Tangible Broadcast Property.—The U.S. radio industry's investment in stations and associated broadcasting equipment in 1945 was reported by the FCC as shown in Table III.

Table III.—Tangible Broadcast Property in the United States, 1945

Item	All Commercial Stations and Networks			Total
	891 stations*	4 national networks and their 10 key stations	6 regional networks†	
Cost to licensee	\$72,281,223	\$15,699,154	\$121,563	\$88,101,940
Depreciation under present licensee	37,734,895	8,715,964	56,062	46,506,921
Depreciated cost	34,546,328	6,983,190	65,501	41,595,019

*Licencee of one station reported no owned broadcast property.
†Includes tangible broadcast property of only three regional networks.

Manufacturing and Selling.—In spite of labour strife, shortages of parts and equipment and other postwar reconversion problems which carried over into 1946, U.S. production of radio receivers was estimated in the industry as approaching 15,000,000 units, a gain of about 9% over the previous record of 13,642,983 receivers produced in 1941.

Retail value of the 1946 output was estimated in the industry as about \$750,000,000, or an average of \$50 per receiver. Reflecting the greater demand and the increased costs of production, the \$50 average in 1946 was almost \$15 higher than the 1941 figure of slightly more than \$35 per set.

Industry Finances.—Basic financial operations data for the radio-electronic industry in the United States in 1946 are shown in Table IV, prepared and copyrighted by Caldwell-Clements, Inc. and *Tele-Tech* magazine:

Table IV.—U.S. Radio-Electronic Industry
Year ended Dec. 31, 1946 (000's omitted)

	Total Investment	Annual Gross Revenue	Number of Employees	Annual Pay Roll
Radio manufacturers (1,100) . . .	\$ 60,000	\$350,000	80	\$ 90,000
Radio distributors, dealers, etc. . .	300,000	700,000	125	200,000
Broadcasting stations (1,100), including talent costs	100,000	380,000	20*	55,000
Commercial communications stations	60,000	15	8,500
Listeners' sets in use (60,000,000) .	3,000,000	375,000†

*Regular staff, not including part-time employees, artists, etc., who number at least 25,000 more.

†Annual operating expense for listeners' sets, tube replacements, electricity, servicing, etc.

Receiver Tube Production.—Production of radio receiver tubes from Jan. to Oct. 1946 totalled 159,120,562, compared with 114,238,098 in 1942, the highest previous figure. (Both totals include tubes installed in new receiving sets.) Retail value of 1946 production was estimated at \$186,150,000 by Caldwell-Clements, Inc., as against \$94,000,000 for 87,700,000 sold in 1942. Manufacturers predicted that tubes would be in ample supply again, after the war-born shortage, before the end of the first quarter of 1947.

Programming.—*Network Commercial Programs.*—The 15 most popular network programs as of Dec. 30, 1946, compared with those of Dec. 30, 1945, were reported as follows by C. E. Hooper, Inc., creator of the Hooperatings-Radio Audience Measurements:

1946	1945
1. Jack Benny*	1. Bob Hope
2. Fibber McGee & Molly	2. Fibber McGee & Molly
3. Bob Hope†	3. Charlie McCarthy Show
4. Charlie McCarthy Show†	4. Radio Theatre
5. Fred Allen	5. Jack Benny*
6. Radio Theatre	6. Red Skelton‡
7. Amos 'n' Andy	7. Mr. District Attorney
8. Walter Winchell*	8. Fred Allen
9. Red Skelton‡	9. Walter Winchell*
10. Screen Guild Players	10. Take It or Leave It
11. Bandwagon	11. Abbott & Costello§
12. Mr. District Attorney	12. Screen Guild Players§
13. Take It or Leave It	13. Music Hall
14. Great Gildersleeve	14. Great Gildersleeve
15. Fanny Brice	15. Eddie Cantor

*Includes second broadcast on Pacific coast.

†Bob Hope and Charlie McCarthy were tied in 1946 report.

‡Computed Hooperating.

§Abbott and Costello and Screen Guild Players were tied in 1945 report.

The top ten daytime leaders reported by Hooper as of Dec. 15, 1946, with the leaders of a year before, were as follows:

1946	1945
1. When a Girl Marries	1. When a Girl Marries
2. Young Widder Brown	2. Portia Faces Life
3. Our Gal, Sunday	3. Ma Perkins (CBS)
4. Portia Faces Life	4. Breakfast in Hollywood (11:15)‡
5. Kate Smith Speaks	5. Romance of Helen Trent‡
6. Ma Perkins (CBS)*	6. Pepper Young's Family§
7. Breakfast in Hollywood (11:15)*	7. Young Widder Brown§
8. Auni Jenny	8. Breakfast in Hollywood (11:00)§
9. Right to Happiness†	9. Our Gal, Sunday
10. Romance of Helen Trent†	10. Stella Dallas
	11. Big Sister

*Ma Perkins and Breakfast in Hollywood (11:15) tied.

†Right to Happiness and Romance of Helen Trent tied.

‡Breakfast in Hollywood (11:15) and Romance of Helen Trent tied.

§Pepper Young's Family, Young Widder Brown, and Breakfast in Hollywood (11:00) tied.

||Stella Dallas and Big Sister tied.

Programming Trends.—Sharp changes in radio station program policies were evident in 1946 as stations and advertisers completed their reconversion from wartime to peacetime programming. A survey of station management conducted late in 1946 for *Broadcasting Magazine* by Audience Surveys Inc., independent research organization, showed that 76% of the nation's stations increased their program expenditures during the year; 76% increased their local news volume; 72% produced more "public interest" programs; 70% began to apply stricter standards controlling the length or content of commercial announcements (to a great extent a natural reaction from the wartime practice of carrying numerous and often lengthy war service messages for various government agencies); and that 68% broadcast more local live-talent programs during the year. The average expenditure for programs among stations which increased their program budgets was found to be 24% more than the 1945 program expenditure.

A major innovation in network programming was Bing Crosby's introduction of a transcribed, rather than "live," series of programs on the American Broadcasting company. Watched closely in the industry, the experiment if successful was expected to start a trend which might attract many other top-flight entertainers. The opening broadcast of the series, in early Oct., won a listener rating of 23 from C. E. Hooper, Inc. A month later the rating skidded to 12.2, but moved up to 15.8 in mid-Nov.

Special Events.—A full schedule of special events broadcasts was maintained during the year, including eyewitness descriptions of the atom bomb tests in the Pacific, features as well as straight news and commentaries from the United Nations meetings and detailed coverage of the off-year elections which returned the Republican party to control of house and senate. President Truman, like President Roosevelt before him, turned frequently to the microphones to reach the public. C. E. Hooper, Inc. reported that he was heard by 25,217,000 persons in a May 24 speech on the railroad strike and by 23,166,000 in an address on his veto of the first Office of Price Administration bill in July.

FM and Television.—Despite the scant number of FM and television receivers in the hands of the public, much progress was made in the programming techniques of these two media in 1946.

In the case of FM stations operated in conjunction with standard (AM) stations—and almost 75% of all FM authorizations were held by persons who were also in the AM field—the programming was largely a duplication of AM broadcasts, within limitations imposed by the American Federation of Musicians' virtual ban on such duplication of music played by A.F.M. members. Independent FM stations generally followed AM programming lines, with additional emphasis on music, which best displays the clarity and high-fidelity characteristics of FM broadcasting.

Benefited tremendously by the development of the highly sensitive Image Orthicon camera tube and the completion of the American Telephone and Telegraph company's coaxial cable linking New York and Washington via Philadelphia, both of which were completed in 1945, television programming was expanded and intensified during 1946. Many sports events were telecast, including the championship boxing match between Joe Louis and Billy Conn, baseball games and both collegiate and professional football games.

Network Programs by Types.—The general composition of commercial evening programs broadcast on the major AM networks during the fall season—October, November and December—is shown in Table V prepared by C. E. Hooper, Inc.:

Table V.—General Composition of Network Commercial Evening Programs
October through December, 1946 and 1945

Type of Program	1946 % of time on air	1945 % of time on air
Dramatic	37.8	31.5
Variety	24.1	21.8
News and commentators	11.4	12.7
Popular music	10.8	14.1
Quiz	6.4	7.4
Concert music	3.2	5.8
Miscellaneous	6.3	6.7

Trade Organizations.—The year 1946 saw renewed activity in the trade organization field, with the National Association of Broadcasters (N.A.B.) still the dominant trade organization representing all segments of the broadcasting industry—AM, FM, television (TV) and facsimile—on over-all problems.

At its first postwar convention in Chicago, Ill., Oct. 20-24, the N.A.B. reported a record attendance of more than 2,000. It was the first convention in five years in which exhibits by manufacturers and independent stations were displayed.

The FM Broadcasters, Inc., (F.M.B.I.) which had voted in 1945 to merge with the N.A.B. on a year's trial basis, formally dissolved on Oct. 21, having accomplished its primary purpose—aiding the FCC in the allocation of FM service in the radio spectrum.

Following dissolution of F.M.B.I. some 40 former members organized the FM association (F.M.A.) to conduct a nationwide promotion campaign in behalf of FM broadcasting. On Jan. 10, 1947, the F.M.A. was formally launched in Washing-

ton, D.C., with some 200 charter members.

The F.M.A. received the official blessing of the FCC when all commissioners attended a luncheon Jan. 10 and Chairman Charles R. Denny pledged the support of FCC to the new organization.

Television Broadcasters association, representing the majority of the television industry, still was an independent organization, although overtures had been made by the N.A.B. looking toward a merger.

At a meeting in Mexico City, Sept. 28-30, the Inter-American Broadcasting association was formed by several South, Central and North American countries. Its primary aim was to preserve a free radio in the Latin-American nations. Although the N.A.B. sent two unofficial observers, as the year closed the U.S. organization had not participated actively. The N.A.B. board, however, was expected to authorize full membership in the Inter-American Broadcasting association early in 1947.

Still functioning alongside the N.A.B. but as an independent entity was Broadcast Music, Inc. (B.M.I.), of which N.A.B. President Justin Miller was president.

Broadcast Measurement Bureau (B.M.B.), organized by broadcasters, advertisers and advertising agencies to establish radio's own audience measuring stick, issued results of its first survey in 1946. B.M.B. was criticized in some quarters, applauded in others. As the year ended, however, the B.M.B. appeared to be strongly entrenched.

Networks.—Two networks ceased operations during 1946—both bankrupt. Associated Broadcasting system, which began operations on a nation-wide scale Sept. 16, 1945 was formally declared bankrupt in early Sept. 1946 by the U.S. district court at Grand Rapids, Mich. In April the A.B.S. closed its New York office and from then on it was a losing battle. The North Central Broadcasting system, a regional network headed by John W. Boler, was declared bankrupt in the courts in Nov. 1946. There were reports throughout the year of possible new networks but as 1946 closed no definite steps had been taken in that direction.

Employment.—Radio's pay roll for 1945 totalled \$116,267,274, according to figures released in Dec. 1946 by the FCC. With the war over and scores of service men and women returning to their former jobs, coupled with new radio stations, employment increased from 34,690 in Jan. 1945 to 37,757 in Dec. the FCC reported.

The FCC failed to report the usual average weekly wage for 1946, making available only statistics covering the monthly pay roll.

Total employment figures for 1945, covering 4 nation-wide networks—American Broadcasting company, Columbia Broadcasting system, Mutual Broadcasting system and National Broadcasting company—6 regional networks and 901 standard radio stations both inside and out the continental limits of the United States, are shown in Table VI.

Table VI.—Employment Statistics in Radio Industry, 1945

Month	Number Employed	Compensation
Jan.	34,690	\$ 8,511,883
Feb.	35,081	8,635,509
March	35,456	9,185,069
April	35,528	8,790,964
May	35,729	9,520,195
June	35,934	9,400,300
July	35,643	9,172,795
Aug.	36,095	9,874,001
Sept.	36,263	9,811,335
Oct.	36,988	9,993,956
Nov.	37,542	10,439,288
Dec.	37,757	12,931,979
Total		\$116,267,274

A breakdown of employment figures showed that 891 stations increased personnel from 26,841 in Jan. 1945 to 29,293 in December, with compensation rising from \$6,015,709 in Jan-

uary to \$9,888,321 in December. A total pay roll of \$82,617,228 was reported by the 891 stations.

Compensation paid by the 4 major networks and 10 key stations (owned by the networks) totalled \$32,740,768 in 1945, with employees increasing from 7,627 in Jan. to 8,136 in December. The 6 regional networks were reported by the FCC as follows: total employee compensation \$909,278; January, 222 employees received \$93,624; in December 328 employees were paid \$78,102.

Labour Unions.—Of foremost importance in the field of labour relations was passage by the congress of the Lea act, a law designed to make unlawful certain practices of the American Federation of Musicians. It became law on April 16, 1946, with the president's signature. On May 28 James Caesar Petrillo, president of the A.F.M. and president of the Chicago Federation of Musicians, called a strike against WAAF, Chicago, Ill., operated by the *Drover's Journal*.

He was promptly charged with violation of the Lea act in a criminal bill of information. Petrillo admitted he had violated the act by calling a strike because the station refused his demands to employ three additional music librarians (members of the A.F.M.). He contended the law was unconstitutional.

Judge Walter J. La Buy, in a lengthy opinion Dec. 2, sustained a motion of Petrillo to dismiss and held that the act violated the 1st, 5th and 13th amendments to the constitution. As the year closed an appeal was pending before the supreme court.

Petrillo still retained his ban against union musicians playing for television. As a result television stations were using recordings to accompany vocalists.

In early Oct. 1946 the American Federation of Labor issued a charter to the Radio Directors Guild, whose members had withdrawn (with approval) from the American Federation of Radio Artists (A.F.R.A.). Chapters in New York, Chicago, Hollywood, San Francisco and Washington comprised the charter group of R.D.G., which embraced radio program producers and directors.

After threats of a nation-wide strike by A.F.R.A. had been heard in late 1946, negotiations were well under way between the union and major networks as the year closed.

Agreements had been reached to give actors, singers and announcers on commercial programs a general 20% increase, with a 20% raise in pay for actors and singers on sustaining shows. Sound effects technicians were given a 25% increase in New York and Chicago and a 30% boost on the west coast.

World Conferences.—One plenipotentiary hemispheric conference and two sessions preliminary to the next World Telecommunications conference, scheduled to begin July 1, 1947, were held in 1946.

On Feb. 4 delegates of all nations signatory to the North American Regional Broadcasting agreement (Havana, 1938) except Haiti met in Washington, D.C., in what was called by the United States as an "informal engineering conference" to extend the North American Regional Broadcasting agreement (N.A.R.B.A.) pending peacetime study of its revision.

Cuba came prepared for a plenipotentiary conference, however, and insisted that a new treaty be drafted. Cuban delegates demanded use of some 20 channels below 1,000 kilocycles (kc.). With other nations (the United States, Canada, Mexico, the Bahamas, the Dominican Republic and Newfoundland) standing pat, the Cuban delegation served notice that it would return home and on March 29, when the N.A.R.B.A. expired, Cuba would use any and all frequencies it saw fit.

At the 11th hour a compromise was reached whereby Cuba was given use of the frequency 640 kc. (then used by the Bahamas). In return Cuba relinquished 1540 kc. to the United

States and the United States subsequently gave it to the Bahamas in exchange for 640 kc.

In addition to the 640 kc. channel, Cuba was given authority by the other nations to operate Class II unlimited stations on the following Class I-A channels: 670 kc., 830 kc., 850 kc., 890 kc.—all assigned to the United States; 690 kc., 740 kc., 860 kc.—assigned to Canada; 730 kc., 800 kc., assigned to Mexico. In addition Cuba was given privileges of operating regional stations up to 25 kw. on 8 regional channels.

On Feb. 25 the following nations signed an interim agreement (*modus vivendi*) extending N.A.R.B.A. to March 29, 1949, and agreeing to begin plans immediately for the Third North American Regional Broadcasting conference to be held in Canada, beginning in late 1947 or early 1948: Canada, Cuba, Dominican Republic, Bahamas Islands, Newfoundland, Mexico, United States. The *modus vivendi* was reserved for the signature of Haiti when relations again were restored with that nation, inasmuch as Haiti was one of the original signers of N.A.R.B.A.

Created at the Washington conference was an Inter-American Engineering committee which was to function in event one country reported radio interference from another. The committee was expected to keep interference to a minimum between broadcasting stations of the inter-American nations.

On Sept. 28 representatives of China, the United States, Union of Socialist Soviet Republics, United Kingdom and France met in Moscow to lay plans for the next World Telecommunications conference. The United States earlier had invited nations signatory to the Cairo treaty (1938) to convene in the United States in the spring of 1947. Britain held out for Europe—preferably Geneva or Paris—as the seat of the next conference. The other nations joined the United States.

As the year closed the U.S. state department announced the conference would be held in Atlantic City, N. J. The Five-

RADIO TOWER on Catalina Island which was to be used in connection with the new micro-wave radio telephone being installed in 1946 between the island and Los Angeles, Calif.

Power conference agreed to open a world session on broadcasting on May 15, 1947, to be followed by a world conference on international broadcasting. The plenipotentiary conference was scheduled to start July 1.

A proposal by the United States to establish an international board for the registration of frequencies was unanimously adopted. A second suggestion by U.S. delegates—that the International Telecommunications union be reorganized and enter into co-operative relationship with the United Nations—also was approved unanimously. The five nations agreed that the seat of the I.T.U. should be the seat of the United Nations.

Following the Five-Power conference in Moscow, a conference on high-frequency broadcasting was held in Paris, Oct. 28–31, resulting in unanimous recommendation that a world-wide high-frequency organization be set up in conjunction with the next World Telecommunications conference.

In that connection, the Advisory committee on United Nations Telecommunications in late 1946 recommended that the United Nations establish its own world-wide radio network, using high-frequency, medium- and long-wave radio stations and working in close co-operation with established networks.

U.S. Foreign Broadcasts.—Still one of the knottiest problems confronting the administration was the continuation of international short-wave broadcasting to all parts of the world. In Dec. the state department announced acquisition of three powerful transmitters at Munich, Germany, which would be used as relays for "Voice of America" broadcasts originating in the United States and designed for world consumption. The department also disclosed that broadcasts in the Russian language would begin in late Jan. or early Feb. 1947.

In a year-end announcement the state department said it was operating short-wave transmitters in the United States, Algiers, Manila, Munich and Honolulu, sending out programs in 17 languages to Europe, 3 languages to Latin America and 8 languages and dialects for the far east.

To Europe the United States was beaming 199 hr., 30 min. of programs weekly; to Latin America 126 hr., 30 min.; to the far east 68 hr., 15 min. per week. During 1946 the state department reported receiving more than 50,000 letters from listeners all over the world as a result of the "Voice of America" broadcasts. Of these 65% came from Europe, 25% from Latin America and 10% from the far east.

(J. N. B.; R. W. CR.; S. TF.)

Radio Scientific Developments.—*Transmitters.*—Radio transmitters of greatly diversified types were in use in many fields including frequency modulation, carrier telephony, pulse communication, television and navigation. Applications for broadcast transmitting licences and increases in power submitted to the Federal Communications commission reached an all-time high. Many new 50, 100 and 200 kw. transmitters were in use with powers up to 500 kw. indicated for the near future. Toward the end of the year more than 900 frequency modulation broadcasting applications were pending before the FCC for powers up to 50 kw. Great strides were made in the application of single side band point-to-point transmitters. The efficiency of this system in power, circuit stability and spectrum conservation resulted in its general adoption throughout the world. Frequency shift keying equipment for communications at high frequency including frequency shift exciters for use with existing telegraph transmitters was made available. These systems were a direct outgrowth of, and offered the advantages realized by FM systems generally.

The Western Union Telegraph company placed in operation during 1946 a four-jump radio relay system, operating at about 4,000 mc./s. between Philadelphia, Pa., and New York, N.Y., for multiplexed carrier telegraph signals. Similar installations

TRUCK DRIVER demonstrating his two-way radio in Chicago in June 1946, with which he could receive last minute dispatching orders, or call in for advice or help

were begun on a closed circuit running from New York to Washington, D.C., to Pittsburgh, Pa., and return to New York.

During 1946 a system of ultra-high-frequency broadcasting was proposed wherein eight simultaneous programs would be transmitted using a time division multiplexing of pulses by pulse-position modulation. This system incorporated a new beam switching tube, the "Cyclophon" (See *Tubes*).

Two-way telephone service was made publicly available between fixed points and automotive vehicles. Using facilities of the Bell Telephone and associated companies the service was available to all service outlets.

Antennas.—The standardization of frequency assignments for FM broadcasting in the 88 to 108 mc. range led to the development of many new types of broadcast antennas as well as improvements in older types. These developments included the slotted tubular antenna known as the "pylon," a "clover leaf" antenna comprising a unit cluster of four curved elements, the units being stacked by mounting on a vertical coaxial feed line, and an improved "turnstile" having many advantages over the early postwar designs.

Considerable advance was achieved in theoretical antenna subjects relating principally to aircraft antenna design and the problem of precipitation static. An electronic instrument was developed for calculating and cathode-ray plotting the radiation pattern of directional systems using as many as six radiators, whereby the pattern may be observed while making changes in current ratio, phase angle, azimuth position and distance from a reference point.

Receivers.—On Jan. 24, 1946, engineers of the signal corps engineering laboratories succeeded in receiving radar echoes from the moon using a receiver of unusual interest. A low-noise grounded grid radio frequency amplifier providing a 30 decibel gain was used with a quadruple conversion superheterodyne, converting a carrier of 111.5 mc. down to 180 cycles. The final intermediate frequency (i.f.) amplifier had a 5 cycle pass-band.

The development of wide-band receivers for radar counter-measures during the war brought forth new approaches in the design of i.f. amplifiers including the stagger-tuned amplifier.

A new type of frequency modulation detector was described as having the property of insensitivity to amplitude modulated disturbances, thereby eliminating the limiter preceding the detector. The system incorporated a single tube locked-in oscillator and discriminator circuit. Further developments were made

in the ratio detector which has the same property of insensitivity to amplitude modulation.

Some of the new components which came into prominence were silicon and germanium crystal detectors, polystyrene dielectric capacitors, new types of insulating materials, dual frequency-intermediate-frequency transformers and very compact self-healing metalized paper condensers.

Bikini Atom Bomb Tests.—The atom bomb tests at Bikini in July 1946 brought together the greatest concentration of radio and electronic equipment ever assembled at one time and place. During and following the explosions a large number of measuring instruments in the target area provided information which was transmitted to radio receivers located at safe distance points. More than 70 planes including pilotless radio-controlled drone planes flew over the area of each explosion recording data and directing operations, the drone planes flying through the radioactive cloud immediately after formation, taking samples of the cloud and air. Following the explosions radio-controlled pilotless boats cruised among the target ships sampling the water for test purposes. Television was predominant in its use to obtain immediate news of the explosions, receivers being located on aeroplanes as well as on the ships carrying officials and observers. Certain of the receivers were equipped with motion picture cameras to record the television transmissions. Coverage of these tests would have been impossible without the special electronic equipment designed and operated for remote control and recording of radioactive phenomena.

Tubes.—*The Cyclophon.*—A new beam tube for electronic switching applications was announced. This tube incorporated an electron gun to produce an electron beam which was electromagnetically or electrostatically deflected over a circular pattern on an apertured plate having a number of uniformly spaced slots. The number of slots corresponded to the number of circuits to be switched and was backed up by secondary electron-emitting dynodes, to which the external circuits to be switched were connected. The tube was designed for application in time-division multiplexing circuits and in a newly proposed broadcasting system. (See *Transmitters.*)

The Phasitron.—This tube was developed for producing a frequency modulated signal, requiring for its operation a crystal controlled three phase energy source at a submultiple of the desired carrier frequency and a source of modulating energy. Focusing electrodes produce a disk of electrons at right angles to the axis of the tube. Another set of electrodes, energized by the three phase source, deflects the electrons radiating from the centre of the disk so as to produce rotating radial undulations in the disk surface. The intercept of the disk on an imaginary cylinder whose axis is common to the disk axis is a sine wave of a frequency equal to that of the three phase deflecting source. The disk of electrons terminates on two concentric cylinders of which the innermost has a series of rectangular holes so arranged that if the rotation of the disk were arrested at the correct position nearly all the electrons pass through the holes to the second cylinder. A half wave displacement of the disk results in all the electrons being caught by the first cylinder. Consequently, there is an alternate collection of electrons by the two cylinders which excites a tuned circuit connecting the two cylinders. Phase modulation of the energy in the tuned circuit connecting the collector plates is accomplished by means of a coil external to the tube with its axis coincident with that of the tube. When energizing this coil from a modulating source, its flux causes electrons starting at the centre of the disk to be deflected from their normal radial path and produces the effect of accelerating or decelerating the sine wave pattern on the collecting cylinders depending

upon the polarity of the flux.

Travelling Wave Tube.—This type of tube obtains its transfer of energy from a moving electron stream to a travelling radio frequency wave by applying the wave to a helix of iron wire surrounding the electron stream. Because of the reduction in wave velocity caused by the radio frequency fields proceeding along the turns of the helix, the electron velocity can be adjusted to exceed slightly the effective wave propagation velocity down the helix and thereby transfer electron energy to the wave. Useful amplification of 100 to 200 with a bandwidth of approximately 800 mc. was claimed for tubes of this type.

Television and Image Tubes.—The image orthicon developed during the war was improved and incorporated in television camera equipment (see TELEVISION). A number of high-power, high-frequency transmitting tubes including beam tetrodes, double beam tetrodes and grounded-grid triodes were introduced. Tubes producing $\frac{1}{2}$ to 10 kw. output for the 100 mc. band and for operation at 500 mc. and at even higher frequencies with a few hundred watts became available.

Infra-red image tubes developed for the wartime use of the "Snooper scope" and "Sniperscope" were publicly disclosed. These tubes, some less than two in. in diameter, incorporated an infra-red sensitive photoelectric surface, an electron optical focusing system and a fluorescent screen on which the image was viewed through a telescope ocular or eye piece. (See also ADVERTISING; FEDERAL COMMUNICATIONS COMMISSION.)

(B. E. SD.)

Great Britain.—The "listener research" section of the British Broadcasting corporation in 1946 noted a reorientation of the listening habits of the population after World War II. A "light program" was substituted for the general forces program; the proportion of listeners to this was about 50% of the total listening population as against 40% or less during the war. The news bulletins, which claimed the largest following (50% of listeners tuned in to the 9 p.m. bulletin), had lost their special interest. The "third program," started in the autumn of 1946 to give listeners a variety of serious music and talks without the handicap of working to a time schedule, proved a success, and several new musical items were presented. Reception differed throughout the country and did not come up to expectations in the London area. The wave length of the transmissions was 203 metres.

From information published in Sept. the total number of receiving licences issued in Great Britain at that time was 10,673,000; the figure included 1,750 television licences, for which an additional yearly charge of £1 was to be made at the end of the year.

The Radio Industry.—The production of radio receivers for the home market reached a new high level in Oct. at 110,000 sets. Difficulties in labour and material supplies had, however, caused the projected program of receiver production to lag behind, and shortage of components was responsible for a low output in television receivers, which for the 4 months preceding Oct. totalled only 2,620. A feature of the 1946 receivers was the introduction of coloured plastic cabinets for the personal and miniature sets. At the "Britain Can Make It" exhibition held early in the year a personal receiver was shown similar in appearance to a handbag, with the strap over the shoulder concealing the aerial. A new form of receiver had the chassis mounted behind a baffle board instead of in the usual cabinet, and it was claimed that this gave superior reproduction without the "boom" associated with a wooden box structure. A number of new designs of phonograph pickup was produced, operating on the moving coil principle with high frequency range; one manufacturer produced a specially designed phonograph at £200

to give the best possible reproduction of records.

Technical Progress.—An experimental wire relay service using carrier frequency was installed in Rugby in Nov. 1946 by the Multi-Broadcast Engineering company in collaboration with the British Thomson-Houston company. Each subscriber to the system was equipped with a three-tube receiver and loudspeaker fitted with a six-way switch for selecting any one of six programs.

A new standard of frequency using an oscillator controlled by a quartz crystal was developed by post office engineers and used at the royal observatory for time checking. The absolute value of frequency is known to ± 1 part in 100,000,000. In speaking of the measurement of time the astronomer royal stated that the new "quartz clock" had shown an increase in the time of rotation of the earth by three milliseconds per day as from Sept. 1945, and that this figure would be checked by observations on the moon during the next few years in Great Britain and the United States.

An original study on the theory of communication by Dr. D. Gabor ("Theory of Communication," *Journal of the Institution of Electrical Engineers*, 93, part iii, 429; 1946) suggested that information conveyed by a given frequency band might be analyzed into elementary "quanta" of information, each quantum conveying one numerical datum. Experimental information showed that in the band between 60 and 1,000 cycles per second the human ear could discriminate every second datum of information, and this efficiency of 50% was independent of the duration of the signals in a remarkably wide interval. At frequencies of more than 1,000 cycles per second the efficiency of discrimination fell off sharply, showing that sound reproduction which was far from faithful might yet be perceived as perfect by the ear. This suggested that condensed methods of transmission and reproduction of sounds with improved wave-band economy were possible in theory.

Radium. While small amounts of radium are associated with the vanadium and uranium ores of the western United States, recovery of the radium received little attention during the years of World War II. The last output officially reported was 2.6 grams in 1942. Imports of radium salts into the United States were as follows:

	Grams	Value		Grams	Value
1937	15.29	\$ 377,659	1942	23.043	\$ 377,326
1938	38.75	787,025	1943	90.755	1,366,538
1939	78.631	1,953,820	1944	101.290	1,374,933
1940	30.311	748,097	1945	67.342	991,979
1941	4.412	110,202			

Demands for war uses, especially for industrial radiography and in luminous paints, overshadowed the normal medical uses during the past few years. (G. A. Ro.)

Raeder, Erich (1876–), German naval officer, was born in Wandsbek, Germany. He entered the German navy in 1894, was promoted to the rank of commander in 1911 and was chief of staff to Adm. Franz von Hipper in 1912. Raeder served in World War I, escaping from the German flagship "Lutzw" before it was sunk in the battle of Jutland in 1916.

In 1922, Raeder was promoted to the rank of rear admiral and was elevated to admiral at the head of the naval command in 1928. He supported the nazis, was rewarded in 1935 by Adolf Hitler with the post of commander in chief of the German navy and he was given the rank of grand admiral in 1939.

During the peace years, he ordered construction of new ves-

sels in secret violation of the Versailles treaty. He fathered the plan for the Norwegian invasion in 1940, and while he also advocated occupation of all Greece, he vehemently opposed Hitler's plans to invade the soviet union.

After the start of World War II, Raeder's U-boats sank unarmed neutral merchantmen and refused to rescue survivors. He retired from the navy at his own request, Jan. 30, 1943, and was succeeded by Admiral Karl Doenitz. Taken prisoner by the Allies in May 1945, Raeder was indicted Aug. 29, 1945, on charges of war crimes and held for trial. Found guilty of having committed crimes against the peace, war crimes and conspiracy to commit these crimes, he was sentenced to life imprisonment, Oct. 1, 1946, by the international military tribunal sitting at Nuernberg.

Railroad Retirement Act: see SOCIAL SECURITY.

Railroads. The outlook for railroads in the U.S. at the beginning of 1946 was promising. Their cash position was unusually strong. Their fixed charges had been reduced. An orderly transition from wartime to peacetime economy appeared to be well under way. In view of the substantial increases in wage rates during World War II no serious difficulty with labour was anticipated. There were favourable prospects of a volume of traffic and net earnings sufficient with cash left over from the war years to finance the needed additions and betterments in plant and equipment. An extensive program for improving the railroad position in competition with other forms of transportation had been begun. Unfortunately, however, the hopeful promises were not realized. The railroad record of 1946 was one of frustration and disappointment.

The volume of rail-borne traffic in 1946 did not fall far below expectations notwithstanding the many serious interruptions to industrial production by nation-wide and large-scale strikes.

RECONDITIONED LOCOMOTIVE being lowered onto its drivers at the Rock Island shops at Silvis, Ill., during 1946

Railroad net earnings, however, were critically low because of further advances in wage rates and prices of fuel and other materials, and the rates which the railroads were permitted to charge for their services were practically the same as in 1940. The financial position of the railroads was so critical during the first half of the year when the railroads collectively were not earning their fixed charges, that an appeal was made to the Interstate Commerce commission to authorize a general increase of 25% in freight rates, with certain exceptions in which the rate of increase would be smaller. For freight traffic as a whole the proposed increases averaged between 19% and 20%.

The need for additional revenues was clearly shown at the hearings and the commission quickly recognized that need in part by granting an interim increase of about 6.5%, effective July 1. The proceedings were continued so that the commission might give more deliberate and comprehensive consideration to further increases. On Dec. 5 the long awaited final decision was announced. It authorized increases which, including the interim increases of July 1, advanced freight rates as a whole about 17.6%, to yield about \$1,000,000,000 additional revenues per year. The second increase, however, was made effective on Jan. 1, 1947, and did not affect the revenues of 1946. The interim increases applying from July 1 added about \$170,000,000 to 1946 revenue. The financial results during the second half of the year were much better than in the first half.

The complete returns for November and December were not available at the close of the year. It is possible, however, to show the actual results during the first ten months of 1946 in comparison with those results during the same ten months of earlier years. The figures are quoted from the Jan. 5, 1947, issue of *Railway Age* and were taken from reports of the Interstate Commerce commission. Class I railroads comprised about 95% of total railroad mileage.

(In millions of dollars)

Item	1946	1945	1944	1942
Freight revenue	\$4,770	\$5,665	\$5,857	\$4,878
Passenger revenue	1,081	1,410	1,504	801
Other operating revenues	481	549	538	394
Total operating revenues	6,332	7,624	7,899	6,073
Maintenance of way expenses	965	1,112	1,049	652
Maintenance of equipment expenses	1,221	1,535	1,320	995
Transportation expenses	2,649	2,500	2,455	1,829
Other operating expenses	437	391	378	287
Total operating expenses	5,272	5,538	5,202	3,763
Taxes	483	1,106	1,587	1,000
Net income after charges	155	473	560	711

It will be noted that the net income of the first ten months of 1946 was approximately one-third of that of the same period of 1945, one-fourth of 1944 and one-fifth of 1942. Were it not for tax refunds included in 1946 net income the showing for the year would have been much worse. During the first nine months of 1946 the "carry-back" credits amounted to \$72,000,000.

On Jan. 1, 1946, there were 72 railroads in receivership or trusteeship. Their combined road mileage was 39,714. The extent of bankrupt railroad mileage was reduced during the year by the reorganization of two important railroads and two small properties, bringing the total mileage on Jan. 1, 1947, down to 31,149, about 13% of the total road mileage. The peak in mileage of bankrupt railroads was 77,013 in 1939.

The improvement in the financial structure of railroads continued in 1946. That improvement, notable since the depression, took form in a decrease in the proportion which the fixed interest-bearing debt bore to the total capitalization, in the refunding of maturing bonds by issues smaller in amount and with lower interest rates and by the purchase by the railroads of their bonds in the hands of the public. On the part of railroads emerging from reorganization a large portion of the fixed interest bonds was converted into income bonds with interest payments contin-

NEW "PACKAGE" railroad freight container inaugurated in early part of 1946. Freight is packed in these aluminum "boxes" which can be shifted from flat car to truck and back again without unloading

gent on earnings, and some of the fixed interest bonds as well as the greater part of other forms of debt were exchanged for new capital stock. The fixed interest charges of all Class I railroads in 1937 were \$441,000,000. By 1945 they had been reduced to \$382,000,000. In 1946 there was a further reduction to \$350,000,000.

The volume of freight traffic is reflected in the number of loaded cars originated and moved and the number of revenue tons moved one mile. In 1946 the number of loaded cars was 41,200,000, 1.5% less than in 1945 and 5.1% less than in 1944. The number of revenue ton-miles of 1946 was approximately 583,000,000,000, 14.4% less than in 1945 and 20.9% less than in 1944. The relatively smaller loss in loaded cars than in ton-miles was due to the smaller amount of military long-haul freight.

In passenger service the decrease in 1946 was greater than in freight service. The 1946 passenger-miles were 65,000,000,000. In 1945 and 1944 they were 92,000,000,000 and 96,000,000,000 respectively. By far the greater part of the decrease was the result of the absence of troop movements on a large scale and relatively little furlough travel in 1946. It was also the result, but in smaller part, of the resumption of automobile driving and the intensified competition of buses and air lines. It is interesting to note, however, that in 1946 the rail passenger-miles were greater than in any previous peacetime year—four times greater than in 1933 and three times greater than in 1939.

In an effort to improve their competitive position with respect to other forms of transportation the railroads made notable improvements during the year, especially in passenger train cars, of which more than 1,300 were placed in service in 1946. These new cars were lighter in weight, had better riding qualities, had better lights, were kept cleaner, had better designed seats, more lounge space and were made more pleasing to the eye in interior decoration and outside design and finish. Several new streamline trains were added, bringing the total of such trains to 73.

In addition to the improvements in passenger carrying cars the railroads generally did much in speeding up the movement of passenger trains. The schedules of 130 through trains were reduced one hour or more from initial station to destination and on some of the longer runs the shortening in running time was

several hours. Through sleeping car service from New York and Washington to the southwest and the Pacific coast was inaugurated, and the necessity of changing cars in St. Louis and Chicago could be avoided.

Less spectacular but of equal importance (because about three-fourths of railroad operating revenues comes from the freight service) were the improvements in the movement of merchandise in expedited and more frequent service. The 1946 record, however, was marred by freight car shortages and the car situation at the end of the year was a cause for concern. During World War II the railroads had done their best to acquire additional freight cars, but priorities for the necessary materials could not be obtained. Nor was it possible to obtain all of the materials needed for that purpose in 1946. The new cars delivered by the builders in that year, 37,219, were about one-third of the needs. At the end of the year 63,616 freight cars were on order.

There was no shortage in locomotives in 1946. A substantial number of the older types of steam locomotive were held in reserve. The development in the substitution of diesel-electric for steam locomotives was continued and on a larger scale. Of the total 919 locomotives ordered in 1946 only 55 were for steam locomotives, 856 were diesels and 8 were all-electric.

In the field of labour relations the outstanding event of 1946 was the nation-wide strike of locomotive engineers and trainmen. The coast-to-coast stoppage on rail transportation was almost instantly and completely effective. The strike grew out of demands for higher wages and changes in working rules which had been presented to and refused by management late in 1945. The five operating brotherhoods (engineers, firemen, conductors, trainmen and yard switchmen) had demanded an increase of \$2.50 per day and many rule changes which would increase compensation or the number of employees. The nonoperating unions (15 in all, embracing the several shop crafts, trackmen, station-

men, clerks and others) wanted an increase of 30 cents per hour. Direct negotiations between the two groups and a committee of railroad executives broke down and federal mediation was ineffective. In Jan. 1946, the nonoperating group and three of the five operating brotherhoods agreed to arbitration. The engineers and trainmen would not be party to arbitration nor would they join with the other 18 unions in accepting the arbitration award. That award gave the employees a wage advance of 16 cents per hour and favourable changes in certain rules. The rejection of the award by the engineers and trainmen was accompanied by notice that a strike would be called.

President Harry S. Truman then took a hand in the controversy and on March 8 appointed an emergency fact-finding board which on April 18 recommended for the engineers and trainmen the same rate of wage increase and rule changes that had been awarded to the 18 unions by the arbitration board. These recommendations of the fact-finding board were rejected by the engineers and trainmen and the strike, after one postponement of a few days, went into effect at 4 P.M. on May 23.

A day or two previously President Truman had suggested a compromise under which the wage boost of 16 cents to the 18 unions would be increased to 18.5 cents to all of the unions, the extra 2.5 cents to be in lieu of rule changes and the whole subject of rule changes to be deferred one year. The compromise was accepted by the 18 unions and by management but the engineers and trainmen would not yield. On the day preceding the strike the President, acting under his emergency powers, took over the railroads for government operation and turned them over to the Office of Defense Transportation, but that action did not deter the two militant brotherhoods from striking. The other unions did not join in the strike, but inasmuch as trains could not be operated without engineers and trainmen the tie-up was complete.

In a radio broadcast to the nation on the day following the strike President Truman severely criticized the heads of the two

AIR VIEW of locomotives left idle at the Pennsylvania railroad roundhouse at Kearney, N.J., when their crews went on strike in May 1946

brotherhoods and stated that he would at once recommend to congress that steps be taken to draft the strikers and place railroad operation under the army. On the next day he personally appeared before a joint session of congress and made those recommendations with others which would drastically curtail the power of union leaders to strike against the public interest. The result of the President's action and pressure from other labour leaders was the quick capitulation of the engineers and trainmen. They agreed to accept the President's compromise proposal, the strike was called off at once and the railroads were released by the government. There were no further labour troubles of any magnitude on railroads in 1946.

The total number of railroad employees in Aug. 1946, was 1,370,953, a decrease of 77,509 from Aug. 1945. The decrease was due mainly to the smaller volume of traffic which required fewer trains, but there was some curtailment in maintenance because of smaller earnings. The total compensation paid to employees in Aug. 1946, was \$367,000,000, an increase of \$33,000,000 in excess of the same month in 1945. The number of employees in 1946 was 5% less, but their compensation was 10% more. The 1946 wage increases added \$680,000,000 per year to the railroad payroll and in addition the railroads had to pay \$41,000,000 per year more in pay-roll taxes. The average yearly compensation per employee in 1946 was about \$3,090. The comparable figure in 1945 was \$2,721. In 1939 it was \$1,887. The average hourly wage for straight time (without overtime) in 1946 was about \$1.12. In 1945 it was 93.3 cents and in 1939 it was 74 cents.

The only new legislation affecting railroads enacted in 1946 was the Railroad Social Insurance bill, generally known as the Crosser bill. It was signed by the president on July 31, to become effective on Jan. 1, 1947. It created a new system of annuities for survivors of railroad employees, enlarged the scope of unemployment benefits to include absences because of sickness and generally placed railroad employees in a more favourable position than employees of other industries subject to the Social Security act. The pay-roll tax to be borne by the railroads was increased from 6½% to 8¼% (including the 3% unemployment tax) on Jan. 1, 1947. It was to be further increased to 9% on Jan. 1, 1949, and to 9¼% on Jan. 1, 1952. The higher tax rate on Jan. 1, 1947, increased the railroad tax bill at the rate of \$90,000,000 per year. The employees pay no part of the unemployment tax of 3%, but the higher taxes for social security apply to employees in the same degree as to railroads. The employees' contributions were increased from 3½% to 5¼% on Jan. 1, 1947, to 6% in 1949 and to 6¼% in 1952.

The Bulwinkle bill, which would have cleared doubt as to the legality of railroad rate associations and the conference method of establishing competitive rates, was passed by the house, was reported on favourably to the senate by its committee but did not come up for consideration by the senate before adjournment. The bill was strongly supported by the Interstate Commerce commission and by national associations of shippers but was opposed by the department of justice.

The Reed bill, which would have amended the existing law governing the reorganization of railroads in bankruptcy in order to give more considerate treatment to the holders of railroad capital stock found by the Interstate Commerce commission to be of no value, was passed by both the house and the senate but was vetoed by the president after congress had adjourned. The President approved the general aims of the bill, but he stated that certain defects would prevent the accomplishment of the avowed purpose.

The antitrust suit instituted by the department of justice in Aug. 1944, against the Association of American Railroads, the Western Association of Railway Executives and certain individ-

uals, was still pending when the year ended. The suit was aimed particularly at outlawing the conference method of rate-making, a practice approved and encouraged by the ICC.

The action of a special federal court in Philadelphia in Dec. 1945, approving the acceptance by the Pullman company of an offer by a group of railroads to purchase the cars and facilities of the Pullman company, was appealed to the supreme court by the department of justice on the ground that consummation of the purchase by the group of railroads would create a monopoly of another kind to take the place of the monopoly which the court had ordered dissolved when it required that Pullman, Inc., must dispose of one of its two subsidiaries: (1) Pullman company which owned and operated Pullman cars under contracts with railroads or (2) Pullman-Standard, a car-building company. The appeal did not come up for argument in 1946. (See also BUSINESS REVIEW; DISASTERS; INTERSTATE COMMERCE COMMISSION; NATIONAL MEDIATION BOARD; UNITED STATES.) (W. J. C.)

Great Britain.—Passenger fares and freight rates were increased in July 1946 to levels averaging respectively 33% and 25% above those of 1939, with certain exceptions in season and workmen's tickets, etc.; in spite of higher charges, however, the total traffic receipts continued to fall. Three events of vital significance to the British railways occurred in 1946: firstly, a decision was made to convert more than 1,000 steam locomotives to burn oil fuel instead of coal, a policy undertaken at the express wish of the government and following upon the experimental conversion of some locomotives by the Great Western railway some months earlier; this change in policy provided striking evidence of the shortage of locomotive coal. How universal the problem was in 1946 is shown by the adoption of a similar policy by the Victorian railways in Australia, where brown coal was also being used. Eire proposed to adopt the alternative of Diesel traction. Secondly, the London Passenger Transport board adopted a "closed shop" trade-union policy, which might have far-reaching consequences in the future of British railways. Thirdly, in July, the British main line railways and the Road Haulage association submitted to the minister of transport a memorandum putting forward their agreed views on the co-ordination of road and rail freight transport. As an example of co-operative effort between two transport services highly competitive in the past the memorandum was a notable achievement, and the satisfactory result of years of difficult negotiation. Although priority would long have to be allocated to the repair of war damage and to overcoming deferred maintenance, for which trust funds covering 1939-1945 and totalling (including the L.P.T.B.) £148,000,000 were available, certain technical developments were made such as the experimental prefabricated station building on the London, Midland and Scottish railway, the new design of 4-6-2 "Pacific" class locomotives on the London and North Eastern railway and the opening of a residential school for clerical staff by the same railway. The Southern railway's "Golden Arrow" Pullman service from London (Victoria) *via* Calais to Paris was restored on April 15. Further wide suburban electric stock, seating six on a side, came into service on the S.R. The G.W.R. extended its zonal scheme of rail and highway co-ordinated services from Birmingham to many other areas, a facility in which it could claim pioneering achievement; this company also reinstalled slip coaches. Certain travelling post-office sorting services were restored.

Europe.—The revival of the activities of the International Union of Railways with headquarters at Paris in 1945-46 proved of great benefit in arranging for the resuscitation of international traffic in western Europe.

French National railways (S.N.C.F.) achieved an enviable record in reconstruction, and plans included the relocation of facilities at the railway centres of Orléans and Tours, the electrification of the Paris-Lyon main line, the linking up of the *métro* and main-line railways on the outskirts of Paris and the mechanization of one or more of the large Paris freight stations. The arrival of "Liberation" type 2-8-2 locomotives from the U.S. in addition to equipment production in French shops eased the motive power position, although wagons were scarce and the locomotive coal position remained crucial. In France, as in Belgium, railway charges were increased more than once. Belgian National railways (S.N.C.B.) earned fame by restoring in April the first European postwar services at 65 m.p.h. between Brussels and Antwerp (electric). Steady progress was being made by the Swiss federal railways in the doubling of the Gotthard route along Lake Lucerne, but it was far from complete in 1946. The same system installed new lightweight passenger cars of remarkable design and a large number of passenger stations were being improved; further electrification was carried out. In Germany the railway system remained divided into four sections in accord with the four occupied zones; practically all lines were expected to be open by the end of 1946 but the number of temporary bridges, as across the Rhine, slowed up circulation of movement and provided many traffic bottlenecks. Little official information was available concerning railways in the soviet zone and in the U.S.S.R. itself. The Netherlands railways launched a large-scale plan of main line electrification and rehabilitation, but war damage was not yet repaired, although the completion of large new bridges, as at Zwolle, helped to restore the country's rail traffic arteries. In Sweden electrification was extended on both the Swedish state and the company lines, so that the conversion of the Bergslagen railway's Ludvika-Daglosen section permitted electrical working throughout from Gotenborg to Gavle as from Feb. 1946.

Asia.—Political changes in India had not by the end of 1946 affected

the organization of the Indian Railway board or the individual systems which, except for those of certain states, were all government-owned and operated in that year. Many new locomotives arrived from the U.S. and Canada and further units were on order. Deferred maintenance would require some years to overcome. The appointment of a completely Indian executive staff continued rapidly. Standard gauge steam locomotives released from war service on the Iranian railways were dispatched to standard gauge lines farther west by an ingenious method of loading on metre gauge wagons to reach Baghdad.

South Africa.—Heavy traffic continued on the South African railways in 1946, and the arrival of new locomotives long on order, including 50 Garratt 4-8-2 + 2-8-4 type, proved timely. Extensive improvements were begun in Johannesburg and at Germiston, where 700 trains were handled daily, and at other places, like De Aar, passenger services were approaching prewar speed and frequency. Suburban services in the Cape Town area had been carrying more than 75,000,000 passengers a year and were to be reorganized and improved as soon as new equipment could be obtained. South African railways continued to operate the union's civil air services, a policy similar in many respects to that of Canada, but in contrast to that of Britain, where the Railway Air services, operated for many years jointly by the British railways, became part of the government-owned British European airways during 1946. A government inquiry as to the desirability of the state's taking over the Rhodesian railways issued its report in 1946 and advised against any immediate nationalization policy.

Canada.—Both the Canadian National and the Canadian Pacific railways were able to install new passenger-car equipment of a striking character, embodying lightweight metals, with greatly increased seating comfort and scientifically designed illumination. Modernization of diners and sleepers was an important aim of Canadian railway endeavour in 1946. Wartime restrictions on reduced fares ended in March. Both railways continued their interests in the affiliated air lines, and the reopening of holiday hotels indicated a return to normality.

Mexico.—Besides the progressive dieselization of the Mexican National railways, largely because of the effective assistance resulting from the visit of the U.S. Railway mission some years previously, other new equipment and motive power were received in 1946. A carrier current telephone system was installed between San Luis Potosi and Mexico City.

South America.—Further progress was made in the electrification of the Brazilian Sorocabana railway main line from Santos, where new construction was also in hand. The opening of the Brazil-Argentina railway bridge at Uruguayana in 1946 forged an important rail link between the two countries. Another railway bridge linking Brazil with Uruguay at Jaguarão was also completed, and a third bridge near Corumbá was under construction between Brazil and Bolivia.

Australia and New Zealand.—Negotiations were continued between the commonwealth and the state governments concerning the financing of the gauge standardization program, and certain adjustments made to the proposals in regard to northern Queensland. The new bridge over the Hawkesbury river in New South Wales was opened in July 1946. The completion of the Kaikoura-Oaro section of the East Coast Main line (South island), New Zealand, at the close of 1945 brought a section, isolated after 1875, into the main system and was thus an important landmark in New Zealand railway history. The five-day 40-hour week came into force on the New Zealand railways in 1946. (C. E. R. S.)

Raimu (1883-1946), French actor, was born at Toulon on April 17; his real name was Jules Muraire. He began his career as an actor at Toulon with a walking-on part, became prompter in a Marseilles theatre and at one point in his early days joined a troupe of U.S. acrobats; later, his début in café concerts in Paris brought him his first fame. The reputation he made at the "Cigale" and the "Folies-Bergères" carried him into the film-world, where he first took part in Sacha Guitry's *Le Blanc et le Noir*. His greatest successes were in *Fanny* and *Marius*, both made in 1931; he was diligent in character study, and it was said that he studied the role of Marius for more than a year before attempting to play it. At the time of his later success in *La Femme du Boulanger* and *Carnet de Bal* he was already an established favourite. In the last years of his life he returned to the stage and became a member of the Comédie Française, acting in *Le Malade Imaginaire* and *Le Bourgeois Gentilhomme*. He died in Paris on Sept. 20 of a heart attack.

Rayon and Other Synthetic Fibres. Previous all-time high records for United States rayon and rayon products production

were broken in 1946. Rayon yarns exceeded the previous record, in 1945, by 7½%. Rayon fabrics increased about 11% in excess of 1945. Only in rayon hosiery was there a decrease, a result of the return to use of nylon in the first year of operations after release of nylon from war use. More gain was shown by filament yarn than rayon staple. Filament yarn, which makes the finer types of fabrics more similar to silk, was 8½% more than 1945 and double that of 1939. Rayon staple, used for the spun rayon fabrics more closely resembling wool, fine cotton and linen weaves, increased 5% more than in 1945. Production of all other synthetic yarns, including nylon, vinyon protein and glass fibres, was estimated to reach between 35,000,000 and 40,000,000 lb.

Table I.—United States Rayon Production in Millions of Pounds

	1941	1942	1943	1944	1945	1946
Rayon filament yarn	451	479	501	555	624	678
Rayon staple fibre	122	153	162	169	168	176

World Rayon Production.—World production of rayon was estimated at 1,800,000,000 lb., an increase of 18% over 1945 but 37% below the record of 1941. This difference was due largely to the depressed levels of production still existing in the former large producing countries of Germany and Japan. Sharp recoveries were shown, however, by Belgium, Czechoslovakia, France, Great Britain, Italy and the Netherlands. New producing units in South American countries combined with production in North America gave the western hemisphere more than 50% of the world's rayon output, of which the United States was responsible for 47%.

Fields of consumption during 1946 showed a sharp change, reflecting the return to peacetime channels with the exception of the tire cord users who continued their wartime interest in the synthetic yarns. The tabulation of United States distribution of filament rayon yarn by trades would show how the full-fashioned hosiery makers who turned to rayon when silk and nylon were taken over for war uses dropped their interest in 1946 to the extent of reducing their consumption to about one-fourth of their 1945 poundage. Seamless hosiery, which used rayon prior to the war, showed a gain in pounds consumed by one-third. A new and growing field of consumption was the warp knit fabric industry which took 35,000,000 lb. in 1945, compared with 20,000,000 in 1941. This fabric, known to the consuming public as rayon jersey, rapidly became a factor in the making of dresses, underwear and sportsclothes. Improved machinery produced better wearing fabrics and high styling in colours and print designs brought increasing consumer acceptance. Makers of the more established woven fabrics were installing knitting equipment for the newer types of fabrics that were proving competitive with the products of the loom. Tire manufacturers used 214,000,000 lb. of rayon yarn, compared with 187,000,000 in 1945 and 55,000,000 in 1943. The export market, which war shortages developed, started its expected downward move in 1946 with a decrease to 12,500,000 lb. from the previous year's all-time high of 20,000,000 lb.

Prices of rayon yarn were increased in the last two months of 1946 to 59¢ a pound in November and 62¢ in December for the viscose 150 filament. The price of 55¢ had been in effect after Oct. 1941. Rayon staple fibre rose to 28¢ for the viscose type compared with 25¢ in effect after Aug. 1944. As to rayon fabric prices, they, like rayon yarn prices, followed a more stabilized line than other textiles.

The chief consumers of rayon yarn, the fabric weavers, again broke their production records. Total yardage produced of all types was estimated to be 1,800,000,000 of which 60% was in the all-filament cloths, such as taffetas, crepes, lining fabrics, satins, etc., 10% in the all-spun rayon fabrics, 10% in the combination filament and spun rayon fabrics and 20% in other rayon mixtures. The all-filament group as shown in Table II showed the largest increases in excess of 1945 production as they were the most desired fabrics for general clothing purposes.

RAW RAYON being passed through taundering operation before being processed with melamine resin, during 1946. The processing was said to make the fabric muss resistant, washable, shrink-proof and of increased wearing quality

Table II.—Production of Rayon Broad Woven Fabrics
(Except Tire Fabrics)

	All-filament	All-spun rayon	Comb. filament and spun rayon	All other rayon mixtures
1944	1,100.4	151.6	154.2	162.1
1945	1,018.2	162.1	159.8	178.2
1946*	1,158.4	195.8	178.2	250.8

*Nine months actual, three months estimated.

Added to rayon fabrics in 1946 were a growing group of nylon fabrics, particularly nylon cloth for sails, first introduced just before the war, and nylon satin for underwear. Nylon marquisettes were also featured first in 1946 for window curtains. Generally, however, production throughout the year was concentrated on standard types in urgent demand for men's and boys' wear linings, for women's low and medium priced dresses, blouses and underwear. Government controls on distribution of these fabrics continued throughout the year, and it was not until November that Office of Price Administration controls on prices of rayon grey goods (unfinished) were revoked. Table III demonstrates the growing weekly average production of rayon, nylon and related fabrics:

Table III.—Weekly Average Production of Rayon, Nylon, Silk and Related Fabrics*

	(Millions of linear yards)	Production
1939 weekly average		27.1
1943 weekly average		31.9
1944 weekly average		32.5
1945 weekly average		31.3
1946 weekly average (first ten months)		34.7
% change 1946		
Weekly average from		
1939 weekly average		+28.0
1943 weekly average		+ 8.8
1944 weekly average		+ 6.8
1945 weekly average		+10.9

*The bulk of the production covered by these statistics consists of rayon broad woven goods. During later months of 1946 rayons were 95.8% of the total.

In the hosiery field, the production of rayon hosiery dropped to 14,513,150 doz. pairs in the first eleven months of 1946, compared with the 35,000,000 in 1945. Nylon hosiery production for the first eleven months of 1946 was 25,280,589 doz. pairs.

Wage and employment trends among rayon and silk mills of the United States were reported during the year for the period 1939 through May 1946. They showed an increase in hourly earnings from \$4.29 to \$8.49 with an increase in hours worked from 36.5 to 41.3 weekly, reflecting the overtime necessary to meet the 22% increase in production during the same period, complicated by the reduction in the number employed which dropped from 110,800 in 1939 to 90,400 in 1946.

The second largest 1946 rayon producer, Great Britain, increased its exports during the year. During the first nine months, 84,000,000 sq.yd. of fabric were sent to foreign markets, compared with 72,732,000 in the same period of 1945. Even so, the Cotton and Rayon Merchants association of Great Britain, in December, asked for not only a legally permissible (under the United States Reciprocal Trade Agreements act) 50% reduction in duties on rayon fabrics entering the United States but an additional 50% on the grounds that they wanted to share the popular and low priced rayon fabric field and could not do so without this aid. At the same time, British consumers were still struggling with rationed clothing. British yarn exports during 1946, during the first nine months

were 135,500,000 lb. of which 81,600,000 were filament and 5,390,000 staple fibre. The combined British production of rayon and nylon averaged nearly 15,000,000 lb. monthly in 1946. At the end of June, there were 24,600 persons employed in the industry of Great Britain.

British and Swiss machinery manufacturers reported in 1946 that contracts had been given by a manufacturing unit in India for installation of rayon spinning machinery that would have the capacity of 10,000 lb. daily of continuous filament rayon.

The Japanese rayon plants were the subject of a survey by a special group of U.S. textile men appointed by the state and war departments who reported in May 1946, that the current production capacity was 354,000,000 lb., 39% below the all-time high level of Japanese rayon production set in 1938. Bomb damage to Japanese rayon plants was nominal compared with cotton mill damage, but scrapping of rayon producing equipment for war metals was responsible for the lowered capacities. During the first three months of 1946, however, only 4½% of even the lowered capacity was being used. Shortage of raw materials was the principal handicap.

Brazil's rayon yarn production, totalling 20,000,000 lb. in 1945, was expected to reach 40,000,000 lb. in 1946, and production of viscose filament yarn in Chile increased during the third quarter of 1946, showing an average monthly production of about 250,000 lb. The yarns were of the coarser variety. Anything finer than 100 denier was imported.

Australia began to knit nylon hosiery in the last quarter of 1946. The nylon yarn was shipped from Great Britain in September and represented about 60% of the British export allocations of this yarn.

In Poland, at Zydowin, near Szczecin, a rayon plant destroyed by the war was being reconstructed in 1946 and was expected to be completed at the end of the year. In July 1946, Poland produced 415,580 kg. (approximately 850,000 lbs.) of stable fibre.

Reconstruction Finance Corporation was created by the act approved by the U.S. congress on Jan. 22, 1932, and began operations as a lending agency on Feb. 2, 1932. On June 30, 1946, loans and other authorizations of RFC amounted to \$41,230,936,765.84, of which \$1,943,162,824.17 was outstanding.

During 1946, RFC, in addition to performing its functions as a lending agency, engaged in the liquidation of its war activities as rapidly as that was practicable, at the same time continuing, under directives from the Office of War Mobilization and Reconversion and the Civilian Production administration, those wartime activities which could not immediately be terminated

Reconstruction Finance Corporation—Summary of Loan & Purchase Activities Feb. 2, 1932, Through June 30, 1946

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture	\$2,603,733,430.83	\$1,452,180,464.11	\$1,452,000,775.45
To open banks to meet demands of depositors	1,334,880,161.08	1,138,251,619.27	1,127,825,604.83
For distribution to depositors in closed banks	1,422,805,381.24	1,060,157,541.49	1,057,674,109.66
For bank capital (including Export-Import bank \$176,500,000 and Federal Home Loan banks \$124,741,000)	1,647,452,669.00	1,471,806,311.56	1,146,679,208.33
For self-liquidating projects, (including PWA securities)	1,300,038,798.95	1,082,195,899.18	984,807,409.68
To business enterprises	1,280,911,156.56	503,492,002.49	357,148,567.61
For loans to national defense	23,148,871,984.06	21,652,639,660.67	21,220,369,140.47*
For loan to Great Britain and Northern Ireland	425,000,000.00	390,000,000.00	156,595,975.76
For purchase of stock—national defense	126,000,000.00	27,000,001.00	21,000,000.00
To drainage, levee and irrigation districts	149,709,448.64	101,108,002.18	80,831,043.99
To railroads (including PWA railroad securities)	1,705,439,535.54	1,052,068,714.70	874,913,140.32
For loans to and capital of mortgage loan companies (including \$25,000,000 capital of The RFC Mortgage company and \$11,000,000 capital of Federal National Mortgage association)	912,342,930.95	782,278,484.26	731,469,433.36
For loans to and capital of insurance companies	151,589,750.19	137,843,209.81	106,079,865.03
To building and loan associations (including receivers)	179,989,559.59	140,158,067.90	140,158,067.90
To public school authorities	25,689,050.00	23,257,175.00	23,257,175.00
For catastrophe rehabilitation loans	17,826,818.36	13,523,726.07	12,437,447.89
To state funds for insurance of deposit of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses	20,296,100.00	9,173,409.40	4,318,181.45
For loan to Export-Import bank	25,000,000.00	25,000,000.00	25,000,000.00
For other purposes	669,057.07	614,813.85	614,813.85
Total by directors of the RFC	\$36,491,333,548.97	\$31,075,813,734.12	\$29,536,244,591.76
Allocations and loans to other governmental agencies and for relief by direction of congress	4,739,603,216.87	3,900,715,936.51	3,497,122,254.70†
GRAND TOTAL	\$41,230,936,765.84	\$34,976,529,670.63	\$33,033,366,846.46

*Includes \$7,650,698,299.91 representing credits arising from the merger of RFC war affiliates with RFC under public law 109—79th congress.

†Includes \$2,785,458,704.21 of the corporation's notes cancelled pursuant to act of congress approved Feb. 24, 1938.

without harmful effect on production and employment. These included the procurement of strategic metals, principally tin and tin ores and concentrates, copper, lead and antimony.

Some defense supplies programs were terminated on recommendation of sponsoring agencies. Several were continued through June 30, 1946, notably the payment of subsidies on flour and meat, which totalled \$774,158,449 for the fiscal year ended June 30, 1946. In addition, the public purchase was continued of commodities in critical supply. The more significant expenditures for commodities during the fiscal year 1946 included goatskins, \$5,271,059; quinine and cinchona products, \$3,341,188; hard fibres, \$28,044,951 and molasses, \$27,461,161.

The defense plants program was marked by orderly liquidation of existing plants; and involved contract termination, close-down, plant protection and maintenance, the designation of surplus plants and equipment as being available for disposal, and continued operation of certain plants under lease agreement. Of a total of 2,486 plants and facilities approved during World War II and the national defense period, representing an aggregate authorization of \$8,972,000,000, it was expected that an average of 46 plants, representing an investment of \$241,960,000, would be maintained during the fiscal year 1947.

RFC continued to perform functions of Rubber Reserve company, with purchases of natural rubber during the fiscal year ending June 30, 1947, expected to be approximately 495,000 tons. An estimated 732,000 tons of synthetic rubber required during the fiscal year ending June 30, 1947, would represent the output of 37 plants which cost approximately \$506,000,000. Six plants costing \$142,000,000 were to be maintained in stand-by condition and eight plants costing approximately \$16,000,000 were expected to be declared surplus for disposal by War Assets administration.

The RFC Mortgage company, during the year ended June 30, 1946, authorized loans and purchased mortgages aggregating \$5,710,538.06. During this period repayments and sales aggregated \$42,325,508.88. From its inception, in 1935, to June 30, 1946, the company made loans and purchased mortgages aggregating 66,203 in number and \$349,941,716.31 in amount. Of these 64,077 aggregating \$334,939,205.85 had been repaid or sold, leaving 2,126 aggregating \$15,002,510.46 on hand. The company makes loans secured by mortgages on income-producing urban real estate, for construction of properties for which a sound economic need has been demonstrated and for refinancing obligations of distressed borrowers, where private financing

can not be obtained. It also purchases certain classes of FHA insured mortgages, and has established a market for veterans' home loans that have been guaranteed or insured by the Veterans' administration. This latter program was undertaken at the request of many private lending institutions engaged in making home loans to war veterans. These indicated that there was insufficient market for such loans among private financial institutions and stated that a dependable market for the loans was needed in order to aid veterans in obtaining loans for the construction or purchase of homes. These loans were to be purchased only

from the lending institutions that originally make the loans.

The Federal National Mortgage association, a subsidiary of RFC, which was continuing its program of standing ready to purchase FHA insured home mortgages from the original lending institutions, when private financial institutions do not provide an ample market, was not called upon to purchase any substantial volume of mortgages in the year ended June 30, 1946. Through that date, it had purchased 66,957 mortgages aggregating \$271,554,633.16 of which 64,711 in number and \$265,183,062.83 in amount had been repaid or sold, leaving 2,246 mortgages aggregating \$6,371,570.33 on hand.

A major activity of RFC during 1946 was the promotion of trade with occupied and liberated countries. The basic policy in conducting such commercial transactions, which were handled by U.S. Commercial company, a subsidiary, was to foster re-establishment of private trade as soon as possible. Under agreements negotiated with the war department, merchandise from both Germany and Japan was imported. Total value of such imports for the fiscal year 1946 was estimated at approximately \$58,100,000, and for the fiscal year 1947 was expected to approximate \$504,000,000, including cost of handling and freight.

As of June 30, 1946, excluding claims for damages to property in the Philippines, 2,138 claims in the amount of \$4,806,471.56 had been received by War Damage corporation, another subsidiary, for the loss of or damage to property as a result of enemy attack. As of June 30, 1946, \$443,482.03 had been paid in settlement of 916 claims. Other claims were in process of settlement. WDC assumed the largest insurance risk ever undertaken in U.S. history and probably the largest in the history of the world. Premium earnings, before payment of participants, amounted to \$221,000,000. More than 8,700,000 policies and renewal certificates were issued.

An important objective of RFC in 1946 was to utilize its powers and facilities to assist in the U.S. effort to develop a sound and enduring postwar economy. RFC's participation was in the form of issuing an adequate supply of credit to banking and business enterprises to meet their sound credit needs, with emphasis being placed in particular upon the needs of small business enterprises. A study initiated by RFC indicated that adequate facilities to finance longer-term credit and capital needs of small enterprises on terms, conditions and maturities comparable with the more favourable conditions enjoyed by big business were essential to postwar prosperity.

This led to development of the Blanket Participation Agreement program under which RFC agrees to guarantee not exceeding 75% of any business loan, not in excess of \$100,000, made to an eligible business borrower by a participating bank. Subject to provisions of the agreement, RFC agrees to take over part of the loan, if the bank desires, upon ten days' notice. As of June 30, 1946, 3,732 banks had signed the agreement and 4,599 applicants received loans aggregating \$257,795,788.82. RFC's participation in these loans aggregated \$187,682,990.76. Banks' participations were \$70,112,798.06. In addition, RFC took over authorizations in the amount of \$119,027,483 as a result of the transfer to it of certain functions of Smaller War Plants corporation, as of Jan. 28, 1946.

The foregoing transfer of certain Smaller War Plants corporation functions to RFC also resulted in giving RFC authority to buy surplus government-owned property for resale to small business under section 18(e) of the Surplus Property act, as amended. As of Oct. 31, 1946, 14,916 applications involving surplus property with an aggregate value of \$42,705,327, had been consummated. As of that date, 8,752 additional applications were in various stages of consummation.

At the close of business March 23, 1946, RFC's function as a disposal agency for approximately 90% of all surplus property was terminated. RFC had functioned as a disposal agency for capital and producers' goods from May 1, 1944, and, in addition, as a disposal agency for consumer goods from Nov. 5, 1945. During that period, surplus aircraft, and capital and producers' goods costing \$12,912,000,000 were turned over to the corporation for disposal, of which, property costing \$1,887,000,000 was either sold or leased through March 23, 1946. Property costing \$1,328,000,000 was sold for \$576,000,000, a return of 43.4 cents on the dollar. The return from surplus industrial plants and real estate was 59.6%, and from aircraft, most of which was nonsalable, 16.6%.

RFC functions under the direction of a bipartisan board of directors whose members are appointed by the president subject to confirmation of the senate. The board in 1946 consisted of: Charles B. Henderson, chairman; Henry A. Mulligan, Harvey J. Gunderson, Henry T. Bodman and George E. Allen.

Loan agencies are maintained by the corporation in Atlanta, Ga.; Birmingham, Ala.; Boston, Mass.; Charlotte, N.C.; Chicago, Ill.; Cleveland, O.; Dallas, Tex.; Denver, Colo.; Detroit, Mich.; Helena, Mont.; Houston, Tex.; Jacksonville, Fla.; Kansas City, Mo.; Little Rock, Ark.; Los Angeles, Calif.; Louisville, Ky.; Minneapolis, Minn.; Nashville, Tenn.; New Orleans, La.; New York, N.Y.; Oklahoma City, Okla.; Omaha, Neb.; Philadelphia, Pa.; Portland, Ore.; Richmond, Va.; St. Louis, Mo.; Salt Lake City, Utah; San Antonio, Tex.; San Francisco, Calif.; Seattle, Wash.; and Spokane, Wash. (C. B. H.)

Reconstruction Planning. The long procedure of establishing the United Nations began under unfavourable auspices at the Jan. 1946 meeting of the General assembly in London. Despite this handicap, the members of the Security council and the Economic and Social council were elected and the Military Staff committee was formed. An Atomic Energy commission, consisting of 11 members of the Security council and Canada, was constituted and started work on plans for the control and peacetime development of atomic energy. The newly-formed Economic and Social council negotiated agreements to bring the International Labour organization, the Food and Agriculture organization and the U.N. Educational, Scientific and Cultural organization into relationship with the United Nations. It also considered reports of subcommittees on human rights, economic, social and employment conditions, and transport and communications.

At the end of the year, the General assembly, reconvening in New York, gained headway in establishing the prestige and workability of the United Nations as a functioning organization. At these meetings the U.N. proved a valuable agency for exposing basic differences of opinion out of which any world order must be constructed. The General assembly chose New York as permanent U.N. headquarters and adopted a program for general disarmament which would provide a basis of agreement for the work of the Security council in carrying disarmament forward. The U.N. Trusteeship council was also formed to supervise the administration of colonial areas.

Basic to all reconstruction planning were the problems and possibilities brought about by atomic power. U.S. policy for atomic control was promulgated in the Baruch report. It proposed a treaty to create an international Atomic Development authority to supervise all phases of the development and use of atomic energy, with full power to punish violators of the proposed agreement. Soviet Russia in a counterproposal refused to relinquish her Security council veto power to such a commission but later abandoned much of her original plan. In December the 12-nation Atomic Energy commission approved the principle of the U.S. plan, with Russia and Poland not voting.

The United States meanwhile passed the Atomic Energy act of 1946, shifting domestic supervision of atomic energy materials, plants and development from military to civilian control under the United States Atomic Energy commission. Scientific progress was made during the year leading toward beneficial uses for atomic power and two tests of the effects of atomic bombs resulted in additional technical knowledge of their destructive force.

The central problem of concluding peace treaties with the axis powers held a large place in the headlines of world affairs. A 21-nation Peace conference in Paris attempted during July through October to iron out national differences and agree on treaties with the German satellites—Finland, Rumania, Bulgaria, Hungary and Italy. The conference finally approved draft treaties for consideration by the Big Four foreign ministers who met later in New York and reached agreement on all five settlements. They resolved more than 40 deadlocked issues, approving a plan for administering Trieste as a free port under Security council control and subscribing to the principle of equal trading rights along the Danube for all nations. The way was cleared for discussion of the all-important German and Austrian peace treaties.

Meanwhile Europe's economic problems continued to be staggering. In July the United States urged the necessity of centralized control for the four zones of occupation in Germany. Failing agreement with Russia and France, England and the United States went ahead late in the year with plans to merge their two zones of occupation into an economic unit.

Problems of minority groups and displaced persons reached an acute stage in 1946. A special United Nations Committee on Refugees and Displaced Persons met in London during April-June to work out plans to meet the needs of Europe's thousands of refugees. The United Nations Relief and Rehabilitation administration's final report in November recommended continued U.N. action to supply emergency food and social services. The Food and Agriculture organization, convening in Copenhagen in September, also considered emergency problems and proposed a World Food board to deal with long-range planning for food production and distribution. The United States, however, favoured a nation-to-nation approach in supplying food needs and this general plan was adopted by the U.N. General assembly. In December, the U.N. approved the constitution of the International Refugee organization, proposing a temporary organization for repatriation and resettlement, which would also assume

U.N.R.R.A.'s administrative functions concerning refugees.

Trade revival was a central theme in the planning of most governments and many private organizations. In preparation for the long-deferred International Trade conference, an 18-nation preliminary meeting was held in October in London. The United States state department released detailed proposals for expansion of world trade and employment and a suggested charter for an International Trade organization. Among the numerous trade agreements of 1946 was a civil transport pact for the European continent, signed by 11 nations in September.

The United States, after a year of labour unrest and political changes, took a long step toward restoring internal peacetime economic conditions. The president in proclaiming the official "cessation of hostilities of World War II," rescinded part of the extraordinary powers of the government and put an end to many wartime controls. The Employment act of 1946 was passed earlier in the year to promote maximum production, employment and purchasing power. It created a Council of Economic Advisers to aid the president in preparing an annual economic report.

National recovery programs were instituted in most European countries and in the western hemisphere and the year witnessed a trend toward eventual independence of Asiatic peoples.

In Japan, under Allied control, political, educational and economic changes were made. A new constitution, adopted in August, proclaimed the sovereignty of the Japanese people. The Philippines became a republic on July 4, 1946. A treaty with the United States provided financial and military assistance to the new republic in its reconstruction and development program. Later in the year, India's first all-Indian executive council was formed pending the adoption of a new constitution. A similar plan of independence was offered to Burma by Great Britain. The Netherlands proclaimed the new provisional state of East Indonesia. Efforts to end the civil war in China proved futile although the Chinese national assembly adopted a democratic constitution as a step toward national unity. Violence also continued in French Indo-China despite an offer of partial self-government under the proposed French union. Red Cross. **United States.**—In 1946 the American Red Cross marshalled all its forces throughout the world to deal with the difficult problems the peace had brought.

Its broadest responsibility lay to the veterans, the hospitalized soldiers and the new forces of occupation. The Red Cross program of services to the armed forces, made up of four operating divisions—military and naval welfare service, home service, camp and hospital council service and services to veterans—carried out this responsibility.

Red Cross service was made available to occupation troops and able-bodied soldiers in the United States and overseas by more than 10,000 Red Cross workers. Under a new agreement, effective July 1, 1946, the army operated all overseas clubs and supplied and dispensed refreshments served therein but Red

Cross trained personnel managed, supervised and conducted an expanded recreational program. Appropriations by Red Cross for such overseas recreational programs during the fiscal year ending June 30, 1946, amounted to \$16,272,000.

Approximately 1,700,000 veterans were given assistance by the Red Cross at the time of their discharge. Red Cross field directors served during 1946 in 62 Veterans' Administration regional offices, with a total of more than 750 Red Cross workers engaged in Veterans' Administration programs. The Red Cross received an average of 30,000 powers of attorney a month during 1946 from veterans and assisted them in filing applications for benefits and assembling supporting evidence for claims.

To the sick and wounded coming home by train, plane or boat, to released prisoners of war and civilian internees, to the wives and mothers and children of soldiers and veterans in need of help the Red Cross turned.

Operating through its 3,755 chapters and more than 5,300 branches throughout the United States, volunteers in Red Cross Community Services to Camps and Hospitals conducted varied programs for servicemen and veterans. Members of Red Cross Volunteer Special Services gave 120,000,000 hours of work. Red Cross hospital social workers prepared disabled men for their return to civilian life. Professional staffs and thousands of volunteers brought recreation, entertainment and comfort to the wounded and the sick in hospitals far away from their own families. On June 30, 1946, some 2,900 trained Red Cross workers were serving in military and naval hospitals in the United States and overseas doing recreation, medical and psychiatric case work.

Supplementing the aid provided by national governments and international agencies such as U.N.R.R.A., which bore the brunt of the vast emergency relief programs carried on throughout Europe and the far east, the Red Cross assisted the military in Germany, Japan and Korea in arranging for the evacuation of displaced persons and in providing them with food, clothing and medical care. American Red Cross relief programs were carried out in Great Britain, Italy, France, Luxembourg and Belgium, in the Netherlands, Norway, Yugoslavia, Greece, China and the U.S.S.R. as well as Austria, Czechoslovakia, Poland and Finland. In its overseas Civilian Relief program the American National Red Cross made available approximately \$50,000,000 worth of chapter-produced clothing, medical and hospital supplies, supplementary food and milk, and automotive equipment from July 1, 1945, to June 30, 1946. More than 75,000,000 people in 49 countries benefited from the American Red Cross civilian relief program from Sept. 1, 1939, to June 30, 1946, during which period more than \$178,000,000 worth of supplies was made available to them by and through the American National Red Cross.

During 1946, the American Red Cross also assisted in the reorganization of the Philippine Red Cross and the reconstitution of prewar Red Cross societies in such countries as France, Belgium and the Netherlands.

With the close of World War II, special attention was given to the strengthening of the American Red Cross Disaster Preparedness and Relief program as well as other peacetime services such as nursing, nutrition, first aid, water safety, accident prevention and civilian blood donor programs. During the year 1945-46, the Red Cross gave assistance in 271 disasters in 45 states, Hawaii and Alaska, aiding more than 142,000 persons. Of this number, 130 disasters occurred during the first six months of 1946. Total Red Cross funds spent in disaster relief operation in the United States and its insular possessions aggregated \$1,604,985 during the year.

Red Cross first aid, water safety and accident prevention service had 10,000 mobile first aid units and 2,000 highway first

aid stations in operation. More than 337,000 Americans received first aid certificates during the fiscal year and 400,000 completed Red Cross water safety training courses.

The new civilian blood donor service which came into being at the war's end started off with a surplus of 1,250,000 packages of dried blood plasma declared surplus by the army and navy. During the year 1946, this plasma was distributed through state and territorial health departments to hospitals throughout the United States, Hawaii, Alaska and the Philippine Islands. Available quantities of immune serum globulin for the prevention and modification of measles were also distributed.

The American Junior Red Cross, with a membership of nearly 20,000,000, contributed about \$1,850,000 worth of educational, health and recreational supplies to children overseas. Its members contributed \$624,275.92 to the National Children's fund to finance programs of special assistance to children in war-devastated countries.

In 1946, adult membership of the American Red Cross numbered 36,000,000. President, *ex-officio* of the American Red Cross is Harry S. Truman, president of the United States. National Chairman of the organization is Basil O'Connor.

(H. BM.)

The World.—During 1946 the Red Cross societies of the world and their international organizations moved rapidly toward the reshaping of their peacetime programs. At Oxford, England, in July the League of Red Cross societies, the federation of the 63 national societies of the world, held its largest meeting from its formation in 1919. The 200 delegates from 55 national societies spent two weeks discussing plans for making the services of Red Cross societies more effective in meeting needs in the postwar world. Particular emphasis was given to a restatement of the principles of Red Cross societies, the expansion of health programs, particularly in preventive measures, the development of child welfare programs and the extension of Junior Red Cross activities. Under the leadership of Basil O'Connor, chairman of the American Red Cross and chairman of the league, steps were initiated aimed at the elimination of the atomic bomb as a weapon of war. Plans to meet more adequately the needs of civilians in war-devastated countries were also discussed. A Junior Red Cross conference of the European societies was held in Stockholm in September under the sponsorship of the Swedish Red Cross.

The International Red Cross committee under the presidency of Professor Max Huber brought together at Geneva, Switzerland, in August representatives of national Red Cross societies, principally to discuss possible changes in the Geneva Red Cross convention and the Geneva Prisoners of War convention and to consider suggestions for new international agreements designed to protect the civilian population under modern conditions of warfare. During the year the International committee reduced the membership of its delegations abroad but continued to maintain delegates in those areas where axis prisoners of war were confined, with the exception of the soviet union where neutral representatives were not permitted to inspect prison camps.

The Joint Relief commission of the International Red Cross, formed during World War II by the International committee and the League of Red Cross societies to facilitate relief measures particularly on behalf of civilian populations in axis-occupied European countries, ceased its operations late in 1946.

The national Red Cross societies in many countries endeavored to expand their medical and health programs. The Chinese Red Cross increased the number of public clinics; the Belgian Red Cross initiated a nationwide blood donor program; the revitalized Austrian Red Cross expanded its ambulance service; in Yugoslavia, Poland and Greece, Red Cross facilities for fighting tuberculosis were extended; and the American Red Cross

made surplus blood plasma available to civilians throughout the United States. The societies able to do so continued to send relief supplies to countries suffering from war devastation.

In December the general assembly of the United Nations recognized the special status of Red Cross societies and called upon member governments to encourage their activities. (*See also PRISONERS OF WAR AND DISPLACED PERSONS.*) (P. E. R.)

Reece, Brazilla Carroll (1889—), U.S. politician and lawyer, was born Dec. 22 in Butler, Tenn. He attended Carson and Newman college (Tenn.), graduating with a B.A. degree in 1914 and later studied at New York university, receiving his M.A. degree in 1916. He joined the U.S. army in 1917 during World War I, winning a commission and rising to the rank of a battalion commander in the American Expeditionary Force.

After the war, he studied at London university (1918–19); on his return to the United States he became instructor of economics at New York university, but left after one term to return to Tennessee where he ran for the U.S. house of representatives on the Republican ticket. Reece was elected in 1920 and was re-elected until 1930. He ran again in 1934, defeated his Democratic opponent and served in the lower house until 1946.

On April 1, 1946, Reece was selected as chairman of the Republican National committee. His appointment was interpreted as a victory for the midwestern Republicans over the Stassen factions in the G.O.P.

Refugees. The repatriation of United Nations nationals from Germany and Austria which had proceeded at a surprising rate in 1945 slowed down substantially in 1946. Some 6,500,000 to 7,000,000 former slave labourers and inmates of concentration camps, drawn into Germany from the occupied countries of Europe during World War II to supply the ever increasing demands of the German war machine for manpower, had been returned to their home countries in 1945. This movement practically came to a standstill in the winter months of 1946 as the hard core of nonrepatriables totalling approximately 1,200,000 began to emerge. The dispersion of this hard core challenged the resourcefulness of the occupying authorities in Germany and Austria and the General assembly of the United Nations which gave serious attention to the problem at its meeting in London in Jan. and Feb. 1946.

This group of nonrepatriable refugees and displaced persons in central Europe consisted primarily of 700,000 Poles, some 250,000 Baltic refugees, approximately 100,000 Yugoslavs, 50,000 Ukrainians and some 100,000 Jewish refugees mostly of Polish nationality who had fled from Poland after the cessation of hostilities, because of the insecurity which they felt in that country and in the hope of reaching Palestine. The infiltration of Polish Jews into Austria, Germany and Italy continued during the spring and summer of 1946 as a result of pogroms in Poland and of the urge to reach the longed for national home of the Jews in Palestine. The movement included not only Jews who had survived the war in Poland but some of the 150,000 Polish Jews who had returned from the soviet union to Poland in 1946 under the Polish-soviet agreement for the exchange of populations which had been concluded at Moscow in 1945. By late summer of 1946 a total of 200,000 Polish Jews had reached central Europe where they were destined to await final decisions

by the British government with respect to their entry into Palestine.

The Anglo-American Commission for Palestine appointed by the British and United States governments in Dec. 1945 presented a series of recommendations with respect to Palestine in April 1946. Included in the recommendations was one that 100,000 Jews then in displaced persons centres in Germany and Austria be admitted to Palestine immediately. The British government took the view however that this particular recommendation could not be implemented without reference to action on the other recommendations of the commission bearing on the political and economic reorganization of Palestine.

The repatriation of Poles, Yugoslavs and Ukrainians among those remaining in central Europe was resumed in the spring and summer months of 1946, but with diminishing results. Those remaining expressed political objections to returning to their countries of origin in which new governments were in control. The view was advanced by some observers that economic reasons played a substantial role in the unwillingness of many to return. The life, shelter and food provided in the assembly centres undoubtedly proved more attractive to some of the displaced persons than the hardships which they would face on return to their home countries. Criticism of the failure of the representatives of the countries of origin to supply adequate and convincing information on the living and economic conditions in the home countries was frequently expressed by Allied authorities concerned with repatriation. By the end of 1946 approximately 1,000,000 refugees and displaced persons remained in Germany and Austria, the larger numbers housed in assembly centres under the administration of the United Nations Relief and Rehabilitation administration, while others endeavoured to eke out an existence in the German and Austrian communities.

In Italy the numbers of refugees and displaced persons were smaller, totalling approximately 150,000, most of whom were living in the Italian community. Some 25,000 Jewish refugees were cared for in U.N.R.R.A. camps. An additional 40,000 Yugoslavs, Poles, Ukrainians and displaced persons of other United Nations nationalities were cared for in camps maintained by the Allied military authorities.

During the year the Anders Polish army in the Mediterranean area was demobilized and its members transferred to England. There they were placed in training camps as civilians to undergo a period of preparation for resettlement in agriculture overseas. The British government announced that it would assume unilaterally the responsibility for the care and ultimate disposition of this group which, including wives and children, totalled 200,000 persons. Canada announced in the fall of the year that it would accept 4,000 Anders Poles as immigrants.

Some progress was made during the year in the return of displaced German nationals to their prewar homes in Germany. Exchanges on a head for head basis were completed between the four zones occupied by the soviet, United States, British and French military authorities. These arrangements fell far short of the mark however of returning all displaced Germans to their original homes.

The destruction of housing in the cities in Germany in the final days of the war forced urban dwellers to seek homes in rural districts. The internal dislocation of Germans was aggravated by the acceptance into Germany under the terms of the Potsdam agreement of 6,000,000 racial Germans formerly resident in Poland, Czechoslovakia and Hungary. This movement, carried out so soon after the end of hostilities, left much to be desired in the way of an orderly peacetime transfer of populations. The political and emotional pressures to expel Germans from Poland and Czechoslovakia particularly were so strong that the occupying military authorities in Germany were forced

ESTONIAN REFUGEES who arrived in Miami, Fla., Sept. 9, 1946, in this 40-ft. converted fishing schooner. They left their country to escape the Russians

to receive the expelled Germans in spite of the fact that the absorption of these numbers in the German economy in 1946 severely complicated the problem of restoring peace and order.

Other groups of racial Germans not covered by the Potsdam agreement such as those formerly resident in Yugoslavia were forced into Austria without the protection of international agreements. These, estimated as between 100,000 and 150,000, were neither recognized as Germans nor as Yugoslavs and were expected to endure a very precarious existence until their civil status was clarified. The overcrowding in Germany prevented their acceptance there and they constituted a continually excessive burden on the Austrian economy.

The claim of this group for admission to Germany was less substantial than that of the 200,000 Germans still resident in Denmark. These constituted the remnants of the westward movement of Germans in flight from the advance of the soviet armies in the spring of 1945. Denmark cared for them in camps from the end of hostilities in Germany, but had not at the end of 1946 been able to secure permission from the occupying authorities in Germany for their admission to Germany.

In the far east efforts were continued to complete the repatriation of Koreans from Japan. Some 2,000,000 labourers and their families had been taken to Japan during the war by the Japanese. Their repatriation began before the cessation of hostilities in 1945 and continued during 1946. Likewise the repatriation of 800,000 Japanese from Korea including some from the soviet zone of occupation was in process during 1946.

In China more than 35,000 overseas Chinese awaited repatriation from China to their prewar domiciles overseas in Burma, Singapore, the Philippines, the Netherlands East Indies, Siam and Indo-China. Some 100,000 Chinese returned to Hong Kong on foot and U.N.R.R.A. reported the repatriation of more than 5,000 to Burma and Singapore. There were no developments within China indicating the permanent or temporary character of the westward movement of 20,000,000 Chinese displaced internally during the war. No authoritative information became available as to the progress made during 1946 in the repatriation of the 2,000,000 Japanese civilians remaining in China at the end of the war.

The problem of refugees and displaced persons received the continuous attention of the United Nations during 1946. Following the meeting of the General assembly in London in January, the Economic and Social council appointed a special subcommittee to explore the problem in all of its aspects and to draft a constitution for a new international organization to assume responsibility for the problem. The Economic

and Social council considered the report of the subcommittee at its meeting in New York in June and set up another committee to recommend a budget and scales of contributions by governments to the International Refugee organization which had been proposed as a specialized agency to be brought into relationship with the United Nations. At the September meeting of the Economic and Social council the draft constitution, budget and scales of contributions of the International Refugee organization were accepted and recommended for the consideration of the General assembly at the second part of its first session meeting in New York in Dec. 1946.

The problem was thoroughly discussed at the General assembly and the proposal of the International Refugee organization adopted by a vote of 30-5. The negative votes were cast by the representatives of the U.S.S.R., Poland, Byelorussia, the Ukraine and Yugoslavia who held the view that all refugees and displaced persons should be repatriated to their countries of origin and all other forms of international assistance such as assistance in emigration withheld from them. The constitution was then opened for the signatures of governments and was to come into force as soon as 15 governments whose allotted contributions totalled 75% of the budget had signed the constitution. The budget for the first financial year was set down as \$160,000,000.

Earlier the council of the U.N.R.R.A. meeting at Geneva in Aug. 1946 had voted to bring its administration of displaced persons centres to an end by June 1947 before which time it was hoped that the new International Refugee organization would be in a position to take over such functions. Also the Intergovernmental Committee on Refugees at a meeting in July 1946 in London had greatly expanded its functions to include that of assistance in the emigration and resettlement of displaced persons. These activities were to be continued until the International Refugee organization came into being at which time the work of the Intergovernmental committee would be absorbed by the International Refugee organization. Relief. In the year 1946 there were no major extensions of the programs of former years for the relief of the necessities of life, and no economic recessions creating new groups of needy persons in the countries of the English-speaking world. The war armies had been demobilized and the extensive provisions made to effect an easy transfer to occupations of peace time proved substantially adequate. Apparently the problems of making such a transfer without economic disaster to a considerable portion of the men affected had been anticipated and to a large degree solved. The trends in each country during the year of war continued and determined the operations of provisions for social welfare, including relief.

New Zealand, which had pioneered in the establishment of an all inclusive Welfare act to include within its benefits all possible classes of need which shared the nature of social insurance and public assistance, changed the tax on wages from 5% to 7½%, abolished the semiannual registration fee and reduced the subsidy from the commonwealth from 5% to 2½%. The classification of beneficiaries was simplified, and benefits were adjusted more to the size of the family receiving them than to the nature of the event (old age, accident, employment, etc.) which made the family eligible. The Welfare act had become the political target of the conservative parties which claimed the charge on the state of such an act would bankrupt the nation. The change of incidence of the tax might have been a concession on the part of the Labour party in power, which was returned by a decreased majority in the elections of November.

In Australia the Welfare act, adopted as a war measure, was continued, and while less ambitious in its coverage than that of New Zealand, it embraced as separate categories, each financed by special provisions, a wide variety of situations such as widowhood, old age, sickness, maternity allowances and unemploy-

ment. One-sixth of the commonwealth revenue raised by taxation was earmarked for the welfare services.

In addition to its regular relief given by the Assistance board as extra allowance to any unemployed, old-age pensioner and civilian sufferer from the effects of the war, Great Britain strengthened its program of providing free meals and milk to school children, by including children in all schools supported by tax funds at an annual cost estimated at £60,000,000. In addition, the plan granting an allowance to families for children other than the first or only one was authorized by parliament in Feb. 1945, and became operative on Aug. 6, 1946. By its provisions any adult member of a family whose parents were citizens of Great Britain was eligible to make application, and the only test of eligibility was that there should be two or more children in the family under 16 living (and if of school age, attending school, college or university). For each except the first child, the family was entitled to receive five shillings a week. It was estimated that there would be about 2,000,000 families, having an average of four and a half eligible children coming under the provisions of the act, and costing the national treasury nearly £57,000,000 a year.

Canada's more complicated Family Allowance act was limited to families whose income is below \$3,000 a year. It completed its first full year in operation in 1946. In September, allowances were paid to families in behalf of more than three and a third million children and in an amount of more than \$20,000,000.

In the United States there was no development in the field of family allowances. The National School Lunch act of June 1946 authorized the department of agriculture to co-operate with the states in providing lunches for children. However, this was primarily a device to use agricultural products—such as the Stamp plan of the depression years—and was not geared in the first place to meet the needs of children. It introduced a much needed innovation in the determination of the federal portion of the grant, making it vary inversely with the wealth of a state and directly with the number of children between 7 and 14 years of age, in ratios so fixed that the total available from both federal and state per child would be substantially higher per child in a poor state than in a wealthy one. Also for the first time, those countries lying outside continental United States—Hawaii, Puerto Rico, Alaska and the Virgin Islands—were included.

The Social Security act received a few slight amendments which fell far short of what had been recommended. Maximum grant in old-age assistance from federal funds was raised to \$25 a month from \$20; grants in aid to dependent children were raised from \$9 to \$13.50 for the first child and from \$6 to \$9 a month for second and subsequent children, with a more liberal subsidy from federal funds in aid to dependent children. The amendments also extended the provisions of the Social Security act dealing with maternal and child health, aid to crippled children and child welfare to the Virgin Islands.

The Social Security board was changed to the Social Security administration of the Social Security agency. This abolished a board that had been in charge of the administration of the provisions of the Social Security act since its passage in 1935, placing it under a single administrator. In the reorganization, the functions of the children's bureau (except child labour) were merged with the Social Security administration, and the whole making one of the four functions of the Social Security agency. The other three were education, health and medical care, and special services such as vocational administration, community war services, etc.

In 12 months, from Sept. 1945 through Aug. 1946, payments to all recipients of public assistance in the United States increased from \$83,000,000 to \$97,000,000, by monthly incre-

ments of about 1% over each preceding month.

In Canada, the community chests raised \$6,086,045 against a quota of \$6,840,977, but which was about \$500,000 more than they secured in 1945.

In the United States, final reports were not in for the entire country, but for the 244 community chests reporting, \$75,672,824 was raised, which was within 98.4% of the goal set. (See also CHILD WELFARE; MUNICIPAL GOVERNMENT; RED CROSS; SOCIAL SECURITY.) (F. J. B.)

Relief and Rehabilitation Administration, United Nations: see UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.

Religion. A compilation from official sources of church membership figures for 1946 show that the 55 denominations with memberships of 50,000 and upward, increased by more than 1,000,000 members during the year. These denominations represent 98% of the total church membership of the nation. Total Roman Catholic accessions slightly exceeded Protestant. (No new Jewish figures were available.) Nine denominations reported gains of 25,000 and up; 7 denominations, on the contrary, reported losses.

Reporting for the previous fiscal year, the United Stewardship council announced expenditures by U.S. Protestant churches of more than \$614,000,000 for local church support and benevolences. This was an advance of 19% over the previous high figure and a 20% increase over the previous year.

Meeting toward the close of the year, the Association of Church Architects estimated that the demand for church buildings and repairs deferred by World War II had resulted in prospective building programs requiring \$650,000,000.

Several denominations reported the checking of the recent serious decline in Sunday school enrolment together with a very great development in supplemental measures of religious education, such as daily religious schools and weekday religious instruction on weekday school time. A recent report enumerates weekday classes in 2,000 communities, found in all but two of the states, with an enrolment of more than 1,500,000.

YOUTH FOR CHRIST rally at the Hollywood bowl, Hollywood, Calif., during the early part of 1946, which an estimated 18,000 young people attended

Virtually every major denomination initiated extensive programs of postwar advance, both financial and numerical. Stressing evangelism the Methodist Church set a goal of 1,000,000 new members for 1946 and fixed quotas for each of its conferences. By the middle of Oct., 910,000 new members had been reported, some sections considerably exceeding their quotas. Seven hundred and twenty-eight new congregations had been established. The Presbyterian (U.S.A.) church's three year "new life movement" is seeking 1,000,000 new members and the establishment of 300 new churches.

Great attention was being paid to the character of future foreign missionary work. In view of restrictions upon missionary propaganda by numerous nations the co-operating agencies have been especially urgent that the United Nations should adopt the charter of human rights, providing freedom of religious teaching. A new pattern of relationships between mission agencies and the national churches was started in Japan where returning missionaries are jointly commissioned by the co-operating bodies, become members of the national church and work entirely within its framework.

The affiliation during the year of the foreign mission relief agencies with numerous agencies for Europe in Church World Service resulted in the largest private agency distributing foreign relief. A fund of \$12,000,000 was being sought for relief expenses in 1947, to be spent about equally for suffering people and the reconstruction of Christian institutions in Europe and Asia.

The Federal Council of Churches' 1946 review of religion declared that an outstanding note of the theological thinking of the times is the increasingly clear-cut recognition of the secularization and essentially pagan character of modern civilization and the necessity of a sharp distinction between the church and the world. There has been increasing dissatisfaction with mere numbers and financial strength and new sharpness of self-criticism and a more general note of humility. The declarations of numerous church bodies registered this chastened and penitent mood. It has been especially influenced by the example of churches in conquered and war-ravaged countries, such as the Netherlands, France and Norway, where the church's institutional life was largely destroyed, but its spiritual vigour more than maintained.

The central body of U.S. Protestantism, as expressed in the Federal council, wished the church to play a positive and constructive part in the crisis of civilization. The churches put important weight behind the United Nations both in the development of its basic plan and in the making of its subsequent policy, particularly through the influence of John Foster Dulles, influential member of the U.S. delegation and chairman of the Federal council's Commission for a Just and Durable Peace. During the year the Federal council issued important reports on atomic energy and upon relations with Russia. In recognition of his long service as an international Christian figure, Dr. John R. Mott was awarded the Nobel prize for the advancement of peace.

Examination of the discussions and resolutions in the meetings of major Protestant bodies in the United States revealed a concern in all for essentially the same group of ethical issues. During the year 1946 numerous churches took strong stands against racial injustice and anti-semitism. They condemned peacetime conscription, and asked amnesty for conscientious objectors. The Federal Council of Churches conducted an important series of studies on the church and the economic order, participated in by competent economists as well as Christian leaders.

In several countries postwar readjustments of the church situation went forward rapidly during the year. An interim

Council of German Evangelical Churches, led by Pastor Martin Niemöller, attempted to establish a basis of national unity for all churches of the Reformation type. The success of this effort is not yet clear. In Japan, the Episcopal and certain minor churches withdrew from the enforced union which had been imposed upon Christianity by the totalitarian government. Numerous readjustments were necessitated among churches within the Russian sphere of political influence. The general conference of the Russian Orthodox Church in the United States, holding its first session for a decade, in Cleveland, O., voted to recognize the Patriarch of Moscow as "spiritual head," provided the full administrative autonomy of the U.S. church was recognized, together with its right to elect its own national head and other officers.

Formal meetings of leaders of the World Council of Churches were impossible during the war years, but in 1946 arrangements were made for the first full assembly of the Council to meet in 1947 in the Netherlands. At this time the permanent constitution was to be adopted. (See also CHRISTIAN UNITY; CHURCH MEMBERSHIP; also under separate denominations.)

(H. P. D.)

Relocation, Japanese: see WAR RELOCATION AUTHORITY.

Reparations. Allied collection and distribution of reparations from the nations defeated in World War II made little progress in 1946.

The Berlin protocol, adopted on Aug. 2, 1945, by soviet Russia, the United Kingdom and the United States, provided that the U.S.S.R. would obtain its share of reparations from the zone of Germany it occupied, plus certain German external assets. In addition, the U.S.S.R. was to receive outright 10% of the industrial equipment removed from the western zones, occupied by the United States, Great Britain and France, and 15% of the industrial equipment removed from the western zones in exchange for an equivalent value in food, coal and other products to be supplied by soviet Russia. Poland's claims to reparations were to be met from soviet Russia's share. The claims of all other nations were to be satisfied by industrial installations removed from the three western zones.

Announcement of the percentage shares of the 18 nations who were to take their reparations from the western zones was made early in Jan. 1946. These percentages were calculated by the Inter-Allied Reparations agency, which was established at the Paris Conference on Reparations, Nov. 9 to Dec. 21, 1945. For the purpose of this division, German reparations were divided into two categories: A, to include all forms of German reparations except those included in Category B; and B, to include industrial and other capital equipment removed from Germany, plus merchant ships and inland water transport.

The percentages allotted were as follows:

	Category A	Category B
Albania05	.35
United States	28.00	11.80
Australia70	.95
Belgium	2.70	4.50
Canada	3.50	1.50
Denmark25	.35
Egypt05	.20
France	16.00	22.80
United Kingdom	28.00	27.80
Greece	2.70	4.35
India	2.00	2.90
Luxembourg15	.40
Norway	1.30	1.90
New Zealand40	.60
Netherlands	3.90	5.60
Czechoslovakia	3.00	4.30
Union of South Africa70	.10
Yugoslavia	6.60	9.60
	100.00	100.00

The percentages were to be applied to excess German industrial plants and equipment, the amount and character to be

determined by the Allied Control council, consisting of representatives of the United States, Great Britain, the U.S.S.R. and France, which on March 28, 1946, announced the level of industry which Germany was to be permitted. It was estimated that the council's level of industry plan would reduce German industry as a whole to about 50% or 55% of its 1938 level.

The level of industry was fixed on the basis that Germany would be administered as an economic unit, as provided in the Berlin protocol. Such unity was not attained. Until Sept. 12, 1946, when the British and U.S. occupation authorities announced plans for merging their respective zones, each of the four zones was administered as an isolated unit.

The isolation became virtually complete in May 1946 when Lt. Gen. Lucius D. Clay, deputy military governor in the U.S. zone, stopped shipments of industrial plants and equipment to the U.S.S.R. on the ground that the U.S.S.R. was violating the Berlin protocol by blocking economic unification of the four zones. His ban was eased late in October when he authorized resumption of shipments of general purpose equipment to the soviet union and other Allies.

An index to the situation in the western zones was given by the Inter-Allied Reparations agency on Oct. 16, 1946, when it announced that it had asked the governments of the United States, Great Britain, France and the soviet union to refer the question of German reparations to the forthcoming meeting of the Council of Foreign Ministers with a plea for prompt action. The agency said that only 72 plants from the western zones had been reported as available to it for reparations and, of that small number, the agency said it had been able to undertake the distribution of only 37 plants since only that many detailed inventories and evaluations had been received by the Allied Control authority.

How much soviet Russia had taken from its zone, or given to Poland, was known only to the soviet authorities, who made no report to the other Allies of what they took. Their takings in Austria and Hungary, however, aroused both the United States and Britain to protest that they were taking assets to which they were not entitled under the Berlin protocol.

Moscow rejected the protests, holding that the Russians were entitled to take all German external assets found in the soviet-occupied zone in Austria. Gen. Mark W. Clark, commander of the U.S. occupation forces in Austria, stated in Washington that the Russians were taking almost everything out of their zone in Austria on the ground that it was a German asset and therefore properly seizable as reparations. The U.S. and British position was that only property in Austria owned by Germans before the annexation of Austria by Germany should be considered suitable for reparations, and only those things should be moved that would not affect the economy of the nations according to the Berlin protocol. The U.S.S.R., the United States and Great Britain agreed at Potsdam there would be no reparations from Austria.

Of the reparations assessed against Germany's satellites in World War II, soviet Russia was awarded the major portion. At the Paris peace conference of 21 nations in October, draft treaties were adopted calling for the following payments:

The treaties provided that Italy must pay its reparations bill over a seven-year period, with the option of withholding payments from current production during the first two years. The

Recipients	Paying Countries					Total
	Finland	Italy	Hungary	Rumania	Bulgaria	
	(in millions of dollars)					
U.S.S.R.	300	100	200	300	...	900
Yugoslavia	100	60	...	62.5	222.5
Greece	100	62.5	162.5
Czechoslovakia	40	40
Ethiopia	25	25
Total	300	325	300	300	125	1,350

other treaties provided that reparations be paid over an eight-year period, out of both current production and capital equipment. The treaties were to go into force upon approval by the Big Four Council of Foreign Ministers, which convened in New York city, Nov. 4.

Slow as the reparations program moved in Europe, the program laid out for Japan dragged just as much.

On Dec. 18, 1945, after a survey of Japanese assets by a mission of U.S. industrial and engineering experts, Ambassador Edwin W. Pauley, the U.S. representative on reparations, who headed the mission, submitted an interim report urging immediate removal of a substantial portion of Japanese industrial installations in various categories. The purpose of his recommendations was to disarm Japan industrially and aid in rebuilding countries Japan had injured.

The Pauley interim report recommended removals from army and navy arsenals, and from the following industries: aircraft, light metals, machine tools, sulphuric acid, shipbuilding, ball and roller bearings, iron and steel, thermal power, and soda ash, chlorine and caustic soda.

The recommendations were turned over to the Far Eastern commission (F.E.C.), comprising representatives of the 11 nations which had fought against Japan. The commission adopted policies as to reparations based on the Pauley report, concluding its deliberations on the report on June 12.

The following month Gen. Douglas MacArthur, supreme commander of Allied forces in the Pacific, ordered the Japanese government to set aside as potential reparations 505 of Japan's largest and most modern plants in eight basic industrial branches. Previously the supreme command had ordered earmarked as potential reparations government-owned arsenals, aircraft factories and scientific laboratories.

The list included 273 privately owned munitions plants, 90 machine tool factories, 22 iron and steel mills, 20 electric stations, 32 plants producing bearings, 25 shipyards, including five of Japan's largest naval bases, 19 plants producing soda ash, chlorine or caustic soda, and 24 plants producing sulphuric acid. The program was based on the Far Eastern commission's reparations goals, and, in accordance with recommendations made by Ambassador Pauley in his interim report on Japanese reparations, most of the burden was placed on the Zaibatsu, the large family holdings.

Supreme headquarters emphasized in announcing the order that no plants had actually been earmarked for removal by any specific power. The reason for this was that no agency had been established to receive and act upon such claims, although as early as April the United States government had submitted to the F.E.C. a plan for fixing inter-Allied responsibility in determining Japanese reparations. Its suggestion for an Inter-Allied Reparations commission for Japan was referred to the commission's committee on reparations.

An attempt was made in Aug. 1946 to hold a conference for the purpose of setting up an agency which would be authorized to allocate Japanese reparations among claimant countries, but was blocked by the soviet representative on the F.E.C. Soviet Russia took the position that what it had taken in Manchuria should be regarded as war booty, and not be included in reparations discussions.

Early in Nov. 1946 the United States announced that later in the month and early in December informal discussions would be held by members of the F.E.C. for the purpose of drawing up a directive to General MacArthur authorizing him to begin distribution of reparations. It was tacitly understood that soviet Russia would be invited to attend these consultations, but would not be permitted to block action by refusal to participate.

Meanwhile, four and a half months after submitting his interim report, Pauley left again for the far east, May 4, 1946, with instructions from the president and Secretary of State James F. Byrnes to study the resources of Manchuria and Korea with particular attention to Japanese assets located therein. These resources were considered basic to the formation of any long-range plan for the peaceful economy of east Asia, and for several months there had been widespread reports that soviet occupation forces were engaged in removals of industrial equipment from those areas.

Pauley and members of his mission were allowed by soviet authorities to pass six days in northern Korea, the soviet-occupied zone above the 38th parallel. They also visited Manchuria, other parts of China and Formosa.

On his return to the United States in July—after conferring at Paris with Secretary of State Byrnes concerning his findings in the orient—Pauley reported that, during soviet occupancy, there had been systematic removals of essential machinery and equipment from Manchurian industry, which was to have been a base on which Japanese reparations installations were to have been superimposed. He found that no substantial industrial removals had been made in northern Korea, but that the economy of that country was strangled by the barrier maintained by the soviet authorities at the 38th parallel. Under such circumstances, transfer of industrial equipment from Japan to Korea could not produce immediate maximum benefit to the Koreans. His findings and recommendations were incorporated in three detailed reports to the president of the United States: a final and comprehensive report on Japanese reparations, which developed his earlier interim report; a report on Japanese assets in soviet-occupied Korea; and a report on Japanese assets in Manchuria.

The comprehensive report on Japanese reparations recommended complete removal of all plants devoted to the making of arms, ammunition and implements of war (other than those subject to destruction or scrapping by the military) and all plants making synthetic rubber, aluminum and magnesium.

It recommended substantial removals of facilities in these categories: electric power, iron and steel, iron ore and ferro-alloy minerals, copper, machine tools, chemicals, heavy electrical machinery, industrial explosives, communications and communications equipment, railroad equipment and rolling stock, shipbuilding and merchant shipping.

The report proposed immunity from reparations for the following industries: handicrafts (including pearl culture), silk, leather, fisheries, light electrical appliances, cement (under limitations) and building materials, food processing, lumber and sawmill equipment, ceramics, coal, crude petroleum, crude rubber processing, mining of gold and silver, refining of zinc, lead, tin, sulphur and pyrite.

It laid especial emphasis to the fact that Japan's economy must be self-sustaining. It left for later determination the decisions as to woolen textile machinery, synthetic fibre, cotton, paper and pulp.

(E. W. Py.)

Representatives, House of: see CONGRESS, UNITED STATES; ELECTIONS.

Republican Party. The Republican party of the United States regained full control of congress in the 1946 off-year elections for the first time after 1928 in a sweeping triumph that precipitated immediate predictions of a presidential victory in 1948.

The G.O.P. increased its senate membership from 39 to 51, giving them a clear majority of six. They raised their representation in the house from 192 to 246 for a gain of 54 seats. The Democrats retained only 188 places, while the American

"EXCUSE MY SOUTHERN ACCENT" commented Shoemaker of the *Chicago Daily News* about B. C. Reece, the new Republican national chairman who comes from Tennessee

Labor party held one. The Republicans also boosted to 25 their quota of governors, which placed them in power in all except seven commonwealths outside the south and the border states. In the congressional contests they outvoted the Democrats by 3,000,000.

The Republicans' comeback had several significant aspects. Its nationwide scope was reflected in the fact that the Republicans recaptured senate seats in such key and scattered states as Massachusetts, New York, Pennsylvania, Delaware, Ohio, Missouri, Wisconsin, Minnesota, Montana, Utah and Washington. They scored heavily in industrial as well as in agricultural regions.

Even more satisfactory to the Republicans was their showing in the larger cities, which had gone Democratic ever since Franklin D. Roosevelt appeared on the national, political stage. The G.O.P. won or ran on fairly equal terms in such centres as Boston, New York, Philadelphia, Pittsburgh, Chicago and St. Louis. It had been Roosevelt's overwhelming majorities in these crowded areas which had enabled him to carry the electorally important states in which they are situated. After 1936 he usually lost the out-city vote.

The city results were also interpreted to mean that numerous powerful political groups had shifted, at least temporarily, from the Democratic to the Republican party, and their allegiance can be decisive in a nationwide struggle. Among the elements believed to have swapped the donkey for the elephant as a means of partisan transportation were racial, Negro, labour and liberal blocs.

Leaders of both parties agreed that the G.O.P. won because of (1) a series of strikes in key industries that were settled only by wage increases which boosted the already high cost of living; (2) OPA price ceilings and regulations that were supposed to have kept production of needed goods at a low level; and (3) the administration's alleged political friendliness toward "Commies" in the U.S. and abroad.

The sensational victories achieved by several key figures immediately placed them in the category of 1948 presidential possibilities. Among the men most frequently mentioned for the

1948 honour were Gov. Thomas E. Dewey of New York and Gov. Earl Warren of California, both of whom were re-elected by large majorities. Others were Gov. Edward Martin of Pennsylvania and former Gov. John W. Bricker of Ohio, who were elected to the U.S. senate. The upper chamber of congress also housed two prospects—Sen. Arthur H. Vandenberg of Michigan and Sen. Robert A. Taft of Ohio.

Assembling at Washington, D.C., immediately after the election, the Republican policymakers promised to co-operate with President Truman, provided he did not submit "too radical" a legislative program to the 80th congress. When domestic and foreign spokesmen voiced concern lest Republican control of congress might bring a radical change in U.S. foreign policy, Senator Vandenberg, a delegate to the United Nations, assured that body that the broad Roosevelt-Truman program would not be disturbed. "Our people," he said, in effect, "did not vote for a Democratic or a Republican foreign policy. They voted for an American foreign policy."

In preparing to assume control of congress, the G.O.P. leaders sketched the blueprints of their general domestic program. While admitting that unforeseen developments might necessitate minor modifications, they enunciated their basic philosophy on such controversial questions as labour strife, swollen federal finances and economy.

With respect to labour, a particularly distressing problem at the time of their discussions because of the bituminous coal strike of Nov. 1946, they promised legislation that would be "constructive but not punitive." The vague language of the pledge reflected a desire to prevent unpopular and disastrous work stoppages without antagonizing the great labour vote.

Hardly had the votes been cast before Harold L. Knutson of Minnesota, slated for chairmanship of the house ways and means committee under Republican rule, demanded a 20% reduction in personal income taxes. Other G.O.P. spokesmen, especially important senators scheduled to handle taxation and financial questions, noted that balancing the budget and cutting the public debt should take precedence over a possible tax reduction.

The third Republican pledge was governmental economy through thinning-out of personnel, savings in the army-navy budget and abandonment of foreign and domestic projects which they held to be superfluous. Representative John Taber of New York, incoming chairman of the house ways and means committee, declared that the annual federal budget could—and should—be sliced to \$30,000,000,000 from the 1947 fiscal year figure of \$41,000,000,000 and administration estimates of \$37,000,000,000 for 1948.

The victorious Republicans had also planned to exalt and encourage the system of private enterprise by removing almost all governmental controls over commodities, wages and prices. But President Truman spared them the effort. Apparently bowing to the Nov. 5 mandate, he had abolished almost every federal ceiling and priority before the Republican-managed congress assembled on Jan. 3, 1947. Indeed, G.O.P. strategists complained that he had "stolen our thunder." Despite some members' complaint that a few veterans were "hogging" the leadership posts, senate Republicans of the 80th congress put through their prearranged slate, to wit: president pro tem, Senator Arthur H. Vandenberg of Michigan; majority leader, Senator Wallace H. White, Jr., of Maine; chairman of the steering and policy committee, Senator Robert A. Taft of Ohio; chairman of the conference committee, Senator Eugene D. Millikin of Colorado. Former minority leader Representative Joseph W. Martin, Jr., of Massachusetts was elected speaker of the house by unanimous vote. Representative Charles A. Halleck of Indiana was selected as majority leader. (See also UNITED STATES.)

Reuther, Walter Philip (1907–), U.S. labour leader, was born Sept. 1 in Wheeling, W.Va., the son of a trade unionist. He studied at Wayne university, Detroit, Mich., for three years, and then toured France, Germany, Italy, the soviet union, China and Japan to study labour conditions. On his return home Reuther worked in small tool and die shops and joined the United Automobile Workers. He first gained prominence for his organization of the successful sit-down strikes in the Detroit automobile and related industries (1936–37). He then became director of the U.A.W.'s General Motors department (1939) and was named one of the union's two vice-presidents (1942). Reuther launched a campaign after Japan's surrender to obtain higher wage levels. He demanded (Sept. 14, 1945) a 30% raise for the U.A.W. in General Motors plants, contending that the corporation could grant this raise, even reduce motor car prices substantially and still make larger profits. Upon the corporation's rejection of these demands, about 180,000 U.A.W. union members in General Motors plants throughout the United States went on strike. The strike lasted 113 days and was finally settled March 13, 1946, with Reuther accepting for the union an 18½ cents-per-hour pay increase and adjustments in overtime and vacation pay. After the strike, Reuther was elected president of the U.A.W. (March 27) defeating his predecessor, R. J. Thomas, by a narrow margin; Thomas, however, was elected vice president and his followers captured two-thirds of the seats on the union's executive board.

On Dec. 12, Reuther declared that the U.A.W. would seek an hourly wage increase of 23½ cents in its 1947 contract negotiations. He said the wage demands would not require any increase in prices and would restore to U.A.W. workers what had been taken from them in rising living costs in 1946.

Rhode Island. A north Atlantic state of the United States, in New England; one of the 13 original states; popularly known as "Little Rhody." Area, 1,214 sq.mi. (smallest of the United States), including 156 sq.mi. of water; pop. (1940) 713,346. The urban population was 653,383 (91.6%). On July 1, 1944, the bureau of the census estimated the civilian population of the state at 778,972. Capital, Providence (253,504). Other cities include Pawtucket (75,797); Woonsocket (49,303); Cranston (47,085); Newport (30,532); Warwick (28,757); Central Falls (25,248).

History.—At the regular 1946 session of the legislature, leading measures passed included the following: an act making appropriations for the support of the state for the fiscal year ending June 30, 1947, reaching total net state appropriations of \$23,221,805.68; acts authorizing the city of Providence to borrow \$3,000,000 to rebuild and modernize regional traffic arteries, \$1,000,000 to develop recreational facilities, \$2,500,000 to pay for homes for returning members of the armed forces, \$1,000,000 for the erection of a war memorial; act authorizing city of Providence to assess a charge for the use of its sewerage system to industrial and commercial plants; acts imposing additional taxes on the corporate excess of corporations, on gross earnings of electric corporations; an act imposing an ad-

ditional tax on pari-mutuel betting; an act changing the method of payment of members of the civil service commission from per diem pay to a fixed annual salary; an act providing continuing teaching service after three successive annual contracts; an act to create in the department of labour an industrial code commission which was to issue codes of safety and health rules for places of employment; an act to abolish wage differentials based on sex; an act providing for payment of bonuses of \$200 each to residents of the state who served in the armed forces of the United States and in the merchant marine during World War II; an act declaring the existence of an emergency and providing for stabilization of rents and for the regulation and restriction of evictions; creation of a commission to study government service and cost thereof at state and local levels; an act to empower and direct municipalities to enforce airport zoning regulations and to regulate the use of property in the vicinity of publicly-owned airports; an act creating a horse racing and athletics commission in the executive department; an act providing for rehabilitation and redevelopment of blighted areas in urban and suburban communities in the state; an act regulating motor vehicles carrying property for hire; and a resolution proposing an amendment to the state constitution for absentee voting.

The chief executive officers of the state elected in Nov. 1946 for 1947-48 were John O. Pastore, governor; John S. McLernan, lieutenant governor; Armand H. Cote, secretary of state; John H. Nolan, attorney general; Russell H. Handy, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1945-46 there were in the public elementary schools 56,685 pupils and 1,997 teachers; in junior high schools 18,043 pupils and 897 teachers; in senior high schools (three years) 14,824 pupils and 724 teachers; in senior high schools (four years and vocational) 4,794 pupils and 215 teachers. Pupils attending private schools were: elementary 24,258; junior high 4,946; senior high (three years) 1,034; senior high (four years) 5,280. Total number of teachers in private day schools was 1,354. The director of education in 1946 was James F. Rockett.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of persons receiving public assistance in all categories (excluding incapacitated fathers) in Nov. 1946 was 21,671 or about 3% of the state's 1940 population. The total amounts paid out during the year Dec. 1, 1945–Nov. 30, 1946, were as follows: general public assistance \$1,197,922; soldiers' welfare \$118,461; old-age assistance \$3,227,246; aid to dependent children \$1,436,969; aid to the blind \$47,453. In unemployment compensation, the net amount of benefit payments during 1946 was \$10,852,176.97 to 49,403 different individuals. The amount paid into the fund during 1946 including interest was \$14,842,525.42. There were 734 inmates in correctional institutions on Nov. 30, 1946, and 4,924 patients in charitable institutions and institutions for defectives, the number in the latter being 3,841.

Communications.—The total mileage of highways on Dec. 31, 1945, (excluding city streets) was 2,671.65, of which the state highway system comprised 820.84 mi. At the close of the year 1945 railroads were operating 186 mi. of road, electric railways 28.23 mi. of road, motor buses 189.68 mi. of road and trackless trolleys 61.47 mi. of road. At the close of the year 1946 electric railways operated 23.32 mi. of road, motor buses 194.57 mi. of road and trackless trolleys 63.35 mi. of road. Water-borne commerce of the state for 1945 was 3,563,673 tons, of which 304,256 tons were foreign commerce (imports 298,364 tons; exports 5,892 tons) and 3,259,417 tons were coast-wise (receipts 3,031,079 tons; shipments 228,338 tons). Air-

ways totalled 120 mi.; there were one airport and three landing fields. In Dec. 1945 there were 164,707 telephones in service and in Dec. 1946, 190,130 in service.

Banking and Finance.—There were 32 banking institutions in 1946. Resources of 23 banks under state supervision totalled \$838,431,695.27, and of 9 banks under federal supervision \$276,198,662.94. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 23 state banks) amounted to \$520,937,193.93 on June 30, 1946. In addition, 6 loan and investment companies had resources of \$3,355,363.40; 8 building and loan associations \$68,412,632.60; 26 credit unions \$10,691,104.65.

At the close of the fiscal year, June 30, 1946, total state receipts were \$25,172,417.03; expenditures and encumbrances \$22,963,151.49; surplus from operation \$2,209,265.54. The state gross debt was \$24,417,000.00, net debt \$20,517,195.88.

Agriculture.—The total estimated value of agricultural production was \$18,866,000 in 1946 and actual value was \$19,925,000 in 1945. Total acreage of principal crops harvested was 51,000 in 1946. Cash estimated income from crops in 1946 was \$4,991,000, and actual income was \$5,499,000 in 1945; from livestock and livestock products \$11,775,000 in 1946 and \$12,194,000 in 1945; from government payments \$900,000 in 1946 and \$932,000 in 1945; total cash income \$17,666,000 in 1946 and \$18,625,000 in 1945.

Table I.—Leading Agricultural Products of Rhode Island, 1946 and 1945

Crop	1946	1945
Corn, grain and silage and forage (grain equivalent) bu.	312,000	320,000
Hay (tame), tons	53,000	55,000
Alfalfa, tons	2,000	2,000
Potatoes, bu.	1,742,000	1,332,000
Oats, bu.	32,000	31,000
Apples (commercial), bu.	162,000	85,000
Peaches, bu.	15,000	9,000
Pears, bu.	6,000	3,000
Grapes, tons	200	100

Table II.—Livestock and Livestock Products of Rhode Island, 1946 and 1945

Item	1946	1945
Cows and heifers, 2 years and over	22,000	23,000
All cattle and calves	29,000	30,000
Hens, 3 months and over	578,000	546,000
Sheep and lambs	2,000	2,000
Hogs	8,000	8,000
Milk produced, lb.	122,000,000	133,000,000
Eggs produced, doz.	6,300,000	6,400,000
Chickens raised, no.	830,000	925,000
Turkeys raised, no.	31,000	35,000

Manufacturing.—The total estimated value of manufactures was \$516,390,541 for 1939 and \$517,196,193 for 1937. (No census report after that for 1939.) Employment in 1939 totalled 106,269 wage earners and 12,005 salaried personnel. The number of establishments was 1,460. Wage earners received \$105,406,950 and salaried personnel \$27,940,576. (Figures for 1946 were not obtainable from the bureau of the census.)

Report of the state department of labour for Nov. 1946 showed 130,000 wage earners and weekly pay roll of \$5,240,112 for all manufacturing industries in Rhode Island.

Mineral Production.—The value of mineral production in Rhode Island is small, exceeding only that of Delaware and the District of Columbia. Value in 1944 was \$612,000, in 1943 \$808,000 and in 1942 \$836,040. The principal products are stone (\$213,351 in 1944, \$410,478 in 1943 and \$351,664 in 1942) and sand and gravel (\$287,112 in 1944, \$327,750 in 1943 and \$361,881 in 1942). Production of stone reached 19,790 tons in 1944, 171,230 tons in 1943 and 191,420 tons in 1942; sand and gravel 352,905 tons in 1944, 356,043 tons in 1943 and 572,437 tons in 1942. (Figures for 1945 and 1946 were not available.)

(M. C. ML.)

Rhodesia, Northern. A colony of the British crown in Africa. Area: 290,323 sq.mi. Pop. (est. 1942) 1,381,800 of whom 15,100 were European and 1,366,600 African. Chief towns: Lusaka (cap., Euro-

peans 1,350); Luanshya (Europeans 1,800; Africans 22,000); Ndola (1,000; 8,000); Mufulira (1,100, 12,500). Languages, English, Chiwemba, Chinyanja and tribal dialects. Religion: Christian, Hebrew and pagan. Governor: Sir Eubule John Wadlington.

History.—In the early part of the year there was a mass adult-literacy campaign, which was stated to have shown that the average time taken for an African to acquire literacy is three weeks. The British South Africa company, the former administrators of the territory, won an appeal to the privy council of the United Kingdom against a judgment of the Northern Rhodesia court of appeal in respect of income tax for the years 1938 to 1940. Parliament decided to allocate £3,000,000 from reserves to support grants from the Colonial Development and Welfare fund. Artisans employed by the three large mines on the copper belt went on strike for more pay on July 15. All daily-paid workers were discharged and the mines put on a care-and-maintenance basis. The artisans returned to work on Aug. 21, pending arbitration. A settlement was announced in October of an extra 5s. a shift increase, bringing the rates paid to surface and underground artisans respectively to 35s. and 38s. 6d. a shift.

Education.—Native government schools 44; mission schools 1,036; non-aided schools 1,160. Total number of pupils 165,000.

Finance.—Revenue £2,931,304; expenditure £2,866,816 (1945).

Trade.—Imports £6,699,588; exports £12,147,232 (1944). (See also RHODESIA, SOUTHERN.) (G. A. V.)

Rhodesia, Southern. A self-governing colony in Africa. of the British commonwealth, with imperial government supervision over native rights. Area: 150,333 sq.mi.; pop. (est. 1945) 1,576,310 (European, 81,470, Asiatic and coloured 6,830, and the rest African). Chief towns: Salisbury (61,760); Bulawayo (39,817); Umtali (7,771); Gwelo (7,726). Languages: English, Afrikaans, native tribal languages. Governor: Admiral Sir William Campbell Tait (died July 17, 1946); Major General Sir John Noble Kennedy (appointed Sept. 15, 1946); prime minister: Sir Godfrey Martin Huggins.

History.—A £3,000,000 victory loan floated early in 1946 was fully subscribed within four months, a fact that indicated the enormous surplus purchasing power within the colony; the cost of living index rose two points in the first four months from 128.3 to 130.7. The first government-financed secondary school for Africans was opened. Parliament voted £1,700,000 for discharge grants to ex-servicemen and women. The Liberal party, in opposition, were urging that the government should press for a free corridor westwards to the sea. The Railways Arbitration tribunal announced a 9%–12% increase in railway workers' wages. In the April general elections, the first after the end of World War II, the United party won 13 seats, the Liberals 12, the Rhodesian Labour party 3, and the Southern Rhodesian Labour party 2. Sir Harold Howitt's report on the Rhodesian railways was published and in it nationalization was not recommended. An inquiry was opened as a preliminary to improving the conditions of service of the British South Africa police. K. M. Goodenough was appointed high commissioner in London in place of S. M. Lanigan O'Keefe. The Air Training agreement with Great Britain was signed in September, and negotiations were opened with South Africa to find a basis for a trade agreement.

Education.—European primary schools 49; secondary 10; primary and secondary 5; total of enrolled pupils 11,809; private schools 13 (pupils 653); schools for coloured children 16 (2,001); for native children 1,691 (140,329). Expenditure £453,000. Grants in aid to native education £101,575.

Finance.—Revenue, £10,473,000; expenditure 1945–46, £11,

929,000. The revenue from customs and excise (1944) was £1,294,741; from income tax £5,952,178; from Native tax, £453,341. Mining revenue was £536,942 and the public debt stood at £22,747,582. Gold output was 592,729 oz. (£4,978,922).

Trade and Communications.—Imports, £11,966,632; exports, £14,283,142 (1944). Roads (motor services) 1,637 mi.; rail 1,361 mi. (See also RHODESIA, NORTHERN.) (G. A. V.)

Ribbentrop, Joachim von (1893–1946), German statesman, was born April 30, at Wesel on the Rhine. He served with the rank of lieutenant colonel and later in the war ministry during World War I, and after the war he became a champagne salesman. Ribbentrop joined the nazi party in 1932 and within a year became adviser to Adolf Hitler on foreign policy. In 1936 he was appointed reich ambassador to England. He was recalled to Berlin in early 1938, to assume the portfolio of foreign minister at a time when Hitler was preparing to embark on his plan for conquest. The new foreign minister was shortly dispatched to London to reassure the British government that Hitler's venture into Austria in March 1938 was a preventive measure to curb civil war. He was also instrumental in destroying Czechoslovak independence. Ribbentrop was one of the principal architects of the Soviet-German pact of August 1939 and the following year (1940), he brought Japan into the Rome-Berlin axis.

He sat in on the preparation for the invasions of Yugoslavia, Greece and the soviet union and ordered systematic deportation of Jews from axis-controlled countries. He was ousted from the foreign ministry, May 2, 1945, after Hitler was supposed to have died, and was captured in a Hamburg rooming house by British troops a month later. One of the principal nazi defendants at the Nuernberg war crimes trial, Ribbentrop maintained that Hitler had made all the important decisions, that he never doubted the fuehrer's motives and that he himself had "always stood for a policy of peace."

He was found guilty by the International Military tribunal Oct. 1, 1946, of crimes against the peace, war crimes and crimes against humanity and of conspiracy to commit the above crimes. The sentence, which decreed hanging, was carried out Oct. 16.

Rice. The record 1946 rice crop of the United States was estimated by the U.S. department of agriculture at 71,520,000 bu., which was 5% above the record crop of 68,150,000 bu. produced in 1945 compared with the average of 55,257,000 bu. 1935–44. The acreage was 1,567,000 ac. in 1946 compared with 1,494,000 ac. in 1945 and an average of 1,169,000 ac. 1935–44. The yield was lower in the south but enough higher in California to make a national average of 45.6 bu. per ac. compared with 45.6 in 1945 and an average of 47.6 bu. 1935–44. Some of the Arkansas crop was lost due to frost damage in Oct. Texas lost some of the crop due to heavy rains. California had an increased crop over a year earlier which was harvested early in fine condition. The California yield was 68 bu. per ac. compared with 60.5 bu. in 1945.

Rice consumption in 1946 from the 1945 production was estimated at 4.4 lb. per capita compared with 4.7 lb. in 1945 and a prewar average of 5.6 lb. 1935–39. This reduction in 1945 oc-

curred despite the largest domestic crop on record because of heavy exports for relief, to U.S. possessions, military needs and brewers' use.

Exports in 1945–46 were 359,000 tons out of the crop of 1,026,000 tons.

The price of rice to producers was steady through 1945 and to March 1946 at \$1.80 to \$1.90 per bu. compared with 75 cents in 1935–39. After an advance to \$1.86 in July, the big crop prospects depressed the market until Oct. when the price advanced to \$2.14 per bu. where it remained to the end of the year. The export demand was so strong that only slightly more rice was made available for domestic use. Rice continued under price control to the end of the year. Retail prices were advanced somewhat in the late fall.

The world's rice crop of 1945–46 was estimated at 6,300,000,000 bu. compared with 6,900,000,000 bu. the preceding year and a prewar average of 7,400,000,000 bu. The decline was due to the smaller crops harvested in Asia. The crop in China was about 18% below the prewar level due to floods and the generally disturbed conditions. The Japanese crop was the smallest in 40 years. India harvested a crop about 3% above the prewar average although the crop had been expanded 10% during World War II. The Philippine crop was about 70% of the former output.

In Burma, Siam and Indo-China the harvest was barely sufficient for domestic needs and left little for export. The best crops were reported in Egypt and Madagascar providing considerable for export. In South America the crop was increased in Brazil, Chile and Ecuador. The total for export, however, amounted to only about 4% of international trade. (J. C. Ms.)

Rintelen, Anton von (1876–1946), Austrian jurist and politician, was born on Nov. 15 in Graz. He became professor of civil procedure in the university there in 1911. Dr. Rintelen was named to the provisional local assembly in Styria in 1918, at which time he joined the Christian Socialist party. He twice held the governorship of Styria, 1919–26 and 1928–33, and was appointed minister of public instruction in the cabinet of Chancellor Engelbert Dollfuss. He resigned the latter position in early 1933 and several months later was designated minister to Rome. His province of Styria, where he was known as the "uncrowned king," became a centre of nazi activities in Austria and his backing by the pro-fascist Heimwehr and Austrian nazis gave strength to the rumour that he was being favoured by Hitler and Mussolini to succeed Dr. Dollfuss as head of a compromise government. When nazi rebels staged their coup d'état on July 25, 1934, seizing the chancellery and assassinating Dollfuss, Dr. Rintelen had been scheduled to appear and take over the reins of government. He failed to present himself, however, and when the rebels had surrendered, he was arrested for complicity. His exact role in the abortive *putsch* remained a mystery. Though he was sentenced to a life term in prison, he received amnesty in 1936. After the start of World War II, he openly joined the nazis and served as reich general commissioner for Lithuania from 1942 to 1944, when the country was retaken by the Red army. His name headed the soviet list of war criminals in Lithuania. Dr. Rintelen died in a village near Graz on Jan. 28, according to a Salzburg radio report.

Rivers and Harbours. The corps of engineers, U.S. army, created by an act of congress approved March 16, 1802, was first called upon to func-

**U.S. Rice Production by States, 1946 and 1945
and 10-Year Average**
(In thousands of bushels)

State	1946	1945	Average 1935–44
Louisiana	22,676	23,028	20,670
Texas	17,716	18,000	13,926
California	16,728	13,915	10,331
Arkansas	14,400	13,207	10,331

tion in the conservation and development of streams for navigation under authority of an act of congress approved April 30, 1824. From that time the corps of engineers has continuously carried out, in accordance with the authorizations of congress, various works on the navigable waters of the country and their tributaries. In addition to improving rivers and harbours for navigation, it has been called upon to plan and prosecute the development of streams in the interest of flood control, hydroelectric power, pollution control, conservation and related purposes. The corps' civil works in the field are effected through some 40 districts grouped into 12 divisions conforming roughly to watersheds. The territory in which these works are performed embraces Alaska, Hawaii, Puerto Rico and the Virgin Islands as well as the continental United States.

During the first part of the fiscal year ended June 30, 1946, the river and harbour program continued in conformity with the national policy limiting wartime construction to conserve manpower, equipment and materials. With the cessation of hostilities, however, work was commenced on a number of projects which had been deferred during the war. Improvement operations were carried out on 32 regular river and harbour projects of which one, Morro bay, Calif., was completed. Maintenance operations were performed on 224 projects including the numerous coastal and inland harbours, connecting channels on the Great Lakes, and the extensive Intracoastal Waterway and Mississippi river network, together with the operation and care of the canalized Ohio river system, Illinois waterway, and upper Mississippi river. The Federal expenditures for new work and maintenance operations on navigation projects and allied operations during the fiscal year ended June 30, 1946, were \$79,542,449.85.

The principal items of new work performed during the fiscal

SPILLWAY, mile long, concrete lined, which was put in operation in 1946 at Fort Peck dam in northeastern Montana for control of the Missouri river. The spillway is a safety feature for the dam, and is controlled by the 16 vertical lift gates in the foreground

year 1946, other than on canals and inland waterways, included enlargement of channel facilities of New York and New Jersey channels in Arthur Kill and from vicinity of Bayside-Gedney channel to Perth Amboy to provide for the larger tankers; and completion of dredging and rock removal in the main channel in Newark bay from Kill Van Kull to about 1,200 feet south of the Central Railroad of New Jersey bridge including the cut-offs at the entrance. The improvement of Port Aransas-Corpus Christi waterway was continued by dredging the Corpus Christi turning basin and the Industrial Canal and Avery Point turning basin, and dredging was in progress at the end of the year in the channel leading to Corpus Christi turning basin. Dredging of a seaplane base in San Diego harbour to the extent desired by the navy department and of a settling basin at the mouth of the Los Angeles river diversion channel at Los Angeles and Long Beach harbours, Calif., was completed. At Morro bay, Calif., the extension to the Morro Rock breakwater was completed and dredging was performed in the main channel and the channel into the lower bay.

At Fort Peck dam, Mont., on the Missouri river alterations to the penstock, installation of a wyebranch structure and shaft No. 1 transition section and installation of a 15,000-kilowatt generating unit were continued in addition to other miscellaneous features. Operation of the previously installed 35,000-kw. generating unit was continued during the major portion of the year, the total power production being 102,506,000 kw.hr. The reservoir was also operated in conjunction with maintenance dredging to maintain a channel suitable for navigation on the lower reach of the Missouri river. At the Bonneville dam, Oregon and Washington, one spare 60,000-kva transformer was installed and other equipment procured; 10 power generation units were operated, producing 3,939,841,000 kw.hr. during the calendar year 1946. (R. A. WR.)

Great Britain, the Commonwealth and Europe.—In Britain, bomb-damaged ports such as London and the Mersey were being rapidly restored in 1946. The port of Faslane on the Firth of Clyde, where some 3,000 ft. run of deep-water wharfage for wartime use was made in a sheltered arm of the sea hitherto unused, was being temporarily administered and worked for the ministry of transport by the Clyde navigation trustees. The reconstruction and widening of a long but narrow dry dock at Barry dock in the Bristol channel was about to be begun by the Great Western Railway company. The shortage of supplies of labour and materials due to the allocation of all available supplies to the needs of housing, delayed port development and new construction in England and Scotland.

The two giant dry docks built during World War II at Capetown and Sydney had been brought into use in 1945. Each had a clear entrance width of about 148 ft. with a depth of water over the sill of 40 ft. or more at mean low water of spring tides. The Captain Cook dry dock at Sydney had an available length of 1,140 ft. and the Sturrock dock at Capetown of 1,212 ft. These dimensions were exceeded by those of three dry docks which were built, or building, in Germany during the war at Wilhelmshaven and Hamburg; these, as well as the twin entrance locks to the new naval harbour at Wilhelmshaven, named by the nazis the "Raeder" locks, had entrances 195 ft. wide in the clear. A new dry dock 723 ft. long with an entrance 102 ft. wide was completed and brought into use at East London (South Africa) where also new quayage 1,333 ft. long with 30 ft. to 35 ft. depth at low water was completed during the year. The repair of war damage in the ports of Singapore and Hong Kong, as well as in other ports of the far east which suffered heavily in the Japanese war, made substantial progress.

In the Netherlands the sea-lock at the North sea entrance of the ship canal between IJmuiden and Amsterdam, damaged by

both allied and enemy action, was restored, and navigation to Amsterdam was opened during the summer. The harbour and port works at Rotterdam were also under repair.

In France, where damage on a vast scale was suffered by works at Le Havre, Dunkirk, Calais, Boulogne, Bordeaux, Cherbourg, Nantes, St. Nazaire and many other ports, much was done during the year to restore quays and dock equipment and to clear obstructions from the navigable channels. A new gate caisson for the 135-ft. wide entrance to the large dry dock at Le Havre was being built in England. The cost of reconstruction of war-damaged works in the French ports was estimated at 35,000,000,000 francs and the work would take ten years to complete.

The port of Ostende was under repair and was opened to traffic during the year.

The rebuilding of Gdynia, the new Baltic port made by the Poles after World War I which had suffered severe war damage, was begun in 1946 by the Danish firm of contractors responsible for much of the original port construction. (See also *AQUEDUCTS; CANALS AND INLAND WATERWAYS; DAMS; FLOODS AND FLOOD CONTROL.*) (N. G. G.)

Roads and Highways. In 1946 the roadbuilders of the nations that had been at war turned from military construction to face serious problems in providing urgently needed highways. The highways of Europe, Asia and much of North America were worn by from four to six years of war traffic. Destruction by demolition forces had been great in all combat areas. Rehabilitation of highways to their prewar condition constituted an enormous job, particularly in Europe, China, Japan and the Philippines.

At the same time there was a world-wide demand for modernization and extension of highway systems. The war had interrupted extensive highway programs in almost every country. During 1946 prewar plans were revived and enlarged. People of all nations desired peace and prosperity, and an adequate system of highway transportation was believed necessary for improvement of economic and social conditions.

United States.—At the beginning of 1946 funds and plans were ready for the largest highway program ever undertaken. First attention was to be given correction of serious deficiencies in main routes that had developed during the war years. The federal government had authorized \$500,000,000 for each of the first three postwar fiscal years to aid the states in improving urban and rural sections of the federal-aid system and a system of secondary or farm-to-market roads. The work actually begun fell far short of what was expected. Unsettled economic conditions, high prices, shortages of men, equipment and materials, particularly steel and lumber, seriously checked both the letting of contracts and work on jobs for which contracts were awarded. The number of men employed on construction of main highways at the middle of the season was about half the number employed at that time in 1941. The number of men employed on maintenance throughout the year was close to 90% of the 1941 figure.

Construction contracts awarded in the federal-state co-operative highway program from January through October amounted to \$450,154,000 for 16,125 mi. of road. The federal government was to pay \$243,224,000 of this cost. Total contracts awarded by state highway departments, including the above work, amounted to \$650,419,000 for 39,864 mi. of road. Much of this work was started late in the season or was delayed by shortages of various kinds and was not completed during the year.

Practically every large city in the country had planned post-war construction of expressways to relieve serious traffic congestion. Abnormal conditions prevented anything but a small

beginning of this work.

At the end of the year agreement on routes to comprise the national system of interstate highways had been reached between the federal government and 44 states. It was expected that establishment of the system as a whole would follow in a short time.

The Alaska Highway.—This highway was maintained in good condition and kept open to authorized traffic at all seasons of the year. Early in April the section of the highway in Canada which had been maintained by the United States army was turned over to the Canadian authorities. The highway was not opened to tourist traffic because of lack of eating and sleeping accommodations and repair services. Late in the year the highway was used for transportation of food and other supplies to interior Alaska. There was urgent need of food because of stoppage of water shipping during the summer caused by strikes.

Pan-American Highway.—Only moderate progress was made during the year. On the section from the United States to Panamá, known as the Inter-American highway, construction was retarded by the difficulty of obtaining new equipment and repair parts. Most of the machines available were near the end of their useful life. Work was done in Mexico and in four Central American countries but at the end of the year the tourist from the United States could travel only as far as southern Mexico.

There was little major construction on the South American section of the highway after the beginning of World War II. However, Ecuador began construction of a 100-mi. section from Quito to the Peruvian border, that would close one of the most serious gaps, and all other countries through which the route passes were actively preparing for major improvements in the immediate future.

All of the countries of South America were planning the extension of highways into undeveloped regions but were handicapped by inability to purchase road building machinery. Brazil, Chile, Peru, Argentina and Colombia were all prepared to start major highway improvements when circumstances permitted.

Canada.—Construction on a scale much larger than before the war was planned, including improvement of main highways in the more densely populated areas and extension of new routes through wilderness areas. Work to cost \$153,000,000 was scheduled but difficulties similar to those encountered in the United States greatly reduced the work done.

United Kingdom.—Still seriously occupied with rehabilitation from the destruction of the war and particularly with housing problems, the United Kingdom was unable to launch long discussed and much needed highway improvements. Work was done on the reconstruction and rehabilitation of roadways badly damaged by heavy war use. It was estimated that this work would take about five years after which construction of a network of national routes tying together England, Scotland and Wales would begin.

Near the end of 1946 the labour government took initial steps toward nationalization of intercity truck and bus lines and of railroads. It was planned to remove restrictions that, prior to the war, limited highway transport very largely to local movements. Relaxation of these restrictions during the war demonstrated the advantages of intercity movements.

Europe.—In France more than 4,000 of the 6,500 highway bridges destroyed or damaged were replaced and highways in general were sufficiently repaired to permit prewar speeds for automobiles. Much of the bridge repair was of a temporary nature and must be replaced later by permanent construction. Construction of the express highway from Paris toward Brittany and Normandy, begun before the war, was resumed.

A 570-ft. concrete arch bridge over the Idefjord river near Oslo, connecting Norway and Sweden, was formally opened in June. This notable structure was completed during World War II but the formal opening was delayed.

The most important highway problem in Norway was reconstruction of war-damaged roads and bridges particularly in the northern part of the country. In 1946 about \$9,000,000 was spent for highways—more than half of it for repair of war damage. Construction was started on 125 mi. of new road. This is much below the prewar rate of 300 to 425 mi. per year.

In Germany lack of essential road materials and difficulty in procuring labour made it difficult to maintain the more important highways. Makeshift expedients were used to halt the rapid deterioration of roads. Important work was done in restoring travel across wrecked bridges, particularly those across the Rhine.

The Netherlands was outstanding in restoring its transportation system from the great damage it suffered during the war. Among the many important jobs done was the improvised restoration of the highway bridge across Hollandsche Diep south of Rotterdam giving an important connection with commercial centres of Belgium and France.

Switzerland completed 30 mi. of extremely difficult construction over the Alps near Lucerne. Work had been under way for eight years.

General improvement of road conditions was indicated by establishment in April of bus service from Sweden, through Denmark and Germany, to Switzerland.

An extensive program for the construction of new roads and reconstruction of old ones was launched in soviet Russia. The government of the Ukraine appropriated 500,000,000 roubles (about \$41,000,000) to begin a long-range program.

Africa.—Seeking to protect its supply line to eastern possessions, Great Britain announced plans for a 3,000-mi. highway across central Africa. The route was to extend from Lagos, an Atlantic port in Nigeria, to Mombasa on the Indian ocean. A portion of this route was improvised during the war to get emergency supplies to armies in Egypt. The Nile river was used for the last stage of the movement. The new route was to be an alternate to the Mediterranean-Suez canal-Red sea water route which is affected by changed political conditions.

India.—During World War II the government of India actively planned betterment of economic conditions for its dense population. Improvement of means of highway transport was considered to be one of the chief needs. A network of main highways, built to modern standards, would benefit the whole country and would develop many sections not adequately served by any form of transport. There was also need for better roads from cities to the surrounding areas. In 1946 substantial progress was made in planning work to be done and means of carrying on the work. A large group of Indian engineers visited England and the United States to study methods of highway construction.

Philippines.—Reconstruction of highways in the Philippines destroyed during the war, and improvements needed for defense and economic development would cost about \$100,000,000, according to a report of U.S. engineers sent to the islands to study conditions. Steps toward launching this rehabilitation program were taken during the year. The United States was aiding the Philippine government in the work and authorized \$9,960,000 for the fiscal year ending June 30, 1947. U.S. highway engineers were sent to the Philippines to aid in a program that would require about four years for completion.

China.—China was preparing to resume the large program of highway construction that was interrupted by Japanese invasion. Chinese engineers were studying construction methods

in foreign countries in preparation for this work.

Japan.—U.S. occupation forces directed a large amount of work in reconditioning the badly worn highways of the country. (See also MOTOR TRANSPORTATION.) (T. H. MacD.)

Roman Catholic Church. The pope, Pius XII, is recognized as supreme ruler and pastor of the Roman Catholic Church. It is he who creates cardinals and appoints archbishops, bishops, vicars and prefects apostolic who exercise ecclesiastical jurisdiction throughout the world.

At the consistory held in February, Pius XII invested 28 of the new cardinals with their robes and conferred upon them the red hat. The other 4 of the 32 named on Dec. 23, 1945, were unable to attend for reasons of health and were invested later at a private ceremony. On March 9 John Cardinal Glennon, archbishop of St. Louis, Mo., died in Eire while returning to the United States. His body was brought to St. Louis and interred in a crypt beneath the cathedral. On March 22 Clement August Cardinal von Galen, bishop of Muenster, died in his episcopal city and was buried in the damaged family tomb. Third of the new cardinals to die was Augustin Parrado y Garcia, archbishop of Granada, Spain, who passed away in October. The college of cardinals was further reduced by the deaths of Camillo Cardinal Caccia-Dominioni, in November, and Jean-Marie Rodrigue Cardinal Villeneuve, archbishop of Montreal, Canada, on Jan. 17, 1947, while on a trip to California. Cardinal Caccia-Dominioni was the one who crowned Pius XII in 1939. Prominent for his relief work during World War II and a member of six of the sacred congregations, Pietro Cardinal Boetto, archbishop of Genoa, Italy, from 1938, died on Jan. 31, 1946, at the age of 75.

In May Dennis Cardinal Dougherty, archbishop of Philadelphia, Pa., celebrated his silver jubilee as a member of the sacred college. In November Samuel Cardinal Stritch, archbishop of Chicago, Ill., celebrated his silver jubilee as a bishop. During 1946 Archbishop John D'Alton of Meath was named and installed as primate of all Ireland. He succeeded Joseph Cardinal MacRory as archbishop of Armagh.

During 1946 China was raised from the status of a mission country. In May it was announced that the Holy See had divided the country into 20 metropolitan provinces, with 79 suffragan sees. Thomas Cardinal Tien, who received the red hat in February, is archbishop of Peiping.

In January Pius XII issued an encyclical commemorating the 350th anniversary of the Union of Brest, which reunited the Ukrainian Church with Rome. On March 8 a soviet-dominated synod, in which the Ukrainian hierarchy did not participate, declared the union abrogated. Eugene Cardinal Tisserant, secretary of the Congregation for the Oriental Church, in reply to the Moscow radio announcement of the schism, called attention to the complete lack of religious freedom. The Ukrainian Catholic bishops of the United States and Canada repudiated the "schism." In December the anniversary of the Brest union was solemnly celebrated in Paris, the pope being represented by Bishop Ivan Buchko, newly consecrated ordinary for the Ukrainian refugees.

Church-state relations experienced a crisis in September when Archbishop Aloysius Stepinac of Zagreb was arrested by the Yugoslav government and charged with being an "enemy of the people." He was accused of having approved forced conversion of Serbs and of other crimes. Although the Vatican denied the

CARDINALS walking in procession in the great nave of St. Peter's church, Vatican city, at the consistory on Feb. 21, 1946. Thirty-two new Roman Catholic cardinals were proclaimed by Pope Pius XII

charge and public sentiment was with the archbishop, he was condemned in October to 16 years of hard labour. Various foreign governments made representations to Yugoslavia, but without apparent success. Subsequently it was reported that the archbishop was taken from prison and allowed to set up his establishment in a hotel.

On July 7 Mother Francis Xavier Cabrini, first U.S. citizen to be declared a saint, was solemnly canonized, with 16 cardinals and 70 bishops in attendance. A pilgrimage headed by Archbishop Amelto G. Cicognani, apostolic delegate to the United States, went to the ceremony. In November the pope, in a

solemn ceremony, beatified 29 martyrs of the Boxer rebellion, most of them Franciscans.

Religious orders continued to elect superior generals to replace those who died during the war. On Sept. 15 Very Reverend John Baptist Janssens, Jesuit provincial for northern Belgium, was elected general of the Society of Jesus, to succeed Father Ledochowski who died in 1942. Representatives of 33 countries attended the congregation. On Sept. 21 the Dominicans chose their 80th master general at the general chapter of the Friars Preacher in Rome. The former general, Father Martin S. Gillet, was made an archbishop. The new general was Very Reverend Manuel Suarez, a Spaniard and rector of the Angelicum pontifical university. The Very Rev. Valentine Schaaf, first U.S.-born minister general of the Franciscans, died on Dec. 1. On April 30 the pope named the Rev. Clemente Neubouer, of Milwaukee, Wis., as minister general of the Capuchin Friars. The Society of Mary elected Very Rev. Sylvester P. Juergens, provincial of the St. Louis province, their new superior general.

At the beginning of 1946 the number of ecclesiastical jurisdictions throughout the world was 1,865. There were: residential patriarchates 10; metropolitan sees 333; archdioceses other than metropolitan sees 36; dioceses 964; abbeys and prelatures *nullius* 54; vicariates apostolic 322; prefectures apostolic 133; missions *sui juris* 13. There were in addition 4 titular patriarchates and 750 titular archbishops and bishops.

The number of Catholics in the world in union with Rome was estimated in 1946 at 400,000,000. One set of statistics gave the Catholic population of various continents as: Europe 203,944,000; Asia 9,213,413; Africa 6,866,000; North America 47,056,724; South America 60,836,000; Oceania 1,858,000. These figures total less than 400,000,000, but they were known not to be accurate, failing to take into account population growth of the last few years.

In 1946 the number of Catholics in the United States was estimated at 24,402,124, out of a total population of 133,053,845. There were 5 cardinals, 18 archbishops, 135 bishops, 28 abbots, 38,980 priests. Archbishoprics numbered 22; bishoprics and other jurisdictions 100. In Canada and Newfoundland there were 13 archdioceses; 32 dioceses; 9 vicariates apostolic and other jurisdictions. Of a total population of 11,795,000, Catholics were estimated as numbering 5,000,000. In England and Wales there were 4 archdioceses, 14 dioceses and a Catholic population of somewhat over 2,400,000. In Scotland, with a Catholic population of 615,000, there were 2 archdioceses and 4 dioceses. The Catholic population of Eire was given as 2,773,920, out of a total of 2,951,000. In Northern Ireland the Catholics numbered 455,352, the total population being 1,303,000. The ecclesiastical jurisdictions of Ireland remained the same: 4 archbishoprics and 25 bishoprics.

Missions.—In 1946 full statistics on missionary activities were unavailable, largely because of the uncertain state of affairs following World War II. There were approximately 84,000 missionaries dependent upon the Congregation for the Propagation of the Faith, of whom 22,000 were priests, 9,000 lay brothers and 53,000 sisters. The total number of Catholic U.S. personnel in overseas missions was 3,093. As an example of the problem facing the missions, in 1940 there were 740 missionaries in China but in 1946 only 562; in the Philippines in 1940 there were 231 but in 1946 only 217. War had either resulted in the death or impairment of the health of many missionaries. The future of the missions looked bright in the orient if the problem of personnel could be surmounted. With the Japanese emperor's repudiation of divinity and declaration of freedom of religion, the outlook for Christianity in Japan was favourable. In July the Japanese hierarchy, at its request, was visited by Bishops Michael J. Ready of Columbus, O., and John F. O'Hara,

of Buffalo, N.Y. Reports were satisfactory. In Indo-China, however, the insurrection resulted in anti-European tendencies, with definite loss of prestige for missionaries.

United States.—In June Bishop Aloysius J. Muench of Fargo, N.D., was named official representative to serve as liaison between the church and the U.S. military government in the U.S. zone of Germany. Myron C. Taylor continued as President Truman's personal representative at the Vatican, although some objection to this informal relationship was raised by various Protestants.

In Jan. 1946, the pope established the new diocese of Madison, Wis., naming Bishop William P. O'Connor of Superior, Wis., its first ordinary. Msgr. Albert G. Meyer was consecrated bishop of Superior in his place. To take the place left vacant by Cardinal Glennon, Archbishop Joseph E. Ritter was transferred from Indianapolis, Ind., to St. Louis, Mo. Bishop Paul C. Schulte was named to the Indianapolis see. Other bishops consecrated during 1946 were: Bishop Charles P. Greco of Alexandria, La.; Bishop Thomas L. Noa, coadjutor of Sioux City, Ia.; Bishop John R. Hagan, auxiliary of Cleveland, O.; Bishop Leo P. Dworschak, coadjutor of Rapid City, S.D.; Bishop Daniel Ivancho, coadjutor with right of succession to the Pittsburgh Greek diocese; Bishop Edward A. Fitzgerald, auxiliary of Dubuque, Ia.; Bishop D. J. Fenney, auxiliary of Portland, Me.; Bishop Timothy Manning, auxiliary of Los Angeles, Calif. Bishop Albert L. Fletcher, auxiliary of Little Rock, Ark., was named ordinary. Bishop Aloysius J. Willinger was transferred from Ponce, Puerto Rico, to Monterey-Fresno as coadjutor with right of succession. Bishop Martin O'Connor, auxiliary of Scranton, Pa., was named rector of the North American college, Rome. Bishop George J. Donnelly, auxiliary of St. Louis, was named ordinary of Leavenworth, Kan. Bishop Francis A. McIntyre, auxiliary of New York, was elevated to coadjutor archbishop of Francis Cardinal Spellman.

In January the Rev. George G. Higgins and Rev. John F. Cronin were named assistant directors of the social action department of National Catholic Welfare conference. In the same month President Truman conferred the congressional medal of honour on Rev. Joseph T. O'Callahan, of the navy, the first chaplain ever to be so honoured. Leo T. Crowley was decorated by the pope. The Laetare medal was awarded in 1946 to Dr. Carlton J. H. Hayes, wartime ambassador to Spain. The Hoey interracial awards went to Richard Reid, editor, and Charles L. Rawlings, president of the Detroit interracial council.

Other Events.—June 1946 saw the Catholic Theological Society of America formed at a meeting of theologians in New York city. In January an Inter-American Seminar on Catholic Social Studies was held in Havana, Cuba, with delegates from the United States, Canada and the Latin-American countries attending.

In August the Vatican revealed that Pius XII had written the bishops throughout the world asking them to collect views on the doctrine of the bodily assumption of the Blessed Virgin into heaven, with a view to definition.

Scholarships were donated by Catholic colleges in the United States to 59 Catholic students from China.

Church affairs in Poland remained unsettled. Catholics felt they were discriminated against in the provisional government. In September the bishops, conferring in Czesochowa, demanded Catholic representation in the parliament. In November Pres. Boleslaw Beirut declared that the church must "accept the new state of affairs" in Poland if it were to continue to enjoy the rights it possessed. Earlier in the year the bishops, in a joint pastoral, had made it clear that Catholics could not accept the communization of Poland.

The Italian hierarchy manifested grave concern about the

ascendency of leftist groups and warned its flocks against Marxian doctrines in the months of May and June. Later in the year a definitely anticlerical campaign developed and the pope was made the subject of attacks. (See PRUS XII.)

In Hungary the hierarchy made every possible effort to assist the Hungarians being driven out of Czechoslovakia. Hungarian Catholics contributed to the relief drive and Joseph Cardinal Mindszenty made unsuccessful efforts to have the Prague government modify its resettlement program. (See also CATHOLIC ORGANIZATIONS FOR YOUTH; CATHOLIC RURAL LIFE CONFERENCE, NATIONAL; CATHOLIC WELFARE CONFERENCE, NATIONAL; CHURCH MEMBERSHIP; SOCIETIES AND ASSOCIATIONS; VATICAN CITY STATE.) (J. LAF.)

Roosevelt, Anna Eleanor (1884—), U.S. government official, newspaper columnist and widow of Franklin D. Roosevelt, 32nd president of the United States, was born Oct. 11, 1884, in New York city, the daughter of Elliott and Anna Hall Roosevelt. She married Franklin Roosevelt, a distant cousin, March 17, 1905. Mrs. Roosevelt took an active interest in furthering her husband's political career. Following his election to the presidency in 1932, she embarked on a career as a speaker and writer. Her newspaper column, "My Day," became widely syndicated. Mrs. Roosevelt was named (Dec. 19, 1945) by President Truman as a member of the U.S. delegation to the United Nations general assembly, and on April 29, 1946, she was elected chairman of the Commission on Human Rights of the United Nations Economic and Social council.

Mrs. Roosevelt frequently clashed with the soviet delegates on the commission over aims and ideals. On May 13, 1946, she declared that the Russians "speak of democratic procedure, but they just don't know what it means." "They must learn," she added, "that you do not have a revolution every time you disagree." To Andrei Vishinsky's warning that the U.S.S.R. would refuse to support the projected International Refugee organization if it aided refugees who refused to return home, she replied (Nov. 8, 1946) that the United States and the soviet union have little hope of living "without friction in the same world" unless both could concede the "right of opposition."

Rosenberg, Alfred (1893–1946), German politician, was born in the Baltic city of Reval (Tallinn) and studied architecture and engineering at the Technological institute of Riga. After the end of World War I, he preached the doctrine that bolshevism was the creation of the "Jewish anti-Christ," but his ideas carried little weight until he came in contact with another disciple of racial supremacy, Adolf Hitler. Rosenberg joined Hitler, held the party together after the abortive Munich putsch of 1923 and became the number one nazi ideologist. Rosenberg was elected to the reichstag in 1930 and after Hitler came to power in 1933, he was made reich leader of the National Socialist party. In 1934 he was appointed the fuehrer's deputy for supervision of the entire spiritual and ideological training of the nazi party.

After the start of World War II, Rosenberg became a general in the S.S. (Elite Guards) and the S.A. (storm troops). He was appointed reich minister for the occupied eastern territories on July 17, 1941.

He was indicted Aug. 29, 1945, as a war criminal by the International Military tribunal sitting in Nuernberg. In the final verdict handed down by the court, he was charged with having organized the system of plunder of public and private property in the occupied areas during the war and of having helped to formulate nazi policies of Germanization, exploitation of forced labour and of extermination of Jews and opponents of nazi

rule. He was found guilty of crimes against the peace, war crimes, crimes against humanity and of conspiracy to commit these crimes, and was sentenced to death by hanging, Oct. 1, 1946. The sentence was carried out Oct. 16, 1946.

Rosenthal, Moriz (1862–1946), Polish pianist, was born on Dec. 18 at Lwow (then Lemberg), Poland. He was a pupil of Franz Liszt in Weimar and Rome and made his formal debut in Vienna in 1876. Two years later, he went on a concert tour of European capitals. Between the years 1880 and 1886, he was a student at the University of Vienna where he specialized in philosophy. In 1886, he returned to the concert stage, making his debut in Leipzig. He travelled across Europe to Great Britain, thence to the United States and South America. In his first appearance in New York (1888), he was enthusiastically hailed by critics as a "perfect pianist" and a "giant of ability." One of the great virtuosos of his time, he achieved a fabulous reputation, not only as an interpreter of Frederic Chopin and Liszt but as a master of technique. The last of Liszt's pupils to be on the concert stage, Rosenthal was before the public almost constantly for 50 years. Famed as a philosopher and wit, he was an accomplished story-teller, as well as an able and convincing writer. His treatise on piano technique, *Schule des höheren Klavierspiels*, written in collaboration with the Danish composer, Ludwig Schytte, was translated into many languages. His compositions include "Romanza," "Prelude," "Papillons," "Carneval de Vienne" and many piano pieces. He died in New York city on Sept. 3.

Rowing. A resurgence in competitive rowing took place in the U.S., Canada and parts of Europe in 1946.

In England during February, Oxford defeated Cambridge in a revival of their ancient rivalry. The race was held on the Ouse river over an upstream course of one and one-half miles, Oxford taking the lead at the half-mile mark and never relinquishing it. The time was 8 min. 6 sec.

Intercollegiate rowing in the United States extended from east to west, although the Poughkeepsie, Dad Vail and other time-honoured college cup regattas were not renewed.

Two great college regattas were held: one at Annapolis, Md., on the Severn river on May 11, with 9 crews competing in the varsity race, and the other on Lake Washington, Seattle, Wash., on June 22, where 12 crews met in 2 events. The latter was the largest college regatta ever held on the Pacific coast.

A big Wisconsin crew won the nine-crew varsity event on the Severn, covering the one-and-three-fourths-mile distance in 9 min. 12.8 sec., and followed in order by the U.S. Naval academy, Columbia, Rutgers, Cornell, the University of Pennsylvania, Princeton, M.I.T. and Harvard. Massachusetts Tech won the junior varsity race.

The lightweight collegiate regatta (150 lb.) on the Charles river, Boston, was held the same day, Harvard winning in 6 min. 33 sec., followed by Pennsylvania, Cornell, Princeton, and M.I.T. The distance was one and five-sixteenths miles.

The Seattle regatta returned Cornell as victor, followed closely by M.I.T. and Washington university. The winning time for the one-and-three-fourths-mile course was 7 min. 19.7 sec. Wisconsin, Harvard, Rutgers, California and the University of British Columbia finished in that order. Rough water and high winds prevailed in both regattas.

The U.S. college rowing season opened on April 27 at Carnegie lake, Princeton, N.J. The University of Pennsylvania

swept this regatta, winning the varsity from Rutgers with Princeton third for the one-and-three-fourths-mile distance on rough water. Times: Pennsylvania 9 min. 55 sec., Rutgers 9 min. 59 sec., Princeton 10 min. 19.9 sec. Pennsylvania took both junior varsity and lightweight races from Princeton by close margins.

The same day on the Harlem river, N.Y., Columbia's varsity rowed to victory over Navy's highly regarded eight. The lead alternated until the last quarter mile when Columbia surged to the front to win by three-fifths of a second. Winning time for the one-and-three-fourths-mile distance was 7 min. 55 sec. Navy easily won the junior varsity contest.

On May 14 four regattas were staged: At Cambridge, Cornell defeated Harvard, Princeton and M.I.T. in that order. On the Schuylkill, the University of Pennsylvania barely nosed out Columbia by three feet after leading all the way. On the Raritan river at New Brunswick, N.J., the Rutgers varsity defeated the Navy plebe crew. Wisconsin easily defeated Marietta college of Ohio on Lake Mendota.

May 18 recorded Massachusetts Institute of Technology's victory over Harvard varsity and junior varsity crews at one-and-five-sixteenths miles. The same day Pennsylvania beat Navy and Princeton on the Schuylkill and Rutgers nipped Columbia by a foot on the Harlem.

On May 26 Wisconsin shaded Pennsylvania by two feet, at Philadelphia, while Rutgers was trouncing Princeton for the third time on its home waters.

Intercollegiate regattas were concluded on June 1. Harvard beat Yale in the latter's only race. Wisconsin was victorious in a heat regatta at one mile on Cayuga inlet over Cornell, Pennsylvania and Princeton.

Cornell and Wisconsin should be placed at the top of collegiate rowing for 1946.

The year witnessed the greatest number of schoolboy regattas ever held in the U.S., with large entry lists and unusual spectator interest. Joseph McIntyre of Philadelphia was crowned schoolboy single sculls champion, and the LaSalle High school of Philadelphia won the senior schoolboy eights.

The National Association of Amateur Oarsmen conducted their 72nd National regatta at Philadelphia on July 19–20. Seventeen national champions were crowned. The largest entry list in many years competed.

Highlights of this first national regatta after 1942 were the winning of the Julius H. Barnes Point Trophy by the Detroit Boat club. Its crews entered six and won six events. Joseph Angyal, New York, captured both lightweight singles races.

Jack Kelly, Jr., of Philadelphia, Pa., son of the two-time Olympic champion, beat his fellow townsman, Arthur Gallagher, former U.S. singles champion (1942), for the single sculls title.

In Canada the Royal Canadian Henley at St. Catherines, Ontario, staged its 64th annual regatta on July 25–26–27. The famous Hamilton Leanders captured the point trophy from the West Side club from Buffalo, N.Y., and also won the feature race: the senior eight from the same club.

Jack Kelly, Jr., successfully defended his singles crown, won in 1945, and Homer Zink, Jr., of Belleville, N.J., took the lightweight.

In England, early in July, the Royal English Henley regatta was resumed for the first time after 1939. Young Jack Kelly, Jr., and Arthur Gallagher flew to England to challenge for the Diamond sculls, held for two consecutive years before World War II by world champion Joseph Burk, U.S.A. Both Kelly and Gallagher advanced to the semi-finals, where they were paired against each other. Kelly defeated Gallagher by four lengths, but was beaten in the final by the French champion Jean Sepharies by three lengths.

In war-torn Europe, a startling revival in rowing took place. In Belgium, France and Holland racing craft were removed from safe hiding places; crews were seen on streams almost before the invading enemy had completely evacuated. In Switzerland, Italy, Spain and Portugal increased interest was manifested, rowing was resumed and rowing publications appeared.

The Olympic games were awarded to England in 1948.

(C. L. Br.)

Roxas y Acuna, Manuel (1892–), Philippine statesman and president of the Philippines commonwealth, was born Jan. 1, in Capiz, Panay Island, the Philippines. He was educated in English-language public schools and was graduated from the University of the Philippines college of law in 1913 with an LL.B. degree. Elected to the house of representatives in 1921 Roxas later became speaker of the house.

In Nov. 1938 Roxas was named secretary of finance in Manuel Quezon's cabinet. Shortly after the Japanese attack on the Philippines, Roxas was assigned, Dec. 16, 1941, as liaison officer and aide to Gen. Douglas MacArthur. When the latter went to Australia Roxas remained for a while on Corregidor and later turned up as a cabinet minister in the pro-Japanese Laurel government. After the war when he was charged with collaboration, Roxas claimed that he used his high position to carry out espionage for the Allies and sabotage enemy activities; these declarations were supported by Gen. MacArthur and Roxas was subsequently cleared of collaborationist charges. He was unanimously elected president of the reconstituted senate and campaigned for president of the republic in early 1946; in the elections, held April 23, 1946, Roxas defeated his opponent, Sergio Osmeña. He was inaugurated on May 28, 1946.

Rubber. Successful reconversion of the rubber industry proceeded rapidly during 1946. Shortly after the first of the year the production and exports of GR-S (butadiene-styrene co-polymer) rubber were increased to promote full operation of factories despite shortages of natural rubber. An agreement reached March 2 between the United Rubber Workers of the Congress of Industrial Organizations and the four largest manufacturers of rubber products increased pay and favoured steady production. Manufacture of rubber goods continued at high levels throughout 1946, accompanied by expansion of the industry in many countries, including new factories for tires and other rubber articles in the Netherlands, Sweden, South Africa, Egypt and Peru, as well as expanded facilities in the United States. Interest centred in the early delivery of tires for passenger cars since all over the world many people were driving cars on rubber made into tires six years before. The resulting demand for materials stressed sharply the need for large supplies of natural rubber from the formerly abundant sources in the far east where bad social and economic conditions, unstable government and shortages of labour and materials were reported throughout the first half-year. Only minor delays were incurred as a result of destruction of rubber trees by the Japanese military occupants. By midyear the Malayan and Borneo sources of Hevea rubber had started brisk production, while the Netherlands Indies were still lagging, and shipments from French Indo-China reflected the recovery of a large inventory rather than an active resumption of tapping. For many years before World War II rubber plantations were subjected to economic controls to limit production and keep up prices. No

scheme of restriction was in force during 1946, but past events indicated that unrestricted competition on a free market favours the small producers. In the Netherlands Indies the potential capacity of the small holders to produce rubber comprises nearly two-thirds of the total, and after the war this region had hardly been tapped. In 1936, Netherlands Indies natives exported 149,000 short tons of rubber at an f.o.b. price of about two cents per pound. With a potential yearly capacity from small holder sources probably in excess of 700,000 short tons from the Netherlands Indies alone, there was little doubt that very large tonnages would be made available as soon as unimpeded commercial activity was resumed. The eventual recurrence of a local price comparable with the former low of two cents per pound seemed reasonable. By contrast with the prospect of low-cost rubber from the small holder, the plantations of the East Indies were confronted with many adverse factors, including higher labour costs, expensive removal and control of infestations like lallang, a variety of spear grass, re-establishment of malaria controls and the need to adjust their future operations to a completely altered outlook concerning contract labour and the former social and governmental relations. Need for government subsidies to plantations had already been hinted in Great Britain.

Natural Rubber.—Stocks of natural rubber (including latex and guayule) in the United States in Dec. 1945—133,000 short tons, had risen by April 1946 to 205,000 short tons with world stocks of 625,000 short tons; this exceeded all inventories from 1942. United States consumption of crude rubber for 1946 was estimated (October) at close to 300,000 short tons compared with 118,000 short tons in 1945. Premature reports that more than 100,000 short tons of rubber were to be shipped from Indo-China to the United States were later altered to indicate that these shipments were going to French rubber factories which required more rubber than had earlier been anticipated.

Rubber purchases for the United States continued to be made by the Rubber Development corporation subject to the restrictions which had prevailed from 1941 covering the maintenance of an adequate stockpile. Allocations to the industry were at a price of \$0.225 a pound for No. 1 ribbed smoked sheet. Purchases for the account of the Rubber Development corporation were arranged through the Combined Rubber committee, on which there were representatives of the United States, United Kingdom, Belgium, Canada, France and the Netherlands. By early fall British sources were voicing dissatisfaction with the action of the Combined Rubber committee which had maintained prices in the range of \$0.2025 to \$0.235 a pound f.o.b. far eastern ports and were arguing for a free market. Early in the fourth quarter the announcement came from both the Combined Rubber committee and the British board of trade that all international controls over the distribution of natural rubber would be removed on Jan. 1, 1947. This action created a free market for rubber except in the United States. According to F. D. Ascoli, chairman of the Rubber Grower's association (London), after Oct. 1946 only natural rubber would be used in Great Britain to make tires. These events heralded the return of increased supplies of natural rubber. Hence, after five years of the shortage caused by war the world could soon look for free competition between natural and synthetic rubbers.

By the end of the second quarter the huge guayule rubber project of the U.S. department of agriculture, with nearly 30,000 ac. planted in 1942 and 1943, was abandoned by action of congress and most of the shrub was uprooted to free the land for normal agricultural use. Experiments on the growth of rubber in North America (guayule and kok-saghyz, mainly) were reduced to a small scale by the withdrawal of appropriations. In contrast with these decisions were the continuance of

the research program on the growth of kok-saghyz in Sweden and the plans to resume planting large crops of this dandelion source of rubber by the U.S.S.R.

Synthetic Rubber.—Statistics pertaining to general purpose rubber, GR-S, which had for four years extensively supplanted crude rubber, and the special purpose rubbers, GR-1 (butyl), GR-M (neoprene) and the nitrile rubbers, are submitted in the following tables:

Table I.—Statistics for Synthetic Rubber, by Types, for the U.S., 1942-45 (Short Tons)

Production	GR-S	GR-M* (Neoprene)	GR-1 (Butyl)	Nitrile* Types	Total
1942	4,170	10,000	26	10,900	25,096
1943	204,100	37,600	1,540	16,200	259,440
1944	761,500	63,460	22,700	18,800	866,460
1945	811,800	51,150	58,660	8,800	930,410
Consumption					
1942	2,890	7,650	25	9,200	19,765
1943	147,800	29,350	340	13,900	191,390
1944	555,000	51,800	12,050	15,800	634,650
1945	672,200	47,480	48,170	9,000	776,850
Exports					
1942	250	1,160	—	180	1,590
1943	16,700	2,840	45	710	20,295
1944	110,200	5,370	590	620	116,780
1945	85,700	6,540	1,100	450	93,790
Stocks at End of Period					
1942	1,180	2,000	4	1,980	5,164
1943	34,700	7,180	1,160	3,500	46,540
1944	130,070	13,150	11,080	5,800	160,100
1945	191,040	10,870	20,580	5,380	227,870

*Includes production of privately owned plants.

Table II.—Consumption of Synthetic Rubber by Types, Jan.-June 1946 (Short tons)

United States	January	February	March	April	May	June
GR-S	63,629	59,641	69,767	67,338	67,058	59,563
Neoprene	3,715	3,277	3,911	3,991	4,060	3,510
Butyl	7,335	8,156	8,994	7,350	7,726	6,807
Nitrile rubbers	353	348	448	509	580	567
Total	75,032	71,422	83,120	79,188	79,424	70,447
World						
Total	89,600	89,600	100,800	98,000	98,000	86,800

From London Rubber Secretariat, Rubber Statistical Bull. 1, 3, (Sept. 1946).

Table III.—World Consumption of Synthetic Rubber, All Types, Including United States, United Kingdom, France, Germany, U.S.S.R. (Excluding Home Production), Australia, Canada, South Africa and the Rest of the World

Short Tons	1939	1940	1941	1942	1943	1944	1945
	16,800	50,400	78,400	128,800	324,800	828,800	946,400

From London Rubber Secretariat, Rubber Statistical Bull. 1, 3, (Sept. 1946).

The dominant position of the United States in the manufacture of both synthetic rubber and rubber articles explains the large ratio of its consumption compared with the world total, and makes the recommendations of the Inter-Agency Rubber Policy committee pertaining to the eventual disposition of government-owned factories of vital importance to the users of rubber. In two reports released by the Office of War Mobilization and Reconversion, Washington, Feb. 19 and July 22 respectively, the committee, headed by W. L. Batt, made recommendations as follows: For the immediate future, until supplies of natural rubber were assured, all but the least efficient ("fringe") synthetic rubber plants should be maintained in operation or stand-by condition, stocks of natural rubber should be increased and government allocation of rubber should be continued with a gradual increase in the amounts of natural rubber permitted in civilian products. For the long-term program the committee advocated the production and use of sufficient synthetic rubber to supply at least one-third of the rubber requirements of the United States exclusive of special purpose rubbers, the private ownership and operation of the synthetic rubber industry, the maintenance in stand-by condition of plants with an estimated yearly capacity of about 672,000 short tons or 60% of existing capacity and the retention of a strategic stockpile of rubber. The committee favoured transfer of the plants to private industry as far as possible and as soon as possible in order to guarantee improvement in the quality of the product through research and to insure vigorous com-

RAYON TIRE CORD which has been dipped in latex, is being dried on these "drying cans" to remove its moisture content before a calendar coat of rubber is applied to it. The scene was a United States Rubber company tire plant, in 1946

petition with natural rubber with such incentives as would favour private initiative. The War Assets administration was to be directed to dispose of the "fringe" plants earlier than the "basic" plants since the latter must serve as sources of rubber in the event of national emergency and hence need to be vigilantly managed in the national interest. To implement such management it was anticipated that congress would be asked to provide a "National Rubber Supervisory Body" with broad powers to act in the interests of national security, including government-sponsored research, stockpiling of rubber, continuous operation and maintenance of plants and whatever aid to industry would be required to assure continuous operation of the plants which supply the minimum requirement of synthetic rubber (estimated at about 280,000 short tons). The best method of government support was considered to be a product specification or a subsidy or a combination of both to insure the minimum consumption of synthetic rubber by the industry. In short, the Batt committee's recommendation favoured the return of the industry to private agencies as soon as a free market with adequate supplies of rubber could be established. A minimum intrusion of government control rather than government ownership would thus be established.

In contrast with this attitude was the action of the Canadian government in acquiring the Polymer corporation to be operated as a government enterprise for the manufacture of synthetic rubbers, ostensibly for several years, the plans to nationalize industry in the British occupation zone of Germany where a large synthetic rubber plant was located and state ownership and operation of the synthetic rubber plants in the U.S.S.R. and in Sweden.

Reports of tire tests on government and private test car

fleets revealed that the tread wear of synthetic rubber passenger car tires was at least as good as that of natural rubber tires. In the more efficient government-owned plants GR-S had been made at a cost of \$0.11 to \$0.12 a pound excluding amortization, depreciation, profit and certain administrative costs.

Great activity was displayed outside the government synthetic rubber program in originating and testing special purpose polymers, such as the polyesters, Paracon and Paraplex, the polyacrylates, e.g., lactoprene, the silicon rubbers, and advantageous mixtures such as those of Hycar and Geon. These and many other new products of industrial research furnished examples of compositions of great superiority to those made from natural rubber in resistance to temperature, to flexure fatigue, to sunlight, to electrical stresses and to swelling and penetration by solvents and by gases. Natural rubber is not in competition with such special purpose polymers which lend themselves to advances in engineering design and give products with superior performance.

Reclaimed Rubber.—The tonnages of reclaim required by the rubber industry were second only to those of natural and synthetic rubbers. The consumption of reclaimed rubber for the United States had been at the rate of 75 to 80% of world consumption from 1941.

Table IV.—U.S. Consumption of Reclaimed Rubber (Short Tons)

1941	1942	1943	1944	1945	1946 (6 Mo.)
282,000	287,000	326,000	281,000	270,000	148,000

Satisfactory progress was reported during 1946 concerning the industry's ability to handle processes for making reclaimed rubber from tires which originally contained natural rubber, GR-S or blends of these. Hybrid reclaims do not deviate widely in properties from those predicted from a study of the parents, which signified that the intrusion of large tonnages of GR-S into the tire compositions in late years was not a seriously disturbing factor in the efficient use of existing reclaiming facilities.

Tires.—Great Britain's production during the war included 32,693,748 automobile tires and 47,168,747 bicycle tires. Expansion of facilities for tire manufacture in 1946 included South Africa 75,000 a year, Sweden 600,000 a year and the completion of a number of projects in the United States which were started in 1945.

Rubber Director W. J. Sears of the Civilian Production administration reported the production in 1946 (to Sept. 30) of 11,472,327 bus and truck tires and 47,704,382 passenger car and motorcycle tires, and stated that the goal for 1946 of 69,150,000 tires of all classifications would probably not be attained although the shortage anticipated would not exceed 3,000,000 tires. By October, although the demand for truck and bus tires was partly satisfied, the need for passenger car tires was still urgent.

Third World Rubber Conference.—Representatives of the United States, United Kingdom, France and the Netherlands convened for a six-day meeting at The Hague on Nov. 25. At this, the third annual meeting of the Rubber Study group, the questions of paramount importance were the supply and demand for both natural and synthetic rubber, the anticipation of the earliest date for a world-free rubber market and the probable date at which a surplus of rubber could be anticipated. (See also BUSINESS REVIEW; CARBON BLACK; PETROLEUM; RAYON AND OTHER SYNTHETIC FIBRES.) (H. L. TL.)

Rulers: see PRESIDENTS, SOVEREIGNS AND RULERS.

Rumania. A kingdom in southeastern Europe. Area (1939) 113,889 sq.mi., pop. 19,933,802. Rumania later lost the provinces of Bessarabia and northern Bukovina to the U.S.S.R. Capital: Bucharest. Principal cities: Bucharest (648,162); Jassy (104,471); Galatz (102,232); Timisoara (89,872). Religion: mostly Greek Orthodox. King: Michael I (Mihai). Prime minister (1946): Peter Groza.

History.—At the end of 1945 Rumania was governed by the National Democratic front, a coalition of several parties under communist inspiration. The two most important Rumanian parties, the National Democratic Peasant party under Julius Maniu, the veteran democratic leader of the peasantry, and the Liberal party under Dinu Bratianu were not represented in the government. The official propaganda line was directed against the reactionary Maniu and against the western democracies. At the Big Three conference in Moscow at the end of 1945 it was decided to send representatives of the three powers to Rumania to broaden the government by inclusion of democratic elements, to restore the liberty of the press and to prepare free elections. Some hopes for the liberalization of the regime were entertained but they were not realized. The opposition demanded that the key ministries of the interior and justice, held by Communists, be given to nonparty men who would ensure freedom from intimidation. These demands were rejected and Teohari Georgescu remained minister of the interior. The two candidates presented by the leading opposition parties for inclusion in the cabinet, Constantin Bratianu of the Liberal and Ion Mihalache of the Peasant party, were not accepted; instead of them the government agreed to the inclusion of Emil Hatieganu, rector of Cluj university, as the representative of the Peasant, and Michael Romniceanu as the representative of the Liberal party, as ministers without portfolio.

On the basis of the official pledges by the Rumanian government, to hold free elections and to assure liberty of the press, of speech and assembly, the United States and Great Britain announced on Feb. 6 their recognition of the government. On Feb. 8 the first number of the newspaper of the Liberal party, *Liberalul*, was allowed to appear; in a signed editorial the Liberal leader Constantin Bratianu protested that in spite of government pledges "public liberties are not yet restored. Journalists receive even now directives as under the regimes of terror, and in the whole country none but extreme left wing newspapers are allowed to be read." Newspapers of the opposition were not necessarily suppressed by the government but by the typographical workers who under order of their communist unions refused to print articles critical of the government. The two representatives of the democratic opposition parties who had no resort of their own, spent their time in vainly protesting against interference and terrorism directed against their parties. The opposition parties charged officially on April 15 "flagrant breaches with respect to the liberties granted by the Moscow agreement. The clear intention not to co-operate with the opposition is evident by the continual attacks upon opposition parties and leaders." The U.S.S.R. objected to an international supervision of the elections, thus removing the only guarantee for their relative fairness.

In June the U.S. and British governments protested the failure of the Rumanian government to keep the pledges made in agreement with the Moscow declaration. These, like later repeated protests and warnings, were not heeded by the Rumanian government and produced not the slightest effect upon the course of events.

As in other central European countries, Rumania's economic life was completely co-ordinated with that of the U.S.S.R., as it had been after 1939 with that of Germany. Through a network of jointly owned Sovrom companies, the U.S.S.R. controlled all

major Rumanian economic and transportation enterprise. The vague definition of German assets in the Potsdam declaration helped the process of soviet penetration into Rumanian economy. The soviet-controlled companies were granted special privileges, priorities and rebates so that they enjoyed a tremendous advantage over competing private enterprise. In addition to war booty and restitution of looted property, the soviets were entitled to reparations amounting to \$300,000,000. The original period of payment in six years was extended by the Russians in 1946 to eight years. Among the reparation items were the following, valued at 1938 prices in U.S. dollars: petroleum products \$150,000,000; railway equipment \$48,504,000; industrial equipment \$28,034,000; sea and river craft \$90,656,000; the rest for grains, horses, other livestock and lumber.

The drain of reparations to the U.S.S.R. and the loss of farm machinery and draft animals, coupled with a severe drought, produced in Rumania, formerly one of the granaries of Europe, most difficult economic conditions in the fall of 1946. The Rumanian currency went through a process of inflation with corresponding rocketing prices which made life for the middle class extremely difficult. By the middle of November the Rumanian leu was quoted around 90,000 to the U.S. dollar, one-third of its value in the summer of 1946.

Elections were held on Nov. 19. The government presented a democratic bloc, the bloc *Partitul Democrat* which in its platform confirmed the continuation of the constitutional monarchy and demanded only the nationalization of the national bank. This bloc consisted of the six groups forming the government. The opposition was not united and was in every way hampered in its activities. The U.S. state department denounced on Nov. 26 the Rumanian elections as unfair and undemocratic and indicated that the U.S. did not believe that the results did truly represent the will of the Rumanian people.

The elections, though by far not so totalitarian as in Yugoslavia, brought the expected result. Of the 6,823,928 votes cast (1,144,786 registered voters did not go to the polls) the government received 4,766,630 votes. Of the opposition parties the National Peasants received 879,927, the Hungarian Popular union 569,651, Liberals 259,306, the National Peasant Democrats 156,755 and the Independent Socialists 65,528 votes. The two ministers who represented the opposition in the cabinet resigned. The new parliament was opened formally by King Michael on Dec. 1. In his address he announced the country's first nationalization project, the Rumanian National bank, of which the government was to become the only stockholder.

Running: see TRACK AND FIELD SPORTS.

Runyon, (Alfred) Damon (1884–1946), U.S. author and journalist, was born on Oct. 4 in Manhattan, Kan. Educated at public schools in Pueblo, Colo., he enlisted in the army during the Spanish-American War when only 14, after successfully exaggerating his age. He served with U.S. forces during the Philippines insurrection, and upon demobilization became a reporter for the Pueblo *Chieftain*. By 1911 he was a sports reporter in New York and shortly afterwards built up a reputation as a general reporter of murder cases, political conventions and presidential elections. When the U.S. army sought Pancho Villa in Mexico in 1916, Runyon covered the story for the Hearst newspapers; during World War I, he accompanied the U.S. 1st army. Later, he became a columnist and by 1937 his popular feature "As I See It" was syndicated to all the Hearst papers. Subsequently, another column "The Brighter Side," was distributed. A prolific writer,

he was a playwright, poet and novelist, but it was through his short stories that he became internationally famous. New York's Broadway was the milieu for many of his stories; his characters were the gamblers, promoters, fight managers, race-track bookies and other habitués of the street. Employing an unusual and colourful style, his characters such as "Joe the Joker" and "Regret the Horseplayer" became familiar to thousands of his followers. In 1941, he became a writer-producer for Hollywood motion picture companies. His first production was entitled *The Big Street*. His works include *Tents of Trouble* (verse) (1911), *Rhymes of the Firing Line* (1912), *Guys and Dolls* (1932), *Blue Plate Special* (1934), *Money from Home*, *A Slight Case of Murder* (1935), *Take It Easy* and a book of essays *My Old Man* (1939). He died in New York city on Dec. 10.

Rural Electrification. The electrification of rural areas in the United States proceeded at an accelerated pace in 1946, after virtual elimination of war-time controls permitted construction of new rural power lines as fast as materials could be obtained. As of June 30, 1946, the Rural Electrification administration estimated that 3,106,000 farms were converted to power lines, and that 2,769,000 farms still lacked service.

From 1934 to 1946, the number and percentage of electrified farms in the United States increased as follows: Dec. 1934, 744,000, 10.9%; June 1936, 840,000, 12.3%; June 1938, 1,300,000, 19.1%; June 1940, 1,870,000, 27.1%; June 1942, 2,337,000, 38.3%; June 1944, 2,573,000, 42.4%; June 1946, 3,106,000, 52.0%. The percentages are based on the total number of farms reported in the agricultural censuses of 1935, 1940 and 1945. From the time the Rural Electrification administration was established in 1935, REA-financed systems had built power lines to about half of the farms that had received central station electric service. REA made more than 95% of its loans to non-profit rural electric co-operatives. These co-operatives are owned by the consumer members and governed by boards of directors selected by the members.

In 1946, REA-financed co-operatives started construction of power lines into hundreds of unelectrified rural areas in all parts of the United States. Some of the unelectrified areas covered several counties; others extended over large portions of various states. A number of areas were practically without rural distribution lines and less than 10% of the farms were electrified in many counties. The co-operatives also prepared plans for the extension of service into hundreds of other areas where farms still lacked electricity. Upon completion, these plans were to be forwarded to REA with applications for loans to finance construction.

REA-financed systems in 42 states reported that larger supplies of electrical energy were needed to meet rising consumption on electrified farms. The increased demand reflected the needs of newly-electrified farms and more extensive use of power on farms already served. During World War II, farm families with electric service made greater use of electrical farm and household labour-saving equipment, such as water systems, milking machines, pig and chick brooders, feed grinders, hay hoists, hay driers, grain blowers, corn shellers, farm shop tools, refrigerators, washing machines and irons. After the war, this trend gained momentum as many electrical devices became available in larger quantities. REA-served rural consumers used 2,424,000,000 kw.hr. of electricity in 1946, as compared with 2,135,000,000 kw.hr. in 1945 and 1,925,000,000 kw.hr. in 1944.

By the end of 1946, REA had approved approximately \$957,000,000 in loans for rural electrification. Eight hundred and seventy-two borrowers had REA-financed rural electric facilities in operation, including 500,000 miles of lines serving 1,675,000

consumers. About 80% of these consumers were farms; the rest consisted of nonfarm homes, stores, churches, schools and other rural establishments. The REA borrowers had paid nearly \$126,000,000 in principal and interest on their government loans, including \$20,000,000 paid on principal in advance of the time it was due. REA loans are made on a self-liquidating basis at 2% for periods up to 35 years.

Because of the contribution electric power can make to farm production and farm living, development of new and improved electrical equipment for the farm and rural home received increased attention from federal, state and private research agencies. Great interest was shown in farm applications for electrical refrigeration equipment, particularly freezers and food storage chests for the farm home. New applications under study in 1946 included the use of electric light bulbs as a lure in destroying insect pests. Research resulted in the installation of electrically-operated new hay-curing equipment on thousands of farms. This equipment helps the farmer to produce better quality hay and prevent losses due to unfavourable weather during the haying season. (C. Hn.)

Great Britain and Europe.—In 1946 the extension of rural electrification became a matter of first importance in Great Britain and most countries in Europe. The necessity, brought about by the general food shortage, for increasing the output of the available agricultural labour by mechanical aids was pressing. Electricity was required for such mechanization, and to provide amenities in rural districts in order to prevent the long-continued migration from country to town largely because of the better living conditions.

In Great Britain there was an insistent demand for electricity on farms, which was strengthened by the very bad harvesting conditions experienced in 1946. These called special attention to the need for labour-saving devices and for crop-drying equipment, research upon which was in progress during the year. Liaison committees of agricultural and electricity supply interests were active and details were published of a five-year plan for the electrification of 150,000 farms at an estimated cost of £72,000,000, to be provided in appropriate proportions by the two industries concerned. The government was to be asked to accord high priorities for the supply of the essential materials. A number of constructional projects and distribution schemes prepared by the North of Scotland Hydro-Electric board were approved, and work was started on some of these. In Eire the organization for the development of the country's rural electrification scheme was outlined and a start made on the constructional work.

On the continent, rural developments were on similar lines to those in Great Britain. France nationalized its electricity supply industry and a five-year program of rural development was drawn up, the co-operation of agricultural and electrical interests being called for to complete it. Electrically operated threshing became widespread on French farms. In Switzerland there were further developments in electrical grass drying. Swedish rural electrification progressed and it was anticipated that 95% of all rural dwellings would be electrified by the end of 1950. Constructional work on village power plants proceeded actively in Russia, and 2,000,000 kw. were to be provided for agriculture in the postwar five-year plan, already under way in 1946. Details were made public of a 20-year plan for a national hydroelectric system for Greece which, if carried out, would ensure the rehabilitation of the country. (E. W. G.)

Russian Literature. No outstanding work in soviet literature appeared during 1946. A Fad-eyev's successful novel *Young Guards* continued the tradition of wartime literature, combining conventional heroics with factual documentation; the story is centred on anti-German activities of communist youth in Krasnodon which came to light during the war.

By far the most important literary event of the year was the literary "purge" announced in August. A special resolution of the central committee of the Communist party denounced the work of two Leningrad reviews (*Zvezda* and *Leningrad*), accusing them of sponsoring antisoviet writers. The once popular humorist Mikhail Zoshchenko (whose work has been translated into several languages) and the well-known prerevolutionary poetess Anna Akhmatova were singled out for a particularly virulent attack. Zoshchenko was charged with showing an unpatriotic attitude during the war, with lampooning soviet society in his latest story (*The Adventures of an Ape*) and with open hostility to the soviet regime. His autobiographical work, *Before Sunrise*, published in 1943 and already denounced, was recalled. Akhmatova's poetry was proclaimed "empty," "im-bued with bourgeois mentality," and incompatible with the soviet conception of life. It is interesting to note that in 1940, after 20 years of almost complete silence, Akhmatova was allowed to publish a book containing some new poems. She also wrote some patriotic poems during the war. A more general and significant charge of "servility to modern western bourgeois civilization" was laid at the door of the Leningrad reviews. They were accused of "poisoning" the minds of soviet youth. After listening to a report from A. A. Zhdanov, the official head of the Leningrad communist organizations, the Leningrad writers hastened "to assure comrade Stalin that they would be able to overcome in a short time those major shortcomings." The Communist party organization of Leningrad, and the newspapers *Leningrad Pravda* and others, were accused of having "overlooked" this vital matter. This episode was but part of a general tightening-up of the ideological party line, which came as a reaction after wartime "laxity"; Moscow theatres were severely rebuked for including in their repertoire "decadent" bourgeois plays by Somerset Maugham, Pinero and others, and the famous composer Shostakovich was taken to task for his ninth symphony, proclaimed "a formalistic trifle." One of the leading soviet authors, Nikolay Tikhonov, was involved in the purge and was dismissed from the post of chairman of the Union of Soviet Writers and replaced by a "collective."

Outside the U.S.S.R. there was a mild revival of literary life in Paris; a new book of stories by Ivan Bunin, *Temnyya allei* (mostly love stories with a strong erotic element), and several slender almanacs appeared. The pages of the *Novy Zhurnal* in New York city were strengthened by some Parisian writers. A number of younger soviet writers in Paris rallied to the soviet regime, following a widespread postliberation movement which was already on the wane in 1946. (G. St.)

Russian S.F.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Rye. The 1946 rye crop in the U.S. was the smallest in more than 70 years except for that of 1934. The crop at 18,685,000 bu. was 22% less than the 23,952,000-bu. crop of 1945 and less than half of the average of 42,356,000 bu. for 1935-44. The acreage was only 89.6% of 1945 and about half the average. The yield was about average at 11.7 bu. per acre. Of the total acreage planted in the fall more than half was used for hay, pasture or plowed under for soil improvement. The farm price of rye advanced slowly throughout 1945 from \$1.06 to \$1.43 per bushel. By Feb. 1946 the price was higher

U.S. Rye Production in Leading States, 1946 and 1945

		(In bushels)			
State	1946	1945	State	1946	1945
Nebraska . . .	3,070,000	4,512,000	Indiana	540,000	875,000
South Dakota . .	2,530,000	4,205,000	Oregon	540,000	462,000
North Dakota . .	2,058,000	1,552,000	Kentucky	518,000	500,000
Minnesota . . .	1,534,000	1,712,000	Illinois	475,000	588,000
Wisconsin . . .	874,000	1,092,000	Oklahoma	432,000	740,000
Michigan	672,000	840,000	Virginia	392,000	486,000
Colorado	646,000	960,000	Pennsylvania . .	341,000	636,000
Kansas	556,000	850,000	Montana	300,000	187,000

than that of wheat and by April stood at \$1.95 per bushel which was above the record of \$1.76 in 1917. A ceiling on rye was imposed by OPA on June 1 which brought the average price for June down to \$1.45 per bushel. Reports of a "corner" on the principal markets were widespread. When ceilings were removed the price of rye rose again and for October averaged \$1.99 per bushel to farmers. In December the average was \$2.18 which was a record above World War I. (J. C. Ms.)

Saar. The Saar is an industrial mining district on the border of France and Germany. The territory was administered by the League of Nations from 1920 until 1935 when as the result of a plebiscite it was restored to Germany. Its area is 738 sq.mi., of which 574 sq.mi. belong to the Prussian Rhine province and 164 sq.mi. to the Bavarian Palatinate. The population is about 860,000. The economic importance of the territory is based upon its coal mines.

The Saar territory belongs to the area in Germany put in 1945 under French occupation. The French government several times expressed its determination not to allow the return of the Saar under the political and economic control of a central German administration. In July 1946 the French ordered the administrative transfer of 79 Rhineland villages and hamlets totalling about 600 sq.mi. to the Saar. On Dec. 22 the French established a customs frontier between the Saar and the rest of Germany, officially "to prevent the exporting of food products from the Saar and an influx of currency into the Saar." This did not amount to an immediate incorporation of the Saar into France, but in view of a possible future integration of the Saar, France intended to undertake economic measures to ensure that the Saar be in as good condition as possible when that future moment might arrive. France was especially concerned about an increase in the output of the mines by augmenting the food supply of the miners.

While the political parties in Germany protested the French measure, the Germans living in the Saar were reported to favour largely an Anschluss or union with France. In elections in the Saar two of the three leading political parties favoured the step, the Catholic Christian People's party who won 53% of the votes and the Social Democrats who gained 25% of the votes. The third party, the Communists, who obtained only 8% of the votes, were violently opposed to the union with France. The French authorities disclaimed any wish to annex the Saar without the consent of the other occupying powers but they insisted that the French have "a historic and economic right to the Saar." At the end of 1946 the number of miners employed in the Saar was about 48,000 and the daily output of coal was 34,000 tons as against 38,000 tons before World War II. (H. Ko.)

St. Louis. Eighth largest city of the United States, St. Louis, Mo., had a population of 816,048 by the federal census of 1940, with an additional 541,567 persons living within the greater metropolitan area. Mayor (Jan. 1, 1947): Aloys P. Kaufmann (Rep.).

The political trend of late years was continued at the Nov. 5, 1946, elections with the Republican party winning by substantial margins. It elected all its nominees for city offices, 2 of 3 state senators and 11 of 18 state representatives. St. Louisans also favoured the Republican party nationally, giving majorities to its candidate for the U.S. senate and to two of three Republican candidates for the house of representatives from local districts.

Though it ended the last four fiscal years (1943-46) with surpluses, the municipal government anticipated a deficit by April 1947. Cost of government increased sharply and city employees' wages were raised \$2,100,000 annually. Much tax revenue, meanwhile, was in jeopardy caused by pending test suits. Challenged were a city income tax (one-fourth of one per cent of gross earnings of individuals and net profits of businesses) enacted Aug. 1, 1946, and expected to bring \$2,500,000 annually; and the right to collect tolls (about \$800,000 a year) on the Municipal bridge spanning the Mississippi river.

The city began postwar public improvements financed with \$63,385,000 of bond funds voted prior to 1946. Concentration was on vast expansion of aviation facilities, for which \$14,000,000 was available.

During the year voters approved a \$4,000,000 bond issue to better collection and disposal of garbage and rubbish, and increased the public library tax from four to six cents on each \$100 valuation. A new pipe line authorized by the Federal Power commission promised to increase the flow of natural gas into St. Louis 40% within a year or two. Fifty new street cars, part of a \$9,000,000 order for 1946-47, were added to the transit system. After 120 years, Jefferson barracks, historic frontier army post, was deactivated as a military establishment.

John Cardinal Glennon (*q.v.*), 83, archbishop of St. Louis for 42 years, died in Eire March 9, 1946, while en route home 19 days after his elevation to the College of Cardinals in Rome. (E. L. R.)

Salazar, Antonio de Oliveira (1889-), Portuguese statesman, was born at Santa Comba Dão (Coimbra) on April 28. In 1916 he became professor of economics at Coimbra university. Shortly after the revolution of May 1926 the Portuguese president, Gen. Antonio Oscar de Fragoso Carmona, invited him to join the government as finance minister; he accepted the post, but, finding himself unduly restricted, resigned within a week. After stipulating that complete freedom should be given him within his department, he resumed office on April 27, 1928. In 1930 Dr. Salazar founded the civil organization known as the National union. On July 5, 1932 he became president of the council of ministers; in the following year the new corporative constitution of the Portuguese republic was submitted to the country in a plebiscite and a national assembly elected. In 1936 Dr. Salazar assumed the portfolios of war and foreign affairs. In Sept. 1944 in drastically remodelling his government, he handed over the war portfolio to a former undersecretary in the department but retained the portfolio of foreign affairs. On May 18, 1945, he made an important speech to the national assembly justifying Portuguese neutrality in World War II.

vis à vis the Anglo-Portuguese alliance. "It is at times," he observed, "a great favour to be quiet, provided one is vigilant and faithful; and it can not be disputed that it served a positive interest of the Allied nations for us not to have become involved in the conflict."

In Oct. 1945 Dr. Salazar permitted the creation of political parties other than his own, but both during the following election period and in 1946 their movements were severely restricted.

Throughout the year Dr. Salazar's health gave cause for anxiety and he delegated much of his work to colleagues, especially to the minister of the interior, Col. Botelho Moniz, who, it was thought by some, might succeed him. (*See PORTUGAL.*)

Sales, Retail and Wholesale: *see* BUSINESS REVIEW.

Salt. With the close of World War II, the output of salt in the United States dropped from 15,717,171 short tons in 1944 to 15,394,141 tons in 1945, including 3,505,740 tons of rock salt, 3,630,729 tons of evaporated salt and 8,257,672 tons of salt in brine. Rock salt made a small increase, but both other types declined. Even with this quantity available, demand constantly crowded supply. War demand increased many uses and created some new ones. The 1944 peak output was 57% greater than that of 1939, and many postwar readjustments were in prospect as the industry returned to normal civilian supply.

In Canada 1944 production also reached a new high, at 695,217 short tons, as compared with 687,686 tons in 1943, but dropped back to 678,004 tons in 1945. (G. A. Ro.)

Salvador, El. A republic on the west coast of Central America, the only one without a Caribbean littoral. It is the smallest Central American state but the most densely populated (area, 13,176 sq.mi., pop. 1,915,546 by 1944 official est.). The capital is San Salvador (1944 est. pop. 110,435); other cities are Ahuachapán (13,765), Cojutepeque (15,317), Nueva San Salvador (formerly Santa Tecla) (24,239), San Miguel (18,676), San Vicente (13,637), Santa Ana (47,631), Sonsonate (17,540). Language, Spanish; religion, Roman Catholic. President in 1946, General Salvador Castañeda Castro.

History.—The year 1946 was fraught with political and social agitation, and the government was forced to yield some ground to leftist groups. The early months were peaceful, and May 1 (Labour day) was celebrated in the capital by mass demonstrations for the first time in 15 years, although the speeches were censored in advance. Late in May there was popular agitation for a more progressive constitution and for the removal of three cabinet members, accused of collaboration with former dictator Maximiliano Hernández Martínez. The demonstrations increased in intensity, and the administration was forced to reshuffle its cabinet three times during the year.

The popular movement reached a crisis in September when clashes with the police in the capital resulted in four killed and several injured, Sept. 15, and when a general strike was organized on Sept. 23 by labour and university student groups. Schools, banks, stores and transportation facilities were forced to shut down. Martial law was imposed Sept. 26 with a suspension of constitutional guarantees, a curfew, press censorship and national guard patrols in the capital. Two days later normal business and traffic were resumed. The government dismissed most of the unpopular cabinet members, finally appointed a minister for the new labour portfolio and promised to promulgate a labour code. Other demands by the strikers were not met, however, and tension continued throughout the year.

• In foreign affairs, El Salvador was host to three conferences

designed to revive the old Central American union. A meeting of the Unionist party council at San Salvador Jan. 15, a conference of the presidents of the republics in September, and a session of special commissions on Dec. 4 found only Guatemala and, to a lesser extent, Costa Rica collaborating with El Salvador. Conventions with both countries were signed in Sept. for the elimination of passport requirements, and resolutions were passed in favour of abolishing customs affecting their mutual commerce. In April Dr. José Gustavo Guerrero, one of El Salvador's leading proponents of the union, was elected to the United Nations Court of International Justice.

Education.—Primary schools in 1944 numbered 1,376, with 98,935 students; intermediate schools, about 50, with 4,207 students. In 1945 the campaign to combat illiteracy (approximately 75%) increased the number of primary schools to 1,519 and inaugurated afternoon and night adult classes in almost all urban centres. It was estimated that 68% of the total population was being affected.

Finance.—The monetary unit is the colón, valued in 1946 at 40 cents U.S. The 1946 budget estimated revenues at 37,317,547 colones and expenditures at 37,223,163 colones. The foreign debt at the beginning of 1946 amounted to \$18,300,000, including unpaid interest. On June 30, of the total commitments by the U.S. Export-Import bank to El Salvador, \$1,400,000 was outstanding and \$200,000 remained undisbursed.

Trade and Resources.—Exports were down 7.2% to \$21,331,631 in 1945 while imports rose 10.2% to \$13,534,230. The United States received \$17,000,000 and supplied \$8,700,000 worth of the trade. Coffee production for the 1945-46 crop year was estimated at 862,500 bags (60 kg. each), compared with 920,000 bags in 1944-45. Gold exports in 1945 were down to \$372,000 from \$788,000 in 1944, owing to scarcity of mining machinery.

Communications.—Two railroads were in operation with an estimated 376 mi. of track. All-weather roads totalled 1,378 mi. (150 mi. paved) and unimproved roads, 2,300 mi. External air service was supplied by TACA, Pan American Airways and the national A.L.A. line inaugurated May 18, 1946.

(M. L. M.)

Salvation Army. The Salvation Army is a religious body, operating in 1946 in 98 territories of the world, preaching the gospel of Christ in 102 languages and ministering to emergency needs of humans. Trained officers numbering 27,000 guided its more than 5,000,000 followers.

Following the Salvation Army's positive reaction to war urgency needs, the organization sought to help win the peace by action. Its facilities were revamped to serve men headed overseas as replacements, to help returning servicemen step back into civilian life, to assist their wives and families, to brighten the days for hospitalized servicemen, to continue to provide a home away from home. Such activities were channelled through its network of rehabilitation services, its mobile canteens, its Red Shield clubs and those operated through the U.S.O.

A national goal was set for expanded programs: preventive and rehabilitative service in police courts and prisons, extension of Salvation Army facilities to small towns and rural areas of the U.S. and a quickened effort to broaden the army's religious, welfare, health, educational and character building activities.

Among reconversion "musts" aimed at through its activities, the Salvation Army emphasized the recapture of a normal mental outlook; care and recovery for the sick and maimed; food and clothing for the needy; a broad program of employment; the return of family life to a normal peacetime basis; and build-

ing up of health and character for the children of the nation.

During 1946 Salvation Army units were pressed into service to aid in securing temporary shelter for victims of the nationwide housing shortage. Youth activities were intensified, particularly during the summer months when more than 27,000 mothers and children were emancipated from the blights of stifling city summers at Salvation Army Fresh Air camps.

During the country-wide clothing drive, Salvation Army centres shouldered their share of the job by collecting, repairing and crating garments for the needy overseas. Additional overseas relief activities were in full swing. Local corps and other units hurried a wide range of relief supplies to war-torn countries. Many Salvation Army kitchens were converted to canneries where volunteers processed food for overseas shipment. Its world-wide chain of units facilitated the task and many governments requested the organization to render more aid than ever before. Relief shipments were speeded to all countries where the need was greatest.

The entire program was co-ordinated through national headquarters, New York city, by Commissioner Donald McMillan, national secretary. (See also CHURCH MEMBERSHIP.)

(D. MN.)

Samoa, American. A group of islands in the South Pacific, a U.S. possession by virtue of a tripartite treaty with Germany and Great Britain regulating the disposition of the Samoan archipelago, concluded in Nov. 1899. Area, 76 sq.mi. Pop. (1940) 12,908. The capital is Pago Pago, on the island of Tutuila. There are six inhabited islands, Tutuila, Aunu'u, Ofu, Olosega, Tau and Swains. There is also an uninhabited coral atoll, Rose Island, located 70 mi. east of its nearest neighbour.

American Samoa is governed by a naval officer, commissioned as governor by the president. There is a native governor in each of the three administrative divisions; these native governors appoint the county chiefs, who select the village chiefs. The natives are of Polynesian stock and more than doubled in numbers during the period of U.S. rule. There were 36 public schools with an enrolment of about 3,000, and 6 private mission schools in 1943.

The chief product of American Samoa is copra, of which about 1,100 tons are exported annually. Taro, breadfruit, yams, pineapples, oranges and bananas are produced commercially. The government handles the crop for the natives. The budget for 1939 called for an expenditure of \$127,317; the estimated income was \$106,231.

Construction of a naval base at Pago Pago, begun in 1940, was completed during World War II. The U.S. also maintains an airfield, as well as a wireless and coaling station at Pago Pago, which has the only good natural harbour at Samoa. Tutuila was not an important base during the war and its chief function was as a refueling point and naval repair station.

(W. H. CH.; X.)

Samoa, Western: see MANDATES; PACIFIC ISLANDS, MANDATED.

Sand and Gravel. The renewal of building activity in 1945 increased the demand for sand and gravel in the U.S., but decreases in most other uses offset some of the increase in sand, and left gravel with a net decrease, chiefly because of decline in paving demand. The output of sand rose from 68,978,900 short tons in 1944 to 71,726,000 tons in 1945 while gravel dropped from 125,805,000 tons in 1944 to 123,798,000 tons in 1945.

The production of sand and gravel in Canada rose from 28,399,986 short tons in 1944 to 29,750,703 tons in 1945 and 36,223,834 tons in 1946. (G. A. Ro.)

Sandstone: see STONE.

San Francisco. The resident population of San Francisco, Calif., according to a special U.S. census amounted to 827,400 in Aug. 1945. Between that date and Dec. 31, 1946, 25,081 births and 13,962 deaths were reported, leaving a net gain of 11,119. During the interim there was little change in the resident military population in San Francisco and the provision for housing new population was probably offset by reduction of ship population—crews of vessels registered in San Francisco—and a decrease in density after the close of the war. The population in 1940 was 634,536.

San Francisco business and industrial growth during the year 1946 was healthy and sound. Nearly all lines of trade and industry were expanding to serve new markets. Insured workers' unemployment claims at the middle of Dec. 1946 numbered 16,405 of which less than half were compensable. At approximately the same time the unfilled employment opportunities in San Francisco were reported at 3,658, the majority of which were in the clerical, professional and skilled trade groups.

An appraisal of 1946 activity compared with the preceding year based upon the 11 months' cumulative reports showed the following gains: building permits were up about one-half in number and one and three-quarters in value; real estate sales approximately two-thirds; department store sales one-fifth; number of shares traded on the San Francisco stock exchange nearly two-thirds while the market value increased approximately one-third. Bank debits were up 10%; air traffic increased about 59% in planes and 89% in passengers while freight traffic dropped 24%; exports based upon the first three quarters were up a little more than one-third in value while imports were up two-thirds. Inquiries from tourists and settlers rose 157%; sales of electrical energy were practically identical with the previous year and 25 commercial failures were reported with liabilities of slightly less than \$1,000,000 and assets of \$346,000. The total number of outlets licensed in San Francisco Oct. 1, 1946, to sell tangible personal property was reported at 23,217 or 374 more than the number on July 1, 1946. New industries and expansions reported in San Francisco for the year 1946 were expected to reach about 240 with outlays of \$17,500,000.

San Francisco's funded debt outstanding on June 30, 1946, was \$114,734,200, leaving an actual margin for further bond issues of \$87,721,528. Estimated revenue receivable during the fiscal year 1946-47 amounted to \$116,431,697 of which \$47,300,376 was from taxes. The total assessed valuation for the 1946-47 fiscal year was \$1,223,787,734. The tax rate for the 1945-46 fiscal year was \$5.55 per \$100 assessed valuation.

(R. B. KR.)

San Marino. An independent republic in northern Italy, 14 mi. southwest of Rimini by road. Area: 32 sq.mi.; pop. (Sept. 1939) 14,547. Chief town: San Marino. Executive power is exercised by regents, two of whom are appointed every six months from the popularly elected grand council. Wine, cattle and building stone from the Mount Titano quarries are the chief exports.

Under a Socialist government a new program of public works and a new social policy were inaugurated. The former "duce" of San Marino, Giuliano Gozi, chief secretary of state, was sentenced to seven years' imprisonment by the magistracy of the council of 12 on Jan. 29. In March the treaty of friendship with Italy was renewed. (J. RA.)

Santo Domingo: see DOMINICAN REPUBLIC.

São Tomé: see PORTUGUESE COLONIAL EMPIRE.

Sarawak: see BORNEO.

Saskatchewan.

Central of the three prairie provinces of Canada, Saskatchewan was created by parliament in 1905. Area: 251,700 sq.mi., of which 13,725 are fresh-water lakes; pop. (1941 census): 895,922; 600,846 rural, 477,563 male; (dom. bureau of statistics 1946 est.) 845,000. Chief cities: Regina, provincial capital (58,245); Saskatoon (43,027); Moose Jaw (20,753); Prince Albert (12,508). Administered by a lieutenant governor, an executive council and a 52-member legislative assembly, Saskatchewan is represented federally by 21 members of parliament and 6 senators.

History.—In 1946 the voting age was dropped from 21 to 18, doubling the number of voters. Compulsory automobile insurance was introduced. Plans for free hospitalization for all citizens, for a compulsory \$5 annual headtax, went into effect at midnight, Dec. 31. It was the first such scheme in North America. The provincial government expanded its ten commercial enterprises by going into fish processing and spray painting. A further reduction of public debt was made (1946: \$169 per capita; 1944: \$252 per capita).

One provincial royal commission studied fish production and marketing; another studied penal reform; a special body surveyed the cause, nature and cost of farm accidents.

Northern Saskatchewan development progressed notably. A new townsite was opened at Lac La Ronge, pushing the frontier 100 mi. northward. Brush clearing on 200,000 ac. in rich Carrot River valley went forward for settlement of 5,000 war veterans. To meet the problem of northland communication, the province's radio branch was extended. A big scheme to develop fur resources, costing \$50,000 annually, began with co-operative sharing of returns by trappers. Government tests proved imports via the Hudson bay sea route could be made more cheaply than via the rail route from eastern Canada.

To aid drought-stricken Saskatchewan farmers, the federal government paid out about \$10,000,000 under the Prairie Farm Assistance act. The federally controlled Royal Canadian Mounted police undertook to blanket the province with their own radio network and two-way radio cars. (C. Cy.)

Education.—For the school session, 1943-44, the enrolment in all educational institutions was 204,001; total revenue for the provincially controlled schools in 1944 was \$14,086,946. The

University of Saskatchewan, with its seat at Saskatoon, is the provincial university. The fall 1945 registration was 2,780.

Agriculture.—In 1944, the estimated gross value of agricultural production was \$624,608,000; farm income, \$503,300,000. In 1945 the wheat crop was 162,000,000 bu. The value of field crops was \$302,904,000 (1944, \$440,494,000). For the first 50 weeks of 1945 the inspected slaughterings of livestock were: cattle 161,276; calves 23,339; hogs 669,436; sheep 48,344.

Sastri, V. S. Srinivasa (1869-1946), Indian statesman, was born on Sept. 22 near Kumbakonam, Madras. Starting his career as a schoolteacher, the Rt. Hon. Sastri joined the Servants of India society in 1907, rose to the presidency of that organization in 1915 and subsequently became leader of the Indian Moderates. He represented his country on government missions abroad, and his last assignment in 1937 took him to Malaya where he conducted an inquiry into Indian labour conditions in that region. He later retired from active political life and in 1940 resigned as vice chancellor of Annamalai university, a post he had held for five years. He died on April 17, according to a report from Madras, India. (See *Encyclopædia Britannica*.)

Saukel, Fritz (1894-1946), German politician, was born Oct. 27 in Lower Franconia. While he was a seaman during World War I, his ship was captured by the British and he spent the remainder of the war as a prisoner in England. Saukel joined the nazi party at its inception and became one of its leading propagandists in Lower Franconia. He became a nazi group leader in Thuringia and later a member of the provincial diet. He subsequently served as minister of the interior and state commissioner.

During World War II, Saukel was chief commissioner for the utilization of manpower and met Hitler's request for greater production by rounding up slave labourers for Germany's factories. Travelling through nazi-occupied territories in Europe, he recruited slave labour by force and made the fullest exploitation of their powers. After the war he was brought to trial at Nuernberg before the International Military tribunal along with other nazi leaders and he was found guilty Oct. 1, 1946, of war crimes and crimes against humanity and sentenced to hang. In the verdict Saukel was described as being in charge of a program involving deportation for slave labour of 5,000,000 people under cruel and insufferable conditions. Sentence was carried out Oct. 16.

Savings and Loan Insurance Corporation, Federal: see HOUSING.

Savings Banks: see BANKING.

Schacht, Hjalmar (1877-), German financier, economist and politician, was born Jan. 22 at Tingleff near Flensburg. He studied political economy and was employed by several German banks in high executive positions. In 1923 he was appointed president of the Reichsbank. Because of his opposition to the Young plan, he resigned from the Reichsbank in 1930, but was reinstated by Hitler in 1933. Thereafter, he co-ordinated the activities of the Reichsbank with the German rearmament program, assisted in the reorganization of Germany's economy for war and instituted the system of exchange control. Schacht subsequently opposed Hermann Goering's program of economic autarchy. However, Goering won Hitler's support and Schacht resigned Nov. 16, 1937, from his post as minister of economics and plenipotentiary general for war economy to which he had been named in 1934. Thereafter, Schacht

TRANSFERRING PATIENT from air ambulance to motor ambulance at the Regina, Sask., airport during 1946; the air ambulance service is provided by the Saskatchewan department of health

began to object to what he called the reich's program of "excessive militarization," and on Jan. 19, 1939, was dismissed as president of the Reichsbank. Later he was also forced to give up his post as minister without portfolio (Jan. 22, 1943).

Schacht, who was involved in the abortive plot to assassinate Hitler, July 20, 1944, was arrested three days later and was put in a concentration camp until the end of World War II.

He was subsequently released by the Allied authorities and on Aug. 29, 1945, he was indicted by the International Military tribunal to stand trial on charges of various war crimes. He was acquitted by the tribunal, Oct. 1, which ruled that there was no proof that Schacht carried out his program as part of the deliberate nazi plan to wage aggressive war. After his release, Schacht was again arrested, Oct. 7, 1946, by German police authorities to stand trial before a German denazification court.

Schirach, Baldur von (1907–), German politician, son of a former German theatre director and a U.S. mother, studied at the University of Munich. He joined the National Socialist party in 1925 and was elected to the reichstag in 1932. He was appointed "reichsleiter" (reich leader) in June 1933, and entered Hitler's inner circle. On June 18, 1933, Von Schirach was made youth leader of the German reich. He held this post until Aug. 1940 when he was appointed gauleiter of Vienna. Taken prisoner in 1945, he was indicted Aug. 29, 1945, by the International Military tribunal to stand trial as one of the major nazi war criminals. During the trials, Von Schirach admitted (May 23, 1946) that Hitler had given him the post of gauleiter for the express purpose of driving the Jews and Czechoslovaks out of Vienna. He also acknowledged (May 27, 1946) that he had taken part in plans to ship Vienna's Jews to eastern areas, but denied that he knew they were to be murdered. Von Schirach was found guilty of crimes against humanity and was sentenced, Oct. 1, 1946, to 20 years imprisonment.

Schwellenbach, Lewis Baxter (1894–), U.S. jurist and cabinet member, was born Sept. 20 in Superior, Wis. He was graduated from the University of Washington, Seattle, Wash., in 1917 with an LL.B. degree and served with the U.S. army as a private during World War I. He was admitted to the bar in 1919, became active in Democratic state politics, and in 1934 was elected to the U.S. senate. During his tenure, Sen. Schwellenbach supported the administration in both its domestic and foreign policies. He resigned from the senate in Dec. 1940 to become federal judge of Washington state, eastern district. President Truman named him secretary of labour, May 23, 1945, and his appointment was approved by both the A.F. of L. and the C.I.O. He endorsed, Sept. 25, the theory of raising the minimum wage law to 65 cents an hour, asserting that the resulting wage increases would not register an appreciable effect on the costs of production, and urged the senate to provide legislation to this end.

Schwellenbach, who was credited with originating the fact-finding procedure for settling labour disputes, warned (Feb. 26, 1946) that no single formula, such as the Case strike-control bill, would work. He favoured price control, warning (June 20) that any weakening of OPA would result in a new cycle of wage demands and work stoppages. Schwellenbach did not play an important role in either of the two major coal strikes in 1946, although the president conferred with him on these issues.

ERNEST SHONE-JONES of London working on a head of Joseph Stalin for the Icelandic government in 1946. The figure was to be included in a permanent exhibition in Reykjavik, Iceland

Sculpture. The trends of sculpture in 1946 were not clearly defined. Prewar conditions of easy success were wanting, giving place to a sterner struggle. Commissions were few and not a great amount of work was displayed; but the general standard was less bound by convention and so had latent possibilities. Increased activity, too, lay in the immediate offing, notably in the field of war memorials.

In the United States, where reconversion was speeded, the period was marked by little major activity until the end of the season. New York's Museum of Modern Art then gave the English sculptor Henry Moore a large retrospective exhibition which placed the modern viewpoint before the public very notably. Two others, given by the National academy and the progressive Whitney Museum of American Art, aimed to show the current state of U.S. sculpture in its varied aspects. The joining of these exhibitions by returned war veterans was in both instances perceptible. Meanwhile, the official National Sculpture society, once a dominating factor in the sculpture field, was not remarkable for its leadership, though a new program was promised.

There were indications, but not many, of the revival of practical sponsorship, and a few important commissions were in progress in 1946: among these were Herbert Haseltine's bronze statue of Sir John Greer Dill, the British field marshal, to be placed over his grave in Arlington National cemetery, near Washington, D.C.; Richmond Barthé's bronze bust of the Negro educator Booker T. Washington, installed in the sculptural Hall of Fame on the campus of New York university; Hans Schuler's bust of the southern poet Sidney Lanier, also placed at New York university; and John Angel's statue of St. John given to the Cathedral of St. John the Divine, New York city, as a testimonial to the Right Rev. William T. Manning, bishop of New York, on his retirement. Brenda Putnam, New York sculptress, was engaged on the designing of a gold medal to be presented by congress to Fleet Adm. Ernest J. King in recognition of his services during World War II. A similar medal for General of the Army George C. Marshall also was authorized.

In a report of the subject of war memorials, the American Institute of Architects counselled a thorough deliberation of the problem and ample time allowed before proceeding with monuments, in order to avoid the errors of the past. The Brooklyn Civic centre, in line with this sentiment, provided for a building in which sculpture was to be used in the memorial chapel.

Great Britain gave signs of a reawakened interest in sculpture for memorials and public buildings that were auspicious but

confined to a narrow front. The Royal Society of British Sculptors planned several exhibitions to encourage a livelier public interest in the art. The subject of the first, to be held in 1947, was "Children in Sculpture." Another, planned in collaboration with the Royal Institute of Architects, was aimed to increase the use of sculpture in buildings and their layouts.

Some important commissions were in progress; among these were Sir William Reid Dick's bronze statue of Franklin D. Roosevelt, to be erected in a fittingly imposing setting in Grosvenor square, London; Charles Wheeler's stone groups of the winds to be placed at the four corners of the new Waterloo bridge; Gilbert Ledward's bronze figures, a memorial to men of the submarine branch of the royal navy, the commandos and the airborne forces, to be placed in Westminster abbey; and William McMillan's fountain for Regent's park, the first of a series of works to be executed by various sculptors under the terms of the Constance fund. Alfred Hardiman, whose fountain figure for the council house of Bristol was awarded the gold medal of the Royal Society of Sculptors for the best work of the year, was engaged on a companion figure for the same civic centre, and on a memorial fountain to Lord Southwood. Henry Moore was engaged on a memorial figure for Dartington hall, shown in his October exhibition at the Leicester galleries, London.

In France, to which returned several sculptors, including Jacques Lipchitz, who were resident in the United States during a part of World War II, the accustomed support given to sculpture hastened a revival on both traditional and exploratory lines. New work was expected from French sculptors, among them Marcel Gimond, Emmanuel Auricoste, Robert Couturier, Henri Martin and Salendre.

The U.S.S.R. paid practical tribute to sculpture by arranging a travelling exhibition of photographs of works by many soviet sculptors. The exhibition made it clear that their inspiration springs from nature and from life. Many of the soviet sculptors were employed in portraying representatives of the army and of farm and factory workers.

Among others may be mentioned Matvej Manizer, Vera Mukhina, Vladimir Ingal, Benjamin Bogolubov, Alexander Grube and Leonid Sherwood. (See also ART EXHIBITIONS.) (C. BU.)

Secondary Education: see EDUCATION.

Secondary Metals.

Data on the recovery of secondary metals in the United States is shown in the table at right; it should be pointed out, however, that the total recoveries shown do not represent metal brought back from the pool of metal in use, as large amounts of fabrication scrap are included.

The effect of World War II on the secondary metal industry was marked not only by heavy increases in recoveries,

but also by marked shifts in the relative amounts of old and new scrap contributing to the output. Shortage of supply to meet war demand led to increases in the amount of old scrap drawn from the pool of metal in use, but these increases were not as marked as the larger turnover of new scrap from the wide variety of plants making war materials; hence, in spite of the increased amounts of old scrap brought back into use, the ratio of old scrap to total recovery decreased in most cases. However, it must be kept in mind that it is only the reworking of old scrap that increases the actual supply of metal available for use; the reworking of new or plant scrap is merely an additional stage in the preparation of metal that has not been in use.

Dealers' receipts of all types of nonferrous scrap totalled 534,403 short tons in the first half of 1946, as compared with 498,766 tons in the last half of 1945, and 536,107 tons in the first half, or a total of 1,034,873 tons for the year, and 1,030,262 tons in 1943. Dealers' shipments to consumers followed the same general pattern, but at a slightly lower level, so that stocks increased from 155,182 tons at the end of 1944 to 174,677 tons at the end of 1945, and 174,206 tons at the end of June 1946.

There was some improvement in the supply of iron and steel scrap after the peak demand in 1943, but the supply remained short. Consumption of scrap declined from 61,650,956 tons in 1943 to 61,349,201 tons in 1944, 56,191,085 tons in 1945, and, because of the steel and coal strikes early in 1946, only 19,058,000 tons in the first half of 1946. In the production of steel, which accounts for four-fifths of the scrap consumption, it required 656 lb. of plant scrap and 406 lb. of purchased scrap to make a ton of steel in 1944, but in 1945 these figures were 633 lb. and 450 lb. respectively, while in the first half of 1946 they were 534 lb. and 482 lb.; although these figures indicate a reduction of total scrap used, the plant scrap:purchased scrap rate shifted from 62:38 to 58:42 and then to 53:47, which corresponds with the 1937 low. Stocks, however, were low, having declined from 7,175,500 tons at the end of 1943 to 5,969,217

tons in 1944, with apparently a further reduction of the same size or even greater in the first half of 1946. (G. A. Ro.)

Second World War: *see* WORLD WAR II.

Secret Service, U.S. Security work of the secret service during 1946 entailed protection of the president; safeguarding the 700-year-old Lacock Abbey copy of the Magna Carta in transit from New York to Washington, and protection (by the secret service uniformed force) of \$500,000,000,000 in paper money, stamps and other government obligations in transit and in production and storage. The White House was opened to the public Nov. 14 for the first time after 1941, giving added security duties to the secret service and the White House police. In one case the secret service identified and arrested a man who threatened the life of the president. He was held under \$10,000 bail for the action of the grand jury.

In September, secret service agents arrested five men in New York and New Jersey for manufacturing counterfeit \$20 notes. Later, with the co-operation of a navy diving crew, agents recovered from the Passaic river 44 pieces of plates used to print the notes.

In Missouri a secret service agent unearthed a coin counterfeiting plant inside the state penitentiary. A prisoner, serving a sentence for burglary, made clay moulds for fake nickels, dimes, quarters and half-dollars and spent the coins in the prison commissary.

The amount of counterfeit money seized exceeded that seized in 1945, primarily because several bogus bills were received from foreign countries. Representative value of counterfeit bills seized totalled about \$208,122.85, of which \$41,000 represented bills passed abroad. Counterfeit coins seized totalled \$10,020.67. Victims of fake bills and coins in the United States lost \$54,736.31 during the year, as against losses of \$25,666.86 during 1945. Some 84 persons were arrested for counterfeiting offenses, as compared with the 1945 total of 43 arrests.

The major enforcement activity of the secret service comprised government cheques and bonds which were stolen and forged. More than 30,477 forged cheques were received for investigation, representing an increase of about 31.1% over the 1945 total of 23,241. There were 2,074 persons arrested for forgery. In Washington, D.C., agents smashed a forgery ring in May with the arrest of three men and one woman who admitted stealing, forging and cashing about 100 treasury cheques and savings bonds.

The arrest of a group of juveniles in New York city shows how extensively young boys are engaged in cheque theft and forgery. Six boys, ranging in age from 13 to 16 years, were arrested in April for stealing cheques from the mails. All were placed in the custody of the federal probation officer.

Forgeries of savings bonds totalled 14,578 as compared with 6,573 for 1945.

There were 1,960 convictions for cheque forgery in 1946 as against 1,625 in 1945. Bond forgery convictions totalled 280 for an increase of 0.8% over the 1945 figure of 278. There were 61 convictions for counterfeiting. Fines in criminal cases aggregated \$65,189.04 and jail sentences totalled about 2,525 years. Additional sentences of about 2,610 years were suspended or probated. The secret service disposed of some 48,947 criminal cases, as compared with 29,751 in 1945. (J. J. My.)

Securities and Exchange Commission.

On Dec. 31, 1946, the members of this bipartisan, quasi-judicial

agency of the federal government were Chairman James J. Caffrey and Commissioners Robert K. McConaughy, Richard B. McEntire and Edmond M. Hanrahan. With headquarters in Philadelphia, the commission maintains regional offices in Atlanta, Baltimore, Boston, Chicago, Cleveland, Denver, Fort Worth, New York city, San Francisco and Seattle.

Securities Act of 1933.—During the year, securities in the aggregate amount of \$7,000,000,000 were registered under this act for public sale and distribution, representing the highest annual volume to that time and bringing the total of registered securities to \$35,600,000,000. The sole objective of registration (to which requirement there are certain exceptions) is to provide disclosure of significant financial and other information upon which investors may exercise a rational judgment whether to purchase registered securities. The principal medium for disseminating the information is the prospectus or selling circular, which must be delivered to prospective purchasers and must contain an accurate summarization of the information disclosed. Important penalties attach to the filing of materially incomplete or inaccurate information, or the sale of securities upon the basis thereof; and investors have a right of recovery for losses sustained in the purchase of registered securities in the event of such incomplete or inaccurate disclosure of the facts.

It is important to emphasize that investors must judge for themselves, upon the basis of the facts disclosed, whether to acquire registered securities offered for sale to them, the commission having no power to deny registration for lack of merit.

Securities Exchange Act of 1934.—Under this act there were registered with the commission at the year end: 19 national securities exchanges; 3,585 security issues (of 2,188 companies) listed upon exchanges; 4,200 over-the-counter brokers and dealers; and 1 association of such brokers and dealers, with a membership of 2,514.

With respect to the securities listed upon exchanges, the act provides for disclosure of financial and related data upon which investors may exercise an informed judgment as to their merits. In addition, proxy solicitations must meet certain minimum disclosure requirements, and solicitations by nonmanagement groups are facilitated. Requirements for reporting the stockholdings and transactions of "insiders," and provisions permitting recovery by the corporation of their short-term trading profits, operate to curb misuse of inside information.

Provisions of the act and commission regulations thereunder prescribe certain minimum standards of business conduct in the securities markets which operate to curb manipulation, misrepresentations and other abusive practices and to establish just and equitable principles of trade. Designed to protect investors against abusive practices, in both the exchange and the over-the-counter markets, these provisions are implemented by the commission's surveillance of securities trading practices and its power to enforce sanctions of the act against violators. Among such sanctions is the power to suspend or expel from membership in exchanges or the association of over-the-counter brokers and dealers, or to deny or revoke broker-dealer registrations with the commission, if it is found, after hearing, that the act or regulations thereunder have been violated. Nearly 270 such actions had been taken by the commission to June 30, 1946. Other "enforcement activities" are discussed below.

Public Utility Holding Company Act of 1935.—Designed to regulate the financial and related practices of companies in electric and gas public utility holding company systems, and thus curb the abuses which gave rise to enactment of the law, this act also requires various readjustments by system companies to simplify over-capitalized and complex corporate and system structures, to correct unfair distributions of voting power among security holders and to limit system operations to eco-

nominically integrated and co-ordinated utility properties (plus incidental systems and businesses). Constitutionality of the integration requirement was upheld by the U.S. supreme court during the year.

Electric, gas, and nonutility properties approximating \$6,000,000 had been sold or otherwise divested from holding company systems, either in anticipation of the requirement for integration or pursuant to orders directing compliance therewith. An additional \$3,300,000,000 of such properties were subject to divestment orders at the year-end. In 31 cases, the commission had ordered corporate and capital simplification and equitable redistribution of voting power; 46 similar cases pending at the year-end were in advanced stages; and in 68 cases, plans for voluntary compliance with such objectives had been approved by the commission.

At the year-end, the issuance and sale of approximately \$9,700,000,000 of securities had been passed upon by the commission as meeting certain exemption provisions or as conforming to specific statutory standards prescribed in the act for the protection of investors and consumers.

Other Acts.—During the year, (1) indentures covering debt securities aggregating \$3,000,000,000 were qualified under the Trust Indenture Act of 1939, bringing the total to \$9,000,000,000; and (2) the commission served as adviser to federal courts in 104 reorganization proceedings under Chapter X of the Bankruptcy act. At the year-end, 361 registered companies with aggregate assets approximating \$3,500,000,000 were subject to the requirements of the Investment Company Act of 1940 and 853 registered investment advisers were subject to the provisions of the Investment Advisers Act of 1940.

Enforcement Activities.—The commission is authorized to investigate complaints or other evidences of fraud or other law violations in securities transactions. Evidence of such violations may be used in administrative proceedings, as heretofore related, or in civil actions before federal courts seeking an injunction against the acts or practices complained of, or in criminal prosecutions (conducted through the department of justice) for willful violations. At the year-end, such actions had resulted in court injunctions against 1,056 companies and persons and in convictions of 1,200 individuals. (See also STOCKS AND BONDS.)

(O. L. DS.)

Seeing Eye, The. From its founding in 1929, The Seeing Eye, Inc., had trained more than 1,300 dogs as guides for blind men and women. During 1946, 148 blind persons came to the school to spend a month learning to use their dog guides; among them were veterans of World War II who were provided with Seeing Eye dogs at no cost to the servicemen or to the government. They were given priority over other applicants. The school's four year course for instructors, which had become inactive during the wartime manpower shortage, was revived and five sighted men were taken on as apprentices. Seeing Eye graduates were using dog guides in all 48 states, the District of Columbia, Canada, Hawaii and Puerto Rico. They followed almost 100 different types of occupations. The Seeing Eye is a philanthropic organization, supported by members and contributors who during 1946 numbered about 24,000. It is located at Morristown, N.J. Henry A. Colgate is president and chairman of the board of trustees. (H. A. CE.)

Seiberling, Charles Willard (1861-1946), U.S. industrialist, was born on Jan. 26 at Western Star, O., and was educated at Oberlin college, Oberlin, O. He was engaged in the manufacturing business in 1881 and two years later became the superintendent of J. F. Seiberling and company (1883-95), and afterward the secre-

tary of the Akron India Rubber company (1895-98). In 1898, he founded the Goodyear Tire and Rubber company with his brother, Frank, on \$3,500 borrowed capital and in the years that followed the firm expanded until it was one of the largest in its field. The depression of 1920 caught the concern heavily loaded with inventory, and in the face of rapidly dwindling prices the two brothers lost most of their capital and the control of Goodyear in that same year. Obtaining new capital they started again, and with Charles as vice-president and treasurer built up the concern known as the Seiberling Rubber company. Valued at \$7,000,000, it became the eighth largest enterprise of its kind. During his lifetime Seiberling was president of the Thomas Phillips company and of Seiberling Latex Products company, and director of the Citizens Savings and Loan company, and the Macedonia-Northfield Banking company. He died at Akron, O., on Sept. 20.

Seismology. In 1946, the United States navy expanded its program of utilizing seismographic data to detect and track hurricanes. The California Institute of Technology extended its investigation of earthquake magnitudes from instrumental records to include deep focus earthquakes, and published new information on the rate at which the frequency and magnitude of earthquakes decrease with depth. Several new seismological stations were either established or modernized in the United States and South America, and advances were made in the application of electronic principles to new seismograph design, especially in the field of high-magnification visible recording.

Most of the stations left unharmed by World War II resumed world-wide exchange of data all of which eventually appears in the *International Seismological Summary* sponsored by the International Geodetic and Geophysical union. Preliminary information on important earthquakes was issued by the International Seismological association (Strasbourg) and by Science Service (Washington) in co-operation with the U.S. coast and geodetic survey and the Jesuit Seismological association. The latter group issued 45 immediate epicentre locations in 1946.

Seismic seawaves generated by submarine earthquakes killed 173 in the Hawaiian Islands on April 1, 100 in the Dominican Republic on Aug. 4 and 1,500 in Japan on Dec. 21. The April 1 seaquake originated in the Aleutian Islands and caused \$20,000,000 damage in the Hawaiian Islands. The Japanese and Dominican Republic earthquakes were the strongest of the year.

Destructive shocks accompanied by casualties also occurred in Algeria, Turkey, Russia and Peru. The dead in all earthquakes combined totalled about 5,000. Two unusually strong shocks in the Puget sound (Washington) area caused considerable damage and some casualties. In Switzerland a moderately strong shock damaged buildings and disrupted communications in the canton of Valais. Ground vibrations from the atomic bomb experiment at Bikini Island were recorded on a number of sensitive seismographs in the United States. (See also COAST AND GEODETIC SURVEY, U.S.; DISASTERS.)

(F. NN.)

Selective Service, U.S. Outstanding in connection with the administration of the Selective Training and Service act during 1946 was the question of its continuance after the cessation of hostilities to provide adequate military manpower to meet United States commitments to associates in United Nations and for maintenance of national security. This question involved the effect of Selective Service in stimulating voluntary recruitment as well as in supplementing it to supply immediate military manpower needs, together with the potential value of the Selective Service system as basic provision for registering, classifying and selecting U.S. youth

for specialized training to preserve national security.

Pending final decision before the expiration date of the Selective Service act, on March 31, 1947, congress twice, during 1946, extended its duration period to meet then current requirements of the armed forces, and the war department twice suspended calls on Selective Service to test its effect on recruitment. The second of these so-called "draft holidays" was in effect at the close of 1946 without announcement as to whether it would be necessary to resume inductions under the Selective Service act pending decision concerning its extension after March 31, 1947. It was noteworthy, however, that both "draft holidays" during 1946 resulted in dropping voluntary enlistments to levels far below projected minimums.

President Truman, in his "state of the nation" message to congress, Jan. 21, 1946, urged extension of the Selective Training and Service act for at least one year, from the then stipulated expiration date, May 15, 1946, to fulfil demobilization promised to World War II veterans and at the same time meet military manpower commitments to the Allies. However, congress was still indecisive on May 14, the day before the act would have expired, and temporized with extension until July 1, 1946.

The act, during this period of extension, was amended to halt induction of 18- and 19-year-old registrants, except volunteers, fathers (none of whom had been drafted after Dec. 1945) were specifically exempted from induction, and the age bracket for induction was set at 20 through 29 years. Hitherto, after the surrender of Japan on Aug. 14, 1945, the induction age bracket for Selective Service had been 18 through 25 years.

Following this action by congress, the war department began its first "draft holiday" test of the effect of Selective Service on recruitment with the announcement, June 24, 1946, that no calls on Selective Service would be made during July and August.

Army enlistments for June 1946, had totalled 62,494, of which 30,633 were men subject to induction through Selective Service. Without recruitment through Selective Service, the total for July 1946, was only 44,063, of which 26,812 were listed by the war department as "without previous military service," indicating that they were Selective Service registrants liable

for call. The total for Aug. 1946, dropped to 39,615, including 27,580 "without prior military service."

On June 29, 1946, congress again extended the life of the Selective Training and Service act (public law 473) fixing the expiration date as March 31, 1947. This extension amended the act to make the age bracket for liability to military service 19 through 44 years old (which included all Selective Service registrants except those 18 years old), to provide for the induction of World War II veterans who had not served overseas for at least 6 months, to exempt all fathers, and to limit military service through Selective Service induction to 18 months.

As the army did not desire recruits 30 years old or over, President Truman, on July 16, fixed the induction age bracket for Selective Service registrants at 19 through 29 years.

Following the first "draft holiday" during July and August, and the placing of a call for 25,000 men with Selective Service, army recruitment for Sept. 1946, jumped from the total of 39,615 in August to a total of 61,750 in September. The September total included 52,696 "without previous military service," compared with only 27,580 in that category in August.

The second "draft holiday," which remained effective at the close of 1946, began in October and was marked by an even more drastic drop in recruitment than occurred during the first, and this decline was reflected in navy and marine corps enlistments.

With the announcement that no calls on Selective Service would be made during Oct. and Nov. 1946, enlistments in the army dropped from 61,750 in September to 48,769 in October. Moreover, the total enlistments for the first week of November were only 4,851 as compared with 7,599 for the last 10 days of October, and the enlistments of men "without previous military experience" during the 7 weeks from Oct. 1 to Nov. 21 were only 47,699 as compared with a total of 52,696 for the 4 weeks of September.

The most decided drop in all enlistments, and particularly in those of men without prior military service, occurred in the second week of October. This was coincident with the withdrawal of the October call that had been sent to Selective Service and also marked the ending on Oct. 6 of extended G.I. Bill benefits offered by the Voluntary Recruitment act (public law 190) to men voluntarily enlisting before that date.

SERVICEMEN'S WIVES besieging General Dwight D. Eisenhower in Washington, D.C. on Jan. 22, 1946, demanding the return of their husbands from overseas

More than half of October's recruits, or 28,303, enlisted in the first week. For the second week, enlistments dropped to 7,383, then to 5,484 for the third week, and totalled 7,599 for the last 10 days of the month. Enlistments of men without prior military service who were subject to draft during the first week of October totalled 25,909, dropped to 5,344 the second week, to 3,567 the third week, and totalled 4,487 for the last 10 days of the month. These figures remained virtually stationary during November and December and a continued downward trend was indicated by December figures as the "draft holiday" moved into 1947.

On Dec. 2, 1946, during the second "draft holiday," Major General Lewis B. Hershey, director of Selective Service, called for a thorough inventory of U.S. military manpower as it was represented by the rosters of Selective Service local boards.

This survey, which was completed according to instructions on Dec. 20, was designed to place Selective Service local board records in a state of readiness for any calls which might be issued by the war department during the first part of 1947, and to supply data for use by congress in connection with legislation providing for national security and adequate military strength for fulfillment of the nation's commitments to its associates in the United Nations.

These data, transmitted to National Selective Service headquarters by local boards through their state headquarters, were being collated and analyzed at the close of 1946 but would not be available in final form until sometime during the first quarter of 1947.

This manpower picture, close to the end of 1946, for men who were 18 through 44 years old at the time of registration was approximately as follows:

Total registrants	35,180,000
Class I-C, all ages, (Registrants in the armed forces, or honourably discharged therefrom.)	14,064,000
18-year-old registrants (Exclusive of Class I-C)	700,000
Registrants 19-through-29-years old (Exclusive of Class I-C)	3,403,000
Registrants 30-through-49-years old (Exclusive of Class I-C)	17,013,000

The current Selective Training and Service act prohibited any classification activity on registrants 18 years of age; therefore these registrants were in an unclassified status until they became 19 years old. Practically all of the registrants in the 30-49 age group retained IV-A (deferred by reason of age) classifications except a few who were classified I-G (honourably separated from the armed forces) or IV-B or IV-D (deferred by law). Registrants in this age group were in an inactive classification stage as far as Selective Service local boards were concerned.

The only registrants currently under active classification at the close of 1946 were those within the 19-29 age group and their classification status was as follows:

Total registrants (exclusive of Class I-C)	3,403,000
IV-F (rejected for military service)	1,989,000
I-A (being processed for induction)	162,000
Unclassified	23,000
II-A (deferred in occupations other than agriculture)	63,000
II-C (deferred in agriculture)	179,000
III-A (deferred fathers)	851,000
III-D (deferred as hardship cases)	12,000
All other classes	79,000
Deceased	45,000

When congress voted on June 29, 1946, to extend the Selective Service act until March 31, 1947, the cumulative inductions through Selective Service into the armed forces (from Nov. 18, 1940, to June 30, 1946) totalled 10,002,569. At the close of 1946, these cumulative inductions were approximately 10,022,367.

When the nation was attacked at Pearl Harbor, Dec. 7, 1941, the trained military manpower of the United States was only about 1,000,000 officers and men. When the fighting was ended by the surrender of Japan on Aug. 14, 1945, more than 12,000,-

000 of the 14,700,000 men who served under arms against Germany, Japan and their allies were still in service.

Of the 14,700,000 who served in the armed forces of the United States while hostilities were in progress during World War II, 9,700,000, or approximately 66%, were registrants inducted through Selective Service. And among the remaining 5,000,000, a large proportion were influenced to enlist or seek a commission because of their liability to be drafted.

When the war department ended the first "draft holiday" by issuing a September call upon Selective Service for 25,000 registrants, who were required to be 19 through 29 years old to meet the minimum fixed by congress and the maximum acceptable to the army, Selective Service local boards were instructed that occupational deferments in that age group should be gradually reduced to the barest minimum consistent with calls of the army. The purpose was to confine occupational deferments, within the very limited military manpower pool of that age bracket, to those who, after drastic scrutiny, were found to be absolutely "indispensable and irreplaceable to national existence" as individuals in their current occupations. The only exception to this general rule was by statutory provision, the so-called Tydings amendment concerning farm workers.

New categories established for occupational deferment on July 22, 1946, authorized local boards to give "most serious consideration" to registrants in the 19-29 age group who were students in medicine, dentistry, veterinary medicine and osteopathy, and certain teachers and research workers in the physical sciences and engineering who were certified by the Office of Scientific Research and Development.

On Oct. 12, 1946, four new categories for *special* occupational deferment consideration as "essential men" were made at the request of the director of the Office of War Mobilization and Reconversion. They included college and university teachers, home construction workers, and critical production and transportation workers. It was provided that requests for deferment in these four special categories must be certified by designated government agencies.

At the end of the year 1946, there were approximately 300 conscientious objectors assigned to 4 camps and projects. More than 11,300 who had been under control of the Selective Service system had been discharged.

The Veterans Personnel division of the Selective Service system was established by section 8(g) of the Selective Training and Service act of 1940, and continued through all amendments. This division was charged with the responsibility of assisting veterans in obtaining their right to be restored to their former positions as well as in obtaining new employment. During 1946, the activities of this division increased and continued proportionate to the rate of demobilization, especially during the early part of the year.

From Dec. 1, 1945, through Nov. 30, 1946, 4,736,636 veterans contacted Selective Service local boards for information or assistance, in addition to 16,728 persons who were not veterans.

Effective July 16, 1946, under the President's Reorganization Plan No. 3, the function of assisting veterans in obtaining new employment was transferred from the Selective Service system to the United States Employment service. During the first six months of 1946 and prior to the transfer of this function to the United States Employment service, Selective Service facilities and personnel had been utilized throughout the country in those areas where the United States Employment service did not have established facilities.

During this period 32,000 new jobs were obtained for veterans directly by Selective Service officials and 800,000 veterans were referred to other agencies more directly concerned in job-placement activities.

The statutory re-employment rights of veterans were obtained with remarkably little litigation. Since the beginning, and up to Dec. 31, 1946, Selective Service had found it necessary to refer only 2,507 cases to the various United States attorneys, 2,322 of them during 1946, and over 600 of those have already been settled amicably for the veteran without the necessity of any court action. This number is from an estimated total of 5,000,000 veterans with re-employment rights. During 1946, also 103 court decisions were rendered, interpreting the re-employment provisions of the Selective Service law.

While the great majority of the veterans had come home and exercised their rights for old jobs, if they had one, or decided not to do so, many of the difficult cases were in the process of settlement. As of Dec. 31, 1946, there were 254 cases pending in court, awaiting decision, and 1,372 in the hands of the various United States attorneys, awaiting determination as to whether or not litigation would become necessary. During 1946, 254 suits were filed in the federal courts on behalf of veterans.

Fifty-five state organizations (including New York State Procurement office), 6,443 local boards and 505 appeal boards comprised the Selective Service system in 1946.

There were 184,229 persons connected with the system at the close of 1946. Of this number 174,513 who were uncompensated were divided as follows: 23,641 local board members; 7,715 government appeal agents; 73,134 members of advisory boards for registrants; 27,245 examining physicians, 6,839 examining dentists; 1,974 members of boards of appeal; 8,396 members of medical advisory boards; 19,868 re-employment committeemen; 5,180 advisers and field agents of the medical survey program; 2 state directors; and 519 special advisers and consultants.

Executive officers of the Selective Service system on Dec. 31, 1946, were: director, Major General Lewis B. Hershey; deputy director, Brigadier General Carlton S. Dargusch; asst. director, camp operations, Colonel Lewis F. Kosch; executive asst. to the director, Colonel Campbell C. Johnson; adjutant general, Lieut. Colonel Samuel L. Davis; asst. executive, Colonel Raymond T. Higgins; asst. executive, Lieut. Colonel Oliver H. Folk; budget officer, Lieut. Colonel Arthur R. Boone; chairman, presidential appeals board, Colonel Henry F. Rhodes; chief liaison and legislative officer, Colonel Louis H. Renfrow; chief information officer, Lieut. Colonel Irving W. Hart; chief medical officer, Colonel Richard H. Eanes; general counsel, Colonel Daniel O. Omer.

(L. B. H.)

Selenium. World production of selenium is of the order of 600–700 short tons a year, mostly from the United States and Canada. In the United States production advanced from 485,446 lb. in 1944 to 542,099 lb. in 1945, while sales rose from 423,907 lb. to 666,363 lb., a near record figure. At the same time, imports increased from 97,800 lb. in 1944 to 219,215 lb. in 1945. Supplies were plentiful, and production exceeded sales from 1942. Producers had accumulated stocks of more than 500,000 lb., but the high sales of 1945 cut stocks to 392,953 lb. The Canadian production declined from 374,013 lb. in 1943 to 298,592 lb. in 1944, but increased to 419,000 lb. in 1945. Canada supplied all of the U.S. imports. (G. A. Ro.)

Seventh-day Adventists. The principal event in the 1946 history of this church

was the holding of the 45th session of the general conference. To this session, convened in Washington, D.C., June 5–15, came 828 delegates from different countries. This was the first world conference held after 1941. At this session preliminary plans were laid for reorganization of church work throughout the world, both as to rehabilitation and as to realignment of conference territories in view of boundary changes made by World War II. Reports from overseas delegates revealed that despite the almost complete disruption of church life in many lands, the war period showed a membership increase outside America from 309,329 on Dec. 31, 1939, to 363,864 on Dec. 31, 1945. At this session action was taken to publish an overseas edition of the church paper, the *Review and Herald*. The plan, as set in motion in December, provided coverage of approximately 200,000 overseas members.

The annual autumn council, constituted largely of North American leadership, held in Grand Rapids, Mich., in October, voted for 1947 the largest budget in the history of the church, \$13,762,401. This was primarily for overseas work, and did not include the funds for the routine operation of church work in the United States and Canada. Action was taken to incorporate the expanding welfare and charitable activities of the church under the title: Seventh-day Adventist Charities, Inc. Other important actions included: encouraging members to move out of large cities into the country; the appointment of a temperance secretary in each local church; the survey of denominationally owned medical institutions with a view to increased specialized training for the staffs, and specifically in the field of physical medicine.

The number of stations broadcasting the church-sponsored radio program, "The Voice of Prophecy," continued to expand during 1946. By the end of the year it was carried on 440 stations in the United States and Canada, and on 139 stations overseas, which covered Central and South America, the Philippines and China.

World membership as of Sept. 30, 1946, was 583,923, divided as follows: U.S. and Canada, 218,160; overseas, 365,763. Church receipts for 1946 in the United States and Canada were in excess of \$27,000,000, representing a per capita contribution of \$122.69. In addition to this the membership in America, in 1946, contributed to famine relief of overseas members, and to rehabilitation, in excess of \$1,300,000. Retail sales by denominational publishing houses for the calendar year 1946 were in excess of \$6,000,000 in the United States and Canada, and \$2,000,000 overseas. Enrolment in denominational schools in the United States and Canada—elementary, secondary, college—as of Sept. 30, 1946, was 37,956. Conferences and institutions throughout the world showed assets of \$130,000,000 at the close of 1946. (See also CHURCH MEMBERSHIP.) (F. D. N.)

Seyss-Inquart, Arthur (1892–1946), Austrian politician, was born July 22, in Stannern, Austria-Hungary (now Czechoslovakia). He graduated from the University of Vienna and practised law. He served in the Austro-Hungarian army during World War I and joined the Austrian nazi party in 1928, soon becoming one of its acknowledged leaders. When Chancellor Kurt von Schuschnigg, bowing to Hitler's wishes, reshuffled the Austrian cabinet in Feb. 1938, he reluctantly gave Seyss-Inquart the key post of minister of the interior and security. After Schuschnigg's resignation, March 12, 1938, Seyss-Inquart became chancellor and urged Hitler to speed German troops into Austria to "restore order." Two days after the formal proclamation of Anschluss, Seyss-Inquart was ap-

pointed governor of Austria. In May 1940, he became German high commissioner for the Netherlands. Employing brutal measures to extirpate opposition to Nazi rule, he liquidated Dutch Jews and ordered the execution of Dutch patriots for "serious" offenses. He fled from the Netherlands just before its liberation and was captured by the Allies in Germany on May 8, 1945. Seyss-Inquart was among the top Nazi leaders indicted Aug. 29, 1945, on charges of war crimes before the International Military tribunal at Nuernberg. He was convicted of crimes against the peace, war crimes and crimes against humanity and on Oct. 1, 1946, he was sentenced to death. He was hanged in Nuernberg, Oct. 16.

Sharpening Stones: see ABRASIVES.

Sheep. The decline in the sheep industry from the peak reached in 1942 continued through 1946. The number on United States farms Jan. 1, 1946, was estimated by the United States department of agriculture at 44,241,000 head compared with 47,780,000 head a year earlier and a prewar average of 51,344,000, 1935-39. The lamb crop also declined each year after 1942 to 26,000,000 head in 1946, the smallest number raised in any year after 1927. The total slaughter of sheep and lambs was high during the first half of 1946, however, due to the reduction of herds. The sale of ewes was at such a rapid rate that the lamb crop of 1947 was expected to show another decline as great as that of 1946.

Lamb feeding was at a high level from 1941 through 1946. On Jan. 1, 1946, there were 6,724,000 lambs on feed, a number exceeded only in 1942, 1943 and 1945. This large feeding was the result of fewer ewe lambs being kept, the lamb feeding subsidy payments and the general meat shortage. Large feed supplies also favoured the feeders. The supply of lamb and mutton for civilian consumption was about 1,000,000,000 lb. or 7 lb. per capita which was exceeded only in 1945 when the large production of 1944, 1,023,000,000 lb. came to market.

The price of wool to farmers continued practically unchanged from Jan. 1945 to the end of 1946 at around 40 cents per pound. Wool was removed from price control in September but the price did not rise and wool prices were expected to continue stable since government purchasing would continue until April 1947. Stocks of wool on July 1, 1946, exceeded 1,000,000,000 lb.

Prices of lamb and mutton were controlled from 1942, but not the live animals. The subsidy paid to slaughterers for lambs began in 1943, was stopped in Aug. 1945 and replaced by direct payments to farmers for sheep and lambs sold for slaughter. This program was terminated on June 30, 1946. Average prices paid to farmers for lambs were steady at \$12.90 per 100 lb. through 1945. In July this price rose to \$15.90 per 100 lb.; October \$17.50 and \$18.60 in December. The ceiling prices for lamb adjusted in September were designed to return feeders \$2 to \$3 per 100 lb. more than the June ceilings. When all control was removed Oct. 15 all prices advanced and receipts at the markets also increased. After a few weeks however retail prices became stabilized at near the level of the first half of the year. (See also LIVE-STOCK; MEAT; WOOL.) (J. C. Ms.)

Sheldon, Edward Brewster (1886-1946), U.S. playwright, was born on Feb. 4 in Chicago and attended Prof. George Pierce Baker's class in dramatic literature and construction at Harvard. He was graduated with an A.B. degree in 1907 from that school, and the next year one of his plays, *Salvation Nell*, had its première in New York city. In 1909 he produced *The Nigger*, a play which shocked New York audiences because its theme was based on

the love of a white Southern girl for a man with Negro blood. In 1913 he established his reputation as a playwright with the highly successful drama *Romance*, which also brought fame to Doris Keane, who played its leading role. Another of his plays, *The Jest* (1919), co-starred John and Lionel Barrymore, while *Lulu Belle* (1926), in which the author collaborated with Charles MacArthur and in which Lenore Ulric was the star, ranked next to *Romance* in popularity. *Jenny*, produced in 1929 and starring Jane Cowl, and *Dishonored Lady* (1930), starring Katharine Cornell, were written in collaboration with Mrs. Margaret Ayer Barnes. Among Sheldon's other works are *The Boss*, *Princess Zim-Zim* (1911), *Egypt*, *The High Road* (1912), an adaptation of the German play, *The Song of Songs* (1914), *The Garden of Paradise* (1915), *The Czarina* (1917), *The Lonely Heart* (1920), *Bewitched* (1924), which he co-authored with Sidney Howard, and *The Proud Princess* (1924), which he co-authored with Dorothy Donnelly. Hampered by blindness and partial paralysis, he had virtually retired from active writing during the last two decades of his life. He died in New York city on April 1.

Shidehara, Kijuro, BARON (1872-), Japanese statesman and diplomat, was created a baron in 1920. He was graduated from the Imperial university, Tokyo (1895), entered the diplomatic service in 1896, and was appointed Japanese minister to the Netherlands (1914). The following year, he was made vice-minister of foreign affairs. He was Japanese ambassador to Washington, D.C. (1919-22), and attended the Washington conference (1921-22). Baron Shidehara was foreign minister from 1924-27 and from 1929-31, when he resigned in protest against Japanese seizure of Manchuria. This earned him a reputation as a "liberal." It was subsequently alleged, however, that Shidehara, related by marriage to the Mitsubishi family, had championed the practices and policies of the "Zaibatsu" (Japanese big business). He lived in relative seclusion until the fall of the first postwar cabinet of Prince Naruhiko Higashi-Kuni in 1945, whereupon Shidehara formed the new government on Oct. 6. On Oct. 9, he promised establishment of a "liberal" regime. He urged caution in abolition of Shinto as the state religion and, like his predecessor, Higashi-Kuni, defended the authority of the emperor.

Shidehara complied reluctantly with Allied directives to liberalize his government and he resigned April 22, 1946, after the first postwar elections held in Japan. He became vice-premier in the succeeding Yoshida government, May 22.

Shipbuilding. Approximately one-half of the gross tonnage of merchant seagoing ships in the world on June 30, 1946, consisted of vessels flying the U.S. flag. World tonnage of ships, each of 1,000 tons or more, on that date was distributed as follows:

	Number of vessels	Gross tonnage		Number of vessels	Gross tonnage
United States . . .	4,861	35,363,000	Sweden	443	1,437,535
Great Britain . . .	3,159	18,064,000	Netherlands . . .	291	1,591,000
Norway	607	2,933,000	France	262	1,370,000
Russia	488	1,851,675	Other countries . .	2,334	8,389,790
				12,445	71,000,000

The total number of ships on June 30, 1946, was somewhat smaller than that prior to World War II, but because of the greater average size, world tonnage was about 13,000,000 gross tons greater.

New ship construction in the United States declined rapidly after World War II, which contrasted markedly with an increased volume of shipbuilding in Europe. On Sept. 30, 1946, there were 464 vessels with a gross tonnage of 1,874,878 under construction in Great Britain and Ireland, 62 vessels of 354,283 tons being built in the United States and a total of 521 ships of

1,339,998 gross tons under construction in other countries. Of this total world construction, 1,047 vessels of 3,569,159 gross tons, 643 vessels of 1,963,490 gross tons were motor vessels of which only 17, of 8,178 gross tons, were being built in the United States. The rest of the vessels were powered with other types of propelling machinery.

There were 122 seagoing merchant vessels of 928,230 gross tons under construction in the United States on Jan. 1, 1946, most of them under wartime contracts not yet completed. Up to Dec. 1, 1946, only 21 additional contracts had been placed for seagoing merchant vessels, totalling 109,000 gross tons, although there were many miscellaneous small craft being built, such as carfloats, barges, tugs and fishing vessels, the aggregate tonnage of which was small. At the end of the year there remained under construction in the United States approximately 52 seagoing vessels of about 346,000 gross tons and seven dredges of 31,040 displacement tons.

Many merchant vessels built during World War II and some older ships were placed in reserve in four locations on the Atlantic coast, three locations on the Pacific coast and two locations on the Gulf of Mexico. Ship repair yards were active during 1946, both in repairing merchant vessels and in reconverting merchant vessels from war use back to peacetime use.

A large number of vessels which were used during the war were available for scrapping, and 13 concerns were engaged in shipbreaking—four on a large scale and nine on a smaller scale.

Employment in private shipyards fell from approximately 305,000 on Jan. 1, 1946, to 157,000 in October, and a further reduction to about 110,000 was expected by the end of the year. This compares with a peak employment of 1,400,000 in Nov. 1943. The average hourly earnings, which continued to be among the highest of any durable goods industry in the United States, increased from \$1.272 for Jan. 1946 to \$1.430 in Sept. 1946, compared with \$1.069 for January and \$1.201 for September, averages for durable goods industries as a whole. In Feb. 1946 a horizontal increase of 18 cents an hour was given

in the industry. (See also SHIPPING, MERCHANT MARINE.) (X.)

Great Britain.—The year 1946 began with all the British yards working to capacity, although not all had yet been able to turn over from war to a peacetime routine. Many outstanding naval contracts were still on hand although they were being cancelled by the admiralty as quickly as possible and many ships went straight from the launching ways to the ship breakers. Some ships ordered by the ministry of war transport were being completed for government work but others had been bought by the builders to finish on speculation, or by private owners to alter as far as possible to their ideas. Many private orders were also on hand; admiralty restrictions on their design diminished according to the date of the licence granted until they were very small.

Although restrictions on design were limited, the admiralty still maintained a large measure of control. Every ship ordered had to have a licence granted on its merits, the war losses sustained by its owner, the importance of the trade on which it was to run and the national need for tonnage of its type. In March it was announced that a shipbuilding advisory committee would be set up, replacing that which had been working from 1944; the admiralty, ministry of transport, shipbuilders, ship-owners and labour were to be represented with a civil service chairman. It was intended to advise on priorities in building licences, the allocation of shipbuilding facilities to British, Allied and neutral owners, etc.

Applications for licences to build continued unchecked for some time, and there was talk of employing the royal dockyards on mercantile work to relieve the commercial establishments; the result of the same experiment after World War I, however, was most unsatisfactory and the authorities were not anxious to repeat it. Comparatively few ships of the tramp type were ordered, partly because the admiralty did not normally consider them a priority type and partly because the owners were nervous of the cost and the effect on the market of the sale of government-standardized ships. Many yards which specialized in tramps turned to better-class tonnage. Towards the middle of the year there was a distinct falling off in orders for all types,

H.M.S. "EAGLE," giant British aircraft carrier, sliding into the water after having been launched by Princess Elizabeth at Belfast, Northern Ireland, on March 19, 1946

but by that time the yards were fully booked for a considerable time ahead.

Domestic orders were checked by the anxiety of the authorities to encourage the export market for currency purposes. At the request of the board of trade the industry sent a deputation round South America which returned with valuable orders to be started as soon as possible; in May it was announced that orders for export amounted to £30,000,000. A large part of these had been placed because of the continental builders' difficulty in guaranteeing quick deliveries, but a number of orders were lost through an attempt by the authorities to stipulate that hull and machinery should both be built in Britain. When £16,000,000 was agreed as compensation for the services and losses of French ships running for Britain during the war, about two-thirds was spent in British yards.

Apart from new construction, repairs which had been deferred through the war, reconstruction after alterations and reconditioning demanded first attention. Prices rose to such a height, and the work took so long, that it was often questioned whether it was worth while, but it was frequently a shipowner's only means of restarting a service.

Like the ships, the yards had been forced to run with the minimum of repairs during the war, when many timesaving practices were tried which promised, with the necessary modifications, to answer well in commercial work. As soon as possible without checking deliveries, many firms combined restoration with improvements to secure more efficient work and rapid output, although this frequently meant the sacrifice of a proportion of the slipways. Better means of fabricating large sections, although not the complete prefabrication popular during the war, were conspicuous in every case.

The supply of material presented many difficulties, particularly as other branches of production claimed priority over shipbuilding. Shortages of coal and steel caused periodical delays in different districts; the controlled price of iron and steel was increased early in the year and again in the summer. It was difficult to obtain castings and forgings that would satisfy the standards of shipbuilders or surveyors and a large proportion had to be welded before they could be used. Competition with the house-building industry for priority in sanitary, electrical and various other fittings necessary for the completion of ships caused further delay so that as the year progressed ships lagged more and more behind the contracted time of delivery.

As is inevitable immediately following a war, labour presented great difficulties. The change from war to peace caused a certain amount of temporary unemployment in many yards, and this was prolonged in some areas through the holding up of work by a shortage of various kinds of labour. Minor sectional strikes, usually against the advice of the unions, were incessant and caused idleness among workmen in other branches. Most of the disputes were amenable either to ordinary negotiations or to the National Arbitration tribunal, but the men were impatient of any delay. Many of the improved methods of shipbuilding caused disputes between the unions as to the demarcation of labour. Wages were high at the beginning of the year and were increased by agreement, although the employers rejected the claims for a 5-day 40-hour week without loss of earnings. Holidays on pay were granted and conditions were generally improved, but the output reckoned in man-hours continued to decline very seriously. The problem of apprenticeship had been under consideration before the war and apprentices had been granted good pay during the progress of hostilities; at the first opportunity measures were taken by several of the big yards to improve the training and to give promising and ambitious apprentices the opportunity of preparing themselves for high positions.

The Commonwealth.—In the outlying portions of the empire the shipbuilding industry, which had done excellent work during the war when cost was a minor consideration, was immediately handicapped by high prices in competitive tenders. Only the Canadian yards succeeded in getting a certain number of foreign contracts. In New Zealand shipbuilding was generally regarded as unpractical and in Australia it was admitted to be possible only by generous government aid. In India, where the traditional skill of the native craftsmen in wooden construction had been put to good use, pressure was brought on the new government to establish and support a steel shipbuilding industry.

Europe.—On the continent the industry depended largely on the extent of the damage done by the Germans at the evacuation of occupied territory or by Allied operations. Only Sweden was entirely unaffected and booked orders for years ahead, the minor Spanish and Portuguese industries being handicapped for materials and labour. Italy recovered the most rapidly and during the year sought orders all over the world. (See also BUSINESS REVIEW.)

Shipping, Merchant Marine. Reconversion of the U.S. merchant marine to peacetime operations, the absorption of remaining tasks of the War Shipping administration after Sept. 1, 1946, the sale of surplus war-built merchant vessels, the disposal of surplus marine property and equipment and related programs occupied the major attention of the U.S. Maritime commission in 1946.

Passing the peak of its wartime job of shipbuilding in 1943, the commission had met the needs of the joint chiefs of staff and the United Nations in the supplying of military and civilian ocean transport and, at the end of World War II, was engaged in building only specialized craft. From 1939 to the end of 1946 about 5,865 major merchant types had been built, enough to carry 75% of the 268,000,000 long tons of outbound war cargoes and 90% of U.S. military personnel and to supply the military with special designs on basic merchant-type hulls.

The resumption of full, peacetime operations was delayed by the essential requirements of world rehabilitation and relief which immediately followed the war's end. The return of vessels to former owners for private operation was largely accomplished by the end of 1946, although necessary repairs and conversions had a delaying effect. The S.S. "America," largest U.S.-built passenger vessel, made its maiden postwar voyage in November following conversion from war service as the troopship U.S.S. "West Point."

Owning two-thirds of the world's merchant fleet which had rendered vital war service, the United States had a fleet in excess of any anticipated requirements, but short on a number of desirable types, mainly fast passenger ships to meet foreign competition and vessels for domestic trades.

To dispose of the surplus tonnage congress enacted the Merchant Ship Sales act of 1946 setting forth the policies for the commission's program. By the end of 1946 more than 1,000 sales to domestic and foreign operators had been approved, which, when completed, would return more than \$1,000,000,000 to the federal treasury. By the end of the year more than 1,650 war-built and less desirable vessels were assigned to the reserve fleet to be held and preserved to meet any future national defense or emergency needs.

With new, efficient, fast ships being planned and built by foreign competitors, the U.S. flag fleet composed of war-built and older ships would within a few years be outclassed and obsolete. Plans of the commission were designed to accomplish a balanced fleet with special attention to passenger requirements in the North Atlantic, Mediterranean, South Atlantic and Pacific essential trade routes. Other plans included passenger-

cargo, cargo and refrigerated ships to meet competition on the high seas. Despite growing foreign competition, a critical shortage of materials forced the delay of initial ship construction to meet these needs.

On May 22, 1946, the maritime commission announced its determination of the 31 trade routes essential to the economy and defense of the nation and later in the year announced that on Jan. 1, 1947, payment of operating-differential subsidies with the recapture clause protecting the government would be resumed to aid U.S. flag operators to meet foreign competition with its lower labour and other costs. These parity payments had been suspended during the war. Of shipping companies, 12 held operating parity agreements at the end of 1946.

Construction parity payments which offset lower foreign costs, and which were in limited use during World War II, were to be made available to private operators desiring to build new ships and would keep valued shipbuilding know-how available in the United States.

The maritime commission, directed by the Merchant Marine act, 1936, exercised some control over the maritime industry and in many matters (freight rates, labour agreements and other maritime agreements) served in an advisory capacity.

(W. W. SH.)

Great Britain.—The disorganization of turning over from war to peace, the number of ships under requisition by the various governments and the long time taken to recondition ships after war service or to build new ones made 1946 a trying year for all shipowners. It began with full government control in addition to the demands of the United Maritime authority, arranged by agreement before the end of hostilities. At its close the United Maritime Consultative council remained, with representatives of all the leading maritime powers. In October the council recommended the establishment, through the United Nations, of a permanent international shipping organization of defined scope. The scheme was immediately criticized and its ratification became doubtful. The general requisition of British shipping ended in the spring but the direction of all voyages and the strict control of freights continued.

Nearly all European countries bought British and U.S. government ships. Many British owners of cargo liners preferred the faster U.S. ships to the 11-knot British standard ships and several were bought by various lines at high prices. The ministry of transport issued its first offer to sell in January with a reserve price placed against each ship. The more efficient ships went well, often at high prices, but concessions had to be made for others. Most of the tramp type were offered on time-charter also and this proved popular; many tramp owners preferred to charter until prices were reduced and liner owners also took this opportunity to tide them over the rush period. Private sales of British steamers were also controlled but permission was not generally refused within the flag, although every suggestion to sell a ship to foreign interests was carefully examined.

Passenger business was hampered by the fact that nu-

merous liners were serving as troopships, and long waiting lists for passages accumulated. Civilians were allowed to travel by transport but there were many complaints concerning conditions, food, empty berths, etc., which were generally unavoidable.

Most inward cargo in British ships was still for the government, but the export drive failed to balance it; British ships took a comparatively small part in the United Nations Relief and Rehabilitation administration cargoes which provided welcome freights to some flags.

British Commonwealth.—Canada sold most of its government-built ships to private owners but the Australian authorities had to continue running many of theirs and planned to extend the state fleet. South Africa started building up a merchant navy with enthusiasm; several new private companies built or bought ships and some big British liners were transferred to the South African flag. The new Indian leaders promised to give native shipping strong state aid.

Europe.—Practically all European governments took part in the Seamen's conference of the International Labour office at Seattle, Wash., but there was some doubt as to how readily some countries would ratify the convention.

Every major country except Sweden started the year with its strength far less than that of 1939, often not more than half; Sweden had covered its war losses by new construction. Apart from purchases every effort was made to get ships built or to salvage and refit war wrecks. Many former warships were bought for conversion, particularly by Greece. Germany had to surrender all its big ships and many smaller; Britain received the bulk because of its losses, but many were reallocated to other flags. The former German liner "Europa," taken over by France and renamed "Liberté," sank at Le Havre, France, on Dec. 9 after being torn from its moorings in a heavy gale. Attempts at salvage were being made.

*Preliminary.

No breakdown available for 1946 consumption of shoes, other than leather.

(†) Excludes shoes for military purposes.

nine months of 1946, kept a strong rein on prices and endeavoured to minimize the effect of inflated demands on curtailed supplies. When price controls were lifted, the industry was on its own; but surprisingly enough, prices did not jump too high. Shoe merchants were wary. They bought small lots and made short-term commitments. They wanted to keep in line with the trend of the basic material—leather.

Leather accounts for the principal cost in making a pair of shoes, and since the United States imports one-third of its raw stock, leather prices are inevitably affected by trends in the world market. During 1946 leather was in short supply and nations the world over were competing for their share of the available hides and skins and raw materials. Up to June 26, 1946, the International Hides, Skin and Leather committee, comprised of the major leather producing and consuming nations, was a strong deterrent to inflation of world market prices of leather. This committee allocated and channelled the available supplies fairly and equitably; and maintained effective controls. Unfortunately, the committee was liquidated on June 26. With the barriers removed, leather hungry countries competed in the world market and prices rose precipitously. United States tanners were restrained by the limitations put upon them by the OPA but when these controls and ceilings were finally dropped on Oct. 30, 1946 (in the wake of decontrol of meat and other products), they were obliged to pay the higher prices in order to augment their supplies. Shoe costs, therefore, naturally tended to increase.

Despite uncertainty and concern, more shoes were made month after month in 1946 than ever before and at the end of the first six months a production record had been established. Although the pace could not be maintained, the estimated figures for the entire year were some 522,000,000 pairs. It was the first time that the industry had exceeded the 500,000,000 mark and it was accomplished in a period marked by continuous obstacles and shortages of supplies.

The full effect of release from war-imposed style restrictions became noticeable in 1946, when U.S. manufacturers and designers were again given the opportunity to create and devise new shoes. Innovations in sole treatment, colour, decorative motif, etc., gave shoes an added appeal and consumption of women's shoes topped any figures for previous years. Men's, boys' and children's shoes were needed and greater quantities would have been absorbed at retail if size ranges had been more complete. In men's shoes the principal scarcity was in dress types.

Plastics and synthetics, which attained a strong foothold in the shoe industry when leather was short and shoe wardrobes needed the extra replenishment of unrationed footwear, maintained their position during 1946, although their wider usage was more apparent in accessories than in the shoe field.

Rubber footwear was coming back to its own and leading rubber companies were increasing their production of the basic canvas and active sports types. New methods of construction, to give added support, and comfort features were being incorporated into these rubber and waterproof types.

A Reciprocal Trade Agreement Negotiation conference was scheduled to be held in April 1947 between the United States and Australia, Belgium, Brazil, Canada, Chile, China, Cuba, Czechoslovakia, France, India, Lebanon, Luxembourg, the Netherlands, New Zealand, Norway, Union of South Africa, Union of Soviet Socialist Republics and the United Kingdom. Hides and skins, leather and most types of shoes were included on the list of products which were to be considered for possible granting of tariff concessions by the United States.

During the last three months of the year 1946 there were indications that the demand for shoes, which had been such an

important spur to U.S. shoe manufacturers for five years, might be slackening. (See also LEATHER.) (E. G. AN.)

Shows. **Horses.**—The 1946 season witnessed the recovery of most of the important horse shows and the beginning of several new ones. Restrictions on shipments and travel were no longer the major handicaps. While the total number of light horses in the U.S. was less than before the war, the entries indicated that the best show animals had been retained and a considerable lot of young stock trained for the show rings. The public appeared even more enthusiastic to attend and support the exhibitions.

The Chicago Horse show set a new record with 128 classes and \$75,000 in awards. The National at New York came back to its former status with a record attendance. At the American Royal Live Stock and Horse show at Kansas City, Mo., \$45,000 in cash awards attracted more than 450 entries in 129 classes from the middle west and some distant states. In the far west the Grand National at San Francisco was notable with 70 classes and \$16,500 in prizes. The Pacific International at Portland, Ore., was reported the greatest success for that region. The Los Angeles, Calif., National was a notable revival as was the St. Louis National. The Houston, Tex., show attracted many entries and visitors from the southwest. The Tennessee Walking Horse National celebration at Shelbyville, Tenn., was the largest display of this breed ever held.

The smaller community exhibitions exceeded the 175 record of 1945, and the horse departments of the several state fairs also increased in number of entries. Heavy horses were still predominating in the latter in spite of the severe competition of motor power with the heavy draft horse. (J. C. Ms.)

Livestock.—After four years of all but complete restriction during the war, the U.S. livestock show circuit was largely returned to its prewar schedule during the year 1946. With but few exceptions, all of the major state fairs and expositions of the country were held on schedule that year.

The National Western Live Stock show at Denver was the first major show of the year. It was held as usual in January. It was one of the few shows in the United States that went on uninterrupted by the war.

Another January event important to the southwest was the Houston Live Stock show. Both the beef and dairy breeds of cattle were featured. It took place in 1946.

The oldest livestock exposition in the United States is the Southwestern Exposition and Fat Stock show at Ft. Worth, Tex. It was held in March 1946 in the Will Rogers Memorial amphitheatre. Daily rodeos were its chief entertainment feature.

The American Royal in Kansas City, Mo., is one of the major expositions of the fall season. It was held, complete in all departments, in Oct. 1946, after a four-year war lapse, during which the setting of the show, the Coliseum adjoining the Kansas City Stock yards, was requisitioned for war purposes.

The Pacific International at Portland, Ore., is one of the top expositions of the west coast and was again resumed in 1946. The Aksarben show in Omaha, Neb., was one of the strongest steer shows of 1946, with accent on exhibits owned and shown by 4-H and Future Farmer of America boys and girls.

Another important west coast sectional show is the Great Western Live Stock show at Los Angeles, Calif. This exposition was held during the first week of Dec. 1946. It was preceded by the Grand National Live Stock exposition in the Cow palace in San Francisco. The latter show took place in mid-November.

There was scarcely a state fair grounds of importance in the United States that was not requisitioned during the war for military purposes. Despite problems incident to the reconditioning of these grounds, nearly all of them were made ready in time to

reopen in 1946. By comparison to the quality and number of livestock displays that distinguished these events in prewar times, the 1946 versions were, for the most part, under par in terms of livestock exhibits.

This was attributed to the high prices of feed, scarcity of farm labour and the months that are required to prepare animals for show. These summer and early fall state fairs revived on short notice. All, however, established new attendance records.

With one exception, all of the major midwest state fairs went on in July and August 1946. These included the Illinois, Wisconsin, Iowa and Indiana state fairs. The Minnesota state fair, noted in prewar times as the largest farm machinery show in the country, coupled with strong exhibits of livestock from Minnesota farms and adjoining states, was ready for restoration in 1946, but the management was forced to cancel it a week ahead of its scheduled opening because of the prevalence of polio, unusually severe at the time in Minnesota.

The New York state fair, one of the east's largest, and the Kentucky state fair, outstanding for its saddle horse shows in prewar times, did not go on in 1946. Plans were under way for their revival in 1947. The Eastern States exposition at Springfield, Mass., held annually in September before the war, also did not take place in 1946, but dates were announced for Sept. 1947.

The U.S.'s leading livestock show for four decades prior to the war was the International Live Stock Exposition and Horse show in Chicago. Founded in 1900, it closed on Dec. 6, 1941, in its last prewar showing a few hours before the attack on Pearl Harbor.

A series of market shows—including all the fat stock classes featured at the full International—were held at the Chicago Stock yards during the ensuing four years; and the full International Live Stock exposition again went on the first week of December in 1946 in the International amphitheatre, which was occupied by the Signal corps of the army for four and a half years. The "Victory" International Live Stock exposition of 1946 exceeded all records in the number and quality of its exhibits and in the number of people attending. Visitors came from every state in the union and Canada, and exhibits from 35 states and the dominion. The value of the livestock on display, \$15,000,000, was the highest worth of any aggregation of farm animals ever assembled at any show.

In Canada, the only show to survive the war was the Calgary exhibition and stampede, a July event that was again held in 1946. Three other large Canadian shows were restored in 1946. They were the Edmonton exhibition, the Saskatoon exhibition and the Regina Provincial exhibition—all July shows.

Another postwar Canadian show, returned to the September calendar, was the Exposition Provinciale at Quebec; and the Royal Winter fair took place in Toronto in November, the latter comprising Canada's largest livestock show of the year.

A dairy show of national calibre, combined with a national showing of Belgian draft horses, was held annually in October at Waterloo, Iowa, prior to the war. Known as the National Dairy Cattle congress and Belgian Horse show, this event was again held in Oct. 1946.

The only show of importance in Great Britain that survived the war was the annual Perth show and sale in Scotland. It features exhibitions of Aberdeen-Angus and Shorthorn cattle. It took place in Feb. 1946 in consecutive weeks for the two breeds.

South America's leading agricultural show, the Palermo, in Buenos Aires, was held in Aug. 1946. It is the world's largest showing of Shorthorn cattle. It runs for ten days. To a lesser extent than Shorthorns, the Palermo also features Hereford and Aberdeen-Angus cattle as well as Holsteins and Guernseys, the two principal dairy breeds of the Argentine. (W. E. O.)

Dogs.—An all-time record was set up in the number of shows of all breeds—249 in 1946 against 142 for 1945. Many men returning from war service swelled the ranks of exhibitors, though it is to be added that women constituted 47% of all exhibitors.

The outstanding show winner was a 12-lb. Boston terrier female named Champion Mighty Sweet Regardless, owned by Mrs. C. J. Fitzgerald of Detroit, Mich. Mighty Sweet triumphed as best of all breeds at 18 shows in 1946.

The bird dog (setters, pointers and Brittany spaniels) field trials numbered 415, comprising 1,310 stakes and 25,351 starters. Practically all these trials were run under the rules of the *American Field*, Chicago, whose stud book registered 21,052 dogs, a record year, with leaders in order—9,202 pointers, 7,623 English setters, 1,090 Irish setters.

Stud book registration with the American Kennel club, leading registry for all breeds, reached approximately 165,000 dogs and showed the ten leaders as follows, in order: cocker spaniel, beagle, Boston terrier, collie, dachshund, boxer, Chihuahua, Pekingese, springer spaniel and chowchow.

The national championship in retrievers (all breeds) was won at Herrin, Ill., by the black Labrador Shed of Arden, owned by Paul Bakewell III, of St. Louis. (W. Ju.)

Shverník, Nikolai Mikhailovich (1888—), soviet statesman and government official, became an apprentice at the age of 14 in an electrical machine plant. In 1905, he joined a revolutionary party and actively agitated among factory workers. Later, he joined the bolsheviks and upon the outbreak of the revolution in 1917, he was elected chairman of the All-Russian Union of Ordnance Workers. Shverník enlisted in a guerrilla detachment and during the civil war became an officer in the army. He was elected chairman of the metal workers' regional committee in the Donbas in 1921 and was appointed People's Commissar of Workers and Peasants Inspection in 1923. In 1930, he was elected to head the entire trade union movement in the soviet union as first secretary of the Central Council of Soviet Trade Unions. Shverník was also chairman of the Council of Nationalities of the Supreme Soviet. During World War II, he was chairman of the Extraordinary Commission investigating axis crimes in the U.S.S.R. He was also a member of the Central committee of the Communist party in the U.S.S.R. Upon President Mikhail Kalinin's retirement, he was named chairman of the praesidium of the Supreme Soviet. His appointment to this top post was announced March 19, 1946.

Siam (Thailand). A kingdom of southern Asia between Burma and French Indo-China, extending southward into the Malay peninsula. Area: 198,247 sq.mi.; pop. (census 1937): 14,464,105, (est. March 1940) 15,717,000. Chief towns (pop. 1937): Bangkok (cap., 681,214); Chiangmai (544,001); Khonkaen (473,475); Chiengrai (443,476); Language: Siamese; religion: Buddhism. Ruler: King Phumiphon Aduldet (succeeded June 1946); regents: Prince Chainat and Minavaraj Sevi; prime minister: Thawan Thamrong Nawasawat.

History.—On Jan. 1, 1946, a peace treaty was signed between Great Britain and India and Siam. Under its terms Siam agreed to return all acquisitions of British territory, to take part in regional security arrangements in southeast Asia under the provisions of the United Nations charter, and to undertake that no canal linking the Gulf of Siam with the Indian ocean would be cut across Siamese territory without the prior concurrence of the British government. Siam also agreed to provide 1,650,000 short tons of rice for Asia; to participate in any general international arrangement regarding tin or rubber, to prohibit exports

KING PHUMIPHON ADULDET of Siam, surrounded by royal household guards and protected by the royal umbrella, entering the grounds of the throne room to attend rites for his brother, former King Ananda Mahidol, whose death occurred on June 9, 1946

except under the direction of the combined boards, and to regulate trade and stimulate production of rice, tin, rubber and tea.

In the early months of 1946 efforts were made to arrange a conference which would formally end the state of war between France and Siam and restore the territory ceded by Vichy to Siam in 1941. The presence of armed bands of refugee Annamites hostile to France necessitated constant crossing of the frontier by French frontier police to round up guerrilla troops. The Siam government reported that on May 24, 25 and 26 some 800 French troops crossed the Makong, and on June 1 it made a formal protest to the United Nations, appealed for sympathy and assistance, and at the same time asked for admission to membership of the United Nations. On July 16 it asked that the situation be brought before the Security council as one threatening the maintenance of peace but subsequently requested a postponement of the discussion. Negotiations instituted by France on Aug. 1 for bringing the case before the International Court of Justice were also broken off. On Oct. 15 the Siamese parliament endorsed the government's decision to return the disputed territory to France, and on Nov. 17 an agreement was signed in Washington by a French and Siamese delegation which provided for the return of the ceded territory to France. Diplomatic relations were restored, Siam withdrew its complaint against France laid before the Security council, and France withdrew opposition to the admission of Siam to the United Nations.

On June 9 King Ananda Mahidol was found dead in his bedroom from a gun-shot wound. A commission aided by a committee of 19 medical members was appointed to inquire into his death and on July 2 an official police statement declared that 12 out of 20 members reported that murder was the most likely explanation. Prince Phumiphon Aduldet, 18-year-old brother of the dead king, was unanimously selected by the legislature to succeed to the throne and a council of regency was appointed.

On Jan. 31 Kuang Aphaiwong was appointed prime minister. He resigned on Aug. 21 and was succeeded by Thawan Thamrong Nawasawat on Aug. 23. It was announced in October that the Siamese government was to buy for £1,250,000 that part of the Burma-Siam railway built with prisoner-of-war labour. First claim on the money was to owners of rolling stock, locomotives and rails removed by the Japanese from Burma, Malaya and the Netherlands Indies. The remainder was to be credited against Japanese reparations. The British government acted as agent for the Allies in the deal. (J. R.A.)

Education.—In 1938–39: government schools 429, scholars 61,297; local public and municipal schools 11,072; scholars 1,484,483; universities 2, students (1937) 11,525.

Banking and Finance.—(1942) revenue \$77,650,000; expenditure \$95,800,000; expenditure, capital (est. 1941) \$20,700,000; public debt (March 31, 1940) \$25,500,000; notes in circulation (July 31, 1941) \$96,000,000; reserves (July 31, 1941), gold \$35,850,000; foreign assets (July 31, 1941) \$56,100,000; exchange rate (average 1940) 1 baht=35.15 U.S. cents; (Sept. 1941) 1 baht=36.97 U.S. cents.

Trade and Communication.—Foreign trade 1940–41 (merchandise): imports \$60,200,000; exports \$95,000,000. Communications: roads, state highways completed (1938) 1,815 mi.; railways open to traffic (1938) 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937–38): 11,439; wireless receiving set licences (1938) 29,834.

Agriculture and Mineral Production.—Production (in short tons); rice (1939–40) 5,590,200; rubber (1940 exports) 49,500; tin ore, metal content (export 1940) 19,470; tobacco (1938–39) 9,240; cotton ginned (1940–41) 2,640; maize (1938–39) 6,160.

Silk. Return of silk to world textile markets was initiated in 1946 by a series of six sales conducted by the U.S. Commercial company, a government agency operating under the Reconstruction Finance corporation in Washington, in which a total of 32,700 bales of Japanese silk was offered to buyers who represented U.S., British and Swiss consumers. Reflecting a somewhat apathetic attitude of former users toward the once favoured fibre was the fact that only about 20,000 bales were sold. The sales were held monthly beginning July 12, 1946, in New York and, with the exception of the first two sealed bid sales, were based on a minimum published price for each grade, referred to as an "upset" price. This minimum steadily declined on the higher preferred grades. In Sept., the first public sale, the price of the highest grade offered, 20/22 denier Special AAA, 965 evenness, was \$10.50 a pound. The same grade in December had a minimum of \$7.80. In 1941, when silk was removed from civilian commerce, the price was about half of the latter amount.

The sale of the Japanese raw silk was a keen disappointment to the government officials since it had been expected that the cash return on the sale of the silk would go far in underwriting the cost of necessary supplies for the Japanese people. By the end of the year, plans were under way to embark on a plan to promote the use of silk in order to dispose of the large stocks on hand in the United States and in Japan. The stocks were reported as 99,200 bales in Japan and between 55,000 and 60,000 bales in the United States.

Practical Problems in Silk Manufacture.—To what degree weavers and knitters in the United States and Europe would return to the use of silk depended not only on price. It was conceded that silk should be reserved for the luxury type of product, but important also were the quality of silk sent from Japan and the cost of handling it in modernized mills which had been streamlined for rayon yarn production. Rayon processing did not require the same degree of individual attention from the worker. The winding of silk was tedious and time-consuming. Workers accustomed to smooth-running synthetic yarns balked at returning to silk. With a labour shortage still existing in textile mills, 1946 found mill managers loath to return to a fibre that could be woven only on a loom load, *i.e.*, looms per worker, of 4 or 6, compared with 32 on rayon.

At the year's close, the U.S. Commercial company indicated an intent to offset the fear of unstabilized prices by guaranteeing a price for a period of six months. Hosiery and fabric trade associations were also planning to work out revisions of the international raw silk grading system known as the International Raw Silk Classification. While this indicated an acceptance of silk as a regular textile supply source, there was little evidence of a return to prewar consumption figures of about 35,000-40,000 bales per month. Best estimates were a consumption of about 4,000 to 5,000 bales a month, for the most part by fabric makers. Hosiery manufacturers found that even the small amount of silk hosiery marketed in 1946 found few buyers. The retail price steadily declined from around \$3.00 a pair to \$1.30 for the sheer type. It was expected, however, that there would be a market for a heavier type purchased chiefly by older women. The relative amount of raw silk that could be used would still be small. Underwear fabrics, of chief interest to potential silk fabric users, were beginning to appear in increasing quantities by the close of the year but silk prints for dresses that in 1945 were selling at \$11.00 or \$12.00 a yard in the retail stores were being featured by the same stores at about \$3.00 a yard by the close of 1946. Silk underwear of the type that could have been purchased on the retail counter of 1940 for

STACKS of raw silk awaiting shipment to the U.S. from Japan in 1946

\$5.00 a garment was \$18.00 to \$25.00 in 1946.

Other Silk Sources.—The amount of Japanese silk available clouded over the other sources of silk, China, Italy, Brazil, etc. Italian silk was reported as poor grade. Chinese silk was received in small quantities but only for special purposes. Brazilian silk was forgotten by the close of the year. All of this did not discourage the promoters of sericulture (raising of silkworms and reeling of raw silk) in the United States. In Texas and New Jersey, offers were being made to provide mulberry cuttings and silkworm eggs to those who wanted an easy, lucrative business, said widely distributed circulars and advertising in national farm journals. Estimates as to potential sales were based on prewar reports on raw silk consumption at prices reflecting 1945 purchases of Brazilian silk. (See also RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY.)

Silver. Output of silver by the major producing countries is shown in the table.

World Silver Production (Millions of fine ounces)						
	1940	1941	1942	1943	1944	1945
United States	68.28	71.08	55.86	40.87	35.65	29.33
Canada	23.83	21.75	20.70	17.35	13.63	12.87
Newfoundland	1.49	1.66	1.11	1.26	1.16	1.08
Mexico	82.64	78.36	84.86	76.63	65.46	61.10
Honduras	3.90	3.63	3.48	3.16	3.12	3.00
Argentina	3.71	2.92	2.84	?	?	?
Bolivia	5.63	7.35	8.12	7.30	6.80	6.68
Chile	1.51	1.24	1.32	1.09	1.09	?
Peru	19.37	15.12	16.04	14.66	15.83	16.08
Belgian Congo	3.54	3.47	3.96	3.11	2.61	2.50
South Africa	1.29	1.48	1.48	1.33	1.21	?
Australia	15.87	15.41	14.24	10.33	9.37	9.40
Total	275.39	261.57	247.75	217.04	186.20	?

It will be noted that data are lacking from Europe and Asia, each of which supplied about 8% of the prewar output. In these figures, almost as much as in the case of gold, is evidence of the extent to which output was restricted in favour of metals essential to the war program.

United States.—The U.S. outputs shown in the table are refinery data. Mine production was slightly lower, declining

SILVER PRODUCTION of the major producing countries and of the world, as compiled by *The Mineral Industry*

from 34,473,540 oz. in 1944 to 29,024,197 oz. in 1945, a drop of 57% from 1940. Silver shared with gold the burdens imposed by the suspension of production, but to a less pronounced degree.

Even after the restriction order was rescinded on July 1, 1945, mine output continued to decline, not reaching the minimum (1,637,091 oz.) until Feb. 1946. By October the monthly total had grown to 2,073,079 oz., and the total for the 10 months was 17,178,176 oz.; this figure is equivalent to an annual rate of 20,414,000 oz., which may be increased still further by improvement in the final two months of the year.

Canada.—The trend of silver production in Canada was much the same as in the United States—a decline of 46% between 1940 and 1945, ending with 12,866,597 oz. in 1945. The 1946 production rate improved over 1945, with a total of 10,085,435 oz. in the first three quarters, an increase of 6% over the same period of 1944. (See also MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

Simeon II (1937–), former king of Bulgaria, was born on June 16. After the death of his father, King Boris, on Aug. 28, 1943, the six-year-old Simeon ascended the throne and ruled under a three-man regency council formed by Prince Cyril, Boris' brother, Lt. Gen. Nikola Michov, former war minister, and Bogdan Philoff, former premier. After Bulgaria quit the axis the regents were arrested and on Feb. 1, 1945, all three were executed as enemies of the regime and as collaborators with the Germans. On Sept. 8, 1946, the Bulgarian people voted the monarchy out of existence and Simeon and his mother, Queen Ioanna left Bulgaria Sept. 17 and went into exile in Alexandria, Egypt.

Singapore: see MALAYAN UNION AND SINGAPORE.

Sinkiang (HSIN-CHIANG, NEW FRONTIER, CHINESE TURKESTAN). Largest and farthest inland province of China, bounded N. by the Mongolian republic; E. by China; S. by Tibet and India; W. by Afghanistan and by the Tajik, Kirghiz and Kazakh Republics of the U.S.S.R. Area (according to Chinese police of the interior, 1938), 705,969 sq.mi.; pop. (provincial police figures, published in 1946) 3,730,051. Capital: Urumchi (Tihwa) (est. pop. 50,000), in the northern part of the province. The two largest towns, Kashgar and Yarkand, with estimated populations of 80,000 and 75,000, are in the south; 84% of the total population is on the western side of the province, adjacent to the U.S.S.R. and separated from China by the major desert expanses. Chinese estimates are that 90% of the population is Turkish-speaking, the settled majority being Uighurs and the nomadic minorities Kazakhs and Kirghiz; the Chinese comprise about 5%, divided between Moslems and non-Moslems and the remaining 5% include Mongols, Manchus, Tajiks and still smaller minorities. The prevailing religion is

Islam; with Lama Buddhism among the Mongols and nominal Confucianism and Taoism among the non-Moslem Chinese. Governor (appointed 1945): Chang Chih-chung.

According to a Chinese estimate, only about 2% of the province is cultivable. About one-third is suitable for grazing. The rest is desert. Most agriculture is concentrated in oases, irrigated from rivers coming down from high mountains, but there is a little rainfall agriculture in the north. Principal food crops are wheat, corn and rice, with beans, melons and fruit as subsidiary crops and cotton as a cash crop. Some silk is produced in the south. Farm rents range as high as two-thirds of the crop in the south and 80% in the north.

Livestock figures fluctuate sharply, especially when spring blizzards cause heavy mortality. A Chinese estimate of 1943 listed 11,720,000 sheep, 1,550,000 cattle, 870,000 horses, 90,000 camels.

The most productive parts of Sinkiang are within about 63 mi. of Russian railways, but not less than 620 mi. from Chinese railways, and trade tends to move accordingly. All principal towns are linked by rough truck roads, on which operated, in 1944, 210 government-owned trucks and 140 privately owned. Toll charges were high, and gasoline expensive.

Limited market impedes industrialization and most industry was owned or part-owned by the government. Five towns had electric light plants; there was one cotton textile mill and one chemical factory. The Russians developed some oil production during World War II but withdrew their equipment in 1943. Reserves were believed to be large. The Chinese air service extended to Sinkiang.

Russian political influence was strong from 1934 to 1943, when there was considerable danger of Japanese penetration, but was then withdrawn. The provincial government was dominated by appointees of the national government, but there was a growing autonomy movement among the non-Chinese majority. (O. Le.)

Sjahrir, Sutan (1910?–), Indonesian statesman and politician, joined the Indonesian Socialist party and during World War II refused to collaborate with the Japanese occupation authorities in the Netherlands Indies. This stand made him more acceptable to the British and Dutch as a representative of the Indonesian nationalists than President Achmed Soekarno and in Nov. 1945, he became premier of the "Indonesian republic." Sjahrir overhauled the cabinet, ousted all but one of Soekarno's cabinet officers and assumed the portfolios of foreign minister and home minister himself.

Incensed by the arrival of British reinforcements in Java in the fall of 1945, Sjahrir warned (Dec. 11, 1945) that the Indonesians would fight any attempt to bolster Dutch rule of the islands. He also denounced the U.S. for providing equipment to the Dutch troops. Following a controversy with opposition members who wanted him to form a more representative cabinet, he resigned in late Feb. 1946. However, he was given a vote of confidence in the national committee and formed a new government, March 12.

After nearly a year of fighting between Indonesian and Dutch troops, Sjahrir and Netherlands officials signed a truce, Oct. 14, 1946, and on Nov. 15, he initialed a draft plan under which the Dutch agreed to recognize the Indonesian republic and the latter's claims for equality and freedom.

Skating: see ICE SKATING.

Skiing. Alf Engen of Sun Valley, Ida., won the national open ski jumping title at Steamboat Springs, Colo., with a leap of 259 ft. Although 30 ft. short of the national record, set

by Torger Tokle (deceased), Engen's leap was 11 ft. more than the former course record. Art Devlin of Lake Placid, N.Y., the national amateur champion, was second.

Steve Knowlton of Aspen, Colo., was crowned both open and amateur downhill champion with his time of 2 min., 6.9 sec., for the mile-and-a-quarter run at Franconia Notch, N.H. Dick Movitz, 20-yr.-old Salt Lake, Utah, youth, won the national slalom, while Barney McLean of Denver captured the combined championship.

Merrill Barber of Brattleboro, Vt., and Walter Bietila of Ishpeming, Mich., gave Devlin his chief competition in amateur jumping. Barber won the national all-around title, while Bietila captured the eastern amateur and the Iron Mountain, Mich., titles. Devlin won the Tokle Memorial jump at Bear Mountain, N.Y. Kristofer Berg, a Norwegian student in the Harvard school of business, won both the eastern slalom and downhill events. Barber won the annual Norge jump at Fox River Grove, Ill., with jumps of 169 and 176 ft.

In women's competition, Paula Kann of North Conway, N.H., was crowned national downhill champion, while Rhona Wurtele of Montreal won the slalom and combined events. On the collegiate front, McGill of Montreal won the Dartmouth carnival with 568.7 points to 553.5 for Dartmouth. The Hanover, N.H., school won the Middlebury, Vt., and University of Vermont carnivals.

Water Skiing.—The fourth national water ski tournament at Lake Macatawa, near Holland, Mich., was won by a pair of teen-aged champions—Lewis Withey III, 16, of Grand Rapids, Mich., and Willa Worthington, 18, of Oswego, Ore. More than 40 exponents of the new and thrilling sport competed.

Slate. The production of dimension slate in the United States rose from 60,950 short tons in 1944 to 69,660 tons in 1945. The production of slate granules and flour increased from 416,890 tons in 1944 to 482,230 tons in 1945, making total productions of 477,840 tons and 551,890 tons. (G. A. Ro.)

Slezak, Leo (1873–1946), Czechoslovak opera singer, was born on Aug. 18 in Schoeneberg, Moravia. A heroic tenor, he made his debut at Brno in *Lohengrin* in 1896, later appeared at the Berlin royal opera, the Vienna court opera and Covent Garden, London. English critics regarded him as the most important tenor after Enrico Caruso and considered him an even more finished artist. He stood 6 ft., 9 in., and weighed 350 lb., towered over his supporting cast and executed his roles, especially in Wagnerian operas, with great zest. He made his New York debut at the Metropolitan opera house in 1909 and remained for a three-year engagement. He was a member of the Vienna state opera, and while on leave appeared in Germany, Austria, Milan (Italy), Moscow (U.S.S.R.), St. Petersburg (U.S.S.R.), Warsaw (Poland) and Paris, on the concert stage and in opera. Slezak died in Bavaria, according to a London report of June 6.

Slovakia: see CZECHOSLOVAKIA.

Small, John Davis (1893–), U.S. government official and businessman, was born Oct. 11 in Palestine, Tex. He was graduated from the U.S. naval academy at Annapolis (1915), and served in the navy until 1926, when he resigned to enter business. In 1942, he was appointed deputy director of the army and navy munitions board. He joined the War Production board in Oct. 1944. Two months after the war,

the WPB was abolished, and on Nov. 3, 1945, Small was named administrator of the newly-established Civilian Production administration, with the task of steering the U.S. economy back to a peacetime basis. Small and Wilson Wyatt, housing expediter, put a ban on all general building construction on March 26, 1946, to give priority to housing for war veterans. Small's demand (May 16) that congress outlaw all strikes brought immediate repercussions from labour groups, which asked for his dismissal. He was also denounced by veterans' organizations because of CPA approval of more than 30,000 nonhousing projects (announced June 25), but Small denied that this construction would imperil building of veterans' housing. He resigned Dec. 5 and in his final report, issued on Dec. 24, he stated that most reconversion problems had been "licked."

Smith, Logan Pearsall (1865–1946), British essayist and critic, was born on Oct. 18 in Philadelphia. He spent four years at Haverford college, Haverford, Pa., and Harvard, worked for a year with his father's firm and then went to live in England, becoming a naturalized citizen in 1913. He entered Balliol college, Oxford, and studied under Benjamin Jowett, receiving his B.A. degree in 1893 and his M.A. in 1906. He read widely, produced a number of critical works, but his *Trivia* (1902–18), a collection of essays, established his reputation as a literary figure of wit and candour. He was a member of the Society for the Preservation of English. Among his other works are *The Youth of Parnassus* (1895), *Life and Letters of Sir Henry Wotton* (1907), *Songs and Sonnets* (1909), *The English Language* (1912), *More Trivia* (1921), *Words and Idioms* (1925), *On Reading Shakespeare* (1933), *Reperusals and Recollections* (1936), an autobiography *Unforgotten Years* (1938) and *Milton and His Modern Critics* (1940). He died in London on March 2.

Smith, Walter Bedell (1895–), U.S. army officer, was born on Oct. 5 in Indianapolis, Ind. After the U.S. entered World War I, he joined the army. He served overseas in 1918 and later returned to Washington for duty in military intelligence.

In the peace years, Smith held various assignments; he studied at the Infantry school in Ft. Benning, Ga., the Command and General Staff school and was graduated from the Army War college. He was with the war department general staff (1939–42), was promoted to brigadier general in 1942 and was made U.S. secretary of the combined chiefs of staff.

In Sept. 1942, Smith, then a major general, became chief of staff in the European theatre, with headquarters in England, and subsequently chief of staff to Gen. Dwight Eisenhower in North Africa. He remained with Eisenhower throughout World War II. He was promoted to a temporary lieutenant generalship in Jan. 1943 and given the rank of major general (permanent) in Oct. 1945.

On Feb. 14, 1946, Pres. Harry S. Truman named him ambassador to the soviet union. The president's request to congress for legislation permitting Smith to retain his military titles in his new post was approved by the senate military subcommittee on March 11, 1946.

Smith College. Smith college for women in Northampton, Mass., had for the year 1946–47 a total enrolment of 2,238. A revision of the curriculum was to go into effect in 1947. It would institute interdepartmental courses in the humanities, the natural and social sciences and emphasize a unified education with stress upon general culture.

The junior year in Mexico was continued during 1946 with an enrolment of 20 students and, for the first time, the college

sent a group of 37 students for international studies in Geneva, Switzerland, and 3 students spent the junior year in Zurich. The exchange of students with the University of Toronto continued. The intensive method of language instruction was carried on in German and Russian. The Smith college school for social work held its ten-week summer session on the campus with an enrolment of 137 students. The Smith college genetics experiment station started on its fifth year. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (E. Low.)

Smithsonian Institution. The institution was founded in the United States in 1846 through the bequest of James Smithson, an English scientist, "for the increase and diffusion of knowledge among men." The governing body is the board of regents, comprising the vice president, the chief justice of the United States, three senators, three representatives, and six eminent private citizens. The executive officer is the secretary. Dr. Alexander Wetmore was the secretary in 1946. The institution administers six government bureaus—the National museum, the National Collection of Fine Arts, the Bureau of American Ethnology, the International Exchanges, the National Zoological park and the Astrophysical observatory—that grew directly out of its early activities, and also the Freer Gallery of Art. The National Gallery of Art is a bureau of the institution, but is administered by a separate board of trustees. The purposes of the institution are carried out by research, exploration and publication.

On Aug. 10, 1946, the institution celebrated its 100th anniversary. On that date the first sheet of the Smithsonian three-cent commemorative postage stamps was presented to the institution on behalf of the postmaster general. A convocation and reception were held on Oct. 23, a public statement was issued by the president of the United States calling attention to the Smithsonian centennial, and a commemorative publication was issued by the institution under the title *The First Hundred Years of the Smithsonian Institution*.

On Aug. 12, 1946, the president approved an act to establish a national air museum as a bureau of the institution. The Public Buildings act of 1945 contained provision for several buildings for the Smithsonian institution, namely, a historical museum, a building for the engineering and industrial collections and additional buildings at the National Zoological park. Under the president's reorganization plan No. 3, the Canal Zone biological area was placed under the administration of the Smithsonian institution.

In 1946, the first year after World War II, the number of specimens accessioned and the number of visitors showed a marked increase, and field expeditions again were sent out, working in Colombia, Guatemala, Panamá and the vicinity of Bikini Atoll.

Archeological surveys and excavations of Indian sites to be flooded by dam construction in the Missouri and other river basins were started during the year; this project was to be administered by the Smithsonian institution in co-operation with the national park service, the corps of engineers, and the bureau of reclamation.

Under a contract with the Office of the Quartermaster General, the Astrophysical observatory was making a study of sun and sky radiation at Camp Lee, Va., to determine causes of tent-fabric deterioration. Instruments were developed and installed at Camp Lee, and a large amount of detailed information was accumulating regarding the daily quality and quantity of solar radiation.

The "diffusion of knowledge" is accomplished chiefly by several series of publications. At the end of 100 years of existence,

the Smithsonian institution had issued 7,500 individual publications, of which more than 12,000,000 copies had been distributed throughout the world. Outstanding publications of 1946 were volumes 1 and 2 of the *Handbook of South American Indians*, edited by Julian H. Steward, and *The Indians of the Southeastern United States*, by John R. Swanton.

The International Exchange service handled during the year 540,502 packages of publications weighing 472,229 lb. Shipments of governmental and scientific publications to most of the countries to which service had been suspended during the war were resumed. The Smithsonian library at the end of 1946 contained 928,353 volumes. (A. Wt.)

Snyder, John Wesley (1896–), U.S. government official, was born June 21 at Jonesboro, Ark. He attended Vanderbilt university, Nashville, Tenn., 1914–15, and in 1917 he joined the army and was promoted to artillery captain. While in France, he met Capt. Harry S. Truman and after the war the two became friends. Following the armistice, Snyder entered the banking profession, and in 1930 he became national bank receiver in the office of the comptroller of currency in Washington, D.C. He was appointed manager of the St. Louis loan agency of the Reconstruction Finance corporation in 1937 and executive vice-president and director of the Defense Plant corporation, a subsidiary of the RFC, in 1940. In early 1943, Snyder resigned from his various governmental posts to return to private banking. On April 17, 1945, President Truman appointed Snyder federal loan administrator, and three months later (July 16) Snyder was made director of the Office of War Mobilization and Reconversion. In his first report on the U.S. transition from a wartime to a peacetime economy on Sept. 6, he advocated retention of some controls and urged that the forces of deflation and inflation be checked by a "firm policy of economic stabilization." On June 6, 1946, Snyder was named secretary of the treasury by President Truman; he succeeded Fred Vinson who was appointed chief justice of the supreme court.

Soap, Perfumery and Cosmetics. Up to the Christmas season the total volume of trade in the United States was estimated for 1946 at about 10% over 1945; but all parties at interest were chary of predicting possible holiday business as for the first time in five years all kinds of competitive gift goods were in better supply. There were strong indications that the phenomenal rise of "men's toiletries"—essentially gift goods—had levelled off to something approaching normal growth long before the year's end. Relaxation of government price controls, begun in the spring and completed in late October, appeared to have no appreciable effect on the cosmetics market.

Throughout 1946 the supply position continued as difficult as during World War II. Glassware remained especially tight despite cancellation of government order L-103, which had prohibited the production and use of new moulds. The greatest difficulty was with fats and oils. Scarcity of these materials weighs heaviest on the soap industry, but also impinges on that part of the cosmetics industry which features bath preparations, and even on the perfumery trade (animal fats are essential to the production of natural attars). Annual prewar imports were about 2,000,000,000 lb. During the war this figure was halved. As late as mid-September there was no immediate prospect of a return to the prewar importation rate. The department of agriculture estimated that in 1946 the country would export up to 250,000,000 lb. more fats and oils than it imported, whereas before World War II the net favoured imports by about 1,500,000,000 lb. In June the department fore-

cast a 17% decline in the annual pig crop, and reckoned that annual per capita consumption of fats and oils would be down to 62 lb., the lowest from 1933. Preliminary estimates indicated annual per capita soap consumption—14 lb. in 1942—would not exceed 11 lb. in 1946.

In France these trades faced in a more aggravated form the same difficulties as in the United States. Nevertheless by the end of 1946 there were fair supplies of goods in the domestic market, while the effort to revive exports prompted one U.S. observer to remark that "it seems to me every Frenchman is now in the business and that most of the 50 million are calling at this office." French producers' prices, however, were of necessity so completely out of line with the U.S. market—France's biggest export market—as to make their cause almost hopeless. In this connection goods imported into the United States from France are not to be confused with goods made and sold in the United States under French names.

Great Britain started the year with high hopes that did not materialize. Contrary to expectation, wartime restrictions on manufacture for domestic consumption remained in full force. Additional quota for export was readily obtainable. But it was, in the first instance, permissive only; secondly, expressed in sterling. Producers found it impossible to procure all but insignificant portions of the materials needed to make the goods it represented. As elsewhere the great difficulty was with glassware, fats and oils.

(H. T.)

Soccer. The National Challenge cup returned to Chicago for the second time in its 32-yr.-old history on the triumph of the Vikings in the east-west play-off. Tied at 1-all by Ponta Del Gada in the first of a two-game series at Fall River, Mass., the Vikings defeated the Fall River team, 2 to 1, in Chicago for the title. The 1938 Spartas were the last Chicago team to win the National Challenge cup.

SOCCER PLAYERS at London, Eng., shown during a practice session in 1946

Fall River won the national amateur cup, while the Baltimore Americans topped the American league. The Lewis cup went to the Brooklyn Hispanos. The Chicago Spartas won the National league title.

Invasion of foreign soccer teams was resumed in the United States during 1946, with the British Liverpool Football club dominating its U.S. opposition. The Britishers twice defeated the American Soccer league all-stars in New York city, the second game by a 10-1 score. Soccer also boomed in England, Russia, France, Portugal and Germany. (M. P. W.)

Socialism. In the latter part of 1946, in the United States, the National Executive committee of the Social Democratic federation voted to accept the invitation of the Socialist party executive for a joint meeting to discuss steps for the creation of a unified Socialist party in the United States. The meeting of the committees was arranged for the first part of 1947.

Both the S.D.F. and the S.P. sent delegates to a conference in Chicago in Feb. 1946, which resulted in the organization of a National Educational Committee for a New Party. Other groups represented on the governing board of this committee were the Liberal party of New York state, the Michigan Commonwealth federation and various labour, educational, veteran and co-operative bodies. The N.E.C.N.P. declaration maintained that a new party alignment must "see to it that the citadels of power—the giant monopolies and other key industries—are controlled not by the few for the benefit of absentee owners but by the many for the benefit of the entire community. It must be opposed to totalitarianism in every form" and "must work toward the development of a world organization of free people."

The Socialist party during the year agitated for nationalization of the mines, for world disarmament under international control and for other domestic and international reforms.

Canada.—The Cooperative Commonwealth federation (C.C.F.) of Canada—a socialist-farmer-labour party, continued in power in Saskatchewan under Prime Minister Thomas Douglas during the year, and was represented in parliament by 28 members. M. J. Coldwell at the party convention in Regina was re-elected president of the C.C.F., Professor Frank Scott, chairman and David Lewis, secretary.

Latin America.—In Chile the Socialists, in the presidential elections, ran their own candidate, Bernardo Ibanez, but succeeded in securing for him only 12,000 votes, as against 190,000 for the winning Radical-Communist candidate, Gabriel Gonzalez Vidella. In Venezuela, the Socialists continued to support the Democratic Action government of Dr. Rómulo Betancourt, which was overwhelmingly victorious in the elections of Oct. 27, 1946, securing more than 100 out of 160 seats in parliament. The Communists in this election received 4% of the vote. In the congressional elections of March 1946, in Argentina, the Socialists, though receiving a considerable vote in many districts, failed for the first time in 34 years to win a single seat in the lower house. In Peru, the Aprista party—now the People's party, a socialistic party—continued during the year with the largest delegation of any party in the lower chamber and occupied several important posts in the José Bustamante Rivero cabinet.

Australia.—In the elections of Sept. 29, 1946, the Labour party won 44 seats out of 74. The senate results were: Labour, 33 (a gain of 12); and Opposition 3 (a loss of 12). Following the election, Joseph B. Chifley, leader of the Labour party, was re-elected prime minister and treasurer, and Dr. Herbert V. Evatt was appointed minister of external affairs and deputy labour party leader. The government during the year began to carry out the nationalization of all interstate civil air-line operations and extended the sphere of public banking.

New Zealand.—The New Zealand Labour party, which had been in power from 1935, was re-elected to office in Nov. 1946, winning 42 seats out of 80. The National party won 38. Peter Fraser was again chosen premier; and Walter Nash, deputy prime minister and minister of finance.

Great Britain.—During the year, the British Labour government nationalized the coal industry of Britain and certain allied activities, passed acts nationalizing the cable and wireless services and all civil air services and laid the foundation for the nationalization of inland transportation and the electrical services. It enacted laws to control new capital investment, social insurance and health service acts, repealed the restrictive Trades Disputes and Trade Unions act of 1927 and began an extensive housing program, while assisting in the rebuilding of cities, in the expansion of educational facilities and the more efficient operation of

private industry. The Labourites during the year won every by-election in the districts in which Labour won in 1945. In the municipal elections, Labour registered a net gain of 159 local council seats.

France.—Following the resignation of General Charles de Gaulle from the presidency in Jan. 1946, Felix Gouin, Socialist leader, was elected president of the provisional government. After the June 2 elections, which gave Socialists 122 seats, Communists 149 and Popular Republicans, 163, Gouin resigned and was succeeded by Georges Bidault. In the Nov. 10 elections, following the adoption of the constitution, Socialists elected 108 deputies; Communists 186; the Catholic Popular Republican movement (M.R.P.) 162. Leon Blum, Socialist leader, on Dec. 12 was elected prime minister of a temporary crisis government. In late December, the council of the republic was organized with 72 Communists, 70 M.R.P. and 47 Socialists out of 260.

During the year Socialists refused the appeal of Communists for organic unity. They supported the acts nationalizing gas, electricity and many insurance companies.

Belgium.—The year 1946 began with Achille Van Acker, Socialist, serving as premier in a four-party cabinet. On Feb. 17, the Socialists (Belgian Labour party) elected 69 representatives as compared with 92 Catholics and 23 Communists.

During the next month or so, Van Acker and Paul-Henri Spaak, Socialist, alternated as premiers. On March 31, Van Acker formed a government of Socialists, Liberals and Communists, with the Catholic party in the opposition. During the following months, the Socialists continued their vigorous opposition to the return of King Leopold, and the Van Acker government on July 26 received a vote of confidence in support of his abdication proposal. On Aug. 2, following a political crisis, the cabinet was reorganized with Camille Huysmans, veteran Socialist, as premier.

Netherlands.—Until the elections of May 1946, William Schermerhorn, leading member of the newly formed Labour party in which the Dutch Social Democratic Labour party was merged, served as premier of a coalition government.

In May, Labour won 29 seats, as compared with 32 for the Catholic party and 10 for Communists in a parliament of 100. Schermerhorn resigned and was succeeded by Louis J. M. Beel, liberal Catholic. Labour later joined the Beel government, following the Catholics' acceptance of a conciliatory Indonesian policy. Labour received 5 posts. In the municipal elections of July, Labour led the field in Rotterdam and the Hague; the Communists led in Amsterdam.

Austria.—Dr. Karl Renner, Socialist, continued as Austrian chancellor throughout the year, and Leopold Figl, of the Catholic People's party, as premier. The parliament was composed of 84 Catholic People's party members, 76 Socialists and 5 Communists.

At the initiation of the Socialists, the Austrian parliament passed a law in 1946 for the nationalization of the oil, shipping, electric power, metallurgy and banking industries. Several Austrians, however, were arrested by the soviet military authorities for attempting to carry out the nationalization decree, the Russians declaring that the property had been forcibly Germanized and belonged to the soviets as occupying forces.

Germany.—In the soviet zone in Germany, the occupying soviet brought powerful pressure to bear upon the Social Democrats to join with the Communists in a Socialist Unity party, and in April 1946 succeeded in effecting that unity. In the other German zones, the Social Democratic party, by an overwhelming majority, refused to merge with the Communists. During the year, the Socialist party and Christian Democratic union in the U.S., British and French zones received in the elections between 70% to 80% of the votes, and the Communist party around 8%.

In the soviet zone, the Socialist Unity party in the elections for the state and provincial diets on Oct. 20, received 47.7% of the votes and the Christian Democratic party received 24.3%. In the municipal elections in the four zones in Berlin in September, the Social Democrats were given 49% of the votes; the Christian Democratic party 22%, the Socialist Unity party 20% and the Liberal Democrats (conservatives) 9%.

	% of votes		
	Socialist party	Christian Democratic union	Communist party
U.S. zone, June 30, state constitutional assembly	33.6	47.9	7.9
British zone, Oct. 13, city and district councils	37.4	36.9	8.1
French zone, Oct. 13, city and district councils	26.8	55.6	7.1
Berlin, Oct. 20, city government	48.6	22.2	Socialist unity party 9.4

Italy.—The Socialists, in the beginning of 1946, were a part of the six-party cabinet presided over by Alcide de Gasperi, Christian Democrat.

In the general elections of June 2, 1946—the first democratic elections in more than 20 years—the Socialist party obtained second place, receiving more than one-fifth of the votes and electing 115 deputies. The Christian Democrats came first with 207 deputies and the Communists third with 104 out of a total of 556. Socialists later received 4 seats in the de Gasperi cabinet, including the ministry of foreign affairs, occupied by Pietro Nenni, leader of the Socialist party.

On Oct. 24, 1946, the Socialist party signed an agreement with the Communists in which both parties pledged themselves, while retaining their autonomy and individuality, to co-ordinate their respective activities in liquidating "fascist remnants," defending the republic and public freedom, providing, among other things, for the nationalization of monopolistic industries, large banks and public services, improving living conditions, abolishing large estates, strengthening co-operatives, maintaining peace, etc.

As the year progressed an increasing conflict developed within the Socialist party over the party's relations with the Communists. Nenni

favoured close collaboration, verging on organic unity, while Giuseppe Saragat, president of the constituent assembly, and Matteo Matteotti, son of the murdered Socialist leader, among others, condemned such collaboration as a "betrayal of socialism."

Czechoslovakia.—From the convening of the provisional national assembly on Oct. 28, 1945, until late May 1946, Zdenek Fierlinger, Socialist, served as premier of the Czech government in a cabinet composed of Social Democrats, National Socialists, Catholics and nonparty members.

On May 27, 1946, in the first postwar general election, Czech Communists won 93 seats, Czech (National) Socialists 55 and Czech Social Democrats 37 in a parliament of 300. On July 3, 1946, Klement Gottwald, chairman of the Communist party, was elected premier and Eduard Benes was elected president, following which a cabinet was constituted consisting of 9 Communists and 17 others distributed among Czech Socialists, Social Democrats and People's party adherents, Slovak Democrats and Independents. The government parties pledged themselves to adopt a foreign policy favourable to Russia. During the year, the Czech government began the operation of many nationalized industries.

Poland.—In Poland during the year the government was directed by a coalition cabinet containing representatives of the Workers', Socialist, Peasant and Democratic parties, headed by Premier Edward Osobka-Morawski, of the Polish Socialist party, and pledged to a foreign policy favoured by the soviet Communists. In late November, the Socialists and Communists entered into an agreement pledging both parties to cleanse themselves of elements opposed to the electorate accord made in connection with the Jan. 1947 elections. The government continued to refuse to legalize the Polish Social Democratic party, which claimed to represent the real socialist movement.

At the meeting of the deputies to the Polish provisional council in Feb. 1946, a motion was passed to nationalize all essential industries employing more than 50 workers. This decision was ratified in a referendum passed by the electorate on June 30, 1946. In the fall the U.S. protested against the activities of the Communist-dominated government departments, which it was alleged, were seeking to interfere with the holding of free elections in Jan. 1947.

Finland.—Social Democrats remained throughout the year the largest parliamentary party with a representation of 52 out of 200. On the resignation of Field Marshal Carl Mannerheim from the presidency and the election to that post of Premier Juko Paasikivi, Conservative, M. Pekkala, Social Democrat, became premier on March 24, 1946. After assuming the premiership, he formed a coalition cabinet containing 5 Social Democrats, 5 Popular Democrats, 5 Agrarians and 1 member of the Swedish party.

Hungary.—Social Democrats in Hungary supplied 4 members of the cabinet and held 76 in parliament against 246 for the Small Landholders, 67 for the Communists and 22 for the Peasants. The soviet military authorities, despite the parliamentary system, were the chief rulers of the country's policies.

Bulgaria.—During 1946, a coalition government, dominated by Communists, continued to rule the country. In Sept. 1946, Socialists joined with Communist and other groups in voting out the monarchy. The elections to select a national assembly, held on Oct. 27, 1946, resulted in the election of 277 Communists out of 465, and of 9 Social Democrats. The Allies, as a result of reports that the Communist-controlled government planned to prevent a free election, offered to supervise the elections, but their offer was refused.

In Rumania, Titel Petrescu, leader of the Socialist party, issued a demand in October for the cessation of illegal arrests on the part of the Communist-controlled government.

Far East.—The Social Democratic party, revived after the defeat of Japan, won in the April elections 94 seats in the diet out of a total of 466. The Liberals elected 142, the Co-operatives, 17 and the Communists, 5. In India, Pandit Jawaharlal Nehru, prominent Socialist, head of the Indian congress, was chosen during 1946 premier of the Indian Interim government.

International.—In November, the British Labour party was host to representatives of 18 Labour, Socialist and Social Democratic parties at a conference in Bournemouth, England, called to create a liaison between the democratic socialist parties in various countries for consultation and the exchange of facts and views.

After several days of discussion, those present agreed to hold another conference in Switzerland in the spring of 1947. (See also COMMUNISM; LABOUR PARTY, GREAT BRITAIN.)

Socialist Soviet Republics: see UNION OF SOVIET SOCIALIST REPUBLICS.

Social Security. In 1946 the international dimensions of social security objectives were outlined by the Social and Economic council of the United Nations. To deal with urgent and immediate social disorganization and distress, the council set up the International Refugee organization and other emergency bodies. In providing for a permanent Social commission, on the other hand, and for specialized organizations like the World Health organization, the council affirmed the concept that social policy must deal not only with the "socially wounded" but rather with the common needs of all.

United States.—Legislative activity and consolidation of additional health, welfare and educational activities within the

Federal Security agency were major developments in 1946. Hearings on social security problems and proposals were held by both the senate and house, from which came amending or new legislation in the closing days of the 79th congress.

The Social Security act amendments of 1946, signed Aug. 10, made changes in all programs but, unlike the 1939 amendments, made no comprehensive extension of the system. Despite the volume of testimony, the final proposals were limited in scope and made comparatively simple changes, to ensure speedy enactment. Contribution rates under old-age and survivors insurance were frozen at 1% each for employers and employees for 1947; the protection of the system was extended to survivors of veterans of World War II who die within three years of their discharge from military service; and certain other minor provisions were liberalized. Extension of coverage of the Federal Unemployment Tax act made possible permanent coverage of private maritime employment under state unemployment insurance laws, and a temporary program of unemployment insurance was set up (title XIII) for seamen whose maritime employment has been technically federal employment; provision was also made to permit states that have collected contributions from employees under state unemployment insurance laws to use them to finance disability benefits. The federal share in financing public assistance programs was increased; this provision became effective Oct. 1, 1946, and was to expire at the end of 1947. Federal grants to states for the three maternal and child health and welfare programs were also increased and were extended to the Virgin Islands.

Congress also amended the Railroad Retirement and Railroad Unemployment Insurance acts, in a bill signed July 31. Among other liberalizations, the amendments establish monthly survivor benefits and temporary disability and maternity benefits. A provision also amended the Social Security act by making service in the railroad industry creditable toward survivor benefits and provides for correlation of such benefits under the two systems.

Another law returned to the states on Nov. 15 the public employment offices which in Jan. 1942, at the request of the president, had been transferred by the states to the federal government to centralize and unify the mobilization of the labour force for war production.

The Hospital Survey and Construction act, signed Aug. 13, was the first step in legislation to implement the president's message to congress on a national health program; it authorizes grants to states toward the costs of surveying existing hospital facilities, developing programs for additional facilities, and constructing such facilities. Congress also approved an act on July 3 which included provision for a National Institute of Mental Health, and for increased federal grants to states for public health services, with special emphasis on mental health problems.

On Aug. 2 the senate directed its Finance committee to make a complete study of old-age and survivors insurance and all other aspects of social security.

Administrative developments during the year stemmed from the president's reorganization plan. As of July 16, the three-member Social Security board was abolished and most of its functions, as well as certain responsibilities in the field of health and welfare which were lodged in other governmental units, were transferred to the Federal Security administrator. On that same date the administrator announced the creation of the Social Security administration as one of four major units within the agency. The Social Security administration includes the bureaus which were formerly within the board and also the children's bureau, transferred from the department of labour with all functions except those relating to child labour.

Social Insurance and Related Programs.—Most of the people who were laid off or released during the reconversion were protected under federal-state unemployment insurance systems, the federal system for railroad workers, or the Servicemen's Readjustment act. The peak of insured unemployment, measured by continued claims filed under the three programs, came in the week ended March 2, for which 3,662,000 claims were filed. Though claims from unemployed veterans continued to mount, claims under the state systems declined gradually thereafter, and by the last months of the year the volume of unemployment was probably close to the irreducible minimum for peacetime. In October, benefit expenditures paid to an average of 1,919,000 persons under the three programs totalled \$169,000,000, of which 60% went to unemployed veterans.

Under federal old-age and survivors insurance, 1,606,000 persons received monthly benefit payments in Oct. 1946, at a monthly rate of \$30,400,000. About two-thirds went to aged retired workers and their wives and dependents; the rest went to surviving widows, children and parents of deceased wage earners. At the end of 1946, an estimated 43,200,000 workers were insured under the program, of whom 35,500,000 were fully insured and 7,700,000 currently insured only. Survivor benefits will be payable on the death of any of these workers, within a given period of time, and retirement benefits will be payable immediately to fully insured workers 65 years old or over if they retire from covered employment. Nearly one in every four of the fully insured workers was also permanently insured; regardless of their future covered employment, these workers, their dependents, and, when they die, their survivors will have the protection of the system.

Monthly retirement, disability, and survivor payments were also paid in October to beneficiaries under the railroad retirement program (189,000) and veterans' programs (3,093,000). Retirement or disability pensions went to some 104,000 former federal employees under programs administered by the Civil Service commission and to almost 190,000 persons protected by state and local government plans; in addition, survivors of more than 30,000 persons were receiving monthly payments under the latter plans.

Aside from the disability payments just mentioned, the only other government programs compensating for wage loss from disability were workmen's compensation, in effect in all states but Mississippi, and temporary disability payments linked to the Rhode Island unemployment insurance law and, effective Dec. 1, under the California unemployment insurance law.

Assistance and Welfare.—Supplementing the social insurance programs, public assistance was an important resource for persons who, because of age, extreme youth, blindness or other handicap, could not support themselves, and for families who met catastrophes with which they could not cope unaided. The number of persons receiving public assistance, which had declined continuously during the war, increased in 1946 as reconversion proceeded. The average payment also rose slowly, as states liberalized their legislative provisions or welfare policies to meet in some degree the rise in living costs. These factors, plus the greater federal funds which became available in October for payments under the Social Security act to the needy aged and blind and dependent children, brought to \$108,000,000 the total amount expended in that month under all public assistance programs including general assistance, which is financed by states and localities without federal sharing. Seven-tenths of this amount went to the needy aged.

Federal grants-in-aid to states for maternal and child health and welfare programs and the emergency maternity and infant care program for dependents of enlisted men totalled nearly \$50,000,000 in the fiscal year 1945-46, of which \$38,000,000

went for the emergency maternity and infant care program. (See also LAW; RELIEF.) (A. J. A.)

Great Britain.—Following the coming into operation, in Aug. 1946, of the Family Allowances scheme, by which it was estimated that about 2,000,000 families would receive weekly children's allowances at an annual cost to the exchequer of some £59,000,000, considerable legislative progress was made with the main insurance sections of the government's comprehensive social security measures based on the recommendations of the Beveridge report. The National Insurance act and the National Insurance (Industrial Injuries) act were passed by parliament in August, but their full provisions would not be implemented until dates to be fixed by the minister of national insurance, probably in 1948. The delay was due to the preliminary adjustments necessary in establishing the complete organization of the new ministry. Neither act deviated in principle nor in any important particular from the proposals which were put forward in the government's White Papers of 1944 (Cmd. 6,550), 1945 (Cmd. 6,651) and 1946 (Cmd. 6,729). Although it was necessary to postpone the operation of the full scheme until 1948, as an exceptional measure the government decided to bring into immediate operation, as from Oct. 1946, those parts of the general scheme of national insurance which related to old age pensioners, including blind persons and widows of 60 and over. The general effect of this decision was that such pensioners received payment at the higher rates provided for in the new act and during the interim, until the full scheme should be in force, the corresponding rates of contributions were also increased. For example, the joint pension of a man and wife insured in the husband's right was increased from 20s. to 42s. weekly, or where the wife was separately insured, to 52s.; pensions for single persons were increased from 10s. to 26s. Particulars of the changed rates of pensions and contributions were given in a White Paper in July 1946 (Cmd. 6,878), issued by the ministry of national insurance. The increased pensions could, if necessary, be supplemented under the existing scheme of supplementary pensions administered by the assistance board, but the number of those requiring such supplement would be considerably less after 1946. The new scheme of national assistance which was projected by the minister when introducing the new insurance scheme made need the sole qualification for state assistance from the assistance board and so marked the final elimination of the old Poor law.

The National Insurance (Industrial Injuries) act would apply without exception to all persons working under contract of service, and would transfer liability for the compensation of those injured in the course of their employment from the individual employer to a separate state insurance fund contributed to equally by employers and employed, with additions from the exchequer equal to one-fifth of the joint contributions. Compensation would be according to degree of disability and not related to previous earning capacity. The principal benefits are: injury allowances for first 26 weeks of incapacity, followed by disablement pensions if incapable of work or if permanent disability is suffered; dependent's allowances for wife, children or adult dependent; rates of benefit the same for men and women; pensions in fatal cases for widows or adult dependents, with allowances for children; the scheme was to be extended to certain industrial diseases to be prescribed by the minister.

The National Health Services bill which was introduced at the beginning of the year was under long consideration by parliament. The National Health Services act passed by parliament in October amended many details of the bill, but the general provisions of the act did not differ from the proposals in the White Papers of 1944 (Cmd. 6,502) and 1946 (Cmd. 6,761), except that all hospitals were to be brought under national ownership.

There was growing recognition that effective planning and co-ordination of the hospital services is inseparable from ownership, with the exception of the teaching hospitals attached to the universities, which have a separate and special function.

See the *Annual Report* of the assistance board for 1945 (Cmd. 6,883, 1946) for information on the administration of assistance during the war. (J. McAT.)

Social Service: see CHILD WELFARE; RELIEF; SOCIAL SECURITY.

Societies and Associations. The following is a selected list of U.S. societies and associations, with date of founding, membership, officers, and chief activities during 1946. See also the separate articles on AMERICAN LEGION; BOY SCOUTS; RED CROSS; YOUNG MEN'S CHRISTIAN ASSOCIATION; etc.

American Academy of Arts and Letters.—An organization founded in 1904 by the National Institute of Arts and Letters to improve the institute's efficiency in the protection and furtherance of literature and fine arts. Membership is limited to 50 persons chosen only from the institute. At the fifth joint public ceremonial in 1946, medals were awarded and twenty-three \$1,000 arts and letters grants were given. On Nov. 19 at the annual meeting three new members were elected: Archibald MacLeish, Charles Austin Beard and Gilmore D. Clarke. Officers (1946): president, Walter Damrosch; chancellor and treasurer, James Truslow Adams; secretary, Van Wyck Brooks. Publications: One art exhibition catalogue and the 25th edition of the *Yearbook*. Headquarters: 633 W. 155th St., New York city.

American Academy of Political and Social Science.—This academy is composed primarily of business and professional people interested in serious discussions of public questions. Membership in 1946 approximated 12,500. Special membership rates are allowed for students of whom there were nearly 600. In addition to publishing the bi-monthly journal *The Annals*, the academy distributes sundry informational documents provided by the U.S. department of state. Officers (1946): president, Ernest Minor Patterson; secretary, J. P. Lichtenberger; treasurer, Charles J. Rhoads. Headquarters: 3457 Walnut St., Philadelphia, Pa.

American Association for the Advancement of Science.—A scientific association whose membership in 1946 totalled 29,000. It publishes a non-technical science series; a technical series of which those on *Human Malaria* and *Relapsing Fever* were widely used by the medical corps of the U.S. army and navy in the tropics; and the serial publications, *A.A.A.S. Bulletin*, *The Scientific Monthly* and the weekly journal *Science*. Officers (1946): president, James B. Conant; administrative secretary, Forest Ray Moulton; treasurer, William E. Wraether; general secretary, Otis W. Caldwell. Headquarters, Smithsonian Institution building, Washington (25) D.C.

American Association of Law Libraries.—The association was founded in 1906 and incorporated in 1935 "to foster the development of law libraries in the United States and Canada, through establishing and maintaining standards for libraries and librarians; to publish in its official organs material of professional interest and value." The association in 1946 had a membership of 325 bar association, county, court, government, law school and state librarians, in addition to 42 associate members. Publications: *Index to Legal Periodicals* and *Law Library Journal*. President (1946-47): Laurie H. Riggs, Baltimore Bar library, Court house, Baltimore, Md.; president-elect, Arie Poldervaart, New Mexico Law library, Santa Fé, N.M.

American Bankers Association.—This national organization, founded in 1875, had a membership in 1946 of more than 15,000 banks, representing more than 99% of the banking resources of the United States. The Association's primary objective is the improvement of banking services in the interests of the public. Educational activities of the association include the American Institute of Banking, for bank personnel, and The Graduate School of Banking for bank officers. During the year 75,000 persons held membership in the A.I.B. and 30,000 had enrolled in courses given in many cities throughout the country. Publication: *Banking*, a magazine. Officers (1946): president, C. W. Bailey, First National bank, Clarksville, Tenn.; vice president, Joseph M. Dodge, The Detroit bank, Detroit, Mich.; treasurer, S. Albert Phillips, First National bank, Louisville, Ky. National headquarters: 12 E. 36th St., New York city.

American Bar Association.—The association was founded in 1878 to advance the science of jurisprudence and promote the administration of justice. Its membership, as of Sept. 1, 1946, was 37,303. The Ross prize of \$3,000 went to Eugene C. Gerhart for the essay on "Labor Disputes: Their Settlement by Judicial Process." The annual medal for conspicuous service to the cause of U.S. jurisprudence went to Carl McFarland. Publications: *The American Bar Association Journal*, a monthly; an annual volume of reports and proceedings and various pamphlets. Officers (1946): Carl B. Rix, president; Howard L. Barkdull, chairman to house of delegates; Joseph D. Stecher, secretary. Headquarters: 1140 N. Dearborn street, Chicago, Ill.

American Bible Society.—Founded in 1816 for the purpose of encouraging a wider circulation of the Holy Scriptures, without benefit of financial gain, the society had a membership in 1946 of 125,000. Activities during the year included the regular work of distributing the Scriptures throughout the U.S. and approximately 40 other countries, in more than 150 languages, and of furnishing New Testaments and Bibles to Japan and Germany. Publication: *The Bible Society Record*, issued ten times a year. President (1946): Daniel Burke. Headquarters, 450

Park avenue, New York city.

American Chemical Society.—Founded in 1876, the society's main purpose is to encourage the advancement of chemistry, to improve the qualifications and usefulness of chemists, increase chemical knowledge and promote scientific interests and inquiry. Membership in 1946 totalled 48,000. Two national meetings were held and 60 predoctoral and 7 postdoctoral fellowships in chemistry and chemical engineering were awarded during the year. Officers (1946): Chairman, Roger Adams; president, Bradley Dewey; president-elect, W. Albert Noyes, Jr.; treasurer, Robert T. Baldwin. Publications: *Chemical Abstracts*, *Journal of the American Chemical Society*, *Chemical and Engineering News*, *Industrial and Engineering Chemistry* and *Analytical Chemistry*. Headquarters, 1155 16th St., N.W. Washington, D.C.

American College of Life Underwriters.—Incorporated in 1927, the college grew out of the needs for efficient life underwriting. To obtain the C.L.U. designation candidates must pass five examinations and satisfactorily complete three years of business experience. During the year the college gave examinations at 115 universities and colleges. In 1946, 2,599 persons held the C.L.U. designation and 3,765 held partial credits. Publications: *Annual Announcement*, *C.L.U. Study Supplements* and *Refresher Monographs*. Officers (1946): President, S. S. Huebner; Dean, David McCahan; chairman of the board, Julian S. Myrick. Headquarters, northeast corner 36th and Walnut streets, Philadelphia, Pa.

American College of Surgeons.—The college was founded in 1913 for the purpose of elevating the standards of surgery and improving the hospitalization of the patients. Membership in 1946 totalled 15,000. Publications include: *Surgery, Gynecology, and Obstetrics*, the official monthly journal; *Medical Service in Industry and Workman's Compensation Laws* (1946); and a quarterly, *Bulletin of the American College of Surgeons*. Officers (1946): president and chairman of the board of regents, Irvin Abell, M.D.; secretary, Paul B. Magnuson, M.D.; treasurer, Dallas B. Phemister, M.D.; associate directors, Malcolm T. MacEachern, M.D. and Bowman C. Crowell, M.D. Headquarters, 40 E. Erie street, Chicago, Ill.

American Economic Association.—This professional association of economists was founded in 1885 to encourage economic research and stimulate thought and discussion of economic problems. It consisted of 4,662 members in 1946 and had 2,161 subscribers (universities, libraries, etc.). The 59th annual meeting for discussion of problems of 1946, was held at Atlantic City, N.J., Jan. 23-26, 1947. Among the topics discussed were the Employment act of 1946, the public debt, the social and economic significance of atomic energy, the economy of the U.S.S.R. and labour-management relations. Publications: *American Economic Review* (quarterly), and occasional monographs. Officers (1947): Paul H. Douglas, president. Headquarters: Northwestern university, Evanston, Ill.

American Geographical Society of New York.—Primarily a research institution, the society was founded in 1852 for the purpose of advancing geographical knowledge. In 1946 the society completed compilation of the two North American sheets of the *Map of the Americas* on the scale of 1:5,000,000. Work also was resumed on preparation of additions to the society's monograph series which had been curtailed by World War II. Membership in 1946 was 4,648. Publications: *The Geographical Review* (quarterly) and *Current Geographical Publications* (monthly). Officers (1946): Roland L. Redmond, president; Dr. John K. Wright, director. Headquarters: Broadway at 156th St., New York city.

American Historical Association.—This association was founded in 1884 for the purpose of promoting historical studies and for the collection and preservation of historical manuscripts in the interests of U.S. history and of history in the U.S. Membership in 1946 totalled 3,812. Activities during the year centred on the selection of manuscripts for publication and the preparation of discussion pamphlets on public questions for use by the armed forces. Publications: *The American Historical Review*, a quarterly, and an annual report in three volumes. Officers for 1946: president, Sidney B. Fay, Harvard university; executive secretary, Dr. Guy Stanton Ford, Library of Congress Annex. Headquarters, Library of Congress Annex, Washington, D.C.

American Institute for Property and Liability Underwriters, Inc.—The institute was incorporated in 1942 for the purpose of establishing educational standards for qualified property and casualty underwriters with the view toward their recognition as professional Chartered Property Casualty Underwriters; 89 persons held the C.P.C.U. designation in 1946. To obtain the award candidates must pass five examinations and satisfactorily complete three years of business experience. During 1946, 271 candidates took 573 examinations throughout 23 states. Officers (1946): chairman of the board, S. S. Huebner; president, H. P. Stellwagen; dean, Harry J. Loman. Headquarters, Hamilton court, 39th and Chestnut streets, Philadelphia, Pa.

American Institute of Accountants.—This national society of certified public accountants was founded in 1887 to maintain high standards of education and practice for the profession and to develop the technique of accounting in the public interest. With more than 10,000 members in 1946, it continued its activities in the improvement of federal income taxation, the preparation of the official Certified Public Accountant examinations for 44 states, the District of Columbia and the four territories. Officers (1946-47): president, Edward B. Wilcox; vice-presidents, Parry Barnes and Percival F. Brundage; treasurer, Maurice E. Peloubet; secretary, John L. Carey. Publications, *The Journal of Accountancy*, *The Certified Public Accountant*, both monthly. Headquarters, 13 E. 41st St., New York city.

American Institute of Chemical Engineers.—This organization was founded in 1908 for the advancement of chemical engineering in theory and practice and for the maintenance of a high professional standard amongst its members. Three regional meetings and the 39th annual meeting were held in 1946. Membership as of August exceeded 6,400. Officers (1946): president, James G. Vail; vice-president, Charles M. A. Stine; treasurer, C. R. DeLong; secretary, Stephen L. Tyler. Publications, *Transactions of the American Institute of Chemical Engineers*. Headquarters, 50 E. 41st St., New York city.

American Institute of Electrical Engineers.—The society, founded in 1884

for the advancement of the theory and practice of electrical engineering, had 75 local sections and 125 student branches in educational institutions in 1946. Activities during the year centred on the development of standards and the advancement of technical developments. Three national and four district meetings were held. Membership in 1946 exceeded 26,000. Officers (1946): president, J. Elmer Housley; secretary, H. H. Henline. Publications: monthly, *Electrical Engineering*; annual, *Transactions and Yearbook*. Headquarters, 33 W. 39th St., New York city.

American Institute of Mining and Metallurgical Engineers.—An organization founded in 1871 for the purpose of promoting the arts and sciences connected with the economic and scientific search for, production of and use of, minerals, including metals, coal, petroleum and other nonmetallic minerals. Its membership in 1946 was 15,000. An annual meeting of the institute was held in February at which time more than 200 technical papers were read and discussed. Publications for the year included five volumes of *Transactions*; monthly issues of the magazine *Mining and Metallurgy* and regular issues of the periodicals *Petroleum Technology*, *Metals Technology*, *Mining Technology* and *Coal Technology*. Officers (1946): president, Louis S. Cates; secretary, A. B. Parsons. Headquarters, 29 W. 39th St., New York city.

American Iron and Steel Institute.—This organization was incorporated in 1908 to promote the interests of the iron and steel industry. Membership in 1946 included 1,400 active and 500 associate members. The institute continued its research projects in 1946 and initiated new research on reinforced concrete and many other items. Publications included six issues of *Steel Facts*, five issues of *Steelways*, the *Annual Statistical Report*, *Steel Products Manuals* and others. Officers (1946): president, Walter S. Tower; vice-presidents, B. F. Fairless and Frank Purnell; secretary, George S. Rose. Headquarters: 350 Fifth Ave., New York city.

American Law Institute.—From its organization in 1923 to early 1944, the principal work of the organization was the *Restatement of the Law*, an orderly statement of the common law of the states of the U.S. The last two volumes were published in 1945. The *Restatement* was in general use by the courts. The chief work of the institute in 1946 was on a model code of commercial law, expected to be completed in 1949 or 1950. There were in 1946, aside from the official membership of persons holding leading judicial bar and law school faculty positions, 860 life members. The president in 1946 was George Wharton Pepper; William Draper Lewis was director and chief of editorial staff. Executive offices, 3400 Chestnut St., Philadelphia, Pa.

American Mathematical Society.—This society was founded in 1888 for the purpose of encouraging and maintaining an active interest in mathematical science. Membership in 1946 was 3,100. Publications: *Bulletin of the American Mathematical Society*, *Transactions of the American Mathematical Society*, *Mathematical Reviews*, *Colloquium Publications* and *Mathematical Surveys*. Officers (1946): President, T. H. Hildebrandt, University of Michigan; secretary, J. R. Kline, University of Pennsylvania. Headquarters: 531 W. 116th St., New York city.

American Society of Civil Engineers.—A society founded in 1852 for the purpose of advancing the sciences of engineering and architecture. Membership in 1946 exceeded 21,000. The professional activities of the society were directed through the society's headquarters; its professional committees; its technical divisions; and its student chapters in 123 engineering colleges. Publications: *Proceedings* (monthly); *Transactions*, a yearly volume; *Civil Engineering* (monthly); and the *Yearbook*. President (1946) Wesley W. Horner, St. Louis, Mo. Principal office: 33 W. 39th St., New York city.

American Society of Mechanical Engineers.—A national organization whose membership of more than 21,000 in 1946 was grouped into 17 professional divisions covering all phases of mechanical engineering. The society's work during the year was carried on by 71 sections including one in Canada. Student branches were also maintained in about 122 engineering schools. The society holds four national meetings annually. Officers (1946): President, Eugene W. O'Brien; secretary, Colonel C. E. Davies; treasurer, K. W. Jappe. Chief publications, *Mechanical Engineering*, a monthly periodical, and *Transactions*, including the *Journal of Applied Mechanics*. Headquarters, 29 W. 39th St., New York city.

American Society of Tool Engineers.—An educational body, the society was founded in 1932 for the purpose of advancing scientific knowledge in the field of tool engineering. In 1946 the society sponsored scholarships in educational institutes and began the organization of student chapters. Membership exceeded 18,000. Publications: *The Tool Engineer*, *A.S.T.E. data sheets*, *A.S.T.E. directory* and *Tool Engineer's Handbook*. The president in 1946 was A. M. Sargent, Detroit, Mich.; vice-presidents, W. B. Peirce, Pittsburgh, Pa., I. F. Holland, W. Hartford, Conn., R. B. Douglas, Montreal, Canada; secretary, George Johnson, Rockford, Ill. Headquarters, 1666 Penobscot building, Detroit, Mich.

Anti-Saloon League of America.—Organized in 1895, interdenominational and nonpartisan in character, this national federation of state temperance organizations had affiliations in 1946 with 31 states and one territory. Activities during the year centred on the development of new methods of temperance education and the adoption of an eight-point program, including collaboration with church leaders and temperance agencies, designed to further the cause of alcoholic temperance. The national publication is *The American Issue*. Officers (1946): president, Bishop Ralph S. Cushman; general superintendent, George W. Crabbe; attorney, Edward B. Dunford; research secretary, Laura Lindley. National headquarters, 131 B St., S.E., Washington, D.C.

Brookings Institution.—This nonprofit organization is devoted to research and training in the field of economics and government. It is supported by grants from foundations, its own endowment and income from the sale of publications. Publications in 1946 included: *Relief and Social Security*, by Lewis Meriam; *Americans in Persia*, by A. C. Millspaugh; *The Regulation of the Security Markets*, by H. G. Moulton, Willard E. Atkins and George W. Edwards; *China's National Income*, by Ta-Chung Liu; and *Depreciation Policy and Postwar Expansion*, by Lewis H. Kimmel. Officers (1946): Harold G. Moulton, president; Lewis Meriam, vice president; Henry P. Seidemann, treasurer and Elizabeth H. Wilson

secretary. Headquarters: 722 Jackson Place, N.W., Washington, 6, D.C.

Carnegie Trusts.—*Carnegie Corporation of New York*, established in 1911, with an endowment of \$135,000,000, makes grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge among people in the U.S. and the British empire. During 1945-46, grants totalling \$3,086,385 were made among colleges and universities and various agencies. The other five separately administered Carnegie organizations in the U.S., founded before the corporation for specific purposes, are:

Carnegie Institute of Pittsburgh (1896), comprising a museum of fine arts, a music hall, a museum of natural history and a public library.

Carnegie Institution of Washington (1902), devoted to scientific research; by 1946 it had expended some \$50,000,000 in its program.

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed throughout the U.S., Canada and Newfoundland; from 1904 it had awarded 3,442 medals and a total of \$6,837,051 in pecuniary awards.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid \$1,879,686 in 1946 in such allowances, raising the cumulative expended total to \$50,977,418.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, continued in 1946 to promote international understanding and further the general cause of peace.

Catholic Community Service, National.—An agency, founded in 1940, to promote the spiritual, recreational, social and educational welfare of men and women in the armed forces, war production workers and the families of both groups. Activities in 1946 centred on the guidance of returned veterans and the younger men who were entering the service. The agency was the recipient in 1946 of the army and navy award for meritorious service during World War II. Publications include *NCCS* (monthly magazine), *Planning Ahead* (book), and the following pamphlets: *Yesterday and Now Tomorrow*, *At Home in Housing Projects*, *Community Aids for Patients and Side by Side on the Long Road Home*. Headquarters: 1312 Massachusetts Ave., N.W., Washington, D.C.

Catholic Library Association.—An international organization of librarians, educators and others interested in the promotion of Catholic literature and Catholic library work. The association's membership in 1946 was 1,351. The compilation and publication of book lists were the principal activities during the year. Publications include: *Catholic Library World*, the official publication, *Catholic Booklist* and *Catholic Supplement to Standard Catalog for High School Libraries*. Officers (1946): president, Richard James Hurley, University of Nebraska; vice-president, Brother Thomas, F.S.C., Manhattan college, New York city; executive secretary, Laurence A. Leavey, Manhattan college. Headquarters: Cardinal Hayes library, Manhattan college, New York city.

Commonwealth Fund, The.—An endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind." In 1946 appropriations totalled \$2,121,917.69. Activities tending to promote or maintain physical and mental health accounted for more than 85% of this total. Fellowships for British graduate students at U.S. universities, suspended during World War II, were resumed with the appointment of 20 fellows for 1946-47. Directors of the fund (1946): Malcolm P. Aldrich (president), David P. Barr, William E. Birdsall, Phil W. Bunnell, Robert A. Lovett, Lewis Perry, Barry C. Smith, William E. Stevenson and Thomas D. Thacher. Offices: 41 E. 57th St., New York city.

Daughters of the American Revolution, National Society of.—An historical, educational and patriotic society whose activities are conducted by 24 national committees, and whose membership in 1946 approximated 150,000 in 2,600 chapters. Two schools are maintained and operated by the society and support is tendered to 18 approved schools. During the year more than \$152,000 was contributed to schools by the various chapters and more than \$339,000 was circulated through the D.A.R. Student Loan fund to deserving students. The society had distributed more than 100,000 D.A.R. Manuals for citizenship to aliens and children; 7,290 clubs, comprising 241,000 junior U.S. citizens, had been taught the ways of "better citizenship and right use of leisure." A genealogical library of more than 25,000 volumes is maintained by the society. President general in 1946 was Mrs. Julius Y. Talmadge. National headquarters, 1720 D street, N.W., Washington, D.C.

Elks, Benevolent and Protective Order of.—This fraternal order was organized in 1868 for the purpose of practising charity, justice, brotherly love and fidelity; promoting the welfare and enhancing the happiness of its members; and to quicken the spirit of U.S. patriotism and cultivate good fellowship. Membership in 1946 totalled 850,000. Charitable expenditures for the year amounted to \$4,200,000. The Elks National Veterans Service commission worked on plans for the rehabilitation of veterans. Publication: the *Elks Magazine*, a monthly periodical. Officers (1946): grand exalted ruler, Charles E. Broughton, Sheboygan, Wis.; grand secretary, J. E. Masters, Chicago, Ill. Headquarters: 2750 Lakeview avenue, Chicago, Ill.

Falk Foundation, The Maurice and Laura, of Pittsburgh, Pa., was founded in 1929 for the purpose of bettering the lot of mankind. During 1946 it devoted part of its funds for research investigation of specific economic problems involved in postwar economic conversion and reconstruction. In practice the foundation attempts to enlarge and refine the economic knowledge of the country. Publications, issued by the Brookings institution in 1946: *Depreciation Policy and Postwar Expansion*, *The Regulation of the Security Markets and Relief and Social Security*. A further publication, *Domestic Servants in the United States*, was issued by the National Bureau of Economic Research. Officers (1946): chairman, Leon Falk, Jr.; vice-chairmen, E. T. Weir and Frank B. Bell; secretary, I. A. Simon; treasurer, Arthur E. Braun; executive director, J. Steele Gow. Headquarters: 1911 Farmers Bank Bldg., Pittsburgh, Pa.

Guggenheim Memorial Foundation.—The John Simon Guggenheim Memorial foundation was established in 1925 for the advancement of research in all fields of knowledge and for creative work in the arts. The founda-

tion in 1946 had an endowment of \$20,268,324.22. A total of 157 post-service fellowships were awarded in 1946 with total grants of \$400,000. Countries added to the Latin American Fellowship program were: Bolivia, Colombia, Ecuador, Paraguay and Venezuela. Officers (1946): president, Mrs. Simon Guggenheim; vice-president, Francis H. Brownell; treasurer, Otto L. Myers; secretary, Henry Allen Moe. Headquarters: 551 Fifth Ave., New York city.

Kiwanis International.—An organization, founded in 1915, which consisted in 1946 of 170,000 business and professional leaders in 2,550 clubs throughout the United States, Canada and Alaska. Community betterment is its principal objective. Its program includes participation in public affairs, aid to youth, promotion of closer rural-urban relations, maintenance of democracy and preservation of the free enterprise system. Publications include *The Kiwanis Magazine*, *The Monthly Club Bulletin* and *The Weekly Club Bulletin*. Officers (1946): president, J. N. Emerson, Pullman, Wash.; secretary, O. E. Peterson, Chicago, Ill. Headquarters, 520 N. Michigan Ave., Chicago, Ill.

Knights of Columbus.—A fraternal order organized in 1882, dedicated to the preservation and championship of Catholic and U.S. principles. Its membership as of June 30, 1946, was 615,280. The organization, which held its 64th annual convention in Miami Beach, Fla. (Aug. 20-22), continued its fund-raising campaign for the educational trust fund for Catholic college training for sons and daughters of members left fatherless as a result of service in World War II. The fund, begun in 1944, totalled more than \$500,000 in 1946. Publications: *Columbia*, a monthly with a circulation of more than 500,000, and *News*, a weekly. John E. Swift was supreme knight in 1946. National headquarters: 45 Wall street, New Haven, 7, Conn.

League of Women Voters of the United States.—The league was founded in 1920 for the purpose of promoting political responsibility through informed and active participation of citizens in government, without supporting or opposing any particular party or candidate. Membership in 1946 totalled 62,000. During 1946 the 525 leagues of this organization were active in promoting a continuous campaign to encourage a large and informed vote. Publications: *Trends in Government*, a biweekly sheet; *Action*, a bimonthly members' magazine. Officers (1946): president, Miss Anna Lord Strauss; vice-presidents, Mrs. Harold A. Stone and Mrs. Marc A. Law; secretary, Mrs. James G. Scarborough; treasurer, Mrs. Leonard Haas. Headquarters, 726 Jackson Place, Washington, D.C.

Lions Clubs, International Association of.—Founded in 1917 as a non-political, nonsectarian association of service clubs whose purpose is to recognize and meet the needs of the community, its activities cover eight classifications: boys and girls; citizenship and patriotism; civic improvements; community betterment; education; health and welfare; safety; sight conservation and aid to the blind. Membership in 1946 totalled 300,000 in 5,700 clubs in 18 different countries. Officers (1946): International president, Clifford D. Pierce, Memphis, Tenn.; secretary general, Melvin Jones, Chicago, Ill. Publications: *The Lion*; *El León* (the Spanish edition) and the *Lions International Monthly Letter*. Headquarters, 332 S. Michigan Ave., Chicago, Ill.

Music Library Association.—This association was founded in 1931 for the purpose of promoting the establishment, growth and use of music libraries and collections of music. Membership in 1946 comprised some 400 individuals and 150 institutional members. Publications: *Notes*, a quarterly journal; *Music and Libraries*, a volume of selected papers presented at the 1942 meetings, and a *Code for Cataloging Music*. Officers (1946): president, H. Dorothy Tilly, Detroit Public library; vice-president, Lowell P. Beveridge, Columbia university; secretary-treasurer, Mary R. Rogers, Library of Congress. Headquarters: Music Division, Library of Congress, Washington, D.C.

National Academy of Sciences.—A scientific body incorporated by an act of congress in 1863 for the purpose of investigating and reporting upon scientific subjects as called for by any department of the U.S. government. As of July 1946 the academy had 390 U.S. members, 44 foreign associates and 6 members emeriti. In 1946 many problems of a confidential nature were undertaken at the request of the government. Officers (1946): president, Frank B. Jewett; vice-president, L. P. Eisenhart; home secretary, F. E. Wright; foreign secretary, Detlev W. Bronk; treasurer, J. C. Hunsaker. Headquarters: 2101 Constitution avenue, N.W., Washington, D.C.

National Association of Manufacturers.—The association was founded in 1895 for the purpose of perfecting an organization of manufacturers for manufacturers. It is the spokesman of industry before the national government and its congressional and administrative agencies. Its findings are imparted to members through publications and bulletins. Membership in 1946 totalled 15,500 manufacturers distributed throughout 48 states. Publications include the weekly *NAM* news and a supplement analyzing and digesting labour rulings and decisions. A number of economic booklets devoted to a wide variety of national topics are also published. President (1946): Robert R. Wason. Headquarters, 14 West 49th St., New York city.

National Association of State Libraries.—The association was founded in 1889 for the purpose of providing, through the medium of the association, the information and data necessary for the better organization and functioning of state libraries. Membership in 1946: institutions, 43; individual, 7; associate, 4; honorary life, 1. The 1946 annual convention was held in Buffalo, N.Y.; problems common to state libraries throughout the country were discussed. Twenty-four state libraries were represented. Publications include *Proceedings and papers*, 46th Annual. Officers (1946): president, Dennis A. Dooley; secretary-treasurer, Alfred D. Keator.

National Lawyers Guild.—Founded in 1936, this organization is dedicated to the aim that human rights shall be regarded as more sacred than property rights. Its membership in 1946 was more than 5,000. It participated in organizing the International Association of Democratic Lawyers in Paris in October and the guild was represented as an official observer at the Nuernberg trials. It campaigned in 1946 to unite democratic lawyers throughout the world to the ideal that international law should be developed as an instrumentality for maintaining peace. Na-

tional officers (1946): Robert W. Kenny, president; Martin Popper, executive secretary. Headquarters: 902 20th street, N.W., Washington, D.C.

Performing Right Societies.—A world-wide confederation of composers, authors and publishers of musical works whose chief purpose is the licensing to commercial interests of the right to perform publicly the copyrighted work of their members. The International Confederation of Societies of Authors and Composers met in Oct. 1946 in Washington, D.C., for the purpose of preparing the agenda for the work of the plenary session scheduled to be held in London in 1947. The conferees unanimously adopted a resolution criticizing and urging abolition of the provision in the U.S. copyright act that prevents payment of royalties for performances played in coin-operated mechanical instruments (juke-boxes). Largest and most influential member of the confederation is the American Society of Composers, Authors and Publishers (A.S.C.A.P.), whose membership in 1946 included about 1,800 writers and 280 publishers. In 1946, A.S.C.A.P. issued licences to 152 symphony orchestras and 200 concert halls and to telecasters in the television field. It also renewed contracts with many European and Latin-American societies. Officers (1945-46): Deems Taylor, president. A.S.C.A.P. headquarters: 30 Rockefeller Plaza, New York city.

Research Libraries, The Association of.—This association of 45 of the largest research libraries in the U.S. and Canada was founded in 1942. It held two meetings in 1946 at which the primary topic was the problem of securing books and periodicals published in axis and occupied countries during World War II. A printed book catalogue of Library of Congress cards, in 164 volumes, was completed in 1946 and plans were made for publishing a photo-offset reprint of the British museum catalogue in 40 volumes. Officers: Paul North Rice, executive secretary. Headquarters, New York Public library, New York (18), N.Y.

Rockefeller Foundation.—The foundation was chartered in 1913 and is concerned with problems in the medical, natural and social sciences, the humanities and public health. In 1946 the foundation centred its interest on research in the field of nervous and mental diseases, experimental biology and the study of international relations in regard to postwar problems. Publications: *The President's Review* and the *Annual Report*. Officers (1946): president, Raymond B. Fosdick; secretary, Norma S. Thompson. Headquarters, 49 W. 49th St., New York city.

Rosenwald Fund, The Julius.—The fund was founded in 1917 for the purpose of improving the conditions of Negroes with the view toward their full participation in U.S. life. Fifty-four fellowships were awarded to Negroes in 1946 and 32 to white southerners. Total funds expended during the year amounted to \$716,000. As of June 30, 1946, assets of the fund totalled \$1,772,000. A biennial review is published every two years. Officers (1946): Edwin R. Embree, president; Will W. Alexander, vice-president; Charles S. Johnson, director for race relations; Fred G. Hale, director for rural education; William C. Haygood, director for fellowships; Dorothy A. Elvidge, secretary and comptroller. Headquarters: 4901 Ellis avenue, Chicago, Ill.

Rotary International.—A world-wide organization of Rotary clubs made up of groups of representative men, for the purpose of furthering co-operation and goodwill in business and community life. In 1946 there were 6,000 clubs in 75 countries with a membership of nearly 300,000. In 1946, clubs in the U.S. and Canada sponsored 297 Institutes of International Understanding, and Rotarians throughout the world devoted their programs during the month of November to the United Nations Educational, Scientific and Cultural organization. Official magazine is *The Rotarian*. Officers (1946): president, Richard C. Hedke, Detroit, Mich; vice-presidents, Charles Jourdan-Gassin, Nice, France; B. T. Thakur, Calcutta, India; and Carl E. Bolte, Kansas City, Mo. Headquarters: 35 E. Wacker drive, Chicago, Ill.

Russell Sage Foundation.—Established in 1907 for the purpose of improving social and living conditions in the U.S., it has an endowment of \$15,000,000. About 75% of its income in 1946 was devoted to work carried on by its own staff; the remainder to work by other organizations. Its later publications included the *Social Work Year Book, 1947*, edited by Russell H. Kurtz; *American Foundations for Social Welfare*, by Shelby M. Harrison and F. Emerson Andrews; and *Music in Hospitals*, by Willem van de Wall. Officers (1946): president of board of trustees, Morris Hadley; general director, Shelby M. Harrison. Offices, 130 E. 22nd St., New York city.

Special Libraries Association.—Founded in 1909 this association is an international organization of librarians and information experts who serve manufacturing concerns, banks, corporations, law firms, newspapers, advertising and insurance agencies, museums, hospitals and many other organizations. In 1946 the membership approximated 4,500. The official journal, *Special Libraries*, was published monthly, September to April, with bimonthly issues from May to August. Among the many other publications are *Index to American Petroleum Statistics*, *Handbook of Commercial Financial and Information Services* and *Source List of Selected Labor Statistics*. Officers (1946): president, Betty Joy Cole; executive secretary, Mrs. Kathleen B. Stebbins. Headquarters, 31 E. 10th St., New York city.

Spelman Fund of New York.—Chartered in 1928 for charitable, scientific and educational purposes, including the advancement and diffusion of knowledge concerning child life and the improvement of interracial relations, the fund continued its program designed to improve techniques in the field of public administration in 1946.

Theatre Library Association.—This association was founded in 1937 for the purpose of preserving and making accessible to the public the records of the drama and kindred fields of entertainment. The membership in 1946 was 161. Publications of the association are the *Broadside*, issued six times in 1946, and the *Theatre Annual*, issued in January. Officers (1946): president, George Freedley, Theatre collection, New York public library; secretary, Mrs. Sarah Chokla Gross, McCord Theatre museum of Dallas, Tex.; treasurer, Mrs. Elizabeth P. Barrett, Theatre collection, New York public library.

Twentieth Century Fund.—Organized in 1919 by Edward A. Filene, the foundation serves a threefold purpose: research; policy formulation; and

public education on current economic questions. During 1946 the fund completed a comprehensive report on *America's Needs and Resources (1950-1960)*. It also completed a survey on the foreign economic relations of the U.S. and issued a report of its Committee on Foreign Economic Policy. The final volume in the series of six reports on *When the War Ends* was published under the title *For This We Fought*. Other publications included: *American Housing: Problems and Prospects and Cartels in Action*. Officers (1946): John H. Fahey, president; Henry S. Dennison, chairman, executive committee; Morris E. Leeds, treasurer; Evans Clark, executive director; J. Frederic Dewhurst, economist. Headquarters, 330 W. 42d St., New York city.

Woman's Christian Temperance Union, National.—During 1946 membership had increased over the preceding year in the amount of approximately 400,000. Activities during the year included two summer schools of alcohol education, held under the National Director of Scientific Temperance Instruction department. An organization school was held at national headquarters for the purpose of training workers, and thousands of pages of literature were sold and distributed in addition to the usual departmental work. Publications: *Union Signal* (weekly); *The Young Crusader* (monthly). Officers (1946): president, Mrs. D. Leigh Colvin; vice-president, Miss Mary B. Ervin; corresponding secretary, Miss Lily Grace Matheson; recording secretary, Mrs. Glen G. Hays; treasurer, Miss Violet Black. Headquarters, 1730 Chicago Ave., Evanston, Ill.

Women's Clubs, General Federation of.—Founded in 1890 for the purpose of uniting women's clubs throughout the world for the promotion of education, philanthropy, public welfare, moral values, civics and fine arts. The federation in 1946 was composed of 3,000,000 members in 17,000 clubs. Activities during the year centred on a program to provide better educational opportunities and adequate health, welfare and recreational services for the youth of today. Other activities included a goodwill program designed to promote better understanding among the peoples of the world. Officers (1946): Mrs. LaFell Dickinson, president; Mrs. J. L. Blair Buck, first vice-president; Mrs. Hiram C. Houghton, Jr., second vice-president; Mrs. Oscar Ahlgren, recording secretary; Mrs. Volney Taylor, treasurer. Headquarters: 1734 N Street, N.W., Washington, D.C.

Sociology. Tendencies long apparent in U.S. sociology became very obvious in 1946. These tendencies were toward the merging of sociology, social and cultural anthropology, social psychology and social psychiatry in what was coming to be called the science of social relations. Harvard brought the trend into the open by establishing a department of social relations, but essentially the same state of affairs existed at Chicago, Wisconsin, Yale, Columbia and a number of other universities.

Clear theoretical formulation of the *de facto* merger was not forthcoming. Earlier systematic works in the various fields named were all lacking in sufficient appreciation of closely related approaches. In some cases, indeed, the lack was not only appreciation but also substantive knowledge. Those trained in a rigidly sociological tradition ignored social psychology; anthropologists overlooked sociology; psychiatrists too directly transferred clinical formulations to everyday but little-known social relations; social psychologists oriented themselves toward the individual "psyche" rather than toward social actions. A renewed interest in far-flung and close-knit theory was badly needed.

Unfortunately, many of the theorists active in the 1930s either passed their peak or had their energies drained off by preoccupation with the *ad hoc* application of theory to research. Such application put the cart before the horse. Scientific research worthy of the name was undertaken with the sole end of proving or disproving a given body of theory; all else was technology, highly useful but promising little for basic advance. The remarks by Franklin Frazier, Herbert Blumer and Alfred McClung Lee at the Dec. 1946 meeting of the American Sociological society bore melancholy witness to this fact, as their critics, Melvin Tumin and William L. Kolb, were quick to point out.

The lagging of strictly theoretical interest was made worse, in a day of rising public appreciation of the importance of a potential science of human relations, by the great number of commercial opportunities awaiting the trained social scientist. Polling agencies, personnel departments, governmental bureaus, military government and many other organizations competed for the services of social scientists, and the low rate of pay in the academic field, where theory as such was most cultivated, lured many of them into positions of lucrative but, where theory is concerned, blind-alley character.

At the same time, it cannot be denied that immediate problems loomed so terrifyingly large that many social scientists felt called by duty to aid in their solution. For example, W. F. Ogburn contributed a significant although disheartening article, "Sociology and the Atom," to the *American Journal of Sociology* (*Am. J. Sociol.*). He also published a volume on the *Social Effects of Aviation*. The preoccupation with atomic problems also resulted in an attempt to discover just how the scientists directly concerned view their responsibilities; Margaret Smith Stahl's "Splits and Schisms: An Analysis of Atomic Energy Factions" (unpublished dissertation, University of Wisconsin) undertook this task. Using sociology of knowledge as a guide, she showed that there was a basic cleavage between pure and applied scientists working on atomic energy projects, and that the resulting factions could be interpreted as following their special interests quite as much as their announced ideals. A somewhat similar analysis, but focusing on sociologists rather than physical scientists, was provided by Kurt H. Wolff, "Toward a Sociocultural Interpretation of American Sociology," in the *American Sociological Review* (*Am. Sociol. R.*). Wolff's contentions, which ran to the effect that marked class biases and sentimental attachments distort the findings of many prominent U.S. sociologists, were somewhat sweeping, and it was to be doubted whether he got much beyond the familiar *argumentum ad hominem*. Research comparable to Stahl's in its thoroughness would be necessary if Wolff hoped to be taken seriously.

Other attempts to deal with contemporary social changes focused on less specific problems and groups, although the significant article by Rudolf Heberle, "A Sociological Interpretation of Social Change in the South" in *Social Forces* (*Soc. F.*) at least concentrated on a region. Joseph Needham, English biologist who was active in the United Nations Educational, Scientific and Cultural organization, felt no necessity for such concentration, and his "On Science and Social Change," in *Science and Society* (*Sc. and Soc.*) took the whole world for its parish. Once a rigid mechanist who succeeded in reconciling his scientific creed with his Catholic faith, Needham became a devotee of the Marxian dialectic, and hence is not now afflicted by uncertainty.

Studies of a German thinker, Max Weber, who opposed the vulgar Marxism of his day, became increasingly numerous. Among the most important were Reinhard Bendix's "Max Weber's Interpretation of Conduct and History," in the *Am. J. Sociol.*, and Paul Honigsheim's "Max Weber as Rural Sociologist" in *Rural Sociology*. The vogue of Weber was furthered by the appearance of H. H. Gerth and C. Wright Mills' *From Max Weber*. This was a collection of important excerpts and articles prefaced by an excellent introduction. This book makes it abundantly clear that Weber was never an exponent of religious determinism *versus* economic, but rather an analyst stressing the interdependence of these and several other aspects of man's institutional conduct. An attempt to uphold economic determinism in the interpretation of history was made by Meyer Reinhold, whose article, "A Critique of Rostovtzeff," in *Sc. and Soc.*, followed the orthodox Marxian line with reference to the Greeks and Romans.

Coming from a quarter quite different from that represented by Weber, an implicit demonstration of the futility of rigid determinism of any sort in the interpreting of human conduct was offered by the anthropologist Morris Edward Opler, in "An Application of the Theory of Themes in Culture," in the *Journal of the Washington Academy of Science*. Opler showed how the "themes" or ideological patterns evident among even a primitive people, the Lipan Apache, divide into at least 20 main strands, among which no single one is dominant in all aspects of life.

Nowhere, however, did Opler or any other responsible social scientist deny the very great importance of economic activity. Indeed, the preoccupation with immediate problems already noted brought forth a new specialty drawing upon economics, sociology, social anthropology and social psychology. It has come to bear the label "industrial sociology," but there are several other terms which could have been used just as well. It does, however, lay marked and justifiable stress upon the importance of social groups and their interrelations within large factory organizations presumably modelled along strictly economic lines. Past efforts to deal with the worker either as a purely individual entity, as has so frequently been the case among industrial psychologists, or as a mere member of a collective bargaining unit, as has so frequently been the case among industrial relations specialists of economic derivation, almost wholly obscured the role of small cliques, factions, congeniality groupings and the like in influencing workers' morale and, incidentally, output. Important articles in this field were: Delbert C. Miller, "The Social Factors of the Work Situation"; Carlo L. Lastrucci, "The Status and Significance of Occupational Research"; and F. Howard Forsyth, "Relevance and Academic Bias," a plea for industrial sociology—all in the *Am. Sociol. R.*

Centring on a somewhat different problem but indirectly throwing much light on industrial sociology, was Mirra Komarovsky's "The Voluntary Associations of Urban Dwellers," in the *Am. Sociol. R.* Here she showed that the working classes, in particular, had relatively few affiliations of "joining" character. Formally named clubs, lodges, churches, unions, and so on were shown to be much less significant than

small informal clusters related to family, friendship and similar "natural" groupings.

Testimony to the same effect was provided by the anthropologist Carleton S. Coon's "The Universality of Natural Groupings in Human Societies" in the *Journal of Educational Sociology*. Coon's evidence made it abundantly clear that social scientists have generally disparaged or ignored the influence of smaller clusters, from the pair or couple upward, in favor of larger but frequently less powerful modes of association. Among the influential small clusters are those set by the succession of generations: parent-child, grandparent-grandchild and similar kinship dyads, as well as other small units in which age difference rather than kinship as such is significant. Many striking and hitherto out-of-the-way data were presented by Leo W. Simmons, in "Attitudes Toward Aging and the Aged: Primitive Societies," in the *Journal of Gerontology*.

The kind of sociological research and therapy rather inaptly christened "sociometry" from the very beginning emphasized the part played by small groupings in social life, and currently has provided many studies, among the most interesting of which are: Reva Potashin, "A Sociometric Study of Children's Groups," Mary L. Northway, "Sociometry and Some Challenging Problems of Social Relationships" and "Personality and Sociometric Status: A Review of the Toronto Studies"—all in *Sociometry* (*Socio.*).

Sociometry, the vehicle of publication for these articles, produced an offshoot entitled *Sociatry*, which, as its etymology indicates, is devoted to "social healing." The founder and editor of both of these journals, J. L. Moreno, became famous through his "psychodrama" which he was beginning, in order to avoid misunderstanding, to call "sociodrama." This is a method of dealing with certain functional varieties of mental ill-health by means of a role-taking therapy involving the deliberate staging of social situations designed to facilitate the curative process. Evidence seemed to show that Moreno achieved a degree of success in his "socioanalysis" at least as great as that claimed by practitioners of psychoanalysis. Several flourishing sociodramatic centres were established, and therapists trained by Moreno had an extensive practice in many parts of the United States. Sociometry or, better, sociatry, devoted much attention to mental difficulties attributable to family complications, in particular, and was gaining widespread acceptance among family counsellors.

More orthodox studies of family problems appearing in 1946 were: James H. S. Bossard and Eleanor S. Boll, "The Immediate Family and the Kinship Group," in *Soc. F.*, Margaret Park Redfield, "The American Family: Consensus and Freedom," in the *Am. J. Sociol.*, and Austin H. Porterfield and H. Allison Salley, "Current Folkways of Sexual Behavior," in the *Am. J. Sociol.*

The article by Mrs. Redfield is interesting, not only in its own right but also because of its bearing on what Philip Wylie, followed by Edward Strecker, called "Momism." If it is true that the larger part of the mental difficulties in the U.S. armed forces were attributable to maternal overprotection and under-discipline, Mrs. Redfield's article helped to set the matter in its proper perspective. She pointed out that U.S. children have not suffered repression in any degree which would make psychoanalytic assumptions applicable, but on the contrary have been deprived of adequate parental oversight and advice. These conclusions run counter to those of Porterfield and Salley who, finding that premarital chastity among U.S. youth in Texas is actually less frequent than is enjoined by prevailing norms or ideals, argued that the latter should be relaxed. This argument is a *non sequitur*; the precise reverse could just as readily be maintained.

The Porterfield and Salley contentions perhaps derived from absorption of popularized psychoanalysis—although, in fairness to psychoanalysis be it said, its more circumspect advocates would champion no such egregious conclusions. This is particularly true of the neo-Freudians: Abraham Kardiner, Karen Horney and Erich Fromm. But these too have been sharply criticized of late; articles evidencing such a trend are: Judson F. Stone, "The Theory and Practice of Psychoanalysis," in *Sc. and Soc.*; Arnold W. Green, "Social Values and Psychotherapy," in *Socio.*; "The Middle Class Male Child and Neurosis," in the *Am. Sociol. R.*; "Sociological Analysis of Horney and Fromm," in the *Am. J. Sociol.*

A searching application of psychoanalytic insights reinterpreted from the standpoint of sociatry and social psychology, was Gustav Ichheiser's "The Jews and Anti-Semitism," in *Socio*. This author broke new ground by advancing the well-attested hypothesis that frontal attacks on anti-Semitism have been, are, and will be fruitless, essentially because the Jews themselves are afflicted by socially acquired attitudes which help the anti-Semite to rationalize his prejudices. Another intertwining of psychoanalysis and social sciences was the book, documented with amazing thoroughness, by Gilberto Freyre, *The Masters and the Slaves: A Study of Brazilian Civilization*. Freyre made a radical break with the traditional geographic interpretations of Brazilian life, but he came dangerously close to espousing an equally fallacious sexual determinism. Nevertheless, the book is of great importance, if only for its documentation.

Studies of major civilizational entities along lines less questionable than those followed by Freyre were provided by: Dinko Tomašić, "The Structure of Balkan Society," and Hsiao-tung Fei, "Peasantry and Gentry: An Interpretation of Chinese Social Structure and Its Changes,"—both in the *Am. J. Sociol.* Tomašić's article was a follow-up of earlier analyses of personality types published in *Psychiatry*.

Shifting from considerations of structure to the more orthodox quantitative presentations, it can be said that the year witnessed the publication of the first full-length treatment of an aggregate much talked about but little known, Ta Chen's *Population in Modern China*, book-size supplement of the *Am. J. Sociol.* This marked a great step in advance; reasonably precise analysis supplanted guesswork. A similar advance was apparently manifested in John H. Burma's "The Measurement of Negro Passing," in the *Am. J. Sociol.* The old estimates of passing provided by Hornell Hart almost two decades before were attacked as

considerably too high. If Burma's conclusions were corroborated by other researchers, drastic revisions of prophecies about Negro-white intermixture would have to be made.

Race problems are of course not confined to the United States; World War II was sufficient demonstration of that. The way in which many persons, otherwise kindly, can think of another race as virtually non-human, and therefore suffer no pangs of conscience in committing or tolerating acts of the utmost cruelty, was set forth by Morris Janowitz, "German Reactions to Nazi Atrocities," in the *Am. J. Sociol.* That these phenomena cannot be regarded as peculiarly German was shown, by implication, in the exceptionally careful and thorough study by C. P. Loomis and J. Allen Beegle, "The Spread of German Nazism in Rural Areas," in the *Am. Sociol. R.* These authors produced evidence going far to prove that any group of comparable background subject to similar influences would have behaved in much the same way as did the German peasantry. Like conclusions were reached in Clifford Kirkpatrick's "Sociological Principles and Occupied Germany," in the *Am. Sociol. R.*, but over and above these he pointed out that many of the difficulties experienced in bringing Germans to appreciate democratic values have been and will be attributable to the fact that the U.S. military should never have been assigned other than essentially police functions.

Government and all related matters should have been handled by U.S. civilians from almost the very beginning of the occupation of Germany. The army and navy were called upon to do a job for which they were never designed—a conclusion amply borne out by the special issue of the *Am. J. Sociol.* for March, devoted exclusively to analysis of military process and structure in combat and non-combat periods and places. Most of the contributors to this issue were returned officers and enlisted men, and while doing full justice to the U.S. army and navy, unshrinkingly maintained their inability to attain other than strictly military objectives.

Of course, any large, hastily improvised organization (and the army, in particular, was so huge, and its responsibilities so heavy, that many of its parts had to be called into being overnight) encounters serious trouble, particularly when dealing with a people as little accustomed to discipline as U.S. people are. Confirmation of this more or less common-sense proposition was afforded by Marshall B. Clinard's "Criminological Theories of Violation of Wartime Regulations," in the *Am. Sociol. R.* He was dealing chiefly with masses of evidence garnered by the Office of Price Administration, but the War Labor board and many other alphabetical agencies could have been drawn upon for further proof.

The postwar revival of the social sciences did not clearly manifest itself outside the United States until 1946, but it then became strikingly evident. The Belgian, J. Haesaert, professor at the University of Ghent, published a large theoretical treatise, *Essai de Sociologie*. In France, Georges Gurvitch and his co-workers established a new journal, *Cahiers de Sociologie*. A new Latin-American journal, edited by Laszlo Rodvanyi, with headquarters at Mexico City, undertook the ambitious task of using English as its medium of communication, thus supplementing the long-established *Revista di Sociologia Mexicana*. In Switzerland, René König of the University of Zürich began the editing of an important series of monographs on sociological topics, one by Klara Vontobel on the work ethic of German Protestantism, and another by König himself on various aspects of the family, having already appeared. In Britain, Howard Becker's *German Youth: Bond or Free* and other new volumes came out in the International Library of Sociology and Social Reconstruction, and mass observation, plus several British polling agencies, got into peacetime swing. The German Sociological society held its first postwar meeting in September, and, although feeble, showed some promise; publication up to the end of 1946 was sharply limited, although a volume of social-philosophical and sociological essays by Marianne Weber was published.

In the United States the American Sociological society sponsored two 1946 meetings; one, postponed from 1945, was held in Cleveland in March; the other, back on regular schedule, took place in Chicago in late December. Carl Taylor of the U.S. bureau of agriculture was the 1946 president; Louis Wirth of the University of Chicago was elected for 1947. (H. BEC.)

Sodality of Our Lady. During 1946 the American central office of this world-wide religious society of Catholics (founded 1563) resumed intensive training of leaders with six one-week summer schools of Catholic Action, with more than 10,000 participating. The theme for the S.S.C.A. was "The Answer to the Atom."

Communications were resumed with the international secretariate in Rome, Italy. During 1946, 363 new sodalities in the U.S. were affiliated with the Mother Sodality in Rome, bringing the total number in the U.S. to 14,093.

Sodality was represented at the first postwar gathering of national leaders of Catholic women's youth organizations in Ghent, Belgium, by Dorothy J. Willmann who was named U.S. representative on the executive council of the Union Internationale des Ligues Femines Catholiques, Section de Jeunesse.

Returning servicemen gave new impetus to men's sodalities. Parish programming was geared to mixed youth groups, with the inclusion of a staff rural sociologist and a recreation department. Collegiate and high school programming, prepared by Rev. J.

Roger Lyons, S.J., was expanded and solidified along spiritual and social-economic lines. Through nation-wide teachers' institutes, Rev. Aloysius Heeg, S.J., intensified elementary school direction.

A League of Shut-in Sodalists, headed by shut-in Mary Ellen Kelly of Marcus, Ia., spread to 26 states and 2 Canadian provinces.

New headquarters, a six-story office building at 3115 So. Grand Blvd., St. Louis (18), Mo., houses the Institute of Social Order and serves as the centre for the Eucharistic Crusade of the Knights and Handmaids of the Blessed Sacrament. These distinct organizations were associated with sodality under the general direction of Rev. Daniel A. Lord, S.J., who was also editor of *The Queen's Work*, official sodality organ.

(D. J. W.)

Sodium Carbonate. Production of natural sodium carbonate in the United States increased from 184,826 short tons in 1944 to 194,045 tons in 1945. The output from natural sources was small as compared with that of the manufactured product, which was 4,693,000 tons in 1944, declining to 4,513,000 tons in 1945. Canada had a small output, 44 tons in 1944 and 239 tons in 1945. (G. A. Ro.)

Sodium Sulphate. The output of natural sodium sulphate in the United States increased from 168,923 short tons in 1944 to 178,196 tons in 1945. These figures compare with a total output of 875,078 tons in 1944 and 838,598 tons in 1945, the bulk of the output being manufactured from common salt. Canadian production dropped from 102,421 tons in 1944 to 86,643 tons in 1945. (G. A. Ro.)

Softball. The world's amateur softball championships brought a repeat in both men's and women's divisions. The Fort Wayne, Ind., Zollners made it two in a row in the men's class, while the Jax Maids of New Orleans won their fourth women's title in five years. The two champions defeated teams representing the Match Corp. of America, Chicago, in each final. The All-America Girls' Professional Ball league was dominated by Racine, Wis., which won the regular league play and defeated Rockford, Ill., in the playoff final. The Chicago Blue Birds defeated the Chicago Chicks, four games out of five, to win the National Girls' Baseball league play-off. (M. P. W.)

Soil Erosion and Soil Conservation. In 1946 many nations were able to give special attention to the practical aspects of soil and water conservation. In 1946, the first year after the end of World War II, erosion-control experiments and demonstrations were begun, or were greatly expanded, in most of the agricultural countries of the world. Complete land surveys, including studies of soils, vegetation, water and climate as related to land use and erosion, were started in such widely separated regions as Australia, Mexico, India, South Africa and various South and Central American countries having a distinctly tropical agriculture. In many instances, the pattern for land studies was similar to that used in the United States where the large volume of information and data already collected and analyzed was being used in practical conservation farming plans by hundreds of thousands of farmers.

As more facts were accumulated, the problem of soil damage resulting from misuse of semi-arid lands was brought to light as responsible in large degree for food crop failures and livestock losses in many parts of the world during the war. Cultivation of steep lands was reported as a serious problem facing newly organized soil conservation agencies and farmers in tropical countries such as Venezuela, Guatemala, Peru and Mexico.

Also in many parts of the tropics and subtropics, land surveys disclosed serious damage to valuable food-producing areas through alkali formations. Recently formed alkali lands were reported to be common in central Asia, India, Iraq, Egypt, North Africa and parts of the United States. Important experiments were being carried out in the United States and India to determine conservation methods of farming reclaimed alkali lands to prevent recurrence of such damage.

In 1946, the governments of 21 nations sent nearly 100 of their leading agricultural specialists to the United States for training with the soil conservation service of the U.S. department of agriculture. Some of the countries represented were India, Burma, Korea, Belgian Congo, China, Palestine, Iran, Mexico, Canada and several South and Central American countries needing additional trained soil conservation technicians and scientists to staff programs which were well under way before the end of World War II.

United States.—An important development of 1946 was the greatly increased demand of farmers for complete soil conservation plans for their farms. Many had learned during the war period that single soil conservation practices, applied without supporting practices and needed land-use adjustments, were inadequate for land protection necessary to sustained yields. On the other hand, thousands of farms under complete conservation plans had steadily improved in productive capacity throughout the period of high production. The trend was therefore strongly in favour of conservation farm planning based on land-capability surveys made and analyzed for the specific purpose of fitting the cropping system and farming practices to different types of land.

During the year, complete soil conservation was applied to an additional 18,000,000 ac. This brought the total amount of land under complete and permanent conservation methods to approximately 100,000,000 ac. At the same time, new plans had been made for an additional 30,000,000 ac. by technicians of the soil conservation service working with farmers and ranchers in soil conservation districts.

Organization of farmers for such complete land conservation went forward in all 48 states. As of Dec. 15, 1946, 1,756 conservation districts had been established throughout the country. They included 945,821,578 ac. in 4,188,213 farms. Five states (Alabama, South Carolina, New Hampshire, Rhode Island and Delaware) were completely covered by districts, and 21 others were more than half covered. A soil conservation districts law was enacted in Puerto Rico early in the year, and districts were being organized in several parts of the island.

Actual work of applying complete soil and water conservation plans to the land was done chiefly in soil conservation districts, where work units of the soil conservation service were assisting farmers directly on their farms. Nearly 60 practices, scientifically designed to control erosion, conserve rainfall and maintain soil fertility and productiveness, were in use, in combinations suited to individual farms and ranches in all parts of the country.

Some of the individual practices incorporated in complete conservation plans and applied to land in soil conservation districts by the close of 1946 were:

Contour cultivation	11,400,000 ac.
Cover crops	3,500,000 ac.
Crop residue management	11,000,000 ac.
Strip cropping	3,000,000 ac.
Range stocked to conserve grazing	27,000,000 ac.
Range and pasture seeded	5,000,000 ac.
Farm and ranch ponds constructed	58,000 (number)
Field and gully plantings for erosion control	252,000 ac.
Farm woodland improvement for sustained yield	4,000,000 ac.
Terracing of cropland	8,000,000 ac.
Water diversions	9,000 mi.
Farm drainage	1,300,000 ac.
Farm irrigation:—	
Land preparation	300,000 ac.
Irrigation water applied	900,000 ac.
Irrigation systems installed or improved	11,200 (number)
Tree windbreak plantings	39,400 ac.
Conservation crop rotations established	7,120,000 ac.

Highly significant land-use changes, resulting directly from soil conservation, were indicated by reports from different parts of the country. For example, in the western gulf region (Texas, Louisiana, Arkansas and Oklahoma) thousands of farmers had adopted vegetative methods of protecting their land and improving fertility conditions. Farmers in soil conservation districts in this region had used crop-residue management on nearly 5,000,000 ac., had seeded 1,500,000 ac. to grasses, were preserving range and pasture grasses by proper stocking on 9,000,000 ac. and were using winter cover crops on approximately 2,500,000 ac. In the southeastern states, the planting of 3,500,000 ac. of severely eroded fields to grasses and legumes for pasture indicated a strong trend toward a more diversified agriculture, including dairying and livestock farming on lands formerly used exclusively for row crops such as cotton and corn.

In the southwestern region (New Mexico, Colorado, Utah and Arizona) the soil conservation program more than doubled during the year. At the close of 1946 there were 183 soil conservation districts, including approximately 99,000,000 ac. of farm and range land, in the region. Faced by a serious wind erosion problem on extensive acreages of grasslands plowed during World War II in the eastern part of the region, farmers and ranchers pooled their resources and facilities to purchase grass seed, mineral supplements, trees and shrubs and fertilizers so that conservation measures could be applied without delay. Some districts were able to buy equipment such as bulldozers, tractors, grass seed drills, harvesters and brush-clearing and land-levelling equipment for use in preparing land for irrigation. The problems of the region were defined as most complex because of three types of farming—irrigation farming, dry-land farming and permanent grazing. At the end of 1946, approximately 4,600 irrigation systems had been improved or installed in soil conservation districts. Contour planting, strip cropping, terracing, contour furrowing of grazing lands and crop residue management had been established on more than 1,000,000 ac. of nonirrigated crop land; and 6,000,000 ac. of range land were placed under grass-conservation stocking. Some farmers in the region also were beginning to adopt cover cropping for wind-erosion control and to plant green manure crops as a means to better fertility of their soils.

Authorized by congress, the soil conservation service resumed flood-control activities on 36 watersheds of the U.S. at the beginning of 1946. The work consisted of (1) surveys of flood control requirements, (2) the preparation of work plans for flood-control operations and (3) upstream operations on farms to stabilize channels, control gullies and construct runoff retardation structures where needed. Work plans were completed for 11 watersheds during the year.

Mexico.—Outstanding progress was made in Mexico in organizing a nation-wide soil conservation program during the year. The Soil Conservation act, approved as a federal law early in the year, authorized a long-time program to apply conservation land-use methods and practices to all lands—public grants, private agricultural lands and national lands. The law provided that the program be financed by annual federal appropriations, and a special fund was set up for the training of soil conservation technicians. Under the new law, the soil conservation department was elevated to the status of a division of the National Irrigation commission, with authority to maintain a staff of experts in soils and erosion, cultivation, revegetation and soil and water saving methods, organized to serve as guides or advisers to farmers directly on the land. Ten soil conservation districts had been established by the government and designated as priority regions for action programs to save seriously eroded lands. The ten districts included most of Central Mexico.

The soil conservation work program developed under Mexico's

Soil Conservation act consisted of five types of operation to be carried out simultaneously by work groups located in soil conservation districts. They were:

Detailed studies of land types, water supplies and erosion conditions. The making of a national work plan, by sections, to show the total needs for land-use changes and soil and water conservation practices.

Application of soil conservation methods as work plans for farms, groups of farms, and watersheds are completed.

Construction of water storage ponds to supplement the work of irrigation districts.

Establishment of experiment stations and demonstration areas, for investigation of soil and water losses and development or adaptation of conservation systems of cultivation.

An educational program to extend to all schools, farm homes, and to city and village residents.

Preliminary surveys showed that 12% of Mexico's plains and 30% of the steep lands had been made unproductive by erosion. About half of the country is semiarid, requiring carefully planned irrigation with soil and water conservation methods of cultivation or scientifically designed dry farming or grazing methods to improve and maintain production. Complete reforestation of steep slopes was deemed essential in many parts of the highlands.

In the states of Michoacan and Jalisco, bordering the Pacific ocean, three soil conservation districts were well on the way to completion of plans for more adequate and safe use of vast areas of range, forest and cropland. In this region, the Morelia-Querendaro soil conservation district includes the irrigation district of the same name, plus the drainage area of the dams of the project. As water for irrigation was being made available for farming and ranching, conservation land use and practices were being applied to the whole drainage area to save water and soil and protect costly structures. Bench and ridge terraces had proved excellent for erosion control and for increasing yields on cultivated land in this district.

Central and South America.—Soil conservation activities were continued in most Central and South American countries during the year. A national soil conservation law was enacted in Venezuela, and the ministry of agriculture and animal husbandry was reorganized to provide for expansion of the service of conservation and utilization of soils throughout the country. Soil conservation agencies were set up in Peru, Chile and Guatemala. In the last-named country, soil conservation demonstrations and experiments were well advanced, and practices shown by demonstrations were spreading to farm lands. Through soil conservation studies in El Salvador, Costa Rica, Venezuela and parts of Brazil, much new knowledge was acquired about erosion control methods and production capacities of tropical soils in the western hemisphere. In Brazil, where soil conservation programs were in operation in four states, there was increasing emphasis on development of soil conservation methods for use on virgin lands being cleared for agriculture and grazing. There was urgent need for controlled stocking of grazing lands in many parts of Brazil where sudden expansion of the livestock industry had caused exploitation and serious erosion of grasslands.

Great Britain.—Remarkable progress was made in reconditioning hill lands in Great Britain. New techniques in grassland management had made it possible to develop excellent pasture on hill tops 1,600 ft. above sea level. Where the soil was so thin that no grass could take root, a crop such as rape was grown and eaten off by cattle, and the operation repeated a second season. After plowing, the land was then seeded to grasses and grazed by bullocks, with distinct evidence of steadily rising fertility of soil. Such technique was increasing stock-carrying capacity in the hill lands from five to ten times. At the same time, with close vegetative cover, there was no soil erosion on lands so protected. During the year, range specialists and livestock farmers from many countries visited Britain to study grass farming as developed for steep uplands.

Australia.—A Standing Committee for Soil Conservation

was established in Jan. 1946. Representatives of the commonwealth and of each state soil conservation department were appointed to serve on the committee. As a co-ordinating body, the committee was charged with over-all plans for proper distribution of demonstrations, research stations, equipment essential to farmer-group projects, planting materials and land studies necessary for carrying out the national program. Plans approved during the year dealt with watershed erosion control by reforestation, restoration of grasslands and use of soil conservation practices on cultivated upland areas in order that water might be available for piping to dry inland regions subject to severe wind erosion. Recommendations for nation-wide methods of bushfire control were adopted during the year.

Work of establishing ten new soil conservation demonstrations was begun on groups of private farms and ranches and construction of the soil conservation experiment station at Gunnedah, New South Wales, was completed. Land surveys, continued during the year, showed that the productive capacity of thousands of farms had been damaged by erosion. In the eastern and central divisions of New South Wales alone, approximately 60,000,000 ac. were found to be eroded and in need of immediate attention.

Africa.—A national soil conservation act was passed by the 1946 session of the parliament of the Union of South Africa. The new law binds the state to support a program to apply soil conservation methods and practices to all lands, whether state- or privately-owned. It set up a Soil Conservation board composed of representatives of the departments of agriculture, lands, native affairs, irrigation and forestry, the division of soil conservation and extension and the farmers of the union. Five members must be bona fide farmers. Formation of soil conservation districts, by application of a majority of owners of land in a defined area, was authorized by the law.

Recommendations of the Soil Conservation committee for the Anglo-Egyptian Sudan were approved during the year. The committee's survey of land conditions in the Sudan showed many serious examples of soil deterioration. Sheet erosion was found in the hill country of southern Kordofan and of Equatoria and near the gullied land of the Blue Nile. Gully erosion was noted as common in Equatoria, along the banks of the Blue Nile, the Dinder and Atbara rivers and in the coastal range of Red Sea hills. Silt dune formation was taking place in the delta of the Khor Baraka, and spoliation of cultivated land by fires was common on the clay plains of Kassala, Blue Nile, Upper Nile and Kordofan. Finally, lands around towns and villages were found to be seriously eroded all over the country owing to overcultivation, overgrazing and excessive cutting of trees for firewood.

India.—At the request of the government of India, a preliminary examination of that country's land was made by soil conservation specialists from the U.S. Regions studied were the Punjab, Central provinces, Bombay presidency, Hyderabad state, Madras presidency, Orissa, Bihar, United provinces, Gwalior state, Bengal and Assam. Erosion in all stages and of all types was observed throughout India, with overgrazing a chief cause in all provinces except Assam. In addition to erosion on cultivated fields, pastures and even woodlands, a large amount of roadside gullying was causing damage to adjacent fields. In Gwalior state, about 800 sq.mi. of formerly good land had been rendered useless for any purpose by erosion induced by overgrazing and improper cultivation methods.

Work in the Punjab to control the silting of waterways was continued and had served to reclaim large areas of stream valleys to production. Sand was still descending from the Siwalik hill lands and from the Salt range, however, and it was apparent that complete revegetation of the tops of the watersheds would be necessary for permanent reclamation of the level areas. In the

province of Bombay, some 700,000 ac. of crop land had been placed under soil and water conservation practices by the end of 1946.

U.S.S.R.—Important large-scale experiments to develop safe methods for using vast areas of arid southeastern European U.S.S.R. were reported in 1946. Many tests were carried out on more than 8,000 ac. to adapt combinations of practices such as tree shelterbelts, crop rotations, irrigation and grassland farming to control wind erosion, conserve soil moisture and increase crop and livestock yields. (See also AGRICULTURE; AQUEDUCTS; DAMS; IRRIGATION; METEOROLOGY.) (H. H. BE.)

South Africa, The Union of. A self-governing dominion of the British commonwealth of nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South-West Africa (pop. est. 1941: European 33,600; Bantu and coloured [mixed] 287,700) is administered under mandate as an integral part of the union, but this territory had not been incorporated as a province; the United Nations invited South Africa to prepare a trusteeship agreement in respect to it. Area, 472,494 sq.mi. (incl. Walvis bay, 374 sq.mi.); pop. (Aug. 1946) 11,258,858 (Europeans 2,335,460; Bantu 7,735,809; coloured 905,050; Asiatic 282,539). Chief towns (pop. census 1946): Capetown (seat of legislature, 454,052); Pretoria (seat of government, 236,367); Johannesburg (727,743); Durban (357,304); Port Elizabeth (146,231). Languages: English, Afrikaans. Religion: European population: Christian 95.5% (Dutch Reformed Church 55%; Anglican 19%; Methodist 6%; Presbyterian 5%; Roman Catholic 5%, etc.); non-European population: 51.5% Christian, the remainder Hindu, Mohammedan and Buddhist). Governor-general in 1946: Maj. Gideon Brand van Zyl; premier: Field Marshal Jan C. Smuts.

History.—Demobilization was completed and £SA14,360,000 was spent in reinstating former volunteers, half in grants and half in loans repayable on easy terms; the men were readily absorbed by industry, which was experiencing acute manpower shortage. The policy of industrial development, which the government placed in the forefront of its postwar program, received a strong impetus from further gold discoveries in the Orange Free State. In April a borehole in the Odendaalsrust district intersected a reef at 3,922 ft. which assayed 1,252 dwt. of gold to the ton of rock, a value far higher than any previously registered by South Africa. Exploratory work over the whole O.F.S. goldfield indicated that 10 or 12 large gold mines would ultimately be formed. Favourable developments on the far west Rand indicated that six additional mines would be established there. These events opened up a new vista of general economic expansion and at the same time led to mass speculation which evoked official warnings. Rising costs of production on the Rand, leading to lower rentability, caused anxiety in the gold mining industry, and two strikes, one by European miners and the other by African labourers, produced a setback. The latter dispute was settled only after violence and bloodshed.

Race relations were strained by the opposition which the Indian community (living mainly in Natal) offered to the new

legislation passed by parliament attempting to confine the ownership or occupation of property by Indians to specific areas. The legislation at the same time conferred communal franchise on the Indians and for the first time gave them indirect representation in the union parliament and direct representation in Natal provincial council. In Durban the Indians began a campaign of passive resistance and appealed to the government of India which, after Field Marshal Smuts had rejected a proposal for a round-table conference, recalled its high commissioner, broke off trade relations and carried the dispute to the United Nations. Against South Africa's contention that this was a domestic issue between the union government and a section of South African nationals the United Nations called upon both governments to report at the next session what steps had been taken to give effect to the agreements entered into between them. This decision, coupled with the United Nations' rejection of South Africa's application for the incorporation of the mandated territory of South-West Africa, left the European people smarting.

The housing program made slow progress mainly because of shortage of materials and skilled labour. The European trade unions, standing for the industrial colour bar, opposed the training of African artisans for the building of native houses, of which there was an acute shortage, and challenged the government's policy in this respect. With industry clamouring for skilled workers, and with the new census figures showing a growing disparity between the European and native populations, Field Marshal Smuts announced a policy of encouraging large-scale immigration from Europe. A European influx, he stated, was needed to re-create the country. In order to check the drift of Africans from the reserves to the overcrowded towns, restrictions were placed on their movement to Capetown and its neighbourhood.

Financially, the country was sound and flourishing. J. H. Hofmeyr, minister of finance, who again acted as premier for several months during Field Marshal Smuts's absence at international conferences in Europe and the United States, stated in his budget speech that the union had ceased to be a foreign borrower. Although the public debt had risen during World War II by £SA272,500,000, the external debt had been reduced to £SA13,700,000. In this, the first peacetime budget, wartime taxation was repealed or reduced to the extent of £SA16,000,000 although expenditure on social services was substantially increased. New plans were announced to revitalize the farming industry, and it was stated that on soil conservation alone a sum of £SA100,000,000 would be spent in the next 25 yr.

Parliament authorized the iron and steel industrial corporation (Iscor) to increase its capital by £SA15,000,000 with the object of raising its steel output by stages from 418,000 to 1,100,000 short tons.

Food shortages appeared during the year. The failure of the local wheat crop was accentuated by the shortage of maize, on which the natives largely depended. Emergency supplies had to be imported and a rationing scheme adopted in the principal towns.

Education.—In 1941: state and state-aided primary and secondary European schools 33,662, scholars 388,925; non-European schools 5,229, scholars 678,161; universities, average number of students, 11,801.

Banking and Finance.—Revenue (est. 1946-47) £SA120,415,000; expenditure (est. 1945-46) £SA120,510,150; public debt (March 31, 1946) £SA582,924,000; notes in circulation (March 31, 1946) £SA66,000,000; gold reserve (March 31, 1946) £SA123,000,000; exchange rate (1946) £SA1=£1 sterling=403 U.S. cents.

Trade and Communication.—External trade (1944): exports (excluding government stores, specie, gold bullion, wool, exported bunker coal and ships' stores) £SA68,552,894; re-exports £SA3,071,142 plus £SA1,263,947 (to South-West Africa and Northern Rhodesia); imports £SA84,825,271 (including £SA4,262,184 South African produce imported from South-West Africa and Northern Rhodesia). Communication and transport: roads fit for motor traffic (1938-39) 87,495 mi.; railways, including South-West Africa (March 31, 1945), 13,479 mi.; airways, including

South-West Africa (Dec. 1945–May 1946): passengers carried 7,936; mileage flown 285,559; shipping (March 31, 1945): tonnage cargo landed 3,162,632, shipped 4,213,575, trans-shipped 207,667. Motor vehicles licensed (Dec. 31, 1940): cars and taxis 317,958; vans and trucks 51,215; tractors 1,044; cycles 21,725; wireless receiving sets, effective licences (end of 1945) 373,411; telephones, instruments in use (1940) 202,753.

Agriculture, Manufacture and Mineral Production.—In 1944–45: maize 17,870,000 bags of 200 lb. each; wheat 3,373,430 bags of 200 lb.; potatoes 2,500,000 bags of 150 lb.; oats (purchased) 96,236 bags of 150 lb.; barley (purchased) 448,913 bags of 150 lb.; groundnuts 120,000 bags; deciduous fruit 67,634 short tons; dried fruit (1945) 19,000 short tons; tobacco (1944) 23,500,000 lb. Virginian, 533,000 lb. Turkish; cane sugar, refined (1945–46) 553,174 bags of 200 lb.; sheep (1943) 37,888,043; cattle (1943) 13,068,414; wool (1945–46 est.) 650,000 bales. Industry and labour (1942–43): establishments 9,965; employees: European 148,248, others 278,263; gross value of output £5A289,240,786; employment index (average, 1929=100), average 1941, 164; 1942, 172. Mineral production, 1945: gold 12,213,545 fine oz.; diamonds 1,222,945 metric carats; silver (1940) 1,292,284 fine oz.; in short tons, coal 25,964,285; iron ore 954,814; manganese ore 126,266; chrome ore 109,229; asbestos 28,216; limestone 3,078,206; pig iron (1940) 297,764; steel (1940) 326,816; copper smelter (1940) 14,991; benzol (1939) 1,874. (J. A. Gv.)

South America: see ARGENTINA; BOLIVIA; BRAZIL; BRITISH GUIANA; CHILE; COLOMBIA; ECUADOR; PARAGUAY; PERU; URUGUAY; VENEZUELA.

South Australia. A state of the Australian commonwealth. 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. Pop. (est. June 30, 1945): 628,940. Cap. (Dec. 31, 1943) Adelaide (362,500). Governor in 1946: Lieut. General Sir Charles Willoughby Moke Norrie.

History.—The Liberal-Country party administration under the premiership of Thomas Playford remained in office throughout 1946 and had the distinction of being the only non-Labour government in Australia. Legislation introduced covered the ratification of the intergovernmental agreement on uniform rail gauges, including the completion of the North-South railway; a bill to raise the school-leaving age and a bill to authorize the construction of sewerage in country towns. The government also announced a vigorous policy to combat the increasing menace of soil erosion. Primary production was at a high level and 3,500,000 gal. more wine were produced than in the record year 1926–27. Fortified beverage wines were expected to total 6,750,000 gal.; unfortified 1,300,000; and distillation 11,250,000.

Shipbuilding at Whyalla continued at a high level and the immediate program included four 12,500-ton vessels and four of 6,000 tons. The larger vessels were to be used to carry iron ore from Yampi sound in Western Australia to steelworks at Newcastle, New South Wales.

Education.—In 1941: number of schools (state) 989 (private) 157; teachers (state) 3,078 (private) 831; scholars (state) 72,156 (private) 13,502; average attendance (state) 62,051 (private) 12,002.

Finance.—In 1944–45: revenue £A15,560,000; expenditure £A16,113,125; debt outstanding (June 30, 1945) £A108,870,938. (£A1=\$3.2 U.S.)

Communication.—Roads (1941) 54,412 mi.; railways (1945), government 2,547 mi. Motor vehicles licensed (Dec. 31, 1945): cars 61,372; commercial vehicles 26,959; cycles 8,793. Wireless receiving set licences (Dec. 1945) 150,881.

Agriculture and Manufacturing.—In 1944–45 (in short tons): wheat 277,320; barley 74,660; currants 7,720; raisins 13,800; wool 52,500; butter 8,624; wine 10,593,000 gal. Industry (1944–45): factories 2,195; employees 65,887; gross value of output £A64,123,125; unemployment (trade union returns) (Feb. 1946) 1.6%. (W. D. MA.)

South Carolina. A south Atlantic state of the United States, 8th of original 13 to ratify the constitution, 1788; known as the "Palmetto state." Area: 31,-

J. STROM THURMOND, Democrat, was elected governor of South Carolina Nov. 5, 1946

055 sq.mi., 461 being inland water; pop. (1940) 1,899,804; white 1,084,308; Negro 814,164; others 1,332; 75.5% rural; 0.3% foreign-born. Capital, Columbia (62,396). Other cities: Charleston (71,275); Greenville (34,734); Spartanburg (32,249). The estimated population of the state on July 1, 1944, was 1,923,354.

History.—J. Strom Thurmond was elected governor in Nov. 1946 to begin a four-year term in Jan. 1947. Voting by Negroes in the Democratic primary

(the effective election) was not attempted. A bill abolishing the \$1 poll tax voting qualification failed. Gov. Ransome J. Williams failed in his attempt to induce the legislature to substitute state for private liquor stores and to create state police. Teachers' salaries and the sum for educating adult illiterates were increased during the year.

The navy department estimated that on June 30, 1946, there were on active duty in the navy 12,009 males and 95 females from the state.

Education.—Greater than usual appropriations for education continued in 1946. Retirement benefits for teachers and other state employees went into effect. State superintendent of education, J. H. Hope, continuously elected by the people from 1922, declined further election and was succeeded by Jesse T. Anderson. For the year ending June 30, 1946, enrolment in white elementary schools was 177,871 (decrease of 2,572); in Negro elementary schools 176,026 (decrease of 2,308); in white high schools 69,353 (increase of 1,901); in Negro high schools 24,994 (increase of 995); total white and Negro teachers, respectively, were 9,528 and 6,223; expenditures (omitting about \$1,500,000 for central and county administration) for white schools \$21,988,627; for Negro schools \$6,083,104. Teachers were divided into seven classes according to preparation and length of service with corresponding salary ranges. In Charleston in 1944 and in Columbia in 1945 federal courts ordered equal pay for teachers irrespective of race. On Jan. 7, 1947, a Negro (sponsored by the National Association for the Advancement of Colored People) filed suit against the University of South Carolina for having been denied enrolment because of his race. The legislature ordered graduate law and medical courses installed at the N.C. College for Negroes in Durham, but during 1946 this provision had not yet been carried out. A sum of \$6,000 was appropriated for sending Negro medical students to institutions outside the state.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1946, federal allocation for needy persons equalled \$2,983,400, to which the state added \$3,850,116. A total of \$4,174,427 went to 22,115 aged; \$1,093,612 to 11,536 dependent children; \$243,888 to 979 blind. Some counties maintained poor houses, sparsely inhabited. The state unemployment trust fund, supplied entirely by employers, totalled on June 30, 1946, \$41,738,860. Payments to 9,065 unemployed during the year were \$1,121,297. Patients in the state hospital (for the mentally diseased) June 30, 1946,

were 4,836; in the school for feeble-minded 971; prisoners in the state penitentiary and on state farms 978; reformatory for white boys 176; reformatory for Negro boys 155; white girls' reformatory 93; legal executions during the year 8.

Communications.—Paved highways, June 30, 1946, totalled 7,801 mi.; total under highway department 13,770 mi.; funded highway debt \$48,500,496 (being steadily reduced); railroads 3,563 mi.

Eastern, Delta, National and Southeastern Air Lines crossed the state.

Banking and Finance.—On June 30, 1946, there were 23 national banks (plus 23 branches), 89 state banks (plus 5 branches), 33 cash depositories and 1 private bank with capital account, deposits and resources, respectively, as follows: national \$16,263,052, \$399,639,000 and \$417,043,770; state \$12,439,036, \$222,137,725 and \$234,948,687. Resources of federal building and loan associations amounted to \$40,359,585; state associations \$15,865,689. The state debt was \$48,936,648, almost all for highways. During the year the state debt was reduced \$6,024,907. State tax collections for the year ending June 30, 1946, totalled \$60,687,311, of which \$15,505,260 was from the gasoline tax and \$2,346,354 from auto licence fees. A surplus of \$6,012,546 remained.

Federal income taxes for the year ending June 30, 1946, were \$162,415,350; other federal internal revenues were \$18,763,576. Duties on imports were \$492,953; imports \$7,297,322; exports \$12,635,268. Farm real estate mortgage debt on Jan. 1, 1946, totalled \$39,636,000 as compared with \$45,948,000 on Jan. 1, 1940.

Agriculture.—The value of the 36 leading field and truck crops in 1946 was \$362,951,000, an increase of almost \$100,000,000 over 1945. Improved fertilization and cultivation resulted in larger yields per acre and total yields than ever, reaching a greater total value. Total acreage for all crops was 4,239,000, a slight reduction.

Table I.—Leading Agricultural Products of South Carolina, 1946 and 1945

	1946	1945.
Corn, bu.	27,493,000	24,123,000
Wheat, bu.	2,706,000	2,972,000
Oats, bu.	20,097,000	18,921,000
Hay, tons	450,000	473,000
Irish potatoes, bu.	3,696,000	2,562,000
Sweet potatoes, bu.	6,090,000	5,510,000
Tobacco, lb.	168,200,000	139,520,000
Cotton, bales	695,000	664,000
Cotton seed, tons.	285,000	263,000
Peaches, bu.	5,670,000	5,760,000
Pecans, lb.	1,520,000	3,404,000
Peanuts, lb.	18,270,000	22,500,000

The value of the 13 leading vegetable and melon crops was \$13,168,000, or 5% less than the record high for 1945.

Manufacturing.—Total value of manufactures for the year ending June 30, 1946, was \$1,111,493,397 as against \$1,106,912,578 for the previous year. Employees numbered 156,560 as against the previous year's 154,384.

Table II.—Products of Principal Industries of South Carolina, 1946 and 1945

	Value 1946	Value 1945
Textiles	\$799,525,720	\$787,171,222
Lumber and products (barrels, boxes, baskets, veneering, paper and pulp, furniture, etc.)	70,951,519	81,832,929
Electricity	26,249,958	25,223,573
Clothing, including knitted	30,932,240	24,981,840
Fertilizers	21,005,869	...

Mineral Production.—Production for the year ending June 30, 1946, chiefly stone and clays, especially kaolin, totalled \$4,570,778; previous year \$3,562,613. (D. D. W.)

South Dakota.

A north-central state of the United States, admitted as the 40th state on Nov. 2, 1889, popularly known as the "Coyote state." Area 77,047 sq.mi., of which 511 sq.mi. are water; population (1940) 642,961, with

GOV. GEORGE T. MICKELSON of South Dakota, elected Nov. 5, 1946, on the Republican ticket

158,087 listed as urban and 484,874 as rural; Indian population 23,347. The federal census bureau estimated the civilian population on July 1, 1944, at 558,629. The state census taken during 1945 revealed a population of 589,802. Capital, Pierre (4,322 in 1940). Principal cities: Sioux Falls (40,832), Aberdeen (17,015), Rapid City (13,844), Huron (10,843) and Mitchell (10,633).

History.—The Republican party won all state offices in Nov. 1946, polling 108,998 against 53,294 votes in the contest for governor.

Three constitutional amendments were adopted by the voters, including one outlawing the closed shop and another providing for the removal of a constitutional limitation on salaries of the governor and other constitutional officers.

State officials elected included: George T. Mickelson, governor; Sioux K. Grigsby, lieutenant governor; Sigurd Anderson, attorney-general; Miss Annamae Riff, secretary of state; Clarence Buehler, treasurer. J. F. Hines was re-elected on nonpartisan ballot as superintendent of public instruction.

Education.—The school census, ages 6-21, was 154,928 in 1945-46 as compared with 155,420 in 1944-45. The enrolment was 84,826 in elementary schools and 29,005 in high schools. Total expenditures were \$15,926,980.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the calendar year 1945 the state department of social security distributed \$3,836,849 among 12,712 persons in old-age assistance; \$644,329 among 1,453 families, including 3,445 children; and \$57,840 for the needs of 221 blind persons. Unemployment benefit payments were allotted during 1945 to 3,325 claimants for a total of \$35,170 at an average weekly rate of \$10.58. Eight penal and charitable institutions were in operation during 1946 on a legislative appropriation of \$1,375,000.

Communications.—The state maintained a highway system of 6,077 mi. which in 1945 included 2,850 mi. of pavement and 2,471 mi. of gravel surface maintained at a cost of \$3,453,536. There were 3,966 mi. of railroad in operation during 1945.

Banking and Finance.—There were 35 national banks in operation on Dec. 31, 1945, with total assets of \$223,358,000 and deposits of \$213,399,000. The 133 state banks and trust companies on June 29, 1946, had resources of \$204,493,000 and deposits of \$194,314,000. Nine building and loan associations on June 29, 1946, reported total resources of \$3,769,135.

Total receipts for the state treasury for the fiscal year ending June 30, 1946, were \$47,196,244; disbursements were \$40,233,043. The bonded indebtedness was \$23,174,000. Federal internal revenue collections for the same period totalled \$44,821,091, of which amount \$37,604,628 was derived from the income tax.

Agriculture.—The cash income from farm crops and livestock in 1945 was \$426,710,000. Favourable weather conditions and the sustained high price level accounted for above average production in 1946.

Principal Agricultural Products of South Dakota, 1946 and 1945

Crop	1946 (est.)	1945	Crop	1946 (est.)	1945
Corn, bu. .	120,300,000	110,484,000	Flaxseed, bu. .	3,440,000	4,630,000
Wheat, bu. .	53,197,000	49,656,000	Potatoes, bu. .	2,842,000	2,945,000
Oats, bu. .	100,398,000	143,377,000	Hay, (tame and wild), short tons	2,563,000	3,312,000
Barley, bu. .	30,294,000	31,826,000			

Mining.—The total value of mineral substances produced in 1945 was \$7,146,305. The state ranked first in the production of beryl, second in bentonite and ground feldspar and third in sheet mica. Production of precious metals increased with the reopening of two gold mines, including the Homestake, in July 1945.

(H. S. S.)

Southern California, University of. This municipal university on private foundation, founded in Los Angeles, Calif., in 1879, comprised in 1946 26 schools and colleges.

The 1946 enrolment far exceeded all previous records, numbering approximately 20,000 students, one-half of them being returned war veterans. Virtually all departments were overcrowded. The alumni numbered approximately 50,000, with 7,000 members of the general alumni association. The trustees were studying the problem of student limitation, giving serious thought to the correct basis of selection. The housing situation reached an acute stage, and an adequate program was in active contemplation.

Among new faculty appointments were: Albert S. Raubenheimer, vice-president, in charge of the educational program; Daniel S. Robinson, director of the school of philosophy; Osman R. Hull, dean of the school of education; Max T. Krone, dean of the Institute of Fine Arts; Carl Hancey, dean of University college; Robert B. Pettengill, director of the Alfred P. Sloan Foundation seminar; William H. Sener, head of the newly-established radio department, with station KUSC, over which special programs are broadcast. Chancellor Rufus B. von Klein-Smidt continued as acting president pending the appointment of a new administrative head. The college of dentistry, hitherto an affiliated institution, was made an integral division of the university.

Plans were adopted for a commodious Y.W.C.A. building on the campus, to be erected early in 1947. Major building projects were delayed by inflated costs and difficulty in obtaining necessary materials.

Graduate departments were authorized for the school of medicine and the Allan Hancock Foundation for Scientific Research. Numerous research projects in varied fields received special financial aid from foundations. The university library and departmental libraries showed rapid development. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Southern Rhodesia: see RHODESIA, SOUTHERN.

South Tirol. Tirol, south of the Brenner pass, was ceded after World War I by Austria to Italy. In spite of almost 25 years of violent Italian efforts to Italianize the population and in spite of ferocious oppression of the Austrian minority, the latter has retained its language and its desire to be re-united with Austria. In Nov. 1945 the Austrian government demanded the return of southern Tirol to Austria. It expressed its willingness in a note to the great powers in Jan. 1946 to let Italy keep title to Italian hydroelectric plants in that territory and share in the development of new power sources. It proposed a plebiscite of the population to decide its wishes.

On April 22 a Tirolese meeting was held in Innsbruck to which a petition with 155,000 signatures from South Tirol was presented for the union of that part of the country with Austria in accordance with the principles of the Atlantic charter. The

Austrian chancellor stressed in his address that Austria wished to settle the South Tirol problem in full co-operation and friendship with the Italian people.

The foreign ministers of the Big Four powers decided, however, tentatively in the meeting in Paris on May 1, 1946, to leave the region inside the Italian border, and this decision was later confirmed in the peace treaty negotiations with Italy.

On Sept. 7 the Austrian and the Italian governments submitted an agreed proposal according to which the territory would remain within Italy but its German-speaking population would enjoy regional autonomy, minority privileges and the right to trade with Austria. The German-speaking population would receive elementary and secondary instruction in their mother tongue, which had been suppressed under fascist laws; they would be entitled to positions in the administration according to their number; their families would have the right to resume their former names which had to be Italianized under the former administration; and German would be accepted, jointly with Italian, as a legal language for place names and official documents. The German-speaking elements were to be consulted when the autonomy statute was drafted. The Austrian north and east Tirol, which had been separated completely by the Italian South Tirol, was to receive free passage and freight transit by rail and as far as possible by road.

Of the 80,000 South Tiroleans who elected German citizenship as a result of the agreement between Chancellor Adolf Hitler and Benito Mussolini and accordingly left the South Tirol, 40,000 declared they wished to return. The Italian government pledged itself to review within a year after the signing of the treaty in consultation with Austria the question of optional German citizenship arranged in the above-mentioned Hitler-Mussolini agreement of 1939.

Southwood, Julius Salter Elias, VISCOUNT (1873-1946), British newspaper publisher, was born on Jan. 5 in Birmingham, England. He had little formal education and as a boy delivered newspapers in London's West End. Becoming a junior clerk with a firm known as Odham Brothers, he worked his way up in the company to become chairman and managing director. Largely through his efforts, the organization, later known as Odhams Press, Ltd., became one of Britain's largest publishing combines. It publishes the *Daily Herald*, organ of the British Labour party; the *People*, a Sunday newspaper; many popular magazines and also *Debrett's Peerage*. In 1929 the Trades Union congress decided to transfer 51 percent of the stock of the *Daily Herald*, which suffered from low circulation, to Odhams. Lord Southwood devoted much of his time to building up the Labourite organ and under his guidance the paper reached a circulation of 2,000,000. Elevated to the peerage in 1937 as 1st baron of Southwood, he was made a viscount in Jan. 1946. Lord Southwood, who became a Labour whip in the house of lords in Nov. 1944, died in London on April 10.

Soybeans. The record 1946 crop of soybeans in the United States was estimated by the United States department of agriculture at 196,725,000 bu. compared with 192,-

076,000 bu. raised in 1945 and the ten-year average of 103,457,000 bu. 1935-44. Early estimates were for a crop below that of 1945 but rapid improvement in October because of favourable weather raised the output. The harvested acreage turned out to be 9,606,000 ac. compared with 10,661,000 ac. in 1945 and an average of 5,698,000 ac. 1935-44. The yield turned out to be higher than expected, averaging 20.5 bu. per acre compared with

U.S. Soybean Production by Leading States, 1946 and 1945
(In bushels)

State	1946	1945	State	1946	1945
Ill.	75,036,000	75,200,000	N.C.	2,862,000	2,700,000
Iowa	34,960,000	35,335,000	Kan.	2,178,000	2,350,000
Ind.	25,346,000	28,587,000	Ky.	1,566,000	960,000
Ohio	19,254,000	19,254,000	Mich.	1,290,000	2,135,000
Mo.	14,360,000	9,360,000	Va.	1,106,000	1,264,000
Minn. . . .	10,675,000	6,554,000	Miss.	1,050,000	806,000
Ark.	5,458,000	3,344,000	Tenn.	810,000	710,000

18 bu. in 1945 and a ten-year average of 18 bu. About 11,500,000 ac. were planted for all purposes in 1946 and 78% was harvested for beans, the highest proportion on record. Unusually high yields in the big producing states greatly enlarged the total output. Illinois led with an average of 23.5 bu. per acre and Iowa had 23 bu. The quality of the crop was unusually good as a result of fine fall weather. Late planted areas had time to mature.

Stocks of previous soybean crops were the lowest of record on Oct. 1 amounting to about 2,000,000 bu. The strong demand for feeds led to early marketing of the 1946 crop. The supply of soybean cake and meal was expected to be nearly equal to that of 1945 or about 3,500,000 tons. This amounted to about twice that of prewar years.

Prices of soybeans to producers were steady through 1945 at \$2.06 to \$2.09 per bushel and in 1946 until August when the average price advanced to \$2.35 per bushel and then declined as the new crop began to be harvested. The prewar average price for soybeans was less than \$1 per bushel. The war demand was for oil rather than stock feed. The output of oil in 1946 was above 1945. The need for oils was expected to continue through 1947 and the United States department of agriculture set the goal for the 1947 crop at 11,300,000 ac., 4% above the previous record. The price of soybean oil rose from about 10 cents per pound in June to over 18 cents in October. (J. C. Ms.)

Spaak, Paul-Henri (1899—), Belgian statesman, was born on Jan. 25, in Brussels. He received his law degree at the Université Libre de Bruxelles, and practised law in Brussels. He was elected as Socialist member from Brussels to the chamber of deputies. In 1935, he was named minister of posts, telegraph and transport in the Van Zeeland cabinet, and the following year he was named foreign minister. At the time, Spaak, who supported the view that Belgium could stay out of a war by remaining strictly neutral, conducted negotiations releasing Belgium from its commitments under the Locarno pact and the Anglo-French-Belgian agreements. He was premier of a short-lived government (May 1938-Feb. 1939) and again became foreign minister at the outbreak of World War II in Sept. 1939. He fled to England after the German invasion in 1940 and became foreign minister and minister of labour in the Belgian government-in-exile. In Feb. 1945, he was retained as foreign minister and deputy prime minister in the Van Acker government established on Belgian soil; the following April he headed the Belgian delegation to the U.N. conference at San Francisco. At the opening session of the U.N. general assembly meeting in London, Spaak was elected (Jan. 10, 1946) president of the general assembly by a 28 to 23 vote. He retained his post as Belgian foreign minister. In opening the general assembly sessions at Flushing, New York city, Oct. 21, Spaak warned "either we succeed or the world falls back into disorder, chaos and, finally, war. . . ."

Spaatz, Carl A. (1891—), U.S. army air officer, was born June 28 in Boyertown, Pa. He was graduated from West Point in 1914. During World War I he commanded a pursuit squadron in the St. Mihiel offensive. He was chief of staff to Gen. Henry H. Arnold in 1941, and in July 1942 he was named U.S. air commander in Europe. Early in 1943 he was shifted to the Mediterranean theatre as commander of the 12th U.S. air force and of the Allies' Northwest Africa air forces. On Dec. 24, 1943, Pres. Roosevelt announced the appointment of Gen. Spaatz as commander of "the entire American strategic bombing force operating against Germany" from all directions. During 1944 and 1945, under his command, U.S. air forces brought all points in Europe within range of Allied bombers.

Spaatz was named for promotion to the temporary rank of full general, March 13, 1945. He represented the U.S. at the German surrender ceremonies in Berlin, May 8. The war department announced his appointment July 5 to commander of the newly created U.S. strategic air force in the Pacific to direct Superfortress blows against Japan.

Gen. Spaatz, who succeeded Gen. Arnold as commander of all army air forces (Jan. 24, 1946), urged the following April that all rocket and guided-missile research be put in charge of the air forces. The successful Honolulu to Cairo, Egypt, flight (via the Polar regions) by the B-29 "Pacusan Dreamboat" was hailed as an "epochal" achievement by Gen. Spaatz, who declared Oct. 6, that it demonstrated the "feasibility of a flight across the polar wastes by properly equipped aircraft."

Spain. A southwestern European state, comprising about 84% of the Iberian peninsula. Area (including the Balearic and Canary Islands), 195,550 sq.mi.; pop. (est. 1946) 27,246,208. Capital, Madrid. Chief cities: Madrid (1,141,000); Barcelona (1,109,000); Valencia (508,000); Seville (348,000); Zaragoza (266,000); Málaga (259,000); Bilbao (208,000). Religion: Roman Catholic. Caudillo, or chief of state, Gen. Francisco Franco. The chief executive and his council of ministers govern without responsibility to the parliament (cortes). All political parties except the Falange are proscribed.

Foreign Relations.—Spain's exclusion from the United Nations (Feb. 9, 1946) initiated a series of diplomatic moves which ended with the 34-6 vote of the general assembly (Dec. 12) to recommend that the member nations break off relations with the Franco government.

The three-power talks proposed by France in Dec. 1945 led to the joint declaration (March 4) that England, France and the U.S. hoped "leading patriotic and liberal-minded Spaniards may soon find means to bring about a peaceful withdrawal of Franco, the abolition of the Falange, and the establishment of an interim or caretaker government under which the Spanish people may have an opportunity freely to determine the type of government they wish to have and to choose their leaders." In April, Poland, after recognizing the government-in-exile, brought before the Security council a proposal for severing relations with Spain, on the grounds that the existing regime was endangering international peace. A subcommittee of the council, created to investigate the Polish charges, made its report on May 31.

The committee's report condemned the Franco government as "a Fascist regime patterned on, and established largely as a result of aid received from Hitler's Nazi Germany and Mussolini's Fascist Italy"; reviewed the "very substantial aid" received by the axis from Spain; cited the "incontrovertible documentary evidence" of Franco's conspiracy with the axis to wage

¹All direct quotations, unless otherwise noted, are from the "Report of the Subcommittee on the Spanish Question."

war on the Allied nations; and showed that following the war Spain had "failed, and in some cases refused, to co-operate in removing the vestiges of Fascism and Nazism in Europe." Though Spanish armed forces (estimated at 600,000-700,000 men, including army, navy, civil guards and police, and requiring 40.9% of all national revenues in 1946) were declared to be "far larger than might be expected in any peace-loving and non-aggressive country," the quality of their training and equipment precluded a finding that "Spain was at the present time preparing for an act of aggression." Furthermore, no evidence was discovered to support allegations of atomic research in Spain or unusual activity in the munitions industry. In conclusion, the committee argued that the absence of "an existing threat to the peace" prevented the council from employing sanctions, as prescribed in the charter; but it could advise the general assembly to recommend "that diplomatic relations with Franco regime be terminated forthwith by each Member of the United Nations."

The report evoked bitter debate in the June sessions of the Security council. Motions to accept the subcommittee's report were lost, as was the demand of Poland, backed by the U.S.S.R., for immediate severance of relations with Spain. No decision was reached, except to keep the Spanish question on the agenda; but in November the matter was removed from the agenda of the council and brought before the general assembly. After prolonged discussion, which underscored the divergent policies of Britain, the U.S. and the soviet union, the assembly agreed to recommend to the member nations the withdrawal of their ambassadors and ministers from Spain and to request the Security council to reconsider the question if Franco did not give way to a democratic government "within a reasonable time." (See also UNITED NATIONS.)

While foreign countries were struggling, often at cross purposes, to find a solution to the Spanish question, the Franco government seized every occasion to reassert its internal stability and to challenge the competence of the United Nations to

sit in judgment. When France, stirred by the trial and execution of Spanish Republicans, decided to close the frontier (Feb. 28), Spain immediately followed suit. At the opening of the cortes (May) Franco declared that the law-making processes of the parliament disproved charges that his government was dictatorial and undemocratic: against the conventional type of democracy, he said, "we present a Catholic and organic democracy, which dignifies and elevates man. . . ." The journey of Don Juan to Portugal for talks with Franco's representatives raised the hopes of those who espoused the cause of restoration, but before the year's end a number of the pretender's sympathizers were fined or removed from office for monarchist activities. Press censorship was imperceptibly lightened by a decree which *inter alia* forbade criticism of high officials, Catholic dogma and foreign policy. Sporadic acts of violence indicated the existence of an underground opposition movement; somewhat surprising, at this late date, was the ability of the secret police to round up hundreds of "communists." By September the jail population had dropped to 37,994, only 6,114 of whom were held for crimes committed during the Civil War.

The Allied governments pressed Spain for the repatriation of German officials and agents, and from January to May 1,659 were forced to leave; but the U.S. complained of the obstructionist tactics of Spanish officials with respect to 2,205 nazis still wanted for questioning. In August the Belgian quisling Leon Dégrelle was formally expelled, but as late as October Belgium insisted that Dégrelle remained in safe hiding in Spain. The Allied Control commission was hampered in its efforts to discover and seize German property, though in October the government finally recognized the commission's right to take over German assets on account of reparations.

Relations with the Vatican were perfected by the concordat of July, which provided for the joint participation of the government and the church in the appointment of priests. A census of heads of family for the purpose of determining voting rights (referred to as "organic suffrage") was completed, but the municipal elections promised for March failed to materialize. The Falange youth front was strengthened in August by the organization of weekly classes, with compulsory attendance, for political, religious and cultural indoctrination.

On the economic front Spain continued to suffer from low production, food shortages, rising prices and widespread black markets. On the tenth anniversary of his rise to power (October) Franco declared: "we have saved the soul of Spain . . . but we have not yet won the economic battle nor destroyed the effect of 50 years of neglect" (*Keesing's Contemporary Archives*, p. 8261). Particularly acute was the dearth of housing, widely recognized as a deterrent to the nationalist aim of rapid population growth.

Finance and Trade.—The peseta held its official value of 9.13 cents (U.S.) but in August the Foreign Exchange institute introduced tourist exchange at 16.4 pesetas per dollar. The ordinary revenues for 1946 were placed at 11,100,000,000 pesetas (10,500,000,000 in 1945), with expenditures calling for 11,300,000,000 (10,600,000,000 in 1945). Additional outlays of 1,900,000,000 (2,600,000,000 in 1945) were provided for in the extraordinary budget. As of Dec. 1944 the public debt stood at 38,300,000,000 pesetas. The note circulation of the Bank of Spain rose to 19,700,000,000 in August (19,000,000,000 in Dec. 1945), while prices and the cost of living moved slowly upward. Reserves of the central bank (August) were reported as follows: gold 339,000,000 pesetas; silver 574,000,000; foreign exchange 92,000,000. Despite the shortage of foreign credits the government planned to pay \$10,300,000 on account of the external debt arising from the purchase of shares in the Spanish Telephone Co.

PAPIER MACHE FIGURE depicting Spain's housing shortage in 1946 was part of the festivities in Valencia for the carnival celebrating the Feast of St. Joseph

In "IS IT STILL TICKING?" Daniel Bishop of the *St. Louis Star-Times* referred to the action of the United Nations Security Council in appointing a subcommittee on April 29, 1946, to investigate whether the activities of the Franco government were a cause of international friction and a threat to world peace

A trade-agreements program was vigorously pushed in an effort to counteract the deficiencies of the domestic economy. The treaty with Italy (January) provided for reciprocal trade of 200,000,000 pesetas yearly, though 75% of Spain's exports were to be applied to the (civil) war debt. But the most important trade and loan agreements were those negotiated with Argentina, the latter country having used the occasion of the United Nations debates over Spain to strengthen its diplomatic and economic relations with the Franco government. The trade agreement of June was followed by an economic and communications agreement in October, in which Spain pledged itself to buy from Argentina up to 90% of its import requirements of wheat and corn over a five-year period. Simultaneously, Argentina extended long- and short-term credits totalling more than \$180,000,000.

Production.—In an effort to stimulate agricultural production the government, early in 1946, made available 1,000,000,000 pesetas in low-interest loans to farmers; and the cortes approved a new agrarian law, renewing the perennial hope of breaking up large estates and appropriating idle lands for the benefit of small-scale farmers. Reflecting some improvement over the low output of grain in the previous year, in July the bread ration was increased by 100 grams, raising the daily ration to 200–250 grams per person. Latest statistics on grain production refer to 1945: wheat 1,687,180 tons; rye 526,930 tons; barley 797,510 tons; corn 719,800 tons; oats 283,150 tons.

Steel production averaged 60,625 tons monthly in the first half of 1946 (51,800 tons in 1945). Latest figures available for other minerals report total output for 1945: coal (including lignite) 13,161,460 tons; pig iron 515,875 tons; copper 7,935 tons; lead 27,780 tons.

The newly electrified Madrid-Segovia railroad was inaugurated in February. On this occasion a 12-year plan for the electrification of 40% of the railway system was announced. (See also FASCISM.)

Spanish-American Literature. Few of the Spanish-American novels published in 1946 attained real literary merit. The Argentinean Enrique Amorim, however, managed to awake special interest with his novel *Nueve lunas sobre Neuquén* mainly because of the fact that he seemed much more concerned with social problems than in his previous books. Amorim, although writing for the movies, kept his artistry intact and for this reason he should be specially commended. In Mexico Mariano Azuela wrote 'one more book to add to a series which some critics believe the author should have interrupted long ago. *La mujer domada*, although well written and constructed, is a story that has been told much too often. Azuela's heroine, coming to the big city from a provincial town, is an easy prey for disappointment and disappointment may also be the reaction of the reader who patiently waits for another masterwork by the author of *Los de Abajo*. José R. Romero, on the other hand, is like the Argentinean Amorim, a novelist who has already proved his skill, but might still have something to say which will surprise the critics. His latest book, *Rosenda*, is a love story, powerfully written and, according to the Mexican critics, of autobiographical value. In Bolivia Augusto Céspedes—the author of *Sangre de Mestizos*, a memorable collection of short stories dealing with the Chaco War—published a book that has the making of a best seller. *Metal del Diablo* tells the story of a not very scrupulous miner who becomes the king of tin leaving behind a trail of blood, exploitation and abuse. The author succeeds in depicting different milieus and characterizes very convincingly a number of adventurers, politicians, financiers, Indian leaders and European noblemen. Two other novels might be mentioned to prove that, although literary quality among Spanish-American novelists may leave something to be desired, variety, at least, is never lacking. The Chilean Marta Brunet—serving a diplomatic post in Argentina—abandoned the field of her first adventures in fiction, the mountains of Chile, and reached a rather unexpected degree of sophistication in *La Mampara*, a very short novel dealing with social life in Buenos Aires. Miss Brunet's characters are on the verge of being caricatures; the narration is dull; the author has not rid herself entirely of the "criollista" technique which indulges heavily in digression and description. The second novel deserving mention is the joint product of the Argentinean S. Ocampo and A. B. Casares: their book is called *Los que Aman, odian* and becomes a fine example of a detective story written by Spanish-Americans with a Spanish-American background.

In the field of historical biographies perhaps the most important item is M. Picón Salas' *Miranda*; it is a well-documented account of a life that has already become a legend. The Uruguayan J. Zavala Muñoz in *Batlle, héroe civil* deals with one of the most fascinating periods of his country's history. *Bulnes* by Alfonso Bulnes is a biography of a Chilean general and president of the republic that should interest the Argentinean public as well, since it was during Bulnes' time that Argentinean and Chilean writers engaged in the so-called "polemic of romanticism," Domingo Sarmiento defending the cause of romanticism and Andrés Bello's disciples the cause of neoclassicism. The famous painter J. C. Orozco published his *Autobiografía* and by telling his life with sincerity has produced a book of real importance. Alberto María Carreño wrote an interesting biography of *Bernal Díaz del Castillo*. *El Marqués de Sobre-Monte* by José Torre Revello is a historical essay on the personality of the viceroy of Río de la Plata. In R. Rodríguez Celada's *Alberdi el Indoamericano* the liberal ideas of Juan Alberdi, eminent Argentinean writer and political leader, are specially emphasized. The Colombian essayist Germán Arciniegas, who seems to be competing with L. A. Sánchez in pro-

ductivity, edited among other things an anthology of Andrés Bello's writings under the title of *El Pensamiento vivo de Andrés Bello*, a volume in the popular Losada series.

Augusto D'Halmar had his short stories collected in a volume *Cristián y yo* which may be the most outstanding book published in Spanish-America in 1946. This Chilean writer is a great stylist, has imagination and, what is stranger in Spanish-American letters, has a philosophy of life which is profoundly inspiring.

In Chile also the *Sociedad de Escritores* edited two short stories by Francisco Contreras, the poet and critic who for a number of years acquainted Parisian readers with the latest news of the Spanish American *modernismo*; the little volume is called *El Huallipén y La Aojada*. Those who knew Luis J. Urbina as a poet only—and "the most Mexican of Mexican poets"—will be surprised to find out that he was also a short story writer of distinction; his *Cuentos vividos y crónicas soñadas* is a romantic document of prerevolutionary days in Mexico. From Mexico comes too *Cuentos Indígenas* by P. Gonzalez Casanova, a bilingual edition in Nahuatl and Spanish of short stories that will interest the students of folklore. Three other books containing short stories should be mentioned: Lourdes Morales' *Delta en la Soledad* (Venezuela); J. P. Ramos' *La Novela de la Vocación* (Argentina); and E. Anderson Imbert's *Las pruebas del caos* (Argentina).

A. Gomez Robledo's *La filosofía en el Brasil* will serve as a fine introduction to Brazilian philosophers; the author shows a great deal of understanding and presents his subject with clearness. Another essay of significance is G. Aguirre Beltrán's *La población negra en México*, a work that opens the field for the study of Negro influence upon the life of Mexico. *Nueva grandeza Mexicana* is a brilliant eulogy of Mexico City by the well-known writer Salvador Lovo. C. García Prada gathered under the title of *Estudios Hispanoamericanos* his articles and reviews which had appeared in *Revista Iberoamericana*.

Two books on Spanish-American music deserve special men-

works published: Ramón Galvez, *Las Personas*; M. Durán Gili, *Puente*; T. Rico Cano, *Esta niebla encendida*. Argentina had an abundant crop of new poets; here are some of them: B. Caraffa, *Raíces de Eternidad*; A. Medina, *Hojas Perdidas*; J. Caraballo, *Prudencio Luna*—a "gauchesco" poem in the tradition of *Martín Fierro*; Raúl J. Aguirre, *El tiempo de la rosa* and A. Blasetti, *Turno del Hombre*. Chile has one more poetess in the person of Mila Oyarzún, author of *Estancias de Soledad*. The outstanding books of poetry in 1946 were three anthologies: Alfonsina Storni's *Obra poética*, published to collect funds for a monument to the great Uruguayan poetess; R. Lopez Velarde's *Antología*, on occasion of the 25th anniversary of the poet's death; and A. Cruchaga Santa María's *Antología*, which will make the Chilean poet known to a broader audience.

The dramatic output for the year 1946 was again negligible. The Mexican E. Abreu Gómez published a comedy, *Un loro y tres golondrinas*; F. Perez Estrada made a collection of popular plays, *Teatro Folklórico Nicaragüense*; and Luis E. Osorio continued the series known as *El Teatro*, plays of modern Colombia. (F. AA.)

Spanish Colonial Empire. Total area (approx.): 135,206 sq.mi.; population excluding Spain (est. July 31, 1944) 1,380,000.

The accompanying table lists the colonies, protectorates, etc., of Spain (*q.v.*) with certain essential statistics appropriate to each of them.

History.—There was a further increase in the economic resources of the Spanish protectorates and colonies in 1946. In Spanish Morocco the total acreage sown with corn was 50% higher than in 1936, and the harvest far surpassed that of 1945, when a severe drought had been experienced. The production of iron ore in the Riff mines (exported mainly to Great Britain and Spain) reached important figures. All the territories maintained substantial exports of cocoa, coffee beans, timber and other products to Spain.

Spanish Colonial Empire

Country and Area sq. mi. (approx.)	Population Estimated July 31, 1944 (000's omitted)	Capital Status, etc.	Principal Products (in short tons)	Imports and Exports (in pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in pesetas)

*Ifni = 35, Rio de Oro, etc. = 37. Rates of exchange, 1946: 1 peseta = 9.15 U.S. cents.

tion: Carlos Vega's *Música Sud-Americana*, a collection of articles, and Alejo Carpentier's *La música en Cuba*. Near the end of 1945 José G. Navarro published his *Artes Plásticas en el Ecuador*, a book of great importance and written in a style that will appeal not only to the experts but also to the general reader.

Spanish-American young poets produced enthusiastically in 1946 and it is a difficult task to choose the ones worthy of mention. *Sonrisa del Alba*, an anthology of young Mexican poets, gathers compositions which have appeared in different magazines. In Mexico also the following young poets saw their

Spanish Literature. No new literary talent appeared on the horizon in 1946. The period was characterized by a scarcity in fiction and, most particularly, in poetry, and a slight revival in the theatre. Several historical and biographical works of merit and many excellent articles and books of a critical nature were published.

Jacinto Benavente of Argentina gave a lecture in the Madrid Athenaeum on life and the theatre in South America; this lecture was later published in Buenos Aires. His play *Titania*, a fine comedy of manners in the typical Benavente style, was

staged in Barcelona by the Argentine actress Lola Membrives. Casas Brício's *Angustias la Faraona*, produced for the first time on Holy Saturday, has Andalusia for its setting. *Lolita Dolores* and *Mambrú va a la guerra*, two musical plays also presented on Holy Saturday, had great success. Critics praised the score and two parts called symphonic poems in the musical play *De orden del rey* by Angel Barrios. Enrique Suárez de Deza's *Miedo* seems to be his best dramatic effort up to now. José María Pemán, president of the Spanish academy, received the unanimous praise of the critics with *La casa*, a comedy of ideas, characters and manners. *Las horas inolvidables*, by Enrique Gutiérrez Roig, is an amusing comedy. *Manolita Quintero*, a posthumous work of the Alvarez Quintero brothers, was given in the Fontalba theater in Madrid. Volume XI in the *Teatro completo* of the brothers contains: *La escondida senda*; *El último capítulo*; *Las de Caín*; *Sin Palabras*. Ismael Sanchez Estevan published *María Guerrero*, a book on one of Spain's greatest actresses.

Pío Baroja published the third volume of his *Memorias*, entitled *Final del siglo XIX y principios del XX*. His personal experiences, books, travels, acquaintances and opinions—all very unheroic—pass in review, expressed in a language ever rambling but completely frank. His latest novel *El hotel del cisne* has for its background the Paris of 1940; the characters are the wretches who occupied the sixth floor of a poor hotel, beset by fears of bombings and rises in the cost of living. Dreams with fantastic adventures and visions make up a good part of the book. Full of details, as all of his writings, it possesses much that is unusual and morbid. Gaspar Gómez de la Serna's small volume *Después del desenlace* consists of three tragic love letters, supposedly from a young Italian soldier who saw action in the Spanish Civil War and World War II. Aguilar published in the *Crisol* series *Cuentistas españoles contemporáneos*, a collection of short stories by contemporary writers.

The philologist and historian Menéndez Pidal published in Argentina *Castilla, la tradición, el idioma*, a book which develops such topics as the language and literature of Castille, the nature of traditional poetry, Spanish epics, the Spanish language in the old and new worlds, euphuistic style and thought in 17th century Spain. The Aragón Medieval Studies club, connected with the University of Saragossa, brought out the first volume of its studies on the Middle Ages under the Crown of Aragón. *La mujer, la casa y la moda* (En la España del rey poeta), by José Deleito y Piñuela, deals with feminine activities, the house, dress, vehicles, etc., during the reign of Philip IV. Natalio Rivas in *El siglo XIX* assembled anecdotal narratives about the politicians and literary figures of the past century. The first volume of the *Diccionario enciclopédico ilustrado de los hombres de España*, by Esperabe de Arteaga, is a useful tool for people interested in any phase of Spanish life.

Literary criticism revealing high calibre and unqualified interpretative value flourished. "Azorín," awarded the Gran Cruz de Alfonso X el Sabio, gathered in *Ante Baroja* various articles concerned with his colleague of the generation of 1898. He also published numerous articles in newspapers and magazines. Dámaso Alonso, elected to membership in the Spanish academy in 1945, studied in *La poesía de San Juan de la Cruz* the saint's indebtedness to Garcilaso, traditional and popular elements in his poetry, the biblical sources, style and structure. In *Estilos del pensar* the art critic Eugenio d'Ors wrote about Menéndez y Pelayo, Luis Vives, San Juan de la Cruz, etc. Carlos Clavería in *Cinco estudios de literatura española moderna* developed with clear elucidation essays on Flaubert and *La Regenta*, "Clarín" and Renan, the theme of time in "Azorín," etc. Benito y Durán published a study entitled *Filosofía del Arcipreste de Hita: Sentido filosófico del "Libro de buen amor"*. As a consequence of inter-

est created by the third centenary of Quevedo y Villegas, Luis Astrana Marín brought out an *Epistolario completo de don Francisco de Quevedo y Villegas*. Max Aub, now living in Mexico, wrote *Discurso de la novela española contemporánea*, a series of lectures evaluating the contributions of writers embraced in the more recent literary generations. Another refugee, Moreno Villa, discovered some interesting stylistic peculiarities of various authors in *Leyendo a San Juan de la Cruz, Garcilaso, Fray Luis de León, etc.*

Speer, Albert (1905—), German politician and architect, was educated at the Karlsruhe Technical academy and at universities in Berlin and Munich. In 1931 he joined the nazi party and after Hitler took power, Speer rebuilt the reich chancellery in Berlin and was the architect for the party building in Nuernberg. He became inspector-general of buildings in Berlin in 1937, and worked with Fritz Todt, builder of Germany's Westwall and superhighways. He was made minister of munitions and armaments in 1942. He joined the Doenitz government after the death of Hitler. Arrested May 23, 1945, he was held for trial before the International Military Tribunal at Nuernberg. In his testimony Speer asserted (June 20, 1946) that he plotted in March 1945 to kill Hitler with poison gas. He also insisted that he was a businessman, not a nazi. Although the court held there was mitigating evidence in his favour, he was found guilty of war crimes and crimes against humanity and was sentenced Oct. 1, 1946, to 20 years' imprisonment.

Spelman Fund of New York: see SOCIETIES AND ASSOCIATIONS.

Spices. The year 1946 was notable in the history of spices. Of the war-blacked-out regions, Hong Kong was first to resume shipping. To a world weary of makeshift imitations, China sent a large tonnage of its genuine, extra selected, Saigon and Honan cinnamons (cassia), and still many grocery shelves were bare. As the year closed, further good quantities were en route. Next to resume was the Netherlands with many bags, 110 lb. each, of Dutch blue poppy and caraway seeds, a boon to bakers who could again offer poppy and caraway rolls and bread. Then Denmark and Sweden made their fancy mustard seeds available, forestalling a threatened shortage.

For a pepper-starved world, Singapore had many tons immediately available. Again the U.S. Office of Price Administration prevented imports to the United States by maintaining its arbitrary ceiling of 15 cents per lb. against world markets of more than 50 cents. But the act under which OPA operated expired June 30, and spices were not mentioned in the new law enacted July 28. Later the U.S. department of agriculture relinquished import licensing and spice trading at last was free in the United States. Other countries were still hobbled by controls, such as quotas for each part of the world, the licensing of shipments, etc.

Nutmegs and mace from the Netherlands Indies, still held back by civil strife, were now and then to be found in Singapore and a few lots of each were shipped to the western world during December.

Resumption of trade resulted in a large number of detentions under the Food, Drug and Cosmetic law by the U.S. Federal Security agency. New tests for defects in quality excluded red peppers, nutmegs, mace, and such aromatic seeds as cumin,

anise, fennel and coriander and cassia, to the extent of many tons. There are three alternatives of disposing of excluded imports: re-export, destruction or reconditioning. The last, a privilege, is usually effective under government supervision to bring detained products into conformity with the law.

The demand for mustard increased. On Aug. 28, 1946, the department of agriculture estimated at 46,990,000 lb. the total crops of Montana, Washington, California and the Dakotas. Canada, too, contributed a good many carloads. It was expected that by the autumn of 1947 ample supplies of spices were almost sure to be available everywhere at reasonable prices.

Worthy of recognition as a supplier during the war years is the island of Cyprus which sent frequent shipments of sage, until cultivation in the United States increased in Washington, California and Kentucky. Anise seed and red peppers (chilies) came in good quantities from Mexico. Spain increased its cultivation of a variety of thyme and held that business until France was again able to export its genuine, rich-flavoured leaves. In 1946 England was shipping some of its fancy mustard seeds, and Hungary was negotiating sales of the famous paprika grown in the Szeged area. This was fortunate, since the 1946 crop in Spain was much decreased by unfavourable growing conditions. Spanish prices were high. Real allspice, the one spice discovered by Columbus, was still controlled by the government of Jamaica. The new government of India was more strictly rationing exports of its much-needed spice seeds, gingers and turmeric.

Squash Racquets. Charles W. Brinton of Philadelphia, Pa., picked up where he left off four years before in winning the 1946 squash racquets singles. He was duration champion, having won the last national tournament in 1942. Brinton teamed with Donald Scratchan to defeat Hunter Lott and William Slack in their all-Philadelphia doubles final. The Lapham International trophy was won by the United States for the 16th time in the 25-year series, the U.S. team defeating Canada, 13 to 2. The United States won the Grant trophy, taking 7 out of 11 games from Canada, but the Canadians defeated England, 8 to 1. Jack Leibel of Toronto and Lou Schaefer of Buffalo, N.Y., won the dominion doubles, while Walter F. Pettit of New York annexed the New York state title. Lester Cummings of Greenwich, Conn., won the national professional title with a 15-6, 15-7, 15-8 victory over Al Ramsay of Cleveland, O. Cummings was champion in 1942, Ramsay in 1940 and 1941.

Frank R. Hanson of New York captured the national squash tennis championship, defeating the 1942 winner, Robert Reeves of New York, 7-15, 15-4, 15-7. Hanson also won the New York A.C. and Yale club titles.

Stainless Steel: see METALLURGY.

Stalin, Joseph Vissarionovich (1879-), soviet statesman, was born

"JOE'S IDEA OF TEAMWORK" pictured in 1946 by Shoemaker of the Chicago Daily News

in Georgia in Transcaucasia and succeeded Lenin as virtual dictator of the soviet union in 1924 (see *Encyclopædia Britannica*). On May 6, 1941, shortly before the German invasion, Stalin assumed the premiership of the U.S.S.R.

Throughout 1942 and 1943, Marshal Stalin repeatedly appealed to the Allies to open a second front and asserted on several occasions that Allied aid was not commensurate with the soviet contribution in engaging the greater bulk of the nazi army. At the historic Tehran conference in Nov. 1943, Stalin, Roosevelt and Churchill agreed on a master plan to destroy German military power. At Yalta (Feb. 4-11, 1945) they agreed on final measures for the defeat of Germany and on policy regarding liberated countries. At the Berlin conference the Big Three made public their agreement on the final decisions for the rule of Germany and settlement of other European problems (Aug. 2), and seven days later (Aug. 9), the soviet union entered the war against Japan.

Of all Stalin's statements in 1946, perhaps the most important was his electoral speech of Feb. 9, in Moscow, in which he characterized World War II as the "inevitable result of the development of world economic and political forces on the basis of modern monopoly capitalism" and called for substantial increases in heavy industries to "guarantee the homeland against all possible accidents."

At the time that the Iran crisis was at its peak, Stalin in a written interview with a U.S. correspondent (March 22) expressed his belief that neither the nations of the world nor their armies were seeking another war, adding that the fear of war was "being brought about by the actions of certain political groups engaged in the propaganda of a new war." In another series of written answers to a correspondent's questions (Oct. 28), Stalin disputed Secretary of State James F. Byrnes' contention that U.S.-soviet tension had increased, but added that "the most serious threats to peace" were the "incendiaries of a new war," naming Churchill as the foremost "incendiary." He then declared that the U.S.S.R. did not possess the secret of the atomic bomb. Nine days later (Nov. 6), Stalin urged the soviet army to remain in constant "battle-readiness" despite "the

present absence of a direct military threat." (See also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: see PHILATELY.

Standards, National Bureau of. Established by act of congress March 3, 1901, this bureau is the principal agency of the federal government for fundamental research in physics, chemistry and engineering. During 1946 it consisted of 11 scientific and technical divisions, three concerned with commercial standardization, and four concerned with administration of internal affairs. The technical divisions were electricity, metrology (formerly weights and measures), heat and power, optics, chemistry, mechanics and sound, organic and fibrous materials, metallurgy, mineral products (formerly clay and silicate products), ordnance development (including electronics) and radio propagation; the standardization divisions were simplified practice, trade standards and codes and specifications.

Dr. E. U. Condon, director of the bureau, served as scientific advisor to the Special Senate Committee on Atomic Energy and was a member of the president's Evaluation commission at the atomic bomb tests conducted by the army and navy at Bikini Atoll.

The bureau's direct appropriation for 1946 was \$3,588,000; this was supplemented by approximately \$8,500,000 transferred by the army, navy, National Defense Research committee and other government agencies. The staff numbered approximately 2,300 during the year. In addition, 65 persons were engaged under the Research and Industrial Fellowship plan.

Many of the war research projects of the bureau were continued during the year, in particular those involving fundamental research and peacetime applicability. Representative of these were the development of special batteries, interior ballistics, lightning hazards to aircraft, optical range finders, chemical analysis of secret materials, jet propulsion studies, aviation fuel research, radar homing missiles, aerodynamics of bombs and rockets, oxygen equipment for high altitude aircraft and synthetic rubber.

Three typical contributions to the war effort, secreted during World War II and on which advancements were still being made during 1946, may be mentioned. The bureau was responsible for the invention, development and engineering of the radio proximity fuse for bombs, rockets and mortar shells. The guided missile BAT, the only fully automatic guided missile used successfully in combat, was also developed, and work on advanced models was continued during the year. Much work was done in nuclear physics, an extension of several decades of activity in the field of radioactivity. The wartime atomic energy project originated at the bureau when President Roosevelt turned to the director of the bureau for its initiation. Work in this field included investigation and development of methods of isotope separation, calorimetric measurements of secret materials, mass spectrometer measurements of isotope ratios, studies in neutron absorption, analysis of ores of uranium and other heavy elements, research in beta and gamma ray spectra of radioactive isotopes and in alpha ray emission of such isotopes, the development of new methods of test, and the development of beta and alpha ray standards in laboratory form. Related projects included the designing of a 100,000,000-volt betatron, tests of Geiger-Mueller counters and associated electronic equipment, testing of more than 3,000 radium samples, preparation of safety codes for X-ray and radium protection, and the construction and operation of a 1,500,000-volt X-ray tube.

Extensive studies were made in the field of radio propagation. During World War II the ionospheric group at the bureau be-

came the centralizing unit in the United States for ionospheric data taken all over the world. This group was given division status on May 1, 1946, with the formation of the Central Radio Propagation laboratory, Division XIV of the bureau. Activity of the division included ionospheric research, propagation, and measurement; microwave research and measurement; and frequency utilization services. Ionospheric data, received from 55 ionospheric stations scattered throughout the world, were gathered and analyzed and the results were disseminated to the armed services, commercial users, scientists and laboratories. Techniques were developed for solving high-frequency radio propagation problems. Methods of predicting radio transmission conditions were improved through special experiments, the study of world-wide observations, and the analysis of radio traffic data and radio disturbances.

Projects representative of the broad scope of the bureau's work in physics, chemistry and engineering included underground corrosion of metals, high voltage research, dental materials, thermal expansivity, automotive antifreeze compounds, lubricating greases, optical glass, porcelains and refractories, ceramic coatings for aircraft exhaust stacks, basic elements for electronic computing machines, electronic measurement instruments, sugar research, photometry of phosphorescent materials, hydrocarbons research, extraction of alumina from clays, lateral contraction of some structural alloys, properties of sound wave fields, fundamental investigations of air flow, high polymer research (including natural and synthetic rubbers), fatigue in metals, and building materials and structures.

Spectrographic investigations included structural analyses of the spectra characteristics of chromium, molybdenum, tantalum, ytterbium, and uranium; the valence electrons of uranium, determined from analysis of the atomic spectrum, were announced; a compilation of atomic energy levels as derived from optical spectra was begun for 450 spectra of 84 elements; approximately 40,000 determinations were made spectrographically on more than 3,000 samples, most of which were uranium.

The test work of the bureau during the year totaled approximately 250,000 tests and calibrations (including the furnishing of standard samples) valued at \$1,200,000. Representative activities of this nature included the calibration of approximately 77,000 thermometers of various kinds, more than 60,000 hours of performance and life tests on engines, the testing of 200 refrigerators, preparation and distribution of 21,000 standard samples of chemicals, approximately 40,000 tests of some 6,000 chemical samples, calibration of about 900 water current meters, examination of 5,300,000 barrels of portland cement for various government agencies, factory inspection of about 4,000,000 lamps purchased by the government and life-test of more than 3,000 at the bureau, almost 19,000 tests on miscellaneous materials (such as concrete and concrete aggregates, soils, paints, textiles, water, soaps, oils and metals) and others.

During the year, 145 papers were published in the bureau's series of publications, and 79 articles by members of the staff were approved for publication in scientific and technical journals. Nine new mathematical tables were made available to the public, bringing the total to 75. The bureau's publications are available in the leading libraries throughout the country. An indexed list of publications (Circular C24 and supplements) is obtainable from the superintendent of documents, Government Printing office, Washington 25, D.C. (H. Od.)

Stanford University (THE LELAND STANFORD JUNIOR UNIVERSITY), an institution of higher education near Palo Alto, Calif.

During the summer of 1946, the war department released Dibble General hospital which by autumn was converted into

Stanford village, a housing project located two miles from the campus for veteran students. A program was inaugurated to remodel some of the hospital buildings into 300 apartment units. The village housed a total of approximately 1,500 students. On the campus, classroom, laboratory and library facilities were crowded with a total enrolment of about 70% above the prewar peak.

With a grant from the Rockefeller foundation, the school of humanities developed a program in the Pacific-Asiatic-Russian studies. In the school of social sciences, the faculty revised and extended the program in international relations. The Hoover library and institute with \$200,000 from the Rockefeller foundation was enabled to employ scholars in the Slavic studies. With a \$300,000 grant from the same foundation, the Food Research institute began work on a five-year international history of food and agriculture during World War II. Judge George E. Crothers made a gift for the purpose of erecting a dormitory for law schools. Gifts and bequests for the year totalled \$1,648,000. In order to provide students with full medical and surgical services and hospital care without charge in addition to tuition fees, the health service was reorganized with the appointment of Dr. George H. Houck as director.

Near the end of 1946, the trustees organized, in co-operation with leading industrialists of the west, the Stanford Research institute, a separate corporation set up to conduct research for industry. President Donald B. Tresidder was appointed chairman of the institute's board of directors. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (A. C. EV.)

Stanley, Wendell Meredith (1904–), U.S. biochemist, was born on Aug. 16 in Ridgeville, Ind. After receiving his Ph.D. from the University of Illinois in 1929, he became research associate and instructor in chemistry at that school. The following year, he went to Munich as National Research fellow and upon his return in 1931 entered the Rockefeller Institute for Medical Research, becoming a member in 1940. He was Hitchcock professor at the University of California, 1941, and Vanuxem lecturer at Princeton, 1942. Prof. Stanley in research on the virus which caused the "mosaic disease" in tobacco plants, came upon the discovery that while it appeared to act like an inanimate chemical, it presented evidence of being a living and growing organism; but its method of reproduction still remained a mystery. He also worked on vaccines, during World War II, for use against influenza and Japanese encephalitis. For his work in the biochemistry of virus proteins he won the Nobel prize in chemistry, Nov. 14, 1946. He and Prof. John H. Northrop received one-quarter each and Prof. James B. Sumner, one-half, of the 1946 Nobel chemistry award.

Stars: see ASTRONOMY.

Stassen, Harold Edward (1907–), U.S. politician and naval officer, was born April 13 in West St. Paul, Minn. He studied at Minnesota university and law school, Minneapolis, Minn., 1923–29, and was admitted to the Minnesota bar in 1929. He first ran for political office in 1930 when he was elected county attorney, a post he held for eight years. He was elected governor of Minnesota on the Republican party ticket in 1938 and was inaugurated in Jan. 1939, one of the youngest governors in the U.S. He was re-elected governor for the 1941–43 term. Stassen was temporary chairman and keynoter of the Republican National convention in 1940 and was national chairman of the Governors' conference and of the Council of State governments,

1940–41. He resigned as governor in 1943 to join the U.S. navy. A commander and flag officer to Adm. Halsey, Stassen saw action in four battles. On Feb. 20, 1945, he accepted Pres. Roosevelt's appointment as delegate to the San Francisco conference of the United Nations. Stassen, who was promoted to the rank of captain in October, was released from the navy on Nov. 15, at which time he said that he intended to return to public life in an endeavour "to strengthen the liberal and progressive elements in the Republican party." In later 1945, he was frequently mentioned as one of the ranking G.O.P. candidates for the 1948 presidential nomination. However, the overwhelming victory of the "regular" Republican candidates in the November elections of 1946 were believed to have reduced considerably Stassen's chances for the nomination.

State, U.S. Department of: see GOVERNMENT DEPARTMENTS AND BUREAUS.

State Guard: see NATIONAL GUARD.

Steel: see IRON AND STEEL.

Steelman, John Roy (1900–), U.S. economist and government official, was born on June 23 in Thornton, Ark. He was graduated in 1922 with an A.B. degree from Henderson Brown college (Arkadelphia, Ark.), received his master's degree from Vanderbilt university in 1924, and took his Ph.D. degree from the University of North Carolina, 1928. He became an economics professor at Alabama State college in 1928, but left the academic world in 1934 to become a member of the U.S. conciliation service. He was special assistant to Mrs. Frances Perkins (then secretary of labour), 1936–37, and was appointed director of the conciliation service in 1937. He resigned in 1944 to set up an industrial relations bureau in New York city, but returned to government service the following year as special assistant to Secretary of Labour Lewis Schwellenbach.

Acting as Truman's aide, Steelman was a central figure in settlement of the railway strike, May 25, 1946, and on June 14 the president appointed him director of the Office of War Mobilization and Reconversion; Steelman also assumed temporary control of the Office of Economic Stabilization.

His initial report (Aug. 13, 1946) on the economic condition of the nation, stressed that "substantially full employment" and higher individual incomes marked the first postwar year. In his second quarterly report, Oct. 3, he warned that continuance of rising prices might result in an "early and severe crash." During the United Mine Workers' coal strike staged in Nov. 1946, it was reported that Pres. Truman rejected Steelman's advice on procedure; thereafter, Steelman was said to have lost favour with the president.

Stein, Gertrude (1874–1946), U.S. author, was born on Feb. 3 in Allegheny, Pa., and was educated at Radcliffe college, Cambridge, Mass., (1893–97), where she studied psychology under Prof. William James. She later attended Johns Hopkins university, Baltimore, Md., and specialized in anatomy, but declined to sit for a degree because "tests bored her." She then journeyed to London and for a year studied Elizabethan literature, moving to Paris in 1903 with her friend and secretary, Alice B. Toklas. There she became the associate and patron of such artists as Henri Matisse, Pablo Picasso, Georges Braque and Juan Gris, and subsequently laid claim to having introduced them to the French and U.S. publics. It was during this period that Miss Stein met Ernest Hemingway and Sherwood Anderson, then aspiring authors, whom she encouraged and influenced. Miss Stein was famed for her unorthodox literary style which emphasized the sound rather

than the meaning of words, as exemplified by one of her more famous phrases, "A rose is a rose is a rose." However, she could, and did, write with remarkable fluency and clarity when occasion demanded. Her first book, *Three Lives* (1909), was free from the type of phraseology that made her later writings unintelligible to all but devotees of her cult. Two other books, *The Autobiography of Alice B. Toklas* (1933) and *Everybody's Autobiography* (1937), were also written in lucid style. A successful lecturer, she generally limited her audiences to 500 persons, because, as she said, she "did not want to be stared at as a marvel." An unquestioned connoisseur of art, her collection of paintings was worth ten times the price she originally paid for it. Her publications include *Making of Americans* (1925), *How to Write* (1931), *Matisse, Picasso and Gertrude Stein* (1932), *Four Saints in Three Acts* and *Portraits and Prayers* (1934), *Wars I Have Seen* (1945) and *Brewsie and Willie* (1946). She died at Neuilly, France, on July 27.

Stellar System: see ASTRONOMY.

Sterner, Albert (1863-1946), U.S. artist, was born March 8 in London and educated at King Edward's school in Birmingham. In 1879, he journeyed to the United States, worked for a time for a lithographic firm and several years later started drawing for magazines. Shortly afterward, he went to Paris where he studied at Julian's academy and the Beaux Arts school. In 1891, he won honourable mention at his first exhibition in the Paris salon for his painting, "The Bachelor." Although he subsequently excelled in several art media, including etchings as exemplified by his work "Neuras-thenic," Sterner was best known as a portraitist. Opposed to many phases of modernistic art, he was himself called by many critics "a progressive conservative." Sterner wrote for several publications and was a successful teacher and lecturer. A National Academician, his works hang in the Carnegie institute, Pittsburgh; the Metropolitan museum, New York city; the Toronto (Ont.) Museum of Art and the South Kensington museum, London. His biography, *Albert Sterner, His Life and His Art*, was published by Ralph Flint in 1927. Sterner died in New York city on Dec. 16.

Stilwell, Joseph W. (1883-1946), U.S. army officer, was born on March 19 at Palatka, Fla. He was graduated from West Point, 1904, and served with the A.E.F. in World War I. After the Pearl Harbor disaster, he was promoted to lieutenant general (Feb. 1942) and served a month as chief of staff to Generalissimo Chiang Kai-shek. In March 1942, Chiang gave Stilwell command of the 5th and 6th Chinese armies in the Burma theatre. Beaten by the Japanese, Stilwell and his forces retreated toward India. After the fall of Burma in May 1942, he candidly confessed: "I claim we got a hell of a beating. We got run out of Burma and . . . I think we ought to find out what caused it, go back and retake it." During 1943, as U.S. commander in southeastern Asia under Lord Louis Mountbatten, he was busy preparing to do so.

Stilwell's efforts were abruptly interrupted Oct. 28, 1944, when he was relieved of his command of the C.B.I. (China-Burma-India) theatre and recalled to Washington. His removal was attributed to growing friction between himself and Chiang Kai-shek over disposition of Chinese troops as well as over strategic and political problems. Prior to his recall, Stilwell had been named (Aug. 1944) a full general. It was announced on Jan. 25, 1945, that Stilwell had been appointed commander of army ground forces in the U.S. On June 22, he was named commander of the U.S. 10th army in Okinawa. He took over command on June 28 and on Sept. 7 accepted the surrender of

some 105,000 Japanese troops scattered throughout the Ryukyus. He was named (Nov. 14, 1945) president of an army board studying postwar equipment for the ground forces and on Feb. 23, 1946, he was appointed commander of the reactivated 6th army on the Pacific coast. He died at Letterman General hospital in San Francisco on Oct. 12.

Stirbey, Barbu, PRINCE (1873-1946), Rumanian statesman, was educated in Paris. He appeared on the national political scene in the last years of the reign of King Ferdinand I. During that period the king had been in precarious health and his power was vested in a regency on which Prince Stirbey served for a time with Queen Marie and Ion Bratianu. Stirbey was appointed premier on June 5, 1927, replacing Gen. Alexandre Averescu, but he showed little independence; and real authority was retained by Bratianu, who was determined to continue the regency to prevent the return of Carol, Ferdinand's eldest son, to the throne. Stirbey's government lasted only 16 days and on June 21 Bratianu took over as premier. When Carol returned to the throne, Stirbey hastily left the country. His return to political prominence in Rumania came in 1944, when the country's leaders, realizing that Germany was losing the war, selected Stirbey as Rumania's chief emissary to negotiate peace with the Allies. In March 1945, King Michael asked Stirbey to become premier of the new government, but soviet objections to Stirbey led to Michael's selection of Petru Groza for that post. Prince Stirbey died in Bucharest on March 24.

Stock Exchanges: see STOCKS AND BONDS.

Stocks and Bonds. The 1946 U.S. market, during the first five or six months, saw but a slight improvement over the Dec. 1945 price level, and following May or June was a distinct bear market of drastic proportions.

The bull market of 1943-46 seemed to have reached its end by June 1946. Following that month, the price level began to waver. Each month saw a decline, and during the months of September and October the decline was so drastic as to raise the question everywhere of whether the stock market had not discounted a serious letup in business. Between June and October, railroad stocks, using Standard and Poor's index, declined by an average of 32.3%. Industrial stocks during the same period declined by 20.4%, public utility stocks by 21.3% and copper stocks by 23%. A combined average of 90 stocks, comprising 20 representative railroads, 50 industrials and 20 public utilities, experienced an average decline of nearly 22%.

The market psychology of the bull year of 1945 seemed to extend over into the first half of 1946. Although unfavourable market factors were plentiful, the speculative community stressed (1) favourable corporate earnings and increased dividend declarations, (2) the anticipated ending of government war controls and business regimentation, (3) the enormous pressure of idle funds seeking investment, with outright purchases the general rule and (4) the prospect of reduced corporate taxation. Moreover, there was a strong undercurrent of inflation thinking and a general belief in a postwar boom to meet the needs of foreign nations as well as a sadly depleted domestic backlog of goods, repairs and construction.

Toward the middle of 1946, however, bullish enthusiasm seemed to have spent its force, and bear considerations clearly gained the upper hand. Continual strikes throughout the country in nearly all leading industries made materialization of the anticipated postwar boom seem more and more unlikely. Reconversion of industry from war to peace was slowed up in all directions. Governmental decontrol efforts also seemed ineffective

and caused feelings of protest throughout the nation. Numerous wage increases won by labour were not accompanied by a compensating increase in prices for producers, thus causing a prospect of declining profits. Many of the leading industries relied upon to set the pace were failing sadly to get back to profitable production, because of strike waves and the numerous resulting shortages in steel, coal, freight cars and required finished parts. Moreover, much apprehension was caused by stymied foreign policy indications and the prospect of serious trouble with the U.S.S.R.

These conditions were probably the cause of the approximately 22% decline in the price level of stocks between June and Oct. 1946. By November, however, the market seemed to recover its composure and became comparatively dull, with the price level remaining fairly steady to the end of the year, despite the continuance of strikes on an appalling scale. Judging from press accounts, the apparent stop in price declines was attributed largely to the November election, with its landslide proportions. Election results seemed to be interpreted as a tidal rise to the right. Although many deadlocks seemed to be assumed, nevertheless, much hope was experienced for a greater conservatism of treatment of business, a substantial reduction in the tax burden and a considerable pruning of the government's emergency powers.

Using the Standard and Poor's barometric figures (average for each month based on daily closing prices), the average monthly price of 20 representative railroad stocks stood at 66.7 for Jan. 1946 as compared with 64.0 and 49.3 for Dec. and Jan. 1945, respectively. Thereafter, with only a minor recession in March, April and May, the

	Railroads 20 stocks	
	1946	1945

Dec.	145.3	166.7	79.5	83.2	123.8	126.3	120.2	137.6

year in January, the decline amounted to 32.3%.

In the field of industrial stocks, again using the Standard and Poor's averages for 50 leading issues, the average monthly price stood at 172.8 for Jan. 1946, as compared with 166.7 and 131.8 for Dec. and Jan. 1945, respectively. From Jan. to May 1946, this monthly average rose from 172.8 to 179.8. Following May a continuous and increasingly severe decline occurred to 177.8 for June, to 173.5 for July, to 170.5 for August, to 145.9 for September and to 142.9 for October. The extent of the severe decline from May to October (from 179.8 to 142.9) amounted to 20.4%.

Similar price movements by months occurred in the public utility group of stocks. For 20 public utility stocks, the Jan. 1946 average stood at 88.5, as compared with 83.2 and 57.7 for Dec. and Jan. 1945, respectively. Following Jan. 1946 the average monthly price increased from 88.5 to 94.5 for June, an increase of 6.7%. Thereafter the price level declined drastically to 90.2 for July, to 88.4 for August, to 75.5 for September and to 74.3 for October.

The extent of the decline from June to October (94.5-74.3) amounted to 21.3%.

The copper group's monthly average price stood at 132.2 for Jan. 1946 as compared with 126.3 and 91.2 for Dec. and Jan. 1945, respectively. By May 1946 the average had increased to 142.8. Thereafter a severe and continuous decline occurred from 142.8 for May to 109.7 for October, or 23%.

Combining the 90 stocks used by the Standard and Poor's index for railroads, industrials and public utilities, the Jan. 1946 average stood at 143.1, as compared with 137.6 and 107.1 for

"RETURN FROM A MOUNTAIN VACATION," by Daniel Bishop of the St. Louis Star-Times illustrates the sharp decline in U.S. stock market prices which occurred in late August and September of 1946

Dec. and Jan. 1945, respectively. The 1946 market showed an increase from 143.1 for January to 148.5 for May, or by about 3%. Subsequently the price level declined moderately month by month to 140.6 for August, and thereafter drastically to 117.2 for October. The decline from May to October was nearly 22%.

On Nov. 1, 1946, the market value of all listed shares on the New York Stock exchange stood at \$66,114,907,000, with an average market price per share of \$51.63. On Nov. 1, 1945, this market value stood at \$69,560,969,000, with an average price of \$58.71. A depreciation in value of approximately 12% was thus shown for the year.

Number, Volume and Amount of Stocks.—According to the New York Stock exchange's compilation, the total stocks listed on that exchange on Nov. 1, 1946, stood at 1,756,181,000 shares, with a total market value of \$66,114,907,000. This value compares with \$69,560,000,000 and \$53,087,000,000 on Nov. 1 of 1945 and 1944, respectively. Of the 1946 total (as of Nov. 1), United States stocks aggregated 1,705,252,000 shares, valued at \$64,970,929,999, and stocks of other countries 50,929,000 shares valued at \$1,143,977,000. The total of shares was distributed over 1,300 separate United States issues and 19 issues of other countries, representing a total of 955 issuing corporations.

Total shares traded on the New York Stock exchange during 1946 amounted to 363,709,312 shares, as compared with 377,563,575 shares during 1945, 263,074,018 shares during 1944, 278,741,765 during 1943, 125,677,963 during 1942, 170,534,363 during 1941 and 1,124,991,490 during 1929, the largest yearly total on record. The 1946 market, like that of 1945, was a fairly active one. It should be noted that 1945 showed an increase of nearly 44% more than the volume of transactions for 1944. January and September were the largest months for volume on the New York Stock exchange during 1946 with 51,510,000 and 43,450,000 shares, respectively, while July was the smallest with 20,595,000 shares. The New York curb market had sales during 1946 of 137,220,000 shares, as compared with 143,337,000 shares during 1945, 71,062,000 shares during 1944, 71,382,000 during 1943 and 22,328,000 during 1942.

Bonds.—Using the Standard and Poor's barometer figures for composite bonds (average for each month based on daily closing prices), the average high price stood at 120.2 for Jan. 1946. Thereafter, the monthly

SALES AND PRICES on the New York Stock Exchange, 1946

high average price remained at 120.2, 120.3 and 120.3 for the months of February, March and April. For May and June the figure stood at 119.8 and then declined gradually to 119.5, 119.3 and 119.1 for July, August and September. For the month of October a sharp decline occurred to 116.2. The bond market was thus remarkably stable during the year, at an exceedingly high price level, and showed a decline between January and October of only about 3%. Monthly fluctuations between high and low were also relatively small, the largest fluctuation occurring during September when the range between high and low, however, amounted to only 3.3 points.

Table III.—U.S. Bond Prices for 1946

Composite Bonds Dollars per \$100 (Standard Statistics Company)			
Month		High	Low
Jan.		120.2	119.1
Feb.		120.2	119.9
March		120.3	120.0
April		120.3	119.4
May		119.8	119.4
June		119.8	119.2
July		119.5	118.6
Aug.		119.3	118.6
Sept.		119.1	115.8
Oct.		116.2	114.8
Nov.		116.5	115.1
Dec.		116.5	115.4

According to the New York Stock exchange's record, bond and note flotations of United States corporations during the first 10 mo. of 1946 totalled \$3,331,202,000; but exclusive of refunding issues, investment trusts and holding companies, the total flotation amounted to only \$1,080,332,000. These figures compare with similar totals during the corresponding 10 mo. of 1945 of \$4,383,043,000 and \$936,510,000, respectively.

Number, Volume and Amount of Bonds.—According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the beginning of Nov. 1946 stood at \$136,879,706,000, with a market value of \$140,245,280,000. This par value compares with \$124,802,000,000 and \$128,741,000,000 for the corresponding date of 1945. The increase in the par value of bonds during 1945, as was the case for a number of previous years, is largely attributable to the issue of large amounts of United States government securities. Of the 1946 total, United States corporation bonds (at the beginning of November) amounted to \$14,175,050,000, with a market value of \$13,263,270,000; company bonds of other countries with a par value of \$602,457,000 and a market value of \$562,425,000; United States government bonds (inclusive of corporations and subdivisions) with a par value of \$120,469,130,000 and a market value of \$125,256,400,000 and other governments (inclusive of subdivisions) with a par value of \$1,633,070,000 and a market value of \$1,163,184,000. The total listed bonds of United States corporations were distributed over 614 issues with 333 issuers; of United States government bonds with 80 issues and 3 issuers and other governments with 200 issues and 48 issuers. Total bonds traded on the New York Stock exchange during 1946 amounted to \$1,364,177,150 as compared with \$2,261,985,000 during 1945, \$2,694,704,000 during 1944, \$3,254,717,000 during 1943, \$2,182,626,000 during 1942 and \$2,114,099,000 during 1941.

Stock Exchange Chronology.—As was the case in 1945, the 1946 chronology of the New York Stock exchange's alterations in its rules, practices and recommendations were confined to a comparatively small range of subjects. The following may be listed as the most important.

Practices with Respect to Contracts and Trading.—Under this heading three actions of importance should be referred to, namely:

(1) The decision of the board of governors on June 15 to re-establish "the daily clearance of contracts between members in listed securities through the Stock Clearing Corporation, and the addition of another 'skip day' between the date of trades and settlement dates." It should be noted that the daily clearance of contracts had been discontinued after Sept. 1, 1942. In view of the decision, the board of governors adopted amended rules, effective Aug. 29, re-establishing daily clearance of members' contracts and inauguration of third day delivery.

(2) Announcement, on April 30, of the abandonment of the informal agreement reported to have been in effect from 1943 between over-the-

counter dealers restricting daily fluctuations in United States government securities to one-fourth of a point. The New York exchange also announced that the volume in government bonds on that exchange, where trading had been free, was the heaviest from 1939.

(3) Announcement by the exchange that, effective Sept. 9, "ticker symbols for all securities of companies reported to the New York Stock exchange as being in receivership or bankruptcy proceedings would be preceded by the letter 'Q,' with a view to "keeping security holders and the investing public informed as to the status of listed companies."

On July 18, the New York exchange issued a statement concerning the volume of margin accounts held by member firms, which was most informative in view of the existing 100% margin requirement. As of June 30, 1946, 287 firms carried 74,265 open margin accounts for customers, compared with 282 firms which carried 137,752 such accounts on June 30, 1945, and 256,504 accounts carried by member firms on Nov. 30, 1938.

Margin Requirements.—Effective Jan. 21, the federal reserve board ruled that "registered securities shall have no loan value for the purpose of stock market transactions." In other words, the margin requirement on stock purchases was raised to 100% from the previous level of 75%. Apropos of this action, the president of the New York exchange, on Oct. 1, declared the "prohibition of the use of credit in the purchase of listed securities is unsound and discriminatory and has resulted in the diversion of investment funds into speculation in commodities, farm lands and real estate where the ability to borrow funds is virtually unrestricted and where credit is abundant" and recommended that "when the new Congress of the United States convenes in January it should undertake a study of the Securities Exchange act of 1934 and that more new blood must be infused into the Federal Reserve Board in order that its policies may become more flexible and elastic."

Listing Requirements.—Effective in July, the exchange's basic initial listing fee was reduced from a flat rate of $\frac{1}{2}$ of a cent per share to $\frac{1}{2}$ of a cent per share for the first 2,000,000 shares and $\frac{1}{4}$ of a cent per share in excess of 2,000,000. The optional payment of the listing fee in a lump sum, instead of on a continuing annual basis, was discontinued except for additional shares of already listed stocks. The extension of credits on current application from fees covering listings authorized in prior years was also discontinued. On Oct. 3 the board of governors also approved "liberalized requirements for the listing of foreign shares on the New York Stock Exchange."

Proposed Incorporation of Firms.—The account of 1945 referred to the undertaking by the New York exchange of a study "to consider the advisability of permitting member firms to do business in corporate form" and that the president of the exchange, on Nov. 15, transmitted to members "an outline of the restrictions and conditions which the Exchange would impose if member corporations were permitted." The importance of this subject is apparent when the past history of the exchange is considered. On April 12, 1946, the exchange transmitted to members a tentative draft of basic amendments to the constitution which would permit permissive incorporation of member firms and asked for the reaction and comments of members before June 1. On June 28 transcripts of arguments for and against permitting member firms to incorporate were presented to the membership by Chairman John A. Coleman, of the exchange, preliminary to a determination by the board of governors whether or not to submit enabling amendments to the membership of the exchange for balloting.

General Stock Exchange Actions.—Three such actions were:

(1) A letter sent to all presidents of listed companies enclosing an up-to-date copy of the exchange's listing agreements and a guide for the officials charged with day-to-day relations with stockholders and the New York Stock exchange. Particular attention was called to the requirement for the prompt publication by corporations of any action with respect to dividends, the allotment of rights to subscribe or other rights or benefits pertaining to the ownership of listed securities.

(2) Another letter to all presidents of listed corporations, redefining the exchange's policy in respect to split-ups.

(3) A request to all member firms to report the nature and purpose of their interest in foreign business enterprises, to facilitate the exchange's study of the development of securities, commodities and financial business in countries outside the United States. (See also BUSINESS REVIEW.)

Great Britain.—The bull market in stocks and bonds which had been in existence on the London stock exchange from June 1940 continued, with secondary reactions, in 1946. A new all-time record was established for industrial ordinary shares as measured by the (London) *Financial Times* index. The market for British funds continued to rise, and the government was able to borrow at record low rates. Three factors stimulated the upward movement: the treasury's policy of "cheap money"; better knowledge of the scope of the government's nationalization program and higher distributions by public companies. The movement did not develop strength until April, with the announcement in the national budget of abolition of excess profits tax at the end of 1946.

The government's borrowing and conversion program included: repayment of £493,000,000 of 2½% national war bonds, 1946-48; creation of £748,000,000 of 2½% savings bonds, 1964-67; notice of repayment (on Jan. 5, 1947) of £429,000,000, 3% local loans and issue "on tap" of a new 2½% treasury stock, redeemable 1975 or after, at par. Municipalities were enabled to convert higher interest-bearing stocks into 2½% issues at 99%, maturing 1966-71. The uncertain redemption date of the 2½% treasury stock proved an unpopular feature and led to considerable selling of local loans and reinvestment in redeemable government securities and, for the sake of the higher yields, in good class debentures and preference and ordinary shares of industrial companies. Search for yield was a keynote of 1946. The nationalization program, although affecting different market sections in different ways, intensified this search. The market received favourably the award by an arbitration tribunal of £164,660,000 as compensation for the nationalization of the coal-mining industry, and higher colliery share prices followed. Conversely, the proposed nationalization of rail-road-water transport for £1,065,000,000 in British transport stock, based on stock exchange quotations at certain dates, came as a shock, led to selling of railway shares

and added to reinvestment demand. Although the supply of stock was increased by many successful new issues, these were insufficient to meet the varied demand, and higher prices were a natural sequel.

Not for many years had such a marked revival in the Argentine railway market been seen; this followed the Anglo-Argentine agreement, which included proposals for the formation of a company to take over the assets of the British-owned lines on terms providing a guaranteed income. Speculative sections were enlivened by a boom and slump in Orange Free State gold shares, and advances in base metals shares in sympathy with the higher world prices for metals. Foreign bonds were a rising market, with main interest in Japanese and Brazilian issues, but European rather neglected.

With the revaluation of the Canadian dollar from \$4.44 to \$4.03 to the pound in July, Canadian dollar stocks were adjusted upwards. Ratification by the U.S. congress of the \$4,400,000,000 loan to Britain and the gradual recovery in British exports also made for firm markets. Probably the two most depressing influences of 1946 were the late summer break in Wall street, and fear of a coal shortage and its repercussions on British industry. The reversion of the London stock exchange to fortnightly accounts dealings (for cash) came too late in the year much to affect markets.

Table V.—Financial Times Indexes, Great Britain*

1946	Government Securities	Home Rails	Ordinary Shares	Gold Mines	Recorded Stock Exchange Bargains (numbers)
Jan. 2	115.32	63.84	114.0	173.90	10,021

*Bases (100): Government securities, home rails and gold mines Oct. 15, 1926; ordinary shares July 1, 1935.

Europe.—Following the sharp and sustained rise in stock market prices during the war years, largely as a result of inflationary conditions and, as in Great Britain, lack of alternative avenues of investment, uncertainty developed on continental bourses during 1946. On balance, prices slightly exceeded the end of 1945 levels. Political and economic problems held back markets in Sweden, Belgium, France and Italy. In Switzerland, highest levels from prewar days were reached in August, but the Wall street slump checked the rise. Amsterdam bourse reopened in May, but prices fell well below the 1943-44 high points. (H. FN.)

Stomach Disorders: see ALIMENTARY SYSTEM, DISORDERS OF.

Stone, Harlan Fiske (1872-1946), U.S. jurist, was born on Oct. 11 in Chesterfield, N.H. He received a B.S. degree from Amherst college, Amherst, Mass., and an LL.B. degree from Columbia university school of law in 1898. He entered private practice in New York but later returned to Columbia where he was named professor of law in 1902. In 1910 he was made dean of the law school but resigned in 1923 to return to private practice. The next year, President Calvin Coolidge appointed him attorney general of the United States (April 7, 1924). Then on Mar. 2, 1925, President Coolidge named him associate justice of the U.S. supreme court. The appointment was criticized because Justice Stone had been a law partner of a man closely associated with the financier J. P. Morgan. Justice Stone frequently concurred with the minority reports of Oliver Wendell Holmes, Louis D. Brandeis and Benjamin Cardozo and was known with these other eminent jurists as one of the "great dissenters." He was one of the most outspoken members of the liberal wing of the bench that upheld many of the decisions on the constitutionality of the various New Deal measures promulgated by the Roosevelt administration. In March 1937 Justice Stone wrote the decision upholding the Railway Labor act and he was with the majority in the three historic opinions of May 1937 which affirmed the Social Security act. Upon the retirement of Charles Evans Hughes, as chief justice, Justice Stone was appointed in June 1941 to that post. He was taken ill while sitting in court in Washington, D.C., on April 22 and died shortly afterward.

Stone. The table lists the production of the various types of stone in the United States in 1943 and 1944.

Production of Stone in the United States
(In thousands of short tons or thousands of dollars)

Name of Stone	1944			1945		
	Dimension	Crushed	Total	Dimension	Crushed	Total
Basalt	18	14,025	14,043	204	14,707	14,911
Granite	284	7,112	7,395	362	7,378	7,740
Limestone	162	115,344	115,506	334	112,240	112,574
Marble	52	101	153	60	112	172
Sandstone	74	6,352	6,427	64	4,323	4,387
Others	29	12,027	12,055	35	13,587	13,622
Total	619	154,961	155,580	1,059	152,347	153,406
Value	\$14,855	\$160,787	\$175,642	\$17,849	\$161,459	\$179,308

Dimension Stone.—Sales of dimension stone in 1945 improved 71% in quantity but only 20% in value. Although materially improved by the beginning of the postwar construction program, the tonnage remained less than that of 1939. In addition to the items shown in the table, 69,660 tons of slate were sold as dimension stone in 1945, against 60,950 tons in 1944.

Crushed Stone.—Sales of crushed stone in 1945 declined 2% in quantity but increased 2% in average value per ton. The 1945 tonnage reported above does not include: 27,332,000 tons of limestone used in making cement and 11,841,000 tons used in making lime; 482,230 tons of slate granules and flour; 642,600 tons of asphaltic stone. Including these additional items and dimension stone, the total stone output was 193,773,000 tons in 1945, against 193,893,000 tons in 1944.

Canada.—Stone production in Canada was 5,884,718 tons in 1945, against 5,994,992 tons in 1944. (G. A. Ro.)

Straits Settlements: see MALAYAN UNION AND SINGAPORE.

Strategic Mineral Supplies. Following the demonstration of the war years that the inadequacy of the United States supply of mineral commodities was not confined to the handful that had previously been classed as "strategic," interest centred in 1946 in the problem of stockpiling all commodities that developed shortage of supply in sufficient amounts to cover the shortages that might be expected to accompany any future emergency. To this end, steps were taken in two directions. First, temporary provision was made that all war surplus that fell within the specifications set up by the Army and Navy Munitions board for stockpiled materials should be added to the stockpiles created under the Strategic Materials act of 1939, unless they were required by industry for current use. Considerable surplus material had already been added to the stockpiles under this provision, and more was being taken over as fast as it was declared surplus, and provision could be made to handle it. Second, the act of 1939 was amended, increasing its scope to cover current needs more adequately. The new legislation, known as the Strategic and Critical Materials Stock Piling act (public law 520-79th congress) was approved July 23, 1946.

The new legislation provided that "the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, acting jointly through the agency of the Army and Navy Munitions Board, are hereby authorized and directed to determine, from time to time, which materials are strategic and critical under the provisions of this Act and to determine, from time to time, the quality and quantities of such materials which shall be stock piled under the provisions of this Act." The procurement division of the treasury department was designated as the agency to make the purchases, provide for storage on approved military and naval reservations, provide for any needed refining or processing to put materials in the best form for stockpiling, provide for rotation of the stocks if necessary to prevent deterioration and dispose of stocks as required by rotation, obsolescence or by a revised determination of requirements. The act also made permanent the temporary pro-

vision for transferring surplus war material to the stockpile, and the procurement division handled the materials received by transfer in much the same manner as new purchases. Later, \$100,000,000 was appropriated by congress for current purchases.

The chief objection to the act is that under pressure from industry the "Buy American" clause was included, giving the output of domestic producers certain priorities over imported materials. This inclusion definitely weakens the protective features of the legislation. The stockpiling of domestic output depletes the already weakened domestic reserves, and contributes nothing to future security except immediate accessibility; hence it should be used only to the extent necessary to keep a marginal industry on a going basis. It is only through the stockpiling of imported materials that the available supply is increased. (G. A. Ro.)

Strauss, Lewis Lichtenstein (1896-), U.S. banker, was born on

Jan. 31 in Charleston, W. Va. A secretary to Herbert Hoover during World War I (1917-19), he attended the Paris peace conference, and later served with U.S. food and relief organizations in Europe. Upon his return he entered the legal firm of Kuhn, Loeb and company in New York, becoming a partner in 1929. He was called to military duty in 1941 as staff assistant to the chief of the bureau of ordnance, later becoming special assistant to the secretary of the navy. He served as member of the army-navy munitions board, and of the interdepartmental committee on atomic energy. Rising to the rank of rear admiral in Oct. 1945, Strauss was awarded the Legion of Merit by both the army and navy. He was credited with discovery of many of the navy's secret weapons. On Oct. 28, 1946, Pres. Truman named Strauss a member of the U.S. Atomic Energy commission—a five-man board—to help direct and control the development of atomic energy in the U.S. He spent many years in private study on nuclear physics and, before the atomic bomb, was interested in the use of atomic energy in cancer therapy.

Strawberries: see FRUIT.

Streicher, Julius (1885-1946), German demagogue and politician, was born Feb. 22 at Fleinshausen. He served in the army during World War I, and after the war, he taught school in Nuernberg. In the early 1920s, he joined the nazi party and participated with Hitler in the Munich putsch, Nov. 1923. Encouraged by Hitler, Streicher became the most extreme anti-Semite in the reich and after the nazis gained power in 1933, he was made gauleiter for Franconia. In Nuernberg, his chief bailiwick, he forbade Jews to eat in public cafés and restaurants and he induced town councils throughout Franconia to re-establish ghettos. Streicher disappeared with dramatic suddenness from the nazi stage in 1940. It was later revealed that he had been arrested for his "real estate operations" and that he was tried before the supreme party court in Munich. The case was hushed and the verdict was never revealed. Streicher then retired to his farm.

After the collapse of Germany, Streicher, disguised as a painter, was captured May 23, 1945, by U.S. troops near Waldring, Bavaria. Indicted along with a score of other top nazi leaders to stand trial on charges of war crimes before the International Military Tribunal at Nuernberg, Streicher was found guilty of crimes against humanity, Oct. 1, 1946, and sentenced to death. He was hanged on Oct. 16 in Nuernberg, where he once ruled with absolute power.

Strikes and Lock-outs.

The United States, Canada and Great Britain published, for many years, current statistics of strikes and lock-outs, their causes and results, together with detailed reports on the more important strikes of each year. After 1942 the statistics on strikes gathered by these countries were less complete because of the wartime conditions.

During the first 11 months of 1946 (Table I) there were but 281 fewer strikes in the United States than there were in the entire 12 months of 1945. More workers were on strike during 1946 than in any other year in U.S. history. Man-days idle were four times as many as in the previous peak year, 1937, and four and a half times as many as in 1945.

Table I.—United States: Number of Strikes, Workers Involved and Man-days Lost: 1941–1946 (11 months)*

Year	Number of strikes	Number workers involved	Man-days idle during year
1941	4,288	2,362,620	23,047,556
1942	2,968	839,961	4,182,557
1943	3,752	1,981,279	13,500,529
1944	4,956	2,115,637	8,721,079
1945	4,616	3,425,000	24,360,000
1946 (11 mo.)	4,335	4,545,000	107,475,000

*Compiled from Monthly Labor Review, United States Bureau of Labour Statistics.

An outstanding characteristic of 1946 was the stubbornness with which both management and labour fought out strikes in many industries. The General Motors strike, which started in Nov. 1945, was not settled until 1946. The Allis-Chalmers strike, which began on April 28, 1946, continued into 1947. The J. I. Case strike had continued for more than a year when this article was being written. Coal, the maritime industries and others experienced unusually bad strikes. Even the railroad brotherhoods, who had not struck since 1888, went out in May and terminated their strike only under severe government pressure. The government took a more active part in settling strikes than in prewar, peacetime years but found itself unable to terminate some of the strikes. In the case of coal and the railroads, government intervention ended the strikes but not the disputes.

Table II compares the number and severity of work stoppages in Great Britain during the first ten months of 1946 and 1945. Strike idleness in 1946 through October was not quite as bad as

it was during the corresponding months of 1945; the principal difference being in the lesser strike idleness in coal mining and transport industries in 1946. Engineering, shipbuilding, and iron and steel were more seriously affected in 1946 than in 1945.

Table II.—Analysis by Industries of Work Stoppages Arising from Industrial Disputes in Great Britain: First Ten Months of 1946 and Corresponding Months in 1945

Industry	January-October 1946			January-October 1945		
	Number stoppages beginning in period	Number working people involved	Aggregate number working days lost	Number stoppages beginning in period	Number working people involved	Aggregate number working days lost
Fishing and agriculture	3	8,800	69,000	3	2,100	10,000
Coal mining	1,143	195,500*	387,000	1,050	205,000*	573,000
Other mining and quarrying	8	600	1,000	10	700	1,000
Brick, pottery, glass, chemical, etc. . . .	28	2,200	18,000	20	2,500	17,000
Engineering	158	98,600	533,000	209	69,600	297,000
Shipbuilding	93	16,100	185,000	167	26,100	132,000
Iron, steel and other metal	156	37,000	300,000	145	18,100	64,000
Textile	32	6,500	42,000	35	3,600	9,000
Clothing	32	14,500	102,000	25	6,500	12,000
Food, drink, tobacco .	17	8,000	52,000	8	1,600	5,000
Woodworking, furniture	15	900	6,000	15	1,500	3,000
Paper, printing, etc. .	7	3,400	4,000	7	500	1,000
Building, etc. . . .	60	5,800	15,000	33	3,200	5,000
Gas, water and electricity supply .	10	4,800	18,000	3	200	1,000
Transport	91	50,700	135,000	140	125,300	1,347,000
Public administration services	6	1,300	8,000	6	1,400	5,000
Distribution, commerce, etc.	18	10,300	67,000	7	400	1,000
All other industries . .	29	6,400	26,000	32	3,700	20,000
Total	1,906	471,400*	1,968,000	1,915	472,000*	2,503,000

*Some workers, chiefly in coal mining industry, were involved in more than one stoppage and are counted more than once in totals. The net number of individuals involved in coal mining stoppages in the period under review in 1946 was approximately 120,000 and in the corresponding period in 1945, was approximately 105,000. For all industries combined, the corresponding net totals were approximately 360,000 and 330,000, respectively.

During the first ten months of 1946 there were 1,906 strikes in Great Britain, which compared with 1,915 in the corresponding months of 1945. There were 471,000 workers idle in the strikes of 1946, compared with 472,000 in the ten-month period of 1945, and 758,000 in the same months in 1944. In man-days lost the 1946 strikes were likewise less serious: 1,968,000 compared with 2,503,000 in 1945 and 3,525,000 in 1944.

PICKET trying to stop an automobile at the gate of Metro-Goldwyn-Mayer studio in Hollywood, Calif., on Sept. 27, 1946, was knocked over by the impact. The strike resulted from a jurisdictional dispute between two A.F. of L. unions

Table III.—Relative Frequency and Size of Labour Disputes in Great Britain in 1946 and 1945

Month	Strikes in progress		Number of work people involved		Number of working days lost

Compiled from *The Ministry of Labour Gazette* (London).

*Figures for Oct. 1946 are provisional and subject to revision; those for earlier months have been revised where necessary in accordance with latest information.

In Great Britain wage questions accounted for nearly one-half both of the total number of stoppages in 1945 and of the total number of workpeople directly involved.

The few disputes which arose on questions of hours of labour accounted for only 3.9% of the total number of workpeople directly involved. Disputes in connection with the employment of particular classes of persons, working rules and disci-

Table IV.—Analysis of Principal Causes of Industrial Disputes in Great Britain in 1945

Principal causes	Number begun during 1945		People directly involved	
	Number	Per cent	Number	Per cent
Wage increase	291	12.7	101,000	22.6
Other wage disputes	699	30.5	118,000	26.4
All wage disputes	990	43.2	219,000	49.0
Hours of labour	89	3.9	34,000	7.6

*These figures relate only to the actual number of strikes and lock-outs in which the workers involved during the year, not being a summation in each case of the monthly figures.

pline made up nearly half of the total number of stoppages. (Table IV.)

The sharp increase in number of strikes in Canada, and particularly in the numbers of workpeople involved and man-days lost (Table V) resulted from the strikes in the automobile and other mass-production manufacturing industries. Most of these

Table VI.—Trend of Labour Disputes in Canada, 1941-46

Year	Number of disputes	Number of workers involved	Time loss in man-working days

large strikes were closely tied in with the situation in the United States.

(See also LABOUR UNIONS; NATIONAL LABOR RELATIONS BOARD; UNITED STATES.) (D. D. L.)

Strong, George Veazey (1880-1946), U.S. army officer, was born on March 4 in Chicago. He was graduated from the United States Military Academy at West Point, N.Y., in 1904, the Army War college in 1924 and the Command and General Staff school in 1931. He was assigned to Fort Meade, S.D., after leaving West Point and later saw service in the Philippines. He was military attaché at the U.S. embassy in Tokyo, 1908-11, and during World War I he received the D.S.M. for his skilful handling of troop movements preceding the attack on St. Mihiel and the Argonne front. After his return to the U.S., he became professor of law at West Point, holding that position until 1923, when he was made chief of the military affairs section of the judge advocate general's office in Washington. He testified in the court-martial of Brig. Gen. William (Billy) Mitchell, supporting the defendant and warning that hostile air bases within easy flying range of the Panama canal might result from concessions made by Latin-American governments to German capitalists. He became assistant chief of staff in 1938, was given command of the 7th corps area at Omaha, Neb., in 1940 and was transferred to the 8th army corps at Brownwood, Tex., in 1941. Promoted to a major general in April 1941, he was named head of the army's military intelligence division the following year. Maj. Gen. Strong retired early in 1944 but was later recalled to serve with the joint chiefs of staff, retiring for a second time in June 1945. He died in Washington, D.C., on Jan. 10.

Strontium Minerals. War demand for strontium passed its peak in 1943, and the United States output of celestite decreased from 7,566 short tons in 1943 to 3,005 tons in 1944 and 2,784 tons in 1945. Imports dropped from 16,881 tons in 1943 to 5,793 tons in 1944, and 3,691 tons in 1945. (G. A. Ro.)

Stuart, John Leighton (1876-), U.S. missionary, educator and diplomatist, was born June 24 in Hangchow, China, the son of U.S. missionaries. He spent much of his childhood in China, but was sent for his higher education to Hampden-Sydney college in Virginia, from which he was graduated in 1896. After further studies in the Union Theological seminary in Virginia, he was ordained as a Presbyterian minister and returned to China as a missionary in 1905. He became president of Yenching university in Peking in 1919 and in the stormy years of internal political strife in China, he succeeded in steering a safe middle course without incurring the hostility of either Kuomintang or Communist elements. He did, however, incur the enmity of the Japanese in 1938 for his refusal to obey their local dictates and on Dec. 8, 1941, Dr. Stuart and other members of Yenching's faculty were interned in a private house in Peking. He was released after the end of World War II and reopened Yenching university in Oct. 1945. After returning to the United States for a brief visit he went back to China as unofficial advisor to Gen. George C. Marshall in April 1946; the following July, President Truman named him U.S. ambassador to China. Negotiations conducted by Marshall and Stuart to end the Nationalist-Communist struggle were not successful and on Aug. 9, they issued a joint statement declaring that settlement of the dispute "appears impossible." Dr. Stuart signed in Nanking for the U.S. (Nov. 4) the five-year U.S.-China treaty of friendship, commerce and navigation.

Sugar. Total United States sugar production in 1946, beet and cane, was estimated at 1,950,000 tons in 1946 compared with 1,667,000 tons in 1945 and an average of 1,948,000, 1935-39. The increase in 1946 over 1945 was caused by a larger beet crop since the cane crop of Louisiana was reduced by bad weather.

The sugar beet crop in 1946 was 10,666,000 tons, compared with 8,626,000 tons in 1945 and a five-year average of 9,568,000 tons, 1935-44. The area was 821,000 ac. compared with 713,000 ac. grown in 1945 and an average of 787,000 ac. 1935-44. This was not a near-record acreage since more than 900,000 ac. had been harvested in several previous years, the latest being in 1942 when 954,000 ac. were harvested. The record was made in 1933 at 983,000 ac. The yield in 1946 was 13 tons per ac., which was near the record of 13.7 tons in 1941 and above the average of 12.1 tons 1935-44. The season was generally favourable in the Great Lakes states and the crop made good gains over 1945. Record yields of 17 tons per ac. were reported for California. The acreage in the irrigated Imperial valley was increased. The quality of the 1946 beet crop was below average but preliminary reports indicated a production of 1,440,000 tons of refined sugar which compares with 1,194,000 tons in 1945.

Cane sugar production in 1946 was estimated at 461,000 tons of 96 degree raw sugar, compared with 475,000 tons in 1945 and an average of 451,500 tons. The tonnage of cane was estimated at 5,925,000 tons in 1946, 6,276,000 tons in 1945 and 5,426,200 tons for the average 1934-44. The acreage was increased in both Louisiana and Florida over 1945 but the yield in Louisiana was reduced by bad weather in the growing season and the yield was only 19 tons per ac. compared with 21.9 tons in 1945. Yields in Florida were 34 tons which was above 1945 and the average. The total Louisiana crop was 4,769,000 tons

compared with 5,234,000 tons in 1945 and an average of 4,698,000 tons 1935-44. The Florida crop was 1,156,000 tons in 1946; 1,042,000 tons in 1945 and 728,000 tons average.

The total acreage of sugar cane for sugar was 285,000 ac. which was above the average of 267,600 ac., 1935-44 but below the record of 1942 at 316,900 ac. which had not been equalled since 1911. The capacity of Louisiana to grow cane for sugar appeared to be somewhere about 250,000 ac.

The sugar output of the maple industry was again low in 1946 following the disastrous season of 1945. The production of maple sugar was estimated at 372,000 lb. which was 57% above the 237,000 lb. of 1945 but 60% of the 1935-44 average of 643,000 lb. Unseasonably warm weather in early spring started the sap and then again turned cold and spoiled the season. Honey production was down 10% in 1946 due to lower yield per colony of bees which increased about 6% over 1945. Production of syrups from sugar cane was reduced and sorgho syrup production was smaller due to reduced acreage.

The United States sugar supply was estimated in Aug. 1946 to be about 5% below 1945 and rationing was expected to be continued through another year. The total supply was short due to the loss of the Philippine crop and the reduced Cuban production, balanced with the strong demand. The stocks of sugar on Jan. 1, 1946, were 1,400,000 tons, slightly above a year earlier but 1,000,000 tons less than in 1941. The distribution of the stocks was uneven and many communities had local shortages that prevented consumers receiving their rations. The Cuban and Puerto Rican sugar crops for 1946 and 1947 were purchased by the government under the Sugar agreement. The total Cuban crop was estimated at 4,476,000 tons in 1945 compared with 3,923,000 tons in 1944. Puerto Rico produced 909,000 tons in 1945, 964,000 tons in 1944 and about 910,000 tons in 1946. Hawaii produced 857,000 tons in 1945 and a little more in 1946 which was about the average crop for that island.

World sugar production was put at 30,000,000 tons for the 1946-47 season which was about 12% more than the 26,700,000 tons of 1945-46, compared with an average of 34,544,000 tons 1935-39. All areas in the world, except Central America, the West Indies and South America produced less sugar during the war years. European sugar production was reduced about 50%. The Philippines, Java, Formosa and other areas were unable to contribute to the world's supply. World production of beet sugar declined 50% from 1940 to 1945. Prospects for 1946-47 indicated an increase in Europe, a 12% larger Cuban crop and perhaps some from Java and Formosa together with a larger sugar beet crop in Europe.

The secretary of agriculture announced a sugar allotment for the first quarter of 1947 slightly larger than that of the previous year but also stated it as unlikely that rations would be increased to consumers before April 1, 1947. Sugar rationing was continued through 1946 at 5 lb. per capita for each four months to household consumers plus 10 lb. for home canning. Industrial users were given 50% of their base usage in the first quarter and 60% in the last three quarters of the year. Total per capita consumption was about 73 lb., the same as in 1945, compared to 96.5 lb. in 1935-39. The price of sugar while under control rose from an average of 6.6 cents per pound in Oct. 1945 to 9 cents in Oct. 1946. The ceiling price on raw sugar was raised from 4.2 cents per pound to 5.5 cents in Sept. 1946.

The Sugar act of 1937 was extended by congress to Dec. 31, 1947. It provides for quotas of production to the United States supply. The Philippines, Florida, Cuba all want a part of the U.S. market and while quotas were suspended after 1942 the problem was expected to arise again. The government's subsidy

FIRST SHIPMENT of sugar from Cuba to arrive in Miami, Fla., after the end of the war being unloaded early in 1946; the cargo totalled about 2,409,000 lb.

program to increase United States sugar production was continued through 1946 and about \$85,000,000 was paid to growers of beets and cane. This was estimated to average \$13.50 per

Table I.—U.S. Sugar Beet Production by States, 1946 and 1945

		(In short tons)			
State	1946	1945	State	1946	1945
California	2,087,000	1,568,000	Nebraska	800,000	635,000
Colorado	1,962,000	1,835,000	Utah	588,000	437,000

Michigan	808,000	627,000	Other states	1,547,000	1,296,000

Table II.—U.S. Sugar Cane Production, 1946 and 1945

		(In short tons)	
State	1946	1945	
Louisiana	4,769,000	5,234,000	
Florida	1,156,000	1,042,000	

ton for beets and \$7.60 per ton for cane. Processors of sugar were also paid to avoid increasing prices to consumers. (See also BEEKEEPING; MAPLE PRODUCTS; PRICE ADMINISTRATION, OFFICE OF; SYRUP, SORGO AND CANE.) (J. C. Ms.)

Suicide Statistics. There was a steady rise in suicides in the United States after the close of World War II, according to the experience of the large body of industrial policyholders of the Metropolitan Life Insurance company. The death rate from suicide in this experience for each of the first eleven months of 1946 was well above the corresponding rate for 1945; for the year as a whole, the increase amounted to 14%. For the first quarter of 1946 alone, the death rate from suicide was more than one-third above that for the like period of 1945, when the country was still at war; among white males the increase was more than 50%, while among white females it was only 10%.

During 1945, there were 759 deaths from suicide in Canada and the death rate was 6.3 per 100,000 total population; the comparable rate for 1944 was 6.1 per 100,000. England and Wales reported 3,934 deaths from suicide for 1945 and a death rate of 9.2 per 100,000, the corresponding rate for 1944 being 8.9. For the United States in 1945, there were 14,782 deaths from suicide, the rate being 11.2 per 100,000; this marks a rise from 1944, when there were 13,231 deaths from suicide, the rate being 10.0, the lowest on record after 1900, when reporting was begun. Only a few other countries had death rates from suicide available for 1944, namely, Belgium 12.3, Denmark 22.2 and Switzerland 25.6.

Of the deaths from suicide within the United States during 1944, the latest year of complete official record, 36.3% were by means of firearms or explosives, 23.1% by hanging or strangulation, 11.1% by taking solid or liquid poisons, 9.4% by inhaling illuminating gas and the rest by other means. There were 46 suicides at ages 10 to 14 years, of whom 34 were white males and 9 white females. For this age group, the death rate was only 0.4 per 100,000. The rate increased steadily with advance in age; for example, at ages 20 to 24, the death rate from suicide was 6.1 per 100,000 rising to 12.5 at ages 35 to 39 and to 30.3 at ages 75 and over. The rates according to sex and race in 1944

Death Rates per 100,000 from Suicide, According to Age, Race and Sex; United States, 1944

Age	Total Persons	White Males	White Females	Negro Males	Negro Females
All ages	10.0	16.1	5.9	4.9	1.4
10-14	.4	.7	.2	.3	.1
15-19	2.8	3.5	2.4	1.7	1.3
20-24	6.1	9.9	4.1	6.7	2.6
25-29	8.6	15.0	5.2	8.8	1.4
30-34	9.8	14.3	7.1	7.1	2.8
35-39	12.5	18.5	8.7	7.8	1.6
40-44	14.5	21.9	9.5	7.3	2.6
45-49	16.1	24.3	10.2	8.4	1.8
50-54	18.5	28.2	11.0	8.1	1.9
55-59	20.7	31.8	11.3	11.8	1.3
60-64	22.4	35.3	11.7	11.4	1.2
65-69	23.6	40.1	10.3	6.5	3.1
70-74	24.4	43.4	9.2	8.6	2.3
75 & over	30.3	58.0	9.9	7.3	2.7

were as follows: white males 16.1; white females 5.9; Negro males 4.9; and Negro females 1.4. Further details regarding suicide death rates according to age, race and sex are shown in the accompanying table.

There are wide geographic variations in the mortality from suicide within the United States. Thus, in 1944, the Pacific states, as a group, led with a high rate of 14.0 per 100,000; on the other hand, the south central states, as a group, were lowest with an average rate of 6.6 per 100,000. The rates for the other geographic regions were: south Atlantic 7.5; mountain 9.1; north central 10.9; middle Atlantic 11.3 and New England 11.5.

Sulphur. Mine production of crude sulphur in the United States increased from 3,604,337 short tons in 1944 to 4,203,571 tons in 1945, and a new record high, 8% above the peak of 1942. Shipments were 3,941,373 tons in 1944 and 4,293,289 tons in 1945. Production sagged during the last quarter of 1945 and the first half of 1946, but the total for the first eight months of 1946 was 2,783,305 tons and shipments were 2,938,309 tons, a 10% decrease in the production rate as compared with 1945, but an increase of 3% in the shipment rate. At this time stocks had increased to 5,277,580 tons. (G. A. Ro.)

Sumatra: see NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES.

Summerville, George J. ("SLIM") (1895?-1946), U.S. motion picture actor, was born in Albuquerque, N.M. As a youngster he roamed the west and Mexico, picking up odd jobs. In 1913 he accidentally wandered into the Mack Sennett studio in California, where he got his start as an extra in comedies and feature pictures. He was one of the original "Keystone Cops" of the early Mack Sennett comedies. It was not until 1930, however, that he achieved a measure of fame in the role of Tjaden in *All Quiet on the Western Front*. Thereafter, the gangling, dour-faced comedian was frequently typed as a rustic bumbler or a blundering buck private hero. He appeared in *The Spoilers*, *The Road Back*, *Tobacco Road*, *Western Union*, *Jesse James*, *The Country Doctor*, *Way Down East*, *The Farmer Takes a Wife* and *Rebecca of Sunnybrook Farm*. He died at Laguna Beach, Calif., on Jan. 5.

Sumner, James Batcheller (1887-), U.S. biochemist, was born Nov. 19 in Canton, Mass. After receiving his Ph.D. from Harvard university in 1914, he took graduate work at the University of Brussels. He joined the faculty of Cornell university medical college in 1914 as assistant professor of biochemistry, becoming full professor in 1929. He was the first to isolate an enzyme, in 1926. According to Prof. Sumner "living cells contain hundreds if not thousands of enzymes and one definition of life is action by those enzymes wherein such phenomena occur as growth, reproduction and other biological changes." Discouraged at first by his teachers from becoming a chemist because he had only one arm, Prof. Sumner won a personal triumph when he was awarded one-half of the Nobel chemistry award on Nov. 14, 1946; the remaining half was divided between Professors Wendell M. Stanley and John H. Northrop, both biochemists.

Sunday Schools. The board of managers of the World's Sunday School association held its first postwar meeting in London on July 1-3, 1946. Among its actions were the following: (1) To set 1950 as the year for the

U.S. SUPREME COURT members making their annual call upon the president in the fall of 1946. Left to right: Associate Justices Wiley Rutledge, Frank Murphy, Felix Frankfurter, Hugo Black; President Harry S. Truman; Chief Justice Frederick M. Vinson; Associate Justices Stanley F. Reed, William O. Douglas, Robert H. Jackson, Harold H. Burton

next World's Sunday School convention, and (2) to appoint a committee on religious films and other visual aids, with J. Arthur Rank, British film producer, as chairman.

Postwar restoration of interdenominational service to Sunday schools and other agencies of Christian education went forward in Europe and Asia as rapidly as conditions would permit. Korea was provided by the World's Sunday School association and mission boards with an emergency printing of Sunday-school lessons. Dr. Chester S. Miao, executive secretary of the National Committee for Christian Religious Education in China, was given a period of rest after harrowing war years in Shanghai and sent back to China with plans for a greatly enlarged program. The work of the Committee on Christian Education in the Republic of the Philippines, in preparing lesson materials and in other services, was reinstated, and then the executive secretary, Rev. Samuel G. Catli, and Mrs. Catli were sent to the United States for a year of rest and study. Principal leaders of national, interdenominational bodies in Europe were given financial aid to enable them to re-establish their work.

The Sunday School associations of the Union of South Africa and of Southern Rhodesia each sponsored a series of meetings in major cities on the occasion of a visit by the general secretary of the World's association from New York.

The Revised Standard Version of the New Testament, prepared by a committee of scholars appointed by the International Council of Religious Education (United States and Canada), was published in February and received wide approval.

A Western Hemisphere Christian Youth conference was held in Cuba in August under the sponsorship of the United Christian Youth movement (United States and Canada), the Unión Latinoamericana de Juventudes Evangelicas (Latin American Union of Evangelical Youth), the World's Sunday School association and the Committee on Co-operation in Latin America. (See also CHURCH MEMBERSHIP.) (F. L. Kp.)

Superphosphates. Increased demand for fertilizers raised superphosphate production in the United States from 6,692,368 short tons in 1944 to 7,372,104 tons in 1945. Sales of phosphate rock to producers of superphosphates in 1945 were 4,418,410 tons, or 73% of the total sales. Exports increased from 205,887 tons in 1944 to 207,157 tons in 1945. (G. A. Ro.)

Supreme Court of the United States. The cases decided in 1946 were predominantly in criminal law, federal regulations, federal tax and labour. The 1945-46 term of the United States supreme court was characterized by a decrease in the number of closely divided opinions. Because of the absence of Justice Robert H. Jackson, representing the United States at the Nuernberg trials, there were no 5-to-4 decisions.

Harlan Fiske Stone, 12th chief justice of the United States supreme court, died April 22 following an attack while sitting with the court. He was elevated to the chief justiceship in 1941 by President Franklin D. Roosevelt.

The Hon. Frederick Moore Vinson, secretary of the treasury, was appointed the 13th chief justice of the United States.

There was a total of 136 opinions handed down during the 1945-46 term, of which 42 were unanimous and in 25 more, there were concurring, but no dissenting votes. Dissenting votes were cast in 69 opinions. Federal regulation cases led the list, 13 for the government and 8 against; federal taxes were second, with 13 for the government and 5 against; criminal law, rising in number from the 1944-45 term, was split 7 for the government and 7 against; labour cases were fourth, with 7 for the government and 2 against. Among the opinions were:

	Favourable to government	Against government
Federal tax cases	13	5
Federal labour cases	7	2
Federal regulation cases (other than labour)	13	8
Federal criminal cases	7	7
Federal war cases	2	3
Federal public contracts cases	3	0
Federal bankruptcy cases	1	0
Federal eminent domain cases	2	1
Federal courts and procedure cases	2	2
Federal miscellaneous cases	1	3
Total	51	31
State tax cases	6	2
State regulation cases	4	0
State criminal cases	3	5
State miscellaneous cases	2	0
Total	15	7

Members of the Court.—The United States supreme court was composed in 1946 of the following members (dates indicate year appointment was confirmed by the senate): chief justice, Frederick M. Vinson (1946); associate justices, Hugo L. Black (1937), Stanley F. Reed (1938), Felix Frankfurter (1939),

William O. Douglas (1939), Frank Murphy (1940), Robert H. Jackson (1941), Wiley B. Rutledge (1943) and Harold H. Burton (1945). (See also LAW.) (B. WE.)

Surgery. Since the cessation of military hostilities ideas resulting from the experiences of World War II have crystallized. Whereas previously it was thought that injury to tendons and nerves needed immediate definitive therapy, during the war it was demonstrated that whereas the immediate wound closure is important in order to prevent further contamination of the wound, unless specialist care is available it is not only possible but also desirable to delay the repair of the tendons and nerves until specialized treatment, which is so important in these cases, can be obtained. Also, the setting up of special centres, such as amputation and paraplegia centres, has been valuable. Although many amputations were done for war injuries, annually there are many more amputations done yearly in civilian life. The establishment of special centres for the application of prostheses is an important advance.

In patients with injuries of the lung in whom there is an accumulation of blood within the pleural cavity the evacuation of the blood after a period of two to three weeks brings about a rapid restitution of function. Without the decortication procedure, there is danger of the lung remaining collapsed and non-functioning because of the development of scar tissue over the surface of the lung. P. C. Samson used this procedure both in military and in civilian life. Paul Sanger used this procedure successfully in acute infections of the pleural cavity.

Streptomycin, one of the new antibiotics, was studied extensively and found to be of great value in the treatment of tularaemia, influenzal meningitis and certain urinary infections. A new antibiotic, bacitracin, developed by Frank Meleney, has many of the advantages of penicillin and offers considerable promise.

The use of male sex gland secretions in the treatment of cancer of the breast proved to be of value, particularly as regards palliation in late cases. In those cases in which there was extension of the cancer to the bones, the administration of the male sex hormone not only controlled the pain but also produced regression of the tumour, permitting even recalcification of the bone which was destroyed by the cancer. The use of other glandular products in the treatment of breast cancer metastases to the soft parts was suggested and offers some promise.

H. de Sousa Pereira successfully treated the severe pain associated with cancer of the neck of the uterus by abdomino-pelvic sympathectomy. Although it is only a palliative procedure, it is certainly justifiable.

With the introduction of propylthiouracil, the preparation for operation of patients with toxic thyroid disease became safer. Although thiouracil was efficacious in controlling the toxic manifestations, it had the distinct disadvantage of being quite toxic and, therefore, was considered not without danger. Propylthiouracil, on the other hand, is just as efficacious and does not have the toxic manifestations of thiouracil. Thiouracil was shown by B. T. King and L. J. Rossellini to be of great value in the treatment of acute inflammations of the thyroid (thyroiditis).

The treatment of arterial disease involving the extremity was fairly well standardized. Many patients with diseases of the peripheral arteries can be benefited by interrupting the impulses carried over the sympathetic nervous system. Tetra-ethyl ammonium was used by Robert L. Berry and his associates in these and other cases in which there is an over-activity of the sympathetic nerves. In order to decrease the increased number of red blood cells in polycythaemia, P. W. Schafer performed sympathectomies with good results, the rationale for the procedure being that the increase in red cells is due to a diminished blood supply resulting in a decrease in oxygen to the bone marrow. Following a sympathectomy, the blood supply and diminished oxygen of the bone marrow increase and the stimulus for increased production of red cells is removed.

Actinomycosis of the thorax and abdomen, which were so difficult to

control in contrast to actinomycosis of the face and neck, was successfully treated by Champ Lyons by the combination of several methods of therapy: (1) the institution of adequate surgical drainage; (2) chemotherapy, employing penicillin during the acute phase of the infection because penicillin does not destroy red cells, to be followed later by sulfonamides, which must be used for many months; and (3) the employment of large amounts of blood during the acute infection in order to re-establish the total circulating haemoglobin and red cell mass. Lyons and his associates further demonstrated the importance of blood volume determinations in chronically ill patients in whom although the haemoglobin per cent and the red cell count per cu.mm. may be within normal limits, there is actually severe anaemia because of the contraction of the blood volume. Only following correction of this severe anaemia can these patients safely withstand a necessary major surgical operation.

Kurt Lange and L. Loewe treated frostbite by the subcutaneous administration of heparin, the rationale being that clotting in the peripheral arteries which frequently occurs in frostbite is prevented by the anticoagulant, heparin. L. E. Hines and D. L. Kessler showed that the combination of heparin and penicillin must be used cautiously because the administration of penicillin to an individual receiving heparin greatly increases the sensitivity to the heparin and unless careful control is made severe haemorrhage may result.

With the availability of radioactive isotopes, it was possible to treat certain conditions with these substances. Toxic goiter was treated successfully by means of radioactive iodine, the selective affinity of the thyroid for the iodine molecule, making it possible for the radioactive material to have a maximum effect on the thyroid gland.

The results from vagus resection in the treatment of duodenal ulcer continued to be good. Although the resection of the vagus does produce a satisfactory decrease in the acid content of the stomach, it also produces a marked interference with the motility of the stomach and should not be used if there is any obstruction to the outlet of the stomach, unless a new opening is made between the stomach and the intestine.

Although the treatment of burns was fairly well standardized, investigations by J. K. Berman and his associates showed that the toxic manifestations in severe burns could be minimized and largely obviated by the injection of isotonic salt solutions into the burned area. In this way, the excessive loss of fluid to the outside and absorption from the burned area is prevented. (See also ANAESTHESIA; MEDICINE.)

Surinam (DUTCH GUIANA). A Netherlands colony in north-eastern South America, bounded on the east, south, west and north, respectively, by French Guiana, Brazil, British Guiana and the Atlantic ocean. Area, 54,291 sq.mi.; pop. 1945 est., 178,000. The population includes approximately 1,000 Dutch, 1,000 other Europeans and Americans, 42,000 British Indians, 34,000 Javanese, 2,000 Chinese, 19,000 bush Negroes, and 2,600 aboriginal Indians. The capital is Paramaribo (pop., 60,723), other inhabited places include Nieuw Nickerie (5,000), Coronie (4,500), and Moengo (1,400). The colony is ruled by a governor, who serves as president of an executive council of four, all nominated by the queen of the Netherlands. The governor in 1946 was Dr. J. C. Brons.

History.—The colonial government organized a department of social affairs and immigration early in 1946. Delegates from Surinam participated in the second Caribbean conference, held in the Virgin Islands of the United States in February-March. The Anglo-American Caribbean commission, organized in March 1942 by Great Britain and the United States, was broadened on a *de facto* basis in 1945 to include Surinam as well as other Dutch and French colonies in the Caribbean area, and the re-organized basis was formalized in the Virgin Islands conference

and subsequently. The 1946 West Indian conference considered the problem of under-population in Surinam, as well as other social and economic questions affecting the colony.

Surinam was greatly interested during the early part of the year in attaining the status of autonomy impliedly promised various parts of the Netherlands empire by the queen in her address of Dec. 6, 1942. The colonial government appointed a committee to accompany a similar group from Curaçao to the Netherlands to petition Wilhelmina to that effect; the two groups left for Europe June 11. The Netherlands government subsequently announced that it proposed to present a bill modifying the constitutions of Surinam and Curaçao in a fashion to provide a greater degree of decentralized territorial administration for Surinam. Netherlands officials later in the year were quoted as regarding Surinam as a province of a metropolitan country. The colony was faced during 1946 with crystallizing restlessness on the part of its large Asiatic population. A mass meeting on June 9, organized by the central board of Hindustanis and Indonesians, adopted resolutions asking that such population elements be granted full economic, social and political rights and that a universal suffrage be established.

Education.—In 1946 the colony had approximately 50 public and 75 private (mostly church) schools with about 18,500 enrolled.

Finance.—The monetary unit is the guilder (or florin) of 100 cents, exchangeable at about 53 cents U.S. currency. The guilder was formerly tied to the Netherlands currency but was detached in 1943. A Dutch commission, headed by a former Surinam governor, went to the colony early in 1946 to study financial conditions and problems, especially the possible adjustment of the Surinam and Curaçao guilder to that of the Netherlands. The government was anxious to keep the guilder pegged to the U.S. dollar at its then value of \$0.5333, but it was considered likely by March that the guilder would be forced to undergo devaluation. The need for dollar exchange increased steadily during 1946 and led before the end of the year to a government order prohibiting importation of all luxury food items. The cost-of-living index by February had reached 160 as against 100 in 1939.

Trade.—The first coffee shipments ever made from Surinam to the Netherlands met a favourable reception in 1946. The colonial government decided early in the year to allow the export of rice production above 20,000 bags of 100 kg. Exports of bauxite to the United States in 1945 totalled 673,185 long tons (the figure included the earmarked stock-pile in Trinidad); bauxite exports in the first quarter of 1946 were 136,541 long tons, about equal to those of the first quarter of 1945. Lumber exports to the United States in 1945 were 202,894 bd.ft., of which 80,364 ft. were fancy hardwoods. Late in 1946 shipments of foodstuffs from the Netherlands and other European countries began to appear in Surinam.

Agriculture.—Sugar production in 1945 was 4,373,512 kg., consumption was 3,621,377 kg., and stocks on hand Jan. 1, 1946, amounted to 728,500 kg. A new type of upland rice began appearing in the Paramaribo market early in 1946. The government estimated that some 14,000 families averaging four persons each were engaged at least part time in rice production in 1945, but the colony had only two rice mills. Balata production in the first quarter of 1946 was 27,837 kg., an increase of 7,829 kg. over the same period in 1945; the total amount of balata received at Paramaribo from the interior in 1945, however, was 192,993 kg. (1944: 194,403 kg.). The Netherlands government announced plans to develop Surinam's forests on a vast scale and in consequence established the Surinam Timber foundation; the colonial government was given 190 shares and a Dutch woodworking company 210 shares. The foundation planned to

work 10,000,000 ac. of forests.

Mining.—Bauxite production in 1945 increased by 155,478 long tons over that for 1944. A strike of bauxite mine workers early in Oct. 1946 prevented any further mining or loading until it was settled Nov. 5. Gold production in the first 10 months of 1946 was 108,128 grams; placer gold production in 1945 totalled 183,364 grams (1944: 177,993 grams).

Surplus Property Disposal. The best estimates available in 1946 indicated that ultimately \$34,000,000,000 of property produced for war purposes would be found surplus. By the end of September, \$21,500,000,000 of this had already been declared to the War Assets administration and other disposal agencies.

Viewed in the light of the purpose for which these goods were produced, they had already accomplished their primary objective. Even if the particular property in question had never left the factory where it was produced it had still contributed to victory.

Congress, however, saw in this vast quantity of war goods the potential answers to many of the nation's postwar needs. The Surplus Property act of 1944, as amended, was written to make the best possible use of this vast accumulation from every possible angle. The dollar return on actual money invested was a goal but not paramount.

The 20 objectives of the act, set forth in Section 11, set up the goals toward which the surplus disposal program was to be aimed. These social and economic aims, while worthwhile in themselves, created difficulties in establishing an orderly program.

Of the total surplus acquired up to Sept. 30, 1946, about \$6,300,000,000 including scrap and salvage, had been sold, or about one-third of all declared up to that date. More than two-thirds of the liquidation job was therefore still to be done. The expectation of the War Assets administration was that the task would be completed sometime in 1948.

The War Assets administration actually came into being only on March 25, 1946. It was set up by executive order under powers granted the executive under the Surplus Property act. It is an agency reporting directly to the president, its sole function the disposal of surplus property under the program outlined by congress.

WAA was the outgrowth of a number of preceding agencies all of which had handled the disposal program either as their sole activity or as one of several activities. In 1933 the procurement division of the treasury department was assigned responsibility for disposing of war surplus of World War I. The advent of World War II, however, saw such a rapid accumulation of surplus property that, at the request of President Roosevelt, Bernard Baruch and John Hancock made a comprehensive survey and report, recommending the creation of a central authority. The Surplus War Property administration, created by executive order of Feb. 14, 1944, was charged with general supervision and direction of the surplus disposal program.

In order further to facilitate and regulate disposal, congress on Oct. 3, 1944, passed the Surplus Property act of 1944 establishing a Surplus Property board to take over the functions of the Surplus Property administration. The board was succeeded by the Surplus Property administration in the Office of War Mobilization and Reconversion by amendment to the original act, Sept. 18, 1945. The Consumer Goods division of treasury procurement was transferred to the department of commerce and later to the Reconstruction Finance corporation. On Feb. 1, 1946, an executive order transferred all surplus disposal

PROSPECTIVE BUYERS and War Assets administration personnel inspecting some of the 25,000 miles of wire which constituted part of the \$5,000,000 worth of surplus property put on sale in 1946 at Torrance, Calif.

functions, except those relating to disposal in foreign countries, to the War Assets corporation in RFC, with provisions for WAA taking over the operation on March 25.

WAA determines policies for all disposal agencies concerning the disposition of surplus located in the continental United States and U.S. territories and possessions. It makes the actual disposals program for 90% of all surplus. Types of surplus sold by WAA include consumer goods (goods usually sold through retail distributors), capital and producers goods, raw materials, semi-finished products, industrial equipment, aircraft and aircraft parts and components; war plants and other industrial real property.

Under the act, congress set up certain buying priorities and preferences to special groups: (1) federal agencies for their own use; (2) veterans for use in their own businesses, professions and agricultural enterprises (except real property); (3) Reconstruction Finance corporation for resale to small business; (4) state and political subdivisions and instrumentalities; (5) eligible nonprofit institutions. Under the May 1946 amendment to the act, veterans have also an exclusive privilege to buy for their own personal use from "set-aside" lists of hard-to-get items. These lists, which by the end of 1946 had been largely cleaned out, include the more desirable items in surplus from the standpoint of popular demand.

Disposals of Surplus Property

(Exclusive of leases)

Cumulative through June 30, 1946

(In millions of dollars)

Total	\$4,646
Real property, total	1,098
Plants and industrial	993
Agricultural land	13
Airports	36
Community facilities	39
Housing	17
Personal property, total	3,548
General products	2,345
Aircraft parts and components	75
Aircraft	847
Electronics	88
In territories and island possessions	56
Marine personal property	68
Foodstuffs and other agricultural products	69

Each of the priorities is given consideration on all applicable sales programs. Consideration is given, also, to the 20 objectives outlined by the act. Since certain of these objectives are in a measure contradictory, it is necessary, in many instances, to weigh them against each other. The main objective is to release World War II surplus as rapidly as possible within the limitations imposed by law.

Sweden. A democratic monarchy of northern Europe. Area, 173,341 sq.mi.; pop. (Dec. 31, 1945) 6,673,956. Capital, Stockholm (as of Dec. 31, 1945) 671,601. Other principal cities (Dec. 31, 1945), were Göteborg (Gothenburg) (315,474), Malmö (171,158), Norrköping (78,344), Hälsingborg (66,537), Örebro (59,879). Religion, Lutheran Christian. Ruler in 1946: King Gustavus V. Prime minister: Per Albin Hansson, until his death on Oct. 6, thereafter Tage Erlander.

History.—Excluded from original membership in the United Nations because of its neutral status, Sweden was nevertheless eager to take its place among the co-operating states of the world as soon as possible. In June 1946 the riksdag (parliament) voted to request admission and Sweden was elected unanimously by the Security council (Aug. 29). When the assembly, on Nov. 9, voted in favour of admission, a Swedish delegation flew to New York; the group was headed by Östen Undén, foreign minister.

During the year, the Swedes continued much of their war-time rationing on food. The bread and flour ration was cut 6%, to save 50,000 tons of wheat and 22,000 tons of rye for European relief. From 1944 to 1946 the Swedes sent 400,000 tons of food to needy peoples abroad (value about \$42,500,000).

One of the heaviest blows suffered by Sweden in 1946 was the death from a heart attack of Prime Minister Per Albin Hansson, Oct. 6. Foreign Minister Östen Undén took over temporary leadership, and on Oct. 9 the Social Democratic party chose Tage Erlander, minister of education, as its president. A few days later Erlander became prime minister.

There was no general election during the year, but on Sept. 15 elections were held for the provincial and municipal councils. The Communists gained, though not as much as expected; the Conservatives and the Social Democrats both lost. The Farmers and the liberal Peoples' party were the large gainers, and the Peoples' party became second in strength to the Social Democratic party in the country as a whole.

	Seats held after Sept. 15 elections	Change from 1942 elections
Peoples' party	252	+74
Conservatives	212	+68
Farmers	247	+36
Social Democrats	743	-82
Communists	99	+67

Probably the two most serious economic problems of the year were the torrential rains of September and the coal shortage. The rains ruined as much as 30% of the crops in some regions and the farmers tried to harvest from boats.

A fund of \$100,000,000 was set up during the year for housing loans, to encourage multiple-family building and repair of older structures. Municipalities made available long-term loans to individuals, and the cities could borrow up to 100% of construction costs from the central government; co-operative organizations could borrow up to 95% and individuals to 85%. The goal was to reduce rents to 20% of workers' income. In June the two chambers of the riksdag approved the program of the minister for social welfare, Gustav Möller, almost doubling the existing pension rates. Pensions might go as high as 1,000

PRINCE CARL GUSTAF of Sweden, whose birth April 30, 1946, assured continuation of the Bernadotte dynasty. His mother, Princess Sibylla, is shown holding him, as his father, Prince Gustaf Adolf, watches. His sisters (left to right) are the Princesses Margaretha, Christina, Desiree and Birgitta

kr. per year for single persons and 1,600 kr. for married couples, with 600-800 kr. additional for rent. Compulsory sickness insurance was enacted by the riksdag on Dec. 18, to take effect July 1, 1950. Nationalization of oil distribution was seriously discussed but the basic principle was still held that no activity should be nationalized if private management was doing an efficient and fair-priced job.

Labour peace existed. Employers as well as employees were organized on a national basis, and each bargained with the other collectively. The federation of trade unions contained 1,106,917 members—about one-sixth of the population.

Sweden extended Russia a 1,000,000,000 kr. (\$278,500,000) credit, to be used in six years, and to be repaid in 15 years. According to the trade agreement Sweden was to send to Russia such things as high quality steel and steel products, ball bearings, machines and measuring instruments, parts for electrical and turbine equipment, breeding stock and herring. Russia was to send to Sweden such items as chrome and manganese ore, asbestos, mineral oils, cotton, flax, fertilizers. Russia also was to provide some of the raw materials, such as pig-iron, for the goods which Sweden was to produce and deliver on the purely credit basis: equipment for electrical power stations, equipment for extraction and concentration of ores, machinery for peat extraction and the mechanization of forestry, equipment for housing construction, 300 steam locomotives, 45 trawlers and 50 motor-ships and other similar items.

These various arrangements bound Sweden to sell only about 15% of its normal export volume to Russia. Internal opposition and U.S. protests against the treaty arose because of the government guarantees involved and because of the tie-up with the Russian controlled economy.

American Overseas Airlines opened service to Stockholm on Jan. 7, 1946, and the Scandinavian Airlines officially opened their transatlantic flights on Sept. 19. Regular air connections were established between Stockholm and Moscow.

Education.—In 1941-42 there were 529,750 pupils and 25,848 teachers in the regular elementary schools, and 53,868 students in secondary schools. In the five institutions of university grade 8,937 students were enrolled in 1944. The state provided also a large number of special industrial and continuation schools.

Defense.—In 1946 attention was centred on development of jet-propelled and radio-guided ships and plans for atomic-energy-driven sub-

marines—and adequate defense against such types of armament.

Finance.—The monetary unit is the krona (23.86 U.S. cents on Nov. 28, 1945, and revalued July 1946 in a sudden stroke to be worth 27.77 U.S. cents (3.60 kr.= \$1.00), an increase of 14%.

The government financial picture must be given in two separate accounts.

Table I.—Data of Finance in Sweden
(In millions of kronor)

	1944-45	1945-46 estimate	1946-47 estimate
Ordinary account:			
revenue	3251	3209	3347
expenditures	4103	3522	3347
Capital account:			
revenue	1533	851	900
expenditures	606	851	900
Public debt	10,953	11,310 (Oct. 1)	

	1945	End of Aug. 1946
Notes in circulation	2,782	2,534
Gold reserve	1,062	1,046
Commercial bank deposits	6,847	7,199
Savings bank deposits	5,468	—

Trade.—General trade statistics, mentioning only the chief countries concerned are shown in Table II. During Jan. to Sept. of 1946 Great Britain took first place as Sweden's customer, buying 267,300,000 kr. worth of goods (c. 15%); the U.S. was second with 139,100,000 kr.; then came the Netherlands (127,800,000 kr.), Norway (127,400,000 kr.),

Table II.—Imports and Exports, Sweden
(In 1,000 kronor)

	1939	1944	1945 (preliminary figures)
Imports (total)	2,498,700	1,677,382	1,087,908
From Germany	619,800	798,466	89,400
Switzerland	45,800	138,606	123,950
Argentina	48,100	120,928	106,967
United States	414,300	44,500	175,898
Exports (total)	1,888,600	853,396	1,756,633
To Germany	369,000	345,350	0
Switzerland	17,800	87,511	55,000
Argentina	34,100	72,211	91,000
United States	178,600	2,100	232,623
United Kingdom	417,500	5,600	282,894
Norway	137,500	30,500	327,517
Finland	93,900	71,000	149,600

Belgium (125,600,000 kr.), France (107,300,000 kr.), Denmark (106,300,000) and Argentina (90,400,000 kr.). The most important change was the dropping out of Germany from its prewar second place. Sweden's imports before World War II came in large part from Germany, but in the first eight months of 1946 the U.S. led as supplier to Sweden with 606,600,000 kr. worth of goods (about 26% of total); next came Great

Britain (226,500,000 kr.), Switzerland (176,500,000 kr.), and Argentina (154,900,000 kr.). In the first eight months of 1946 both imports and exports exceeded the value of the total 12-month trade of 1945: (Jan.-Sept. 1946) imports: 2,367,000,000 kr.; exports, 1,834,000,000 kr.

Communications.—Railroads in 1945 measured 16,711 kilometers. Six new motor-powered trains, on the U.S. streamliner model, were being built in Sweden for 1947 use. There were 1,168,100 telephones, an average of 177 per 1,000 inhabitants. There were 95,967 automobiles. Air lines flew 2,926,797 mi., carrying 81,000 passengers; length of established air routes was about 16,500 mi. Mail carried by air was about the same as in 1944, but baggage doubled and freight trebled.

The merchant fleet in 1945 numbered 2,069 ships with a gross tonnage of 1,598,000 (679 steamers of 548,558 tons, 580 motor vessels of 969,483 tons, 808 auxiliary vessels of 79,676 tons and 2 sailing ships, 90 tons).

Agriculture.—Agricultural area and crop yields for 1945 are shown in Table III.

Table III.—Agricultural Production in Sweden, 1945

	Hectares	Yield in metric tons
Area of meadows	942,139	
Total cultivated area	3,717,179	
Wheat (winter)	203,891	454,452
Wheat (summer)	87,105	133,811
Rye (winter)	162,824	270,326
Rye (summer)	5,358	5,946
Corn	93,286	168,750
Oats	542,727	754,895
Mixed grains	277,378	462,660
Peas	25,791	32,996
Beans	345	538
Potatoes	145,252	1,658,874
Sugar beets	54,633	1,813,661
Hay	1,342,671	—

The livestock census at June 1, 1944, included 603,857 horses, 2,858,949 cattle, 558,290 sheep, 1,053,865 swine, 6,174,517 chickens.

Forestry.—In the period 1940-44 more than 6,000,000,000 cu.ft. of timber was cut for fuel, against a normal cut of about 3,000,000,000 cu.ft. Much of the excess cut was useful thinning, but the labour burden was heavy. Export of wood products was down in 1944 to 324,635,000 kr., but climbed in 1945.

Manufactures.—Industrial establishments in 1943 numbered 20,907 and workers 598,165. Values of chief manufactured products (figures for 1941 and 1943) are shown in Table IV.

Table IV.—Values of Principal Manufactures of Sweden

	1941 kr.	1943 (or 1942) kr.
Machinery	1,359,063,000	1,761,958,000
Ships	206,242,000	242,368,000*
Automobiles, etc.	225,293,000	246,661,000
Electrical apparatus	322,101,000	400,918,000
Milling	204,102,000	190,688,000
Wood pulp	276,578,000	307,337,000
Paper	210,206,000	292,300,000
Wood	229,167,000	423,908,000*
Furniture, etc.	194,341,000	250,049,000
Yarn, etc.	204,942,000	225,045,000
Textiles	330,326,000	330,326,000
Breads	185,659,000	233,147,000
Tobacco products	248,055,000	326,280,000

*1942

Investments in industry during 1940-1944 averaged 726,000,000 kr. as compared with an average of 504,000,000 kr. for 1938 and 1939. State and municipal funds were about one-sixth of the total investments for 1940-1944.

Mineral Production.—Production of the leading minerals in 1941 (in long tons) was as follows: iron ore 10,527,889; iron and steel 1,165,593; bar iron and steel 821,547; coal 556,690; copper 11,879; gold 5,950 kg.; silver 23,682 kg.

Fisheries.—In 1943 there were 15,437 professional fishermen in salt-water fishing, nearly half from the Gothenburg region. Fishing boats numbered 21,432. The total catch was worth 118,928,000 kr. and weighed 143,811 metric tons. Herring accounted for almost half the weight and 41% of the value.

Sweet Potatoes: see POTATOES.

Swimming. Most noteworthy in swimming during 1946 were the remarkably fast and widespread recovery of water sports in devastated Europe; the return to activity of the Fédération Internationale de Natation Amateur, controlling body in aquatics; and an extraordinary feat of endurance achieved by a blind 48-year-old Hawaiian, King Nawahi.

Europe not only resumed most of its national championships and other important fixtures abandoned in wartime, but the competition brought to light two new world's record breakers

and a host of brilliant performers.

Miss Nel van Vliet, of the Netherlands, was the outstanding star. She earned recognition as the greatest breast stroke swimmer ever developed by shattering all six of the standards listed for women and slashing the time for 200 m. from 2 min. 56 sec. to 2 min. 52.6 sec. and for 500 m. from 7 min. 49.9 sec. to 7 min. 41 sec.

Alex Jany, of France, was the other successful ace. He clipped the highly rated mark of 2 min. 6.2 sec. for 200 m. free style to 2 min. 5.4 sec. Teamed with Alfred Nakache and Georges Valerey, Jany also helped to establish a record of 3 min. 16 sec. for the 300 m. medley relay, which was added to the F.I.N.A. table in June, and later to drop it to 3 min. 12.3 sec.

Leonid Meshkov, of the U.S.S.R., swam the 100 m. breast stroke in 1 min. 5.2 sec., against the record of 1 min. 7.2 sec., but the soviet was not a member of the federation, so the performance could not be recognized.

The F.I.N.A., inoperative from 1939, resumed its functions at a meeting in London in June and the executive bureau made many changes in the rules, approved 45 of the records claimed while it was stagnant and elected H. E. Fern of Great Britain president and R. Max Ritter of the United States secretary-treasurer.

The sightless Nawahi performed one of the most amazing feats in natatorial history. Following the sound of a bell on the escorting boat, the hardy veteran conquered the 22 mi. of rough water from Catalina Island to Point Firmin, Calif., in 22 hr. 40 min.

In the United States, Joseph Verdeur lowered the breast stroke records for 200 yds. from 2 min. 21 sec. to 2 min. 19.5 sec. and for 200 m. from 2 min. 36.8 sec. to 2 min. 35.6 sec., but his exploits were overshadowed by the striking work of 15-year-old James McLane, who won the national 400 m., 800 m. and 1,500 m. free style titles, defeating at 400 m. the world's record holder, William Smith. Experts acclaimed him the foremost middle distance prospect of all time. (L. DE B. H.)

KING NAWAHI, 48, blind Hawaiian, being helped ashore by life guards after swimming 22 miles from Catalina Island to Point Firmin, Calif., during 1946

Switzerland. A republican confederation of 22 cantons of west-central Europe, bounded N. and E. by Germany, S. by Italy and W. by France. Flag, white cross on red background. Area 15,944 sq.mi.; pop. (1941 census) 4,260,179. Chief towns: Berne (cap. 129,331); Zürich (333,829); Basle (161,380); Geneva (124,442); Lausanne (91,738). Languages (census 1930): German 2,924,314; French 831,100; Italian 242,034; Romansh 44,204; and others 24,797. President (Jan. 1, 1946) Dr. Karl Kobelt.

History.—On Feb. 12, 1946, after the mysterious disappearance and probable killing of a member of the Swiss legation in Budapest, Switzerland broke off diplomatic relations with Hungary. A month later, after several unsuccessful attempts, Switzerland finally re-established diplomatic relations with the soviet union which were broken off in 1924 after a soviet official was assassinated on Swiss soil. The new friendly relations were followed by the founding of a Russian-Swiss oil company with which Russia was to supply Switzerland with as much Rumanian oil as needed.

On Dec. 8, by a referendum vote of 534,336 to 124,000, Swiss voters rejected a proposal under which the Swiss federal council would have been obligated to guarantee jobs for all. Proponents of the measure said it would prevent unemployment; opponents argued that only authoritarian states could implement such a law.

Education.—Managed locally by the cantons and communities, education is obligatory and free. The seven universities (Basle, Zürich, Berne, Geneva, Lausanne, Fribourg and Neuchâtel) had a total of 12,104 matriculated students in the winter of 1944-45.

Finance.—The franc, the Swiss monetary unit, was devalued about 30% in 1936, so that it contained about 200 mg. of fine gold. It had in 1946 an official exchange value of 23.40 U.S. cents but an actual trading value of 27 or 28 cents or even more; there was talk of raising the official exchange value to 30 cents. Switzerland presented the anomalous spectacle of a dollar-rich country in the midst of a dollar-poor Europe. The Swiss National bank at the end of 1946 had gold holdings of 6,000,000,000, which more than covered the outstanding note circulation. In May, after long months of negotiations, Switzerland finally settled with the Allies a dispute concerning money secreted in Switzerland by Germans for safe keeping during World War II, estimated by the Swiss at \$250,000,000 and by the Allies at thrice that amount. Switzerland agreed to turn over to the Allies half of all German assets which might be uncovered, and would retain the other half to satisfy Swiss claims against bankrupt Germans. In another agreement at the same time frozen Swiss credits in the United States, amounting to \$500,000,000, were released for repatriation under certain restrictions to prevent their having an inflationary effect in Switzerland.

Trade and Communications.—Direct water communications between Basle and the seaports of Antwerp, Belgium, and Rotterdam, the Netherlands, obstructed during World War II by ruined bridges and sunken boats, were reopened in 1946. Prior to the war more than 3,000,000 tons of freight, or about half of Switzerland's imports and exports, passed through the port of Basle. Of this freight 92% was imports, mainly food, coal and other raw materials, and 8% was exports, mainly cheese, textiles, precision instruments and other fine manufactures. By May 1946, the quantity of imports and exports had reached again their prewar level (about 8,000,000 and 700,000 metric tons respectively), and the total value, owing to the rise in prices, exceeded the prewar level. Switzerland had 3,218 mi. of railway, mostly electrified and three main and three local broadcasting stations.

Syria and Lebanon. Independent republics, formerly French mandated territories, bordering the eastern Mediterranean. Syria: area 73,587 sq.mi.; pop. (est. 1942) 2,800,000; chief town, Damascus (cap.) 225,000. Lebanon: area 3,475 sq.mi.; pop. (est. March 1943) 1,025,000; chief town, Beirut (cap.) 234,000. Language: in Syria mainly Arabic, in Lebanon Arabic, French, Hebrew, Armenian, Greek; religion: (approx.) 66% Mohammedan (mainly in Syria), 33% Christian (Maronites 335,904; Greek Orthodox 245,050; Greek Catholics 109,734; Armenian Orthodox 160,570; Armenian Catholics 26,659; Syrian Orthodox 43,806; Syrian Catholics 21,120; Protestants 21,450) and 1% Jewish. President of Syria (1946): Shukri el Quwatli; of Lebanon: Sheikh Bishara el Khoury.

History.—The British and French agreed to start the withdrawal of their troops from Syria on March 11, 1946, and to complete the operation by April 30. The withdrawal was, however, accomplished by April 15. The Syrian government asked the British to send a military mission to train the Syrian army, but the request was refused for fear of French susceptibilities. In spite of Syrian assurances given in Dec. 1945, French schools were forcibly closed in January. In April Saadullah Jabry, the prime minister, resigned but formed a new government in which he retained the ministry of foreign affairs. The Syrians were understood to have informed the French that they would be treated in Syria in the same way as other powers, as would French schools. The Syrians were prepared to buy up French assets in the country. Diplomatic representatives were exchanged with Turkey in March. Opposition, which was reported in September to have broken out against the government, was suppressed.

As the result of a protest made in January by Lebanon to the Security council of the United Nations regarding the retention by France and Great Britain of troops in Lebanon, both countries agreed to evacuate their forces, Great Britain by June 30, 1946, and France by April 1, 1947. A Lebanese delegation went to Paris to discuss details of the withdrawal. These talks resulted in the French advancing the date of their withdrawal to the end of August, it being agreed that 30 officers and 200 men should remain to supervise the removal of material. At the beginning of June the British reported that all their forces had left with the exception of a small staff which would remain to clear up. A similar French statement was issued at the beginning of September. On Sept. 30 the last of the British forces left. In May allegations of maladministration against three of its members caused the resignation of Sami Bey Solh's cabinet. A new cabinet was formed under Saadi Munla as prime minister and minister of national economy, Gabriel Murr as deputy prime minister and Philippe Tecla as foreign minister. Two papers were suspended in April for criticizing the government and British policy in the middle east. Bombs were thrown at the British and U.S. legations in August and at the U.S. university in Beirut as a protest against decisions taken on Palestine. Diplomatic relations were established with Turkey and Switzerland. A Lebanese delegation, including the president and the foreign minister, visited Turkey in June. In Dec. 1946 a new coalition government was formed, with Riyad bey el-Solh as prime minister.

The following figures apply to both Syria and Lebanon.

Education.—In 1942: state schools 742; Christian schools 811; foreign schools 492; private schools 306; Moslem schools 149. Pupils, Syria 142,015, Lebanon 138,318.

Trade and Communication.—In 1944: imports £ Syrian 80,000,000; exports £ Syrian 34,000,000. Roads (1939) c. 1,900 mi.; railways (1939) 690 mi.

Finance.—Revenue and expenditure (est. 1944) balanced at £ Syrian 48,534,000; notes in circulation (Dec. 1945) £ Syrian 35,770,600; gold reserve (June 30, 1939) £ Syrian 1,400,000. Monetary unit: the Syrian pound (divided into 100 piastres). Rate of exchange, Dec. 1945: £ Syrian=54.3 French francs=45.6 cents U.S.

Agriculture.—1943 (in short tons): wheat 641,630; barley 364,194; maize 24,775; sesamum 5,410; olives 148,000; cotton 2,860; cotton seed 6,710; tobacco (1941) 5,170; oats (1939) 5,940; potatoes (1938) 45,760; wool (1938) 10,890; raw silk (1938) 220; wine (1938) 1,135,200 gal. (See also ARAB LEAGUE.) (D. K. M. K.)

Syrup, Sorgo and Cane. The 1946 output of sorgo syrup was estimated at 12,074,000 gal. compared with 9,850,000 gal. produced in 1945 and an average of 12,213,000 gal. in prewar years. Both acreage and yield were higher than in 1945.

Table I.—U.S. Cane Syrup Production by States, 1946 and 1945

		(In gallons)			
State	1946	1945	State	1946	1945
Louisiana . . .	11,825,000	15,075,000	Florida	1,980,000	2,090,000
Georgia	4,025,000	4,564,000	South Carolina .	420,000	342,000
Mississippi . .	3,500,000	3,520,000	Texas	270,000	260,000
Alabama	2,430,000	2,860,000			

Table II.—U.S. Sorgo Syrup Production in Leading States, 1946 and 1945

		(In gallons)			
State	1946	1945	State	1946	1945
Alabama	1,827,000	1,782,000	North Carolina .	1,215,000	640,000
Tennessee . . .	1,520,000	840,000	Arkansas	1,200,000	825,000
Mississippi . . .	1,400,000	1,680,000	Georgia	689,000	912,000
Kentucky	1,360,000	730,000	South Carolina .	580,000	605,000

Cane syrup production was estimated at 24,450,000 gal. which was below the crop of 1945 but higher than that of any other year after 1937. The acreage was reduced but yields were enough above average to offset the acreage reduction. The weather was generally favourable. (See also BEEKEEPING; MAPLE PRODUCTS.) (J. C. Ms.)

Table Tennis. The International Table Tennis federation, which suspended activities during World War II, was revived on June 22, 1946, by its president, the Hon. Ivor Montagu, after a London conference, with 21 member associations as against 28 before the war. The first world championships for individuals and teams after the 1939 Cairo matches were scheduled for the week of Feb. 25, 1947, in Paris. Because of the eight-year lapse, deaths and population shifts, no accurate gauge of national playing strengths was possible. Problems facing the 14th I.T.T.F. congress included the status of national associations in Germany, Japan, Hungary, Austria, Rumania, Finland and new associations in Russia, Bermuda, Denmark, Greece, Portugal, Scotland and South Africa; proposed participation in the Olympic games, discontinuance of individual world titles and zoning of team matches; paid players; racial and religious discrimination; and a constitutional revision. Tai Li (? —1946); Chinese secret police head, was one of the loyal supporters of Chiang Kai-shek from the early days of the Chinese revolution. He studied at the Whampoa military academy when Chiang was commander of the school. During the Mukden incident in 1931, Tai was assigned by

Chiang to create an anti-Japanese undercover group, and he later expanded this organization into a powerful secret service agency. After the Pearl Harbor incident in Dec. 1941 brought the United States into the war, Gen. Tai headed the S.A.C.O. (Sino-American Co-operative organization), a secret service agency allegedly manned by some 70,000 Chinese saboteurs and guerrillas, equipped by the United States. On occasion, S.A.C.O. co-operated with the U.S. Office of Strategic Services. Gen. Tai's ruthless treatment of foes of the Nationalist government was condemned by Chinese Communists and Chinese democratic groups, and when Chungking and the Chinese Communists had reached an agreement on "unity," one of its terms called for dissolution of his organization, which went under the official and innocuous title of the Bureau of Investigation and Statistics. The collaboration between the S.A.C.O. and the OSS for the dispatch of OSS espionage units into Thailand (Siam), in the closing days of World War II, was hamstrung by Gen. Tai, who, according to OSS officers, did not want the OSS to have an "exclusive" espionage pipe line into Siam. On March 17, 1946, Gen. Tai allegedly was among a number of Nationalist government officials who were killed in a plane crash in the mountains, but subsequent reports suggested that he might have been assassinated by his political foes.

Taiwan: see FORMOSA.

Talc. The sales of talc minerals (talc, pyrophyllite and ground soapstone) in the United States increased from 398,863 short tons in 1944 to 401,080 tons in 1945, while mine production fell from 418,228 tons to 401,217 tons. Increased use was reported in ceramics, rubber, roofing, toilet preparations and insecticides, totalling 48% of consumption in 1945, against 42% in 1944. Paint, the largest single use, declined from 28% of the total in 1944 to 24% in 1945.

Canadian production in 1944 included 19,013 short tons of soapstone and 13,584 tons of talc, decreasing to 13,889 tons of soapstone and 13,600 tons of talc in 1945; these figures give totals of 32,597 tons and 27,489 tons respectively. (G. A. Ro.)

Talmadge, Eugene (1884–1946), U.S. politician, was born on Sept. 23 in Forsyth, Ga. After having been graduated from the law school of the University of Georgia in 1907, he practised his profession in Atlanta. In 1927 he was elected state commissioner of agriculture and continued to hold that post until 1933 when he successfully ran for the governorship of the state. After serving two consecutive terms as governor (1933–37) he was defeated in his bid for a seat in the U.S. senate in 1938. In 1940 he was elected governor for a third time. He soon took over control of the state's finances and was accused of dominating the schools. Subsequently pressing for the dismissal of two members of the state's university board system for advocating racial equality, he explained that "I done it to stop them furriners from preaching that niggers and whites should get together." A notorious advocate of "white supremacy," Talmadge was a defeated candidate for the governorship in 1942; his successful opponent, Ellis Arnall, maintained during the election campaign that the issue at stake was "democracy versus dictatorship," and urged the people to support the Arnall administration so that the state "would no longer be the laughing stock of the nation." Talmadge again became a candidate for the governorship in 1946. He attacked the supreme court ruling which upheld the rights of Negroes to register and vote in April 1946, declaring that if he were elected, he would amend the state primary laws, thereby circumventing the decision. In the 1946 election for governor he polled fewer popular votes than his opponent but won the

seat by means of the Georgia county-unit rule system. A governor-elect, he died at Atlanta, Ga., Dec. 21.

Tariffs. Such changes as were made in the tariff systems of the world during 1946 were not only of minor consequence, but they were also of materially less importance in their social and economic implications than were measures undertaken during the year to establish a working basis for future international economic collaboration. Because of the exigencies of World War II, customs duties had probably been employed as instruments of commercial policy less during the period of hostilities than during any comparable period in at least three decades. Although actual hostilities had ceased, the postwar supply situation during 1946 was sufficiently acute throughout the world that the emphasis in many countries continued to be on the control of exports rather than imports. With the prospects of a revived world trade, however, and with the presence of warborn industries in various lands, there was renewed pressure in many countries to adopt restrictive import duties for the benefit of selected domestic enterprises or individual interest groups. These pressures met with only minor success during the year; nevertheless, they constituted important obstacles to the more basic attempts to revitalize multilateral trading through the elimination of the many barriers which had served as continuing restrictions on the volume of world trade.

Thus, while 1946 probably would not be remembered for any noteworthy change in the tariff policies of the important trading nations, the year might ultimately have historic significance because of the beginning which was made toward a broader and freer exchange of goods and services among nations. During World War II the United Nations, particularly through the Atlantic charter and the lend-lease agreements, had committed themselves to a program for promoting world prosperity and facilitating the maintenance of peace. They had thus pledged themselves to seek means for achieving a wider multilateralism of trade through the elimination of trade barriers and the rejection of such instrumentalities of economic warfare as heightened tariffs, embargoes, quotas, exchange controls, multiple currencies, export subsidies, trade discriminations and bilateral agreements. Similar commitments were embodied in the Anglo-American Trade and Financial agreement in 1946. The more important steps during the year to achieve these objectives were the establishment of the International Monetary fund and the International Bank for Reconstruction and Development (*qq.v.*) and the proposal for an international trade organization.

Both the Monetary fund and the International bank were created in response to the Bretton Woods proposals in 1944. The fund was designed to eliminate currency and foreign-exchange difficulties of the type which had obstructed world trade during the interwar period. Member countries undertook through the fund to maintain stable exchange rates, to avoid competitive and discriminatory monetary and exchange practices and, so far as possible, to make their currencies freely convertible. A common pool of monetary resources was established to meet temporary shortages of exchange and to assist members during emergencies.

The resources of the Monetary fund were not available, of course, to finance capital investments and long-term transactions. Hence, a companion institution was created to render such assistance to nations. The International Bank for Recon-

struction and Development had an authorized capital of \$10,000,000,000 subscribed by the member countries. Subject to the provisions of its carefully drawn Articles of Agreement, the bank was in a position to promote the postwar rehabilitation of nations and, therefore, to further orderly economic development. The bank's official statement of purposes was as follows: (1) to assist in the reconstruction and development of territories of members; (2) to promote private foreign investment by means of guarantees or participation in loans and other investments made by private investors; (3) to promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments; (4) to conduct its operations with due regard to the effect of international investment on business conditions and to assist in bringing about a smooth transition from a wartime to a peacetime economy.

In addition to these measures of international co-operation there was still need for more direct action to eliminate trade barriers and to establish "rules of the game" to facilitate world collaboration on a multilateral trading basis. In Feb. 1946, therefore, the Economic and Social council of the United Nations adopted a resolution calling for an international conference to consider the creation of an International Trade organization (I.T.O.). The council also created a Preparatory committee representing 19 nations to arrange for the conference, to prepare an agenda for its deliberations and to draft a charter for the proposed organization. When the Preparatory committee met in London in Oct. 1946, the U.S. delegates brought with them a proposal for co-operative action (Suggested Charter for an International Trade organization) designed to break down trade barriers and expand world trade.

The proposed charter was given painstaking scrutiny in London, where a number of important modifications were made. The final draft agreed upon for submittal to the delegates of the United Nations constituted the proposed charter for the I.T.O.; it embodied a code of international trading principles and provided that the International Trade organization should constitute an agreement among the signatory powers to:

1. Reduce trade restrictions and discriminations imposed by governments.
2. Eliminate restrictions on trade imposed by private business groups.
3. Prevent, by intergovernmental action, disorder in the markets for certain primary commodities.
4. Seek full employment by co-operative action rather than by conflicting nationalistic measures which in the past had failed to accomplish their employment objectives and had further restricted international commerce.
5. Establish an international organization (the International Trade organization) to administer the world trade charter and to provide an effective forum for future negotiation of problems relating to international commerce.

In anticipation of the actual signing of the charter of the new International Trade organization, the United States in Nov. 1946 announced its intention to pursue still further its reciprocal trade agreements program by negotiating on a scale much more comprehensive than in the past. The United States indicated that early in 1947 it would seek most-favoured-nation agreements providing reciprocal reductions in tariff duties and modifications of other barriers. It was also suggested that, should these negotiations prove successful, multilateral concessions among the other negotiating countries might be agreed upon to facilitate a general reduction of trade barriers throughout the world.

As was the case in the previous year, 1946 was substantially a standstill period as far as actual tariffs and related instruments of commercial policy were concerned. Again there were virtually no important modifications of tariff schedules throughout the world; there were, however, many piecemeal changes, usually unimportant, raising or lowering the rates of duty for specified import items. So also as in 1945, these scattered changes displayed no decided pattern nor trend; modifications

providing for increased rates of duty, however, appear to have been somewhat more prominent than those establishing lower import charges.

Perhaps the closest to an over-all revision of a country's tariff schedule were the actions taken by Siam and Costa Rica. In May 1946 Siam revised its tariff increasing the levies on most dutiable items. In September Costa Rica reprinted its schedule and consolidated with the basic duties numerous surcharges previously in effect; to provide additional revenue duties on most items in the schedule were increased.

During the year Argentina, Colombia, Panamá and Peru instituted initial measures to effect comprehensive revisions of their import tariff schedules; the first three of these countries indicated an intention, among other changes, to model their tariffs after the nomenclature and classification recommended by the League of Nations.

Less extensive upward revisions of duties were made in a few other countries. With the termination of the trade agreement between Argentina and the United Kingdom (1936) in Feb. 1946, Argentina increased its duties on nearly 300 tariff items on which concessions had previously been granted to the United Kingdom and generalized to other nations on a most-favoured-nation basis. Ecuador, Panamá and Paraguay increased import duties, in effect, by increasing an import surcharge usually designated as a consular fee. Paraguay imposed an additional surcharge of 6% ad valorem on a substantial list of items described as nonessential imports. For the stated purposes of conserving foreign exchange, increasing government revenue and providing for a more equitable system of taxation, Mexico, in Jan. 1946, approximately doubled its duties on imports of nearly 350 luxury commodities. Three countries in Europe also made substantial upward revisions. By a royal decree in July 1946 Belgium increased its tariff on a long list of imports including paper products, cutlery, scientific instruments, various manufactured tools, electrical machinery, calculating machines, typewriters and cash registers. Finland, which had previously imposed a surtax of 200% of the rates in its basic schedule of 1938, increased the surtax to 300% for most dutiable items. Special licence fees, not to exceed 5% ad valorem, appear to have been imposed on virtually all imports into the Netherlands. In March 1946 Iran imposed a surtax of 10% ad valorem on most imports. A variety of measures of lesser importance provided for increases of duty on scattered individual items in a few other countries.

Although there were numerous changes lowering tariff rates on individual import items in various countries, these modifications were usually of minor importance and scarcely merit elaboration. In two countries, however, the changes, though temporary, were quite far-reaching. Czechoslovakia and Poland temporarily suspended duties on most imports; both of these countries maintained import-licencing systems. (See also INTERNATIONAL TRADE.)

(D. LH.)

Tarkington, (Newton) Booth (1869-1946), U.S. author, was born on July 29 in Indianapolis, Ind. For his early career see *Encyclopædia Britannica*. The gentle humour and the restrained and delicate sentiment pervading his novels of boyhood adventure, adolescent love and family life were widely enjoyed by U.S. readers. Tarkington's earliest books were sentimental romances. Later he returned to portray his native Indiana scene and *Penrod* (1914) and *Seventeen* (1916), both concerned with juvenile heroes, established him a reputation as an expert on the pranks of boys and adolescents. Regarded as examples of Tarkington at his best are *The Magnificent Ambersons* (1918) and *Alice Adams* (1921), both of which won Pulitzer prizes.

He was awarded the gold medal of the National Institute of Arts and Sciences, 1933, and the Howells medal of the American Academy of Arts and Letters, 1945. During his writing career, which spanned 47 years, he wrote some 40 novels, many of them best-sellers, and about 20 plays, on some of which he collaborated with Harry Leon Wilson, E. G. Sutherland and Julian Street. His later works include *The World Does Move*, an autobiography (1928), *Little Orvie* (1934), *The Fighting Littles* (1941) and *Kate Fennigate* (1943). Tarkington was finishing another novel when he died in Indianapolis on May 19.

Tasmania. A state of the Australian commonwealth, forming an island 26,215 sq.mi. in area to the south-east of the mainland, from which it is separated by 140 mi. of Bass strait. Pop. (est. June 1945): 248,063. Chief cities: Hobart (cap., 70,800); Launceston (est. 40,000). Governor (1946): Admiral Sir Hugh Binney.

History.—The Labour administration under Premier R. Cosgrave remained in office during 1946. One of the chief concerns of the government was to attract new industrial enterprises to the state and with this object in view several extensions of the hydroelectric power scheme were sanctioned. The aluminum production commission chose a site for the establishment of the production of aluminum ingots and the general development of Tasmania's bauxite resources, which were known to be extensive. The initial outlay for the purchase of plant, etc., amounted to approximately £A3,125,000. Expenditure on public works during 1944-45 totalled nearly £A938,000, an increase of 50% on the previous fiscal year. Of this sum £A359,375 was spent in Tasmania by the Australian shipbuilding board.

Education.—In 1941: number of schools (state) 424, (private) 63; teachers (state) 1,273, (private) 329; scholars (state) 33,354, (private) 6,886; average attendance (state) 27,457, (private) 5,320.

Finance.—Revenue (1944-45) £A3,656,875; expenditure £A3,675,931; public debt (June 30, 1945) £A30,323,125. (£A1 = \$3.2 U.S.).

Communication.—Roads (1940) 9,386 mi.; railways, government (1945) 642 mi.; private 130 mi. Motor vehicles licensed (Dec. 1945): cars 17,172; commercial vehicles 7,331; cycles 3,044. Wireless receiving set licences (Dec. 1945) 50,720. Telephones (June 30, 1941) 19,565.

Manufacturing.—(1944-45) factories 1,006; employees 10,511; gross value of output £A21,356,667; unemployment (trade union returns) (Feb. 1946) 1.7%. (W. D. MA.)

Taxation. **United States.**—In 1946, for the first time after 1931, there was neither a federal revenue act nor important federal tax legislation. Congressional debate and action upon such matters as general revision of the internal revenue system remained for 1947 and later years. Yet 1946 saw interesting and significant developments in the national tax field.

Excess Profits Tax.—When suspending the wartime excess profits tax for years after 1945, congress continued, for 1946 only, computation of unused excess profits credits as though the tax were still in force and allowed carry-back of such credits to obtain decrease or refund of excess profits tax for prior years. This averaging up of an unproductive transition year with productive war years effectuated an established plan to counterbalance loss of corporate earnings during reconversion. Also to help reconversion congress accelerated the 10% postwar refund of excess profits tax paid, making the refund bonds payable at the owner's option on or after Jan. 1, 1946. Labour leaders indignantly attacked these procedures as an unfair subsidy to their opponents in the current labour-management controversy and inflated assertions were made of amounts payable.

More accurate understanding generally spread, exaggerations died down and the relief provisions operated as planned. While the total sums involved could not be accurately stated at the close of the year, outstanding excess profits tax refund bonds aggregated nearly \$1,028,000,000 as of June 30, 1945.

The extreme rigour of the excess profits tax necessitated insertion of special relief provisions to keep it from having a ruinous or crippling effect in exceptional cases. Taxpayers charged the internal revenue bureau with illiberal, dilatory and disingenuous administration of the relief provisions. These charges grew to great volume and reached an effective climax in hearings before the Congressional Joint Committee on Internal Revenue Taxation during the first half of 1946. The bureau ultimately proposed, and the joint committee approved, establishment without further legislation of an Excess Profits Tax council and initiation of procedure for excess profits tax relief which was plainly intended to be more flexible, franker and generally more satisfactory. Men of outstanding ability were placed on the council. They and the tax court, where test cases on relief are finally adjudicated, faced a long, hard job involving sums running literally into the billions.

The Courts and Federal Taxes.—A well-established, simple tax under proper statutory authorization and administration should give rise to little litigation. The federal internal revenue system of the United States was being better administered. But with the vast elaboration of modern society it became almost fantastically complicated and the lumbering legislative processes of congress did not systematically or speedily correct ambiguities and omissions revealed in application of the internal revenue code. The result was a great deal of litigation, making the judicial attitude toward taxes abnormally important to taxpayers.

Judicial Attitude.—Irrked by inadequacy of specific provisions in the internal revenue code, the United States supreme court, and by its suggestion some of the lower federal courts, took much specific affirmative action by virtue of what they deemed the general tenor of the code. Such action was particularly notable from about 1939 on, raising questions as to proper apportionment of functions between congress and courts in the revenue field. Concededly, a judge, acting upon a general statute, is not rigidly restricted to specific instances enumerated therein but should apply the legislature's principles to the *types* of situations it had in mind. Yet a judge should not extend such a statute, even to reach what he is sure would be a just result, unless certain that the legislature would have gone to that length if faced with the particular case to be decided. Also, with respect to interpretative enlargement of tax laws, the U.S. constitutional provision that "All Bills for raising Revenue shall originate in the House of Representatives . . ." embodies a deep-rooted Anglo-U.S. tenet that scope of taxation is to be determined by popularly elected legislators, not by the executive nor an appointive judiciary.

Adverse critics of the judicial practice of implying specific tax liabilities from generalities in the code urge that development of rules by this method is too haltingly irregular. A court can decide, one by one, only the particular cases brought before it and therefore leaves taxpayers long uncertain as to related cases which legislative draftsmen would foresee and cover in a single enactment. It is further said that judicial lawmaking is too rigid for use in the tax field, where policies must shift with considerable frequency and experiments must be tried and often abandoned. Courts are not authorized to enunciate tax policies, but only to interpret and apply tax laws. Also they are expected to adhere to the rules they announce, rather than to experiment and retract. Hence, under their practice of affirmative action they sometimes multiplied contradictions and

doubts instead of curing them, by laying down fixed lines of decision diverging either initially or later from concurrent congressional action on related matters. Supporters of affirmative action by the judiciary, however, justly urged that congress has power to cure undesired divergence by corrective legislation, and that the courts are taking care of many specific situations urgently calling for attention and not receiving it from the legislature.

For instance: (1) If F, a father, buys a bond, has it appreciate in his hands and gives it to S, his son, who turns the appreciation into a profit by selling the bond, the profit is taxable to S. This is a congressional rule, long embodied in an express provision of the code. (2) But if F tears unmatured coupons from the bond and gives them to S, who collects the coupon interest in the year of gift, F must pay income tax on the interest for that year. That is a 1940 court-made rule, there being no express provision in the code. (3) So if F, who has completed his work under an insurance agency contract, assigns to S all his rights in the contract, and S long afterward receives commissions under the contract because of payment of renewal premiums, the amount of these commissions is taxed to F in the year of their receipt. (4) Likewise if F, holder of a promissory note carrying overdue interest, gives the note to S, who collects the overdue interest in the year of gift, F must under a 1946 decision return the amount of the collection for income tax. (5) But if F dies, owning such a note, or owning a bond with unmatured coupons, and S, receiving the note or the bond under F's will, collects the interest, it is taxable to S. This is according to an express provision of the code enacted in 1942. From 1934 to 1942 interest or other income accrued to F at the date of death, and later collected, was taxable under the code to F in the last tax period of his life. Congress decided that this rule inflicted undue hardship and changed it. Finally, (6) if H, a husband, lives with W, his wife, in California or Washington, where the community property system prevails, H is taxed on only half his earnings, W being taxed on the other half; but (7) H and W, living in a noncommunity state, can in no way so divide H's earnings as to relieve H from tax on all the earnings. Both these rules were court made, and there was no likelihood that the courts would change them, despite the tax disparity thus created between inhabitants of different parts of the United States.

The attitude of Justice Harold H. Burton, and still more of Chief Justice Fred M. Vinson, on this important governmental problem was being watched with interest.

Dobson Case.—Overwhelmed by the load of internal revenue litigation, the supreme court in Dec. 1943 decided the Dobson case. This gave the tax court's determinations much more finality in internal revenue cases than determinations of the court of claims or the district courts. Although only a trial tribunal, the tax court was thus to some extent made supreme. The Dobson ruling is a statutory interpretation, fixed by the supreme court without hearing argument, as counsel had not discussed the point. Justice Felix Frankfurter in 1946 termed it "a brave effort"; Dean Erwin Griswold of the Harvard law school, a leading authority, also in 1946 called it "a *tour de force*." Both of course may be right, but the ruling seems not to have simplified or accelerated consistent final decision of tax cases. Several 1946 decisions show it forced on circuit courts of appeals different standards for review of controversies appealed from the tax courts on one hand, and from district courts and courts of claims on the other, thus making victory too often depend upon lucky choice of the tribunal in which to begin the case. The supreme court divided several times in practical application of the Dobson rule, and in 1946 simultaneously sustained two seemingly contrary decisions by two different members of the

"IN THE FIGHT AGAINST INFLATION." Drawn by Justus of the *Minneapolis Star* during 1946

tax court without indicating any intelligible harmonizing factor. Congressional establishment of a general federal court of tax appeals might meet the unsolved difficulty, but many tax lawyers disapproved this expedient.

Treasury Regulations.—In 1940, again in 1941 and perhaps on other occasions, the supreme court suggested a different attack on the problem of tax uncertainties and consequent judicial overload. This was that the treasury should by "appropriate regulations" resolve ambiguities and fill gaps in the code, apparently making such regulations as to tax incidence, even if beyond the explicit language of congress, authoritative unless irreconcilable with the fair meaning of that language. The treasury moved cautiously on the hint, but once in 1941 and more often in 1945-46 did issue regulations which were little codes about certain classes of tax problems. These were attacked and defended. Their provisions were not altogether consonant with earlier judicial decisions, and during 1946 the tax court asserted power to disregard the regulations in at least some cases where it preferred its own views.

International Conventions.—Prior to 1946 the United States had entered into conventions with Canada, France and Sweden to ease the burdens of double taxation and prevent fiscal evasion. The arrangements with Sweden covered income taxes; with Canada both income and death taxes; with France income and certain related taxes. During 1946 a modifying convention with France respecting income taxation was signed, as was a death tax convention; ratification had not been accomplished at the close of 1946. Also during 1946 conventions with Great Britain and Northern Ireland, signed in 1945 and covering both income and death taxes, were ratified and proclaimed effective (from Jan. 1945 in case of United States tax). A tax convention with the Union of South Africa was signed Dec. 13, 1946. In addition, 1946 saw income tax conventions with the Netherlands, Belgium and Luxembourg drawn up and negotiations opened with these countries respecting death taxes.

Negotiations on the same topics were expected to begin with the Philippine government during Jan. 1947.

Prospective Tax Revision.—During the 1946 election campaign Republicans emphatically promised large and quick reduction of federal taxes if they won. They did win, but President Truman precipitated the tax-cutting issue by proclaiming official cessation of hostilities at noon Dec. 31, 1946. Unless counteracted or accelerated by congress as to tax effects, this meant sharp reduction of many wartime excise rates from July 1, 1947. The president in his state of the union message on Jan. 6, 1947, recommended continuance of the higher rates through June 1948. Meanwhile the Republicans had not fully settled on anything so simple as the 20% individual income tax cut forecast during the campaign. Reductions might be more selective and less drastic. From discussion in the treasury, congress and elsewhere some judgment could be formed as to other revenue matters due for scrutiny. They included: (1) revision of corporate taxes, with special attention to the complex problem of "double taxing" dividends as contrasted with interest, by reason of the latter's deductibility from gross corporate income; (2) taxation of U.S. business abroad—foreign branches, foreign establishments, western hemisphere trade corporations and so on—obviously a matter of increasing importance; (3) income averaging over periods longer than single years, a technique desirable to equalize consequences of progressive rates and already permitted in limited ways but very difficult of sweeping application, as long experience abroad proved; (4) treatment of family income, notably some equalization of the variant tax burdens on married couples living respectively in community and noncommunity property states and (5) more consistent and simple interaction of estate, gift and income taxes. As indicated above, fundamental administrative problems pressed for effective consideration. Among them were apportionment of functions to congress, treasury and courts, with particular reference to treasury regulations and practice, powers of the tax court and possible institution of a single federal court of tax appeals; and better control of ingenious devices for tax avoidance constantly nurtured by necessary continuance of an expanded high revenue system, such control perhaps being furthered through over-all antitax-avoidance legislation substituting flexible principles for meticulous detailed loophole plugging.

State and Local Taxes.—Only about 15 state legislatures passed significant tax acts in 1946, whereas at least 44 would have and probably would take opportunity to do so in 1947. Nonetheless, 1946 produced a large bulk of state and local revenue laws. During the year the process of transition from governmental war economy moved far. Postponed capital expenditure was begun, deferred maintenance had to be made up, large extraordinary expenses such as veterans' bonuses imposed their weight and the universal pressure for higher pay was felt in public service.

Because of differing legal and economic conditions the picture varied state by state. Massachusetts, with an antiquated fiscal system, exhausted its modest surplus (at maximum perhaps \$19,000,000) and searched for new revenue sources. Extension of special taxes on corporate income was necessary to finance an enlarged veterans' bonus. Meanwhile, Boston and other Massachusetts municipalities were in growing fiscal difficulty. Serious talk began of reallocation of expenses between state and local governments, for relief of the latter. Higher state revenues during the latter half of 1946 did not suffice to promise solution under the existing system. Gov. Robert F. Bradford at inauguration Jan. 2, 1947, warned of an over-all \$75,000,000 deficit.

New York had piled up a large surplus (nearly \$186,000,000

on March 31, 1945) and had modernized its fiscal arrangements both as to revenue collection and control of expenditure. In 1946 the New York legislature reduced by 50% personal income taxes for 1945 and for fiscal periods ending in 1946; it also reduced business corporation franchise tax rates and tax rates on unincorporated businesses. New York city, however, was hard put to it financially; under legislative enablement it imposed a nominally temporary tax on transient occupancy of hotel and lodginghouse rooms renting for more than \$2 daily, and extended, at double existing rates, city gross receipts, sales and use taxes.

Missouri, while increasing personal income tax exemptions, enacted a 7% excise income tax on banking institutions in lieu of the bank share tax and the tangible and intangible personal property taxes; also a 4% tax on the yield of intangible personal property. New Jersey enacted a financial businesses tax based on allocated net worth, and in lieu of franchise tax, etc. Oregon by a heavy majority voted down an initiative petition to tax sales and gross incomes 3% for the purpose of providing persons more than 60 with pensions of \$100 per month.

In various parts of the country there were manifestations of fiscal difficulty among the municipalities. St. Louis, Mo., and Toledo, O., imposed low-rate taxes on earnings and profits. Many California cities (*e.g.* Los Angeles, Oakland, San Diego, Santa Monica) enacted sales taxes. San Francisco voted down a sales tax, and the proposed Denver, Colo., sales tax failed to pass, but both cities remained in urgent need of revenue. Salt Lake City, Utah, announced consideration of a sales tax.

By popular vote Illinois approved a bond issue of \$385,000,000 to pay a veterans' bonus, the bonds to be retired in 25 years primarily by additional taxes on cigarettes and pari-mutuel betting, a state property tax levy to cover any deficiency. Michigan and Rhode Island also approved bonuses. Tax exemptions were provided in veterans' favour; *e.g.*, in Louisiana and New York.

During 1945 and early 1946 the states felt considerable apprehension as to the effect on their revenues of the United States supreme court's decision in 1944 that interstate insurance transactions constituted interstate commerce. Congress provided some reassurance in 1945 by the McCarran act, but both constitutionality and scope of this law remained in doubt pending decision of test cases under it. The supreme court decided two such cases in June 1946, with results satisfactory to state governments, whose power was sustained to tax and regulate and to differentiate treatment of domestic and foreign insurance companies.

Canada.—Unlike the United States, Canada during 1946 made such extensive changes in the dominion tax structure that only a partial outline can be given. Personal income tax, to be calculated under a new simplified schedule of graduated rates rising from 22% to 85%, was reduced by increasing exemptions (income deductions) from \$660 for single persons to \$750, and from what was in practical effect \$1,200 for married couples without children to \$1,500. This was estimated to cut from the rolls one-quarter of the total number of personal income tax payers. The marital exemption of \$1,500 utilized by the husband is reduced by the wife's income between \$250 and \$750; when the wife's income as well as the husband's exceeds \$750, each is dealt with for exemption purposes as a single person. In effect, this reduces the exemption incentive to gainful work by most married women from the wartime level of \$660 to \$250. The deduction because of each child eligible for family allowance is \$100; for each dependent not so eligible \$300. This will make acceptance of the family allowance plan practically universal; previously it was not so, as any accepting taxpayer had to repay an amount roughly corresponding to income tax credit for each eligible child. Farmers and fishermen are given the optional benefit of paying income tax on the basis of a three-year moving average, the first average to be built up in 1946-48.

The total ordinary flat-rate tax burden on corporate income is reduced from 40% to 30%; taxation of excess profits, reluctantly continued despite weaknesses and limitations, is confined to corporations and joint stock companies with the rate reduced from 20% to 15%. The broad exemption of co-operatives from income tax is removed, but with a provision for limited deduction of patronage dividends along lines recommended by the McDougall commission.

Dominion succession duty rates are doubled, with a provision for deduction from tax up to half its amount for like duty paid any province.

The utility of this provision to a taxpayer obviously depends not only upon relative rates but also upon relative values at which dominion and provincial taxation begin. The changes just noted are a move toward having the succession duty field put in exclusive occupation of the dominion government.

In most important respects the legislative changes became effective as of Jan. 1, 1947. Finance Minister James Ilsey estimated the annual cost to the dominion government at \$266,000,000.

An income tax appeal board and an income tax advisory board were established, the first to hear appeals from assessments, the second to hear and advise upon taxpayers' objections to the exercise of ministerial discretionary powers.

Progress was made toward agreements between the dominion and five of the nine provinces as to temporary withdrawal by the latter from certain tax fields. Saskatchewan, if the provincial legislature approved, was to withdraw from income, corporation and succession taxation for five years beginning April 1, 1947, in exchange for a \$15 per capita subsidy from the dominion. In respect of Manitoba and New Brunswick, negotiations were concluded but without official release of details at the close of 1946. As to Alberta there was exploratory discussion, and as to British Columbia deliberations began late in Nov. 1946.

Great Britain.—As the British budget was moved nearer to balancing, the government cautiously and systematically extended tax reliefs begun in 1945. At large, the changes of 1946 were less impressive than those of the preceding year, with the possible exception of termination of excess profits tax from Jan. 1, 1947. Even this change, as Chancellor of the Exchequer Hugh Dalton remarked, had its counterbalance; 50% of the loss by repeal came back in income tax and surtax. Total net revenue loss for 1946-47 from the changes was estimated at £32,000,000 or \$128,000,000, and much more for a full year. Not all the revisions led to loss of revenue, as appears from the following summary:

Some adjustments of detail were made in customs duties; both exemption from, and the lower scale of rates under, entertainments duty were extended; at considerable cost to the revenues the purchase tax was eased as of April 10 and July 22, 1946, both by exemption of numerous articles in common use and by application of lower rates, these changes including remission of tax on acquisition by visitors, etc., of motor vehicles for export.

Income tax reliefs included exemption of workers' contributions to national insurance, the sacrifice of revenue here being substantial and resulting from increase as higher rates of contribution become payable; correspondingly, payments of benefits and of family allowances except lump-sum payments were made chargeable for income tax. To encourage gainful work by married women, the special allowance for a wife's earned income was increased (contrast the Canadian reduction noted above) from a maximum of \$320 (£80) to a maximum of \$440; also to encourage industry, the general earned income relief, while not increased beyond the current \$600 maximum, is to be calculated up to that limit at the rate of one-eighth of earned income, instead of the former one-tenth. The total number of persons expected to be completely freed from income tax by these three alleviations was estimated at about 500,000 in a full year. The chancellor stated that during 1946 a married couple with two children and an earned income of \$2,400 would pay \$336 tax as contrasted with more than \$484 in 1945.

Income tax postwar credits for 1941-44 are on application to be released after Aug. 1, 1946, to "the old warriors, the veterans of industry," namely men more than 65 and women more than 60.

Estate duty, the most important of British death duties, was modified as of April 10, 1946, by increase of the exemption limit from \$400 to \$8,000 and regrading of the progressive rate scale to give partial relief to all estates between \$8,000 and \$30,000, to hold the tax on estates from \$30,000 to \$50,000 and to increase the tax on estates more than \$50,000, the scale rising to a maximum of 75% as compared with the previous 65% on estates from \$8,000,000 up. Here the estimates were: total annual deaths about 600,000; about 200,000 subject to estate duty with previous exemption and rates; only about 50,000 subject to estate duty with new exemption rates; only about 10,000 subject to increased tax by the change; but, because of the large aggregate of capital involved in the category last mentioned, total gain to the revenue from the remodelled duty of \$88,000,000 in a full year.

Although, as stated above, excess profits tax was terminated, the national defense contribution of 5% on profits prior to distribution was continued and renamed "the profits tax" from Jan. 1, 1947. The change of name obviously implied comparative permanence.

Other Countries.—From 1945 European and Asiatic countries struggled, some with greater success, others with less, through the troubled conditions between active war and established peace. Their tax systems attest this struggle.

Sweden.—Never an actual belligerent, Sweden was still forced to adjust its fiscal policies to the costs of war. To the state income and property tax and the special graduated property tax of peacetime were added: (1) the graduated defense tax, a superstructure keyed in with the taxes previously mentioned; (2) the general turnover tax, a rarity in Scandinavia and unfavourably received and (3) a war profits (or excess profits) tax with rates of 50%-70% calculated by a complex process. All political parties agreed that the tax last named should be repealed as soon as possible. The labour parties contended that the turnover tax should be next to go, whereas industrialists wished to get rid of the defense tax, the principle of which the socialists desired to retain. A committee on tax revision was appointed to study the problem.

Switzerland.—The Swiss confederation, also nonbelligerent, enacted during the war a number of indirect taxes and—by exception to theoretically normal constitutional practice—several important direct taxes, the latter including a wartime excess profits tax with rates of 50%-70%. All the confederation taxes after 1940 rest on the power of the federal council to determine new taxes in extraordinary times without recourse to the people but subject to requirement of report to parliament. Some of the war taxes terminated with or before the end of 1945. The complex, burdensome and often unfair excess profits tax was marked for early repeal. A new general regulation along normal lines was in preparation to continue the fiscal system on expiry of the extraordinary tax pro-

visions. The detail of Swiss wartime taxation interestingly reflects the burdens cast upon Switzerland not merely for self-protection but also for care of refugees and in general because of its position as an international cross-roads. Weight of taxation enhanced tax avoidance, and one of the war taxes (*l'impôt anticipé*) was essentially a measure against fraud as applied to taxpayers with Swiss fiscal domicile, being refundable to those correctly declaring their taxable revenues.

The Netherlands.—Not only did the Germans invade and occupy the Netherlands, but they intended to make the country part of the reich. Hence, during the war the Dutch fiscal plan was bent more and more into accord with German practice. Return of the revenues to a Dutch pattern therefore required detailed study. After the war the Netherlands imposed a 25% capital levy and a 50% tax on increases in capital position between the outbreak of war and the liberation, the latter tax rising to 90% where increase was because of "illegitimate activity."

Belgium.—Invaded and occupied for years, Belgium took steps by blockage, required declarations or returns and otherwise to control the financial situation as rapidly as the Germans were forced out. Late in 1944 a tax was proposed resembling the Dutch tax last mentioned above. This went through variations and was enacted in Oct. 1945, as a sort of retroactive excess profits tax covering the war period and payable Jan. 1, 1946, with interest charges, etc., for delay.

Germany (United States Zone).—The German national government, physically shattered by the war, was also further broken up for the time being by the zone system of occupation. Administrative co-ordination of the United States and British zones necessarily falls far short of re-establishing a nation. Hence, the tax questions arising under occupation were largely local in nature. Usurpation by the former central government of the taxing and borrowing powers of lower units of government produced a condition which forced the occupying authorities to redistribute taxing powers and utilize decentralized remnants, fortunately substantial, of the former administrative system. Tax yields were so low in 1945 as to necessitate in 1946 reorganization and drastic stiffening of rate schedules by the Allied Control Council, with changes in bases, exemptions, methods of payment and so on. The average effective tax rate, excluding income taxes, was estimated in consequence to have become triple that of 1933-37. The result in the United States zone was a considerable, although not spectacularly reassuring, increase of tax collections.

Japan.—While Japan suffered extremely heavy damage during the latter part of the war, its main islands were not subjected to land invasion and the central government continued to function. The Japanese tax picture, however, was unfavourable, both because of the country's general condition and because the revenue system had been ill planned and ill administered. Broadly speaking, taxes tended to be regressive in incidence, bearing too heavily on wage and salary earners. There was much evasion and avoidance.

The various ordinary levies are familiar in general type—income taxes, business taxes, land and house taxes, death taxes, a number of excises and customs duties. Pressures of the North China Incident led to an extraordinary excess profits tax on corporations and individuals, the rates of which rose as the war developed. Some ordinary taxes—e.g., the land tax, the total yield from which is large—are nationally administered with proceeds distributed to local governments, which also impose directly a variety of independent taxes, generally consisting of surtaxes on nationally levied taxes. Most important of national taxes was the individual income tax, in 1946 supplying about half the national tax revenue. It included a normal tax, intricately classified and with some elements of progression, and a composite, progressive surtax covering four of the eight major normal tax income classes. Incomes of the members of a household are aggregated for tax computation, with liability proportionately distributed to the individuals concerned. Corporate income tax, also important, yields about one-sixth of the national tax revenue. Inheritance taxes apply to transfers between relatives and not to transfers to unrelated persons. A feudalistic element appears in separate classification of inheritance involving succession of a household.

The occupying authorities planned tax revision for increased revenue and greater equity. The plans included at the end of 1946 pay-as-you-go individual income tax, effective enforcement of requirements for individual returns, provision for averaging in income taxation, substitution of an integrated gift and estate tax for inheritance taxes and wide simplification of the tax system. Revision was also desired to tax out of existence the major part of war insurance and indemnity claims against the government.

An extraordinary program prepared on request by the finance ministry was modified after adjustment of many differences and much unfortunate delay extending opportunities for evasion. Among the objects of this program were curbing inflation, raising revenue for emergency demands of occupation and rehabilitation and redistributing national wealth to strengthen the weak middle class. Pursuing the program, the diet on Oct. 11, 1946, passed a capital levy at heavy progressive rates on larger family fortunes. Filing was to continue through Jan. 1947, full payment to be made one month after filing. Enforcement of such a levy obviously involves enormous difficulty in valuation, collection and sundry administrative detail. The present law contained a shrewd provision that in case of disagreement as to valuation of property, the government might buy from the taxpayer at his appraisal, paying in national bonds. If the levy fully attained expectations, it would absorb approximately 10% of Japanese private wealth as of March 1946. (See also BREWING AND BEER; BUDGET, NATIONAL; BUSINESS REVIEW; DEBT, NATIONAL; LAW.)

Eire.—In the 1946-47 budget, the standard rate of income tax was reduced from 7s.6d. to 6s.6d. in the £, at a cost of £1,600,000 in a full year. Excess profits tax was abolished as from Jan. 1, 1947. The excise and customs duties on sugar were lifted, but an extra duty of 12s.6d. per proof gallon imposed on whisky, and a 100% ad valorem duty on wines were estimated to yield £300,000. Total estimated revenue from taxation was £48,200,000.

France.—The 1946 budget removed anomalies in the assessment of married couples under income tax; abolished two indirect taxes on sugar and on salt (*gabelle*) and steeply raised duties on spirits. Total budget

receipts were estimated at Frs.373,000,000,000 (\$3,133,200,000) of which Frs.245,058,000,000 (\$2,058,487,000) had been collected during the first eight months of the year. These figures included, however, an appreciable amount of revenue other than taxes. The principal taxes produced the following amounts during the first eight months of 1946; direct taxes Frs.42,959,000,000 (\$350,855,000); stamp taxes and registration fees Frs.16,966,000,000; among indirect taxes, turnover tax produced Frs.63,391,000,000 (\$522,484,000). The nonrecurrent "national solidarity tax" (in reality a capital levy) had produced Frs.32,451,000,000 (\$212,588,000) during the same period and was known to have exceeded Frs.50,000,000,000 (\$440,000,000) at the end of 1946. In an economic and financial inventory published in Dec. 1946 by the French ministry of finance great stress was laid on the lag between tax receipts and the inflationary increase in prices and earnings and on the unequal fiscal burden borne by the different branches of the economy, in particular the insufficient taxation of agricultural profits.

India.—The budget for 1946-47 gave relief to the small individual income tax payer by reducing the rate in the lower ranges and increasing earned income allowance, while increasing the rate on higher ranges and making super tax more severe. Excess profits tax, budgeted at Rs.900,000,000 (\$271,350,000) for 1946, was discontinued from March 31, 1946; and raw materials for industry were exempted from customs duty. The duty on kerosene was reduced and that on motor spirit lowered from 15 to 12 annas (16 annas=1 rupee) per gal. To discourage speculation in precious metals a duty of Rs.25 per tola (108 grains) of fine gold was imposed, silver duty remaining at 8 annas per fine ounce.

Ceylon.—Few important changes were made in taxation through the budget of 1946-47, but the abolition of excess profits tax was promised, as from the end of 1946. Income tax accounted for Rs.102,500,000 (\$30,900,000) and customs for Rs.141,325,000 (\$42,580,000) out of a total estimated revenue of Rs.342,000,000 (\$103,133,000).

Australia.—Effective from Jan. 1, 1946, a new kind of tax became operative, this being the social service contribution which was levied at a graduated rate rising to 1s.6d. in the £. New rates of income tax started at 3d. in the £ on incomes more than £A500, of single persons, rising to 15s.2d. on the portion in excess of £A500, of individual incomes. Income tax was further reduced in July 1946. Together with reductions announced in the budget for 1946-47, which included a lowering of sales tax to 10%, abolition of the special war customs duty and primage duty on manufacturing equipment and a reduction of 1d. per gallon on gasoline duty, the reduction in exchequer revenue was estimated at £A37,000,000 for 1946. Total receipts from taxation were budgeted at £A348,000,000.

New Zealand.—Total tax revenue for 1946 was estimated at £NZ83,607,000, which included £NZ30,750,000 income tax, £NZ14,500,000 customs; £NZ14,250,000 sales tax and £NZ8,000,000 each from stamp duty and national security tax. War surcharge on income tax was reduced from 33% to 10%; the income tax for companies was reduced to the rate in force in March 1942, at a cost of £NZ4,700,000. Excess profits tax was entirely abolished (cost £NZ500,000). So was sales tax on building materials, household furniture and certain other articles (cost £NZ700,000 in a full year) and gold export duty. The 3% primage duty on books and magazines was also abolished contingent on a 5% reduction in their retail prices.

Union of South Africa.—The budget for 1946-47 left the normal rate of income tax unchanged, but substantial reductions were made in the special personal and savings levies, married people not subject to income tax becoming exempt, with the effect that nearly 130,000 people ceased to be direct tax payers. Motorcar sales tax was abolished at a cost of £SA250,000, as was the tax on telephone accounts and on railway passengers. Both excess profits and trade profits duty were scaled down so as to benefit the small taxpayer, and gasoline duty was reduced by 3½d. per gallon. Despite these and other concessions the budget surplus was estimated at more than £SA3,000,000.

Total Estimated Revenue from Taxation for Some Other Countries in 1946

Country		Amount in national currency	Equivalent U.S. \$*
Austria	Schillings	1,415,600,000	\$141,560,000
Belgium	B. Frs.	25,578,000,000	\$583,178,400
Czechoslovakia	Cz. Crowns	24,166,000,000	\$485,736,600
Norway	Nw. Crowns	1,311,700,000	\$264,438,720
Poland	Zloty	15,211,000,000	\$152,110,000
Sweden	Sw. Crowns	2,832,000,000	\$787,862,000

Taylor, Laurette (1887-1946), U.S. actress, was born April 1 in New York city and made her first stage appearance while still a child. In 1903 she went to the Boston Athenaeum, played in *His Child Wife* and in November of that year made her New York debut in *From Rags to Riches*. A leading player in a stock company for several years, she returned to New York in 1909 to play in *The Great John Ganton* and *The Ringmaster*; the following year, she made her first hit with her portrayal of Rose Lane in *Alias Jimmy Valentine*. Miss Taylor reached the top of the stage ladder with her performances as Peg in *Peg o' My Heart*, which was first presented in New York in 1912. During World War I, she starred in several successful plays written by her husband, J. Hartley Manners, including *Out There* (1917) and *Happiness* (1918). She was accorded considerable critical ac-

claim for her performance as Sarah Kantor in *Humoresque* in 1923, and as Rose Trelawny in *Trelawny of the Wells* (1925). Retiring from public life for several years, Miss Taylor returned to the stage in 1938 to play a small role in *Outward Bound*, but withdrew from the theatre once more until April 1945, when she co-starred with Eddie Dowling in *The Glass Menagerie*. Miss Taylor's performance in this play was lauded by New York critics as the best of the season. She died at New York city, Dec. 7.

Tea. The United States consumption of tea increased in 1946 to .64 lb. per capita which was almost up to the pre World War II average of .67 lb. consumed in 1935-39. The low year was 1943 when only .46 lb. was used. Imports in the year ending June 30, 1946, were reported at 86,586,000 lb. which was slightly less than the 89,542,000 lb. imported a year earlier. The supply was approaching the prewar level of about 90,000,000 lb. average although more than 100,000,000 lb. were imported in 1939-40. Although tea sold for 50% more per pound during World War II than in World War I the consumption per capita was not increasing at the same rate of population. Tea prices advanced late in 1946 in line with other prices. The allocation of tea supplies was under the Combined Food board acting through the Tea committee in London. (J. C. Ms.)

Telegraphy. During 1946 the shortage of materials, resulting from World War II and prolonged labour strife, continued to hamper progress in the program of placing important new developments in wide use in the telegraph industry. In spite of these handicaps, however, significant advances were made.

Carrier Telegraph Systems.—Maximum increased capacity of trunk lines was achieved by use of carrier systems. Telegraph carrier equipment superimposed a number of different frequencies on a single pair of wires, and thus made it possible to obtain as many as 36 independent telegraph circuits, capable of carrying 288 messages simultaneously, from a single pair of wires. A number of new intercity carrier systems were installed in 1946, and more than 200,000 mi. of carrier telegraph channels were in operation by the end of the year.

Reperforator Relay Switching System.—Further improvements were made in 1946 in the reperforator switching system that Western Union installed at major relay cities. The reperforator system eliminates manual retransmission and greatly speeds telegraph service. The improvements permit operators merely to touch the proper buttons to switch incoming telegrams to the desired outgoing circuits instead of using plugs and jacks. Considerable progress was also made in the development of fully automatic switching equipment which segregates, without manual assistance, the telegrams arriving on certain classes of incoming circuits and effects retransmission to destination.

Reperforator switching systems were in operation at Richmond, Va., Atlanta, Ga., St. Louis, Mo., Dallas, Tex., and Oakland, Calif. A reperforator switching unit at Philadelphia, Pa., was nearing completion and one at Cincinnati, O., was to be ready early in 1947.

Radio Beam Telegraph.—Radio beam transmission is perhaps the most significant advance of the decade in telegraphy. A beam system was in experimental use between New York city and Philadelphia, Pa., after Feb. 1, 1945, and construction of the first triangular radio beam network, between New York, Pittsburgh, Pa., and Washington, D.C., was well advanced. High radio towers were erected 30 to 50 mi. apart with an-

tennas equipped with parabolic reflectors to transmit the microwave signals in a narrow beam. A radio beam network to interconnect the major cities in the United States was planned.

Radio beam telegraphy was expected eventually to eliminate the need for the familiar pole lines and hundreds of thousands of miles of wire between main telegraph centres, and afford the ultimate in service continuity. Wires would continue in use to link tributary towns with the main beam centres. The beam system makes possible a vast increase in the number of channels or circuits ordinarily available for the handling of telegraph traffic. Through application of carrier systems to the beam, it is possible to send more than 2,000 telegrams in both directions simultaneously over a single system. Since atmospheric static is not felt in the microwave region, radio beam transmission is unaffected by these electrical disturbances. Service interruptions due to ice, high winds and falling trees are eliminated, and installation and maintenance of a beam system costs less than maintenance of the familiar pole line.

Telefax (Automatic Facsimile Telegraph).—By means of the telefax the public may transmit its own telegrams by dropping them into a slot just as letters are dropped into a mailbox. The machine automatically wraps the telegrams around a revolving cylinder in the telefax cabinet. An electric eye rapidly scans the handwritten message, and the telefax transmits it over the wire to a receiving machine where it arrives as a facsimile copy. Telefax operation is one of the methods employed for the transmission of telegrams between telegraph branch offices and main offices and between the offices of large firms and telegraph main offices. Telefax machines were expected to be placed in hotel lobbies, railroad stations, office building lobbies and air line terminals.

In 1946 facsimile transmission of messages was applied to radio when Western Union inaugurated a marine news reporting service between pilot boats in the outer New York harbour and its main office building in that city. Officers on the pilot boat write on slips of paper data regarding the arrival of vessels and place the slips in the transmitting cylinder of the telefax machine installed in the wheelhouse. The messages are sent by radio to Western Union's marine newsroom, where they are received in facsimile. The news is then flashed over the marine news ticker system to its subscribers. Such reports were previously obtained by stationing observers in a tower at the entrance to the bay where ship movements were observed by means of telescopes.

Another application of telefax to radio telegraphy is the telecar, a mobile delivery unit developed to speed the delivery of telegrams in outlying areas of large cities. A telefax unit, mounted in a vehicle which cruises about a prescribed area, receives telegrams by radio from the local main office of the telegraph company for delivery directly to addressees within that area. As soon as the address appears on the message, the "roving telegraph office" is on its way to make delivery.

Electronic Start-Stop Regenerative Repeater.—Teleprinter signals carried over long circuits must be "regenerated" to overcome distortion produced by electrical interference in telegraph lines. Regenerative repeaters formerly required some form of rotary commutating device to time the selection and retransmission of the signals. During 1946 a revolutionary regenerator, entirely electronic with no moving parts, was developed and placed in operation. The timing of the retransmitted signals is controlled by the propagation time of a transient pulse passing through a circuit network. This method of timing is inherently more precise than motor-controlled devices, hence greater accuracy is obtained. Since no moving parts are involved, maintenance requirements are reduced to a minimum. (J. L. E.)

Telephone. Unprecedented growth in scope of service, record strides in expansion of physical plant and significant developments in the communications art headlined the story of the telephone industry in 1946.

Spared of war's destruction to physical property, the United States—already with well over half of the world's telephones—saw its telephone industry make phenomenal gains. More new telephones were installed and more telephone equipment was manufactured than in any previous year. Telephone people from Maine to California drove toward the principal objective of catching up with the unfilled demand for service. This was a job that began with the backlog of wartime orders and continued to grow in magnitude as the postwar period brought an even heavier demand.

In nations ravaged by war, the first full year of peace following World War II was largely one of restoring and rebuilding telephone systems. And in most countries, the postwar demand for service exceeded the capacity of available facilities. Of the estimated world total of more than 54,000,000 telephones in service, about 42% were outside the United States.

The telephone industry in the United States moved forward on the largest expansion and improvement program in its history. Telephone manufacturers were turning out the needed apparatus faster than ever before despite shortages of materials, and the new equipment was rushed from the factories to local communities throughout the land where it was most needed. To make room for this equipment, new central office buildings were going up along with additions to existing buildings. At the same time enlargement of the outside wire and cable plant kept pace with the expansion of switching facilities.

INSTALLERS of the Western Electric company wiring crossbar frames for additional central office facilities in a midwestern city in the U.S. during 1946

More than 5,500,000 applications for main telephone service were taken care of in 1946. Included in this total were more than three-fourths of the orders on hand when the year began and more than two-thirds of those placed during the year. But so great was the sustained demand for service that year-end found the telephone companies in the United States still with long lists of waiting applicants. The number of telephones in service was increased by the record total of 3,800,000—more than double the net gain for any previous year—and yet there remained 2,500,000 unfilled orders for service, with the flood of new applications still continuing.

Because of the time required to manufacture and install the complex equipment needed to meet the demand, the telephone companies used every expedient possible to make available facilities serve more people. Existing equipment was stretched far beyond normal capacity in the effort to shorten the wait for as many applicants as possible.

To expand the telephone plant, operate it and meet the continuing demand for service required more people and more capital. The job of recruiting and training new employees attained major proportions. Securing the necessary capital for the expansion program was a subject of vital importance for management, employees and investors alike. Linked with the capital requirements was a move for increased rates to meet the higher operating costs.

Service.—The number of telephones in service in the United States reached a new high of 31,700,000 at the end of 1946. The nation's total included 25,700,000 Bell system telephones—a 12-month increase of about 3,300,000—and 6,000,000 telephones served by some 6,000 other companies.

Not only were new telephones installed at a previously unheard of rate, but the people of the U.S. were using their telephones more than ever before. Both local and long distance traffic exceeded even the heaviest wartime calling rates. Telephone conversations averaged 130,000,000 per day—an increase of about 19,000,000 over the daily average for 1945. Local conversations were up from 106,400,000 to 124,200,000 daily, while toll conversations increased from 4,900,000 to 5,800,000 per day.

Investment.—After three quarters of 1946, the investment in telephone plant and equipment stood at \$6,845,000,000. The increase from the first of the year was \$415,000,000. Of the total invested in telephone plant and equipment in the United States, the Bell system's portion on Sept. 30, 1946, amounted to \$6,085,000,000.

Personnel.—Also at a record level was the number of telephone employees. The number of men and women in the operating telephone companies reached 585,000. Of that total, some 500,000 were employed by the Bell system telephone companies. The total Bell system personnel, including 117,000 employees of the Western Electric company and 6,200 employees of Bell Telephone laboratories, numbered 625,000—an increase of 150,000 for the year.

Developments.—The year 1946 witnessed a number of significant developments in the extension and improvement of communications. By the end of the year the Bell companies had telephone service for motor vehicles and other mobile units in commercial operation in 25 leading cities of the United States. Rural telephone service over electric power lines was inaugurated in four states, with installations begun in two other states. Use of radio to link remote farms and ranches with the regular telephone system was begun on a limited scale in eastern Colorado.

The Bell system's coaxial cable network, intended primarily to provide additional long distance telephone circuits, was moving westward. And the over-all coaxial program, to be completed in the next few years, was increased to 12,000 route

miles. One pair of conductors within a coaxial cable can handle hundreds of telephone conversations simultaneously. The cable also is suitable for television transmission.

Between New York and Washington, the coaxial cable was used extensively during 1946 for experimental intercity transmission of television programs. This was the beginning of television network operation, by which one event or program can be broadcast simultaneously by widely separated television stations.

Extension of overseas telephone service between the United States and the rest of the world went forward steadily. With 1946 service extensions, telephone users in the United States were in touch with some 60 overseas countries and territories. The volume of overseas messages was running about ten times greater than in the highest prewar year. Overseas rates had been reduced about 40% below the prewar level. (W. S. G.)

Telescopes. The close of World War II brought a notable increase in the number of large telescopes planned for use in various parts of the world. Of especial interest were those for which financial provision had been made and the design was under consideration. For those listed the dimensions would necessarily be subject to some uncertainty until the design was completed.

The 120-in. reflecting telescope (F5) of the University of California was to form a part of the equipment of the Lick observatory and to be placed on Mount Hamilton. The design provides for a fork type of mounting and use of the telescope at three separate focal lengths.

The 100-in. Newton reflecting telescope, provided by the British government and named after the great inventor of the reflecting telescope on the occasion of the tercentenary of his birth, was probably to be located in southwest England and to co-operate with the observatories at Oxford and Cambridge.

The 100-in. reflecting telescope of the Kodaikanal observatory in northern India was to be provided by the Indian government. This telescope and that immediately following were expected to be of exceptional value to astronomy because of their climatic locations.

The 100-in. reflecting telescope of the Helwan observatory in Egypt was to be provided by the Egyptian government.

A large telescope of Schmidt type was being designed for the Stockholm and Upsala observatories in Sweden, with aperture

of the order of 40 in. and concave mirror about 60 in. in diameter. This would be the second largest Schmidt telescope hitherto designed.

Definite plans had not been completed in 1946 for several other large telescopes in Belgium, France, the soviet union and Turkey.

Optical figuring of the 200-in. mirror for the Palomar telescope and of the 74-in. Radcliffe mirror for Pretoria was nearing completion. The 60-in. telescope of the Cordoba observatory in Argentina was in regular operation. (W. S. Ad.)

Television. **United States.**—Declassification of many of the wartime television developments made these accomplishments available for public and commercial applications. Developments for guided missile control resulted in lighter weight camera equipment and more sensitive and rugged pickup tubes. As a direct result of this war activity more reliable and lighter portable camera equipment of high sensitivity was placed in commercial use for outside pickup, greatly facilitating the coverage of news and sporting events under adverse lighting conditions. This equipment incorporated the Image Orthicon pickup tube, publicly announced late in 1945. The use of this tube resulted in an even higher sensitivity than originally anticipated, and facilitated the use of turret lens systems wherein the tube and associated magnetic coils were moved longitudinally with respect to the lens system for focusing purposes.

Microwave relay equipment, having a power output of approximately 100 milliwatts at 7,000 megacycles (mc.), was developed for relaying television signals from remote pickup points to the television broadcasting station. Such relay systems, together with coaxial transmission lines, were used for networking of television stations. Television programs from Washington were viewed through the use of such networks in Washington, Philadelphia, New York, Albany and Schenectady.

Power gains from four to eight in the frequency band assigned to commercial television broadcasting were obtained by use of various turnstile type antennas having the necessary wide-band frequency characteristics required for television broadcasting.

Postwar television receivers, introduced during 1946, incorporated a number of improvements including the use of more flexible tuning arrangements, the addition of a radio frequency amplifier stage giving acceptable pictures with signal strengths in the region of 200 microvolts and the incorporation of automatic frequency control synchronizing systems giving increased immunity to noise and interference.

Many developments were made in television transmitting equipment, including increase in power output especially at the higher frequencies. Development of special tubes was in large part responsible for these advances. (See *RADIO: Scientific Developments*.)

Developments in television picture tubes resulted in the availability of tubes providing a highlight brilliance in the range of 60 to 100 foot lamberts. Conducive to such an increase was the development of an aluminum coating which acts as a mirror to cause the light which normally would be lost inside the picture tube to be reflected through the tube face as useful light. Development of high voltage systems utilizing the "kick-back" pulses from the horizontal deflection circuits made the higher voltages required for the aluminum coated tubes available on an economical basis for commercial receivers. The aluminum coating makes it possible to eliminate "ion-spot," the small discolored area on the screen, by absorption of ions. Another method for eliminating "ion-spot," incorporated in 1946 receiver picture tubes, was the use of an ion-trap gun so designed that both

PART OF A TELESCOPE being built at the Zeiss optical works at Jena, Germany, during 1946. Originally ordered by Hitler as a gift to Mussolini, the telescope was being completed for the soviet observatory in Leningrad

TELEVISION pickup of a basketball game in Madison Square Garden in New York city in 1946, giving a play-by-play account for the television audience. During the year television branched out to include practically all sports, indoors and out

the ions and electron beam normally would strike the neck of the picture tube, the electron beam being redirected to the axis of the tube so that it can then be deflected over the picture area in the normal manner.

In the postwar period experimentation on colour television was again resumed. During 1946 colour television images were broadcast by CBS using a sequential method and a transmitter operating on 485 mc. The standards employed were changed during the year from 120 fields to 144 fields and the channel width requirements increased to 16 mc. In each case the images in the three primary colours were transmitted sequentially to form a two-to-one, interlaced, 525-line picture. On Dec. 9, 1946, the Federal Communications commission began hearings on a CBS petition requesting establishment on a commercial basis of a proposed set of standards for colour television.

In the fall of 1946 the R.C.A. laboratories of the Radio Corporation of America demonstrated a simultaneous system of tri-colour television in which images in three selected component colours were transmitted simultaneously and reproduced by superimposing three separately produced images on a viewing screen. This system operated at 60 fields in each colour and produced 525-line pictures.

During 1946 a Radio Manufacturers' association-Radio Technical Planning board committee was active in the study of the various elements which are essential to a colour television system from the standpoint of standards. (B. E. Sp.)

Great Britain.—The television system of the British Broadcasting corporation resumed transmissions after six years' suspension on June 7, 1946, and the following day the Victory parade was televised as it moved through the streets of London. With the reopening of the public service, slight alterations were made to the hours and two sessions of approximately one and one-half hours daily were instituted (3 P.M. to 4.30 P.M. and 8 P.M. to 10 P.M.). The following appointments were made: chief of the television service, Maurice Gorham; director of programs, Denis Johnston; senior producers, G. More O'Ferrall

and Mary Adams; superintendent engineer, D. C. Birkinshaw; studio engineer, H. W. Baker; outside broadcast engineer, T. H. Bridgewater.

At a dealers' convention held earlier in the year it was stated that 50,000 sets would be available by the end of the year, but this figure was contingent on supply of raw material being available. The first postwar commercial receivers were on the market at £42 inclusive of tax.

France.—Reports from France indicated that television transmissions would be revived on 400-lines definition, but experimental work had been carried out on 1,000-lines definition. The Compagnie Française de Télévision demonstrated this high-definition system on a cathode ray tube of 15-in. diameter, and at a distance of 8 ft. the quality was stated to be equal to that of an ordinary ciné film. The German occupying forces had built a television studio with seating for 250 people and had fitted it throughout with *Fernseh* equipment to give 441-lines definition. Public service was expected on 450 lines. (G. P.)

Tellurium. The production of tellurium in the United States increased from 69,025 lb. in 1944 to 80,750 lb. in 1945, but sales advanced only from 45,323 lb. to 60,328 lb. and stocks rose to 183,527 lb. In Canada production increased sharply from 10,166 lb. in 1944 to 42,000 lb. in 1945. Several other countries were producers on a smaller scale, but no figures were available in 1946. (G. A. Ro.)

Temporary Controls, Office of: see CIVILIAN PRODUCTION ADMINISTRATION, OFFICE OF; PRICE ADMINISTRATION, OFFICE OF.

Tennessee. A south central state, 16th to enter the union, called the "Volunteer state." Land area 41,961 sq.mi., water area 285 sq.mi. Population (1940) 2,915,841; rural 1,888,653; urban 1,027,206; rural farm 1,271,944; native white 2,395,586; Negro 508,736; foreign-born 11,320; other races, 199. The bureau of the census estimated the civilian population on July 1, 1945, at 2,832,480. Capital, Nashville (167,402). Other cities include Memphis (292,942); Chattanooga (128,163);

Knoxville (III,580).

History.—Governor of Tennessee in 1945-46 was James Nance McCord; secretary of state, Joe C. Carr; state treasurer, C. C. Wallace; comptroller of the treasury, J. J. Maddux; adjutant general, G. H. Butler; attorney general, Roy H. Beeler. Commissioners were as follows: agriculture, O. E. Van Cleave; conservation, Paul S. Mathes; education, Burgin Dossett (superintendent of schools, appointed by governor); finance and taxation, George F. McCannless; highways and public works, C. W. Phillips; institutions, Dr. W. O. Baird; welfare, William A. Shoaf; insurance and banking, James M. McCormack; labour, W. E. Jacobs, Sr.; public health, Dr. R. H. Hutcheson; railroad and public utilities, Andrew T. Taylor, Leon Jourlman, Jr., John Hammer; safety, Lynn Bomar; employment security, W. O. Hake. James N. McCord was re-elected governor in the 1946 elections.

Education.—In 1945, of 5,004 elementary schools, 1,367 had three or more teachers; the number of one-teacher schools declined from 3,555 in 1927 to 2,366 in 1945. Enrolment in elementary schools in 1945 was 498,724. There were 546 high schools with a total enrolment of 111,825; the number of teachers, 5,097.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Sept. 1946, the total amount of assistance was \$1,022,755; 38,974 old-age recipients received \$638,788; aid to dependent children, 31,726 (11,956 families), totalled \$351,630; aid to the blind, 1,605, amounted to \$32,337. In 1945-46 there were eight correctional institutions; expenditures \$1,740,978. Separate schools were maintained for the blind, the deaf and the underprivileged; three state hospitals for the insane; a home and training school for feeble minded.

Communications.—Of 64,204 mi. of public road, 7,541 mi. were state highways; state expenditures were \$13,057,861 for the year ending June 30, 1946. There were 3,513 mi. of railroads in Dec. 1945. As of Nov. 1946, there were 1,007 mi. of designated civil airways and 59 urban airports, of which one was class V, three class IV, six class III, 19 class II, and 30 class I—class V accommodating the largest planes. There were 369,100 telephones in the state, 247,700 residential and 121,400 business. Water-borne commerce on the Tennessee river in 1944 amounted to 2,347,667 short tons; Cumberland river 774,241, Mississippi river 13,115,914 short tons from Ohio river to Baton Rouge, La., and 3,437,270 at Memphis.

Banking and Finance.—In June 1946 there were 70 national banks, and 223 state banks; assets \$1,346,831,000 for national and \$611,018,732 for state banks; deposits \$1,277,381,000 for national banks and \$575,464,879 for state banks. Savings and loan associations, Dec. 31, 1946, numbered four with assets of \$555,779.

Total state revenue for the fiscal year 1945-46 was \$68,798,065; revenue shared with counties and cities, \$9,834,199; revenue for state purposes, \$58,963,867. Direct bonded debt for the state was \$73,440,000; highway reimbursement debt \$5,606,122; gross debt \$79,046,122; unencumbered surplus in sinking fund \$3,395,404; net debt \$75,650,718.

Agriculture.—There were 234,431 farms in 1945; 17,849,455 ac. in farms, and 5,845,145 ac. in harvested crops. Gross value of agricultural production in 1945 was \$435,833,000; cash

farm income, \$336,145,000 (including government payments); cash farm income from crops was \$162,395,000; from livestock and livestock products \$161,205,000; government payments to farmers \$12,545,000. Gross farm income from crops was \$197,288,000 in 1945. The forest area was about 14,000,000 ac.

Manufacturing.—In 1946 it was estimated that around 3,000 manufacturing plants yielded products valued at \$1,375,000,000 of which \$600,000,000 was added by manufacture. The number of wage earners increased from 107,645 in 1925 to 267,000 in 1945, wages paid in 1945, \$507,300,000. In June 1946, 234,900 persons were working in Tennessee factories.

Mineral Production.—The total value of principal minerals

Table II.—Principal Mineral Products of Tennessee, 1945 and 1944

Mineral	Value 1945	Value 1944
Coal	\$23,034,000	\$23,088,000
Stone	6,318,915	7,776,775
Zinc	2,969,801	9,309,468
Cement	4,669,330	6,080,921
Sand and gravel	2,578,379	2,314,478
Clays, bolls, fire, and miscellaneous	1,196,498	1,500,000
Lime	1,373,268	1,246,802
Barite	256,756	279,567

produced in Tennessee in 1945 was \$42,396,947. (C. E. A.)

Tennessee Valley Authority. The TVA multiple-purpose system of dams met its most severe test in flood control operation in Jan. 1946 when it reduced by 10 ft. the crest of a flood which, uncontrolled, would have been the fifth largest in the history of Chattanooga, Tenn., and probably the most destructive in the city's history. By holding the potential crest of 45.8 ft. to an actual stage of 35.7 ft., the TVA dams and reservoirs averted an estimated \$10,000,000 damage. Actual damage was about \$90,000. At the height of the flood, the reservoir system retained storage space to regulate even greater flows had the heavy rains continued.

A second flood of less magnitude in February was regulated to the point of no damage. Flood stages on the lower Ohio and Mississippi rivers were not excessive, but regulation of the flow of the Tennessee reduced crests at Paducah, Ky., and Cairo, Ill., by 1.5 ft. during the two floods.

The integrated resources development activities of TVA, under the TVA act passed in 1933, were reoriented fully to peacetime objectives of water control both on the land and in the river. At the TVA chemical plant at Muscle Shoals, Ala., emphasis again was placed on development and experimental production of soil mineral plant nutrients, principally phosphates, for use in soil and water conserving types of agriculture. However, heavy production of ammonium nitrate fertilizers was continued in order to help meet the demand for increased agricultural production in view of the world food shortages. It was revealed in 1946 that TVA had supplied about 60% of the 98,000 tons of elemental phosphorus made available to the armed forces in World War II and that TVA research in electric furnace production methods was largely instrumental in enabling industry to produce the other 40%. Only about 1,000 tons of phosphorus was available to the armed forces for munitions use in World War I.

The number of test demonstration farms using TVA phosphate fertilizers in readjusted farming systems designed to conserve water and soil resources increased to 38,900, located in 29 states. Among results reported by state agricultural extension services which supervise the test demonstrations was a study of 31 farms in north Georgia which in 1935 obtained their principal income from cotton. The study showed that in the ten-year period from 1935 to 1944 changes significant in the problem of reconversion of the cotton south had been made. Acreages of cotton and corn had been reduced but yields had increased.

Table I.—Leading Agricultural Products of Tennessee, 1946 and 1945

Crop	1946*	1945
Corn, bu.	72,810,000.	66,204,000
Tame hay, tons	2,455,000	2,658,000
Cotton, bales	540,000	566,000
Wheat, bu.	4,980,000	5,235,000
Tobacco, lb.	141,845,000	141,940,000
Potatoes, bu.	3,471,000	3,440,000
Sweet potatoes, bu.	2,800,000	2,850,000

*Estimated.

Pastureland and small grain acreages, conserving soil and water, had increased, and increasing feedstuff production was reflected in nearly double the number of cattle and increases in other livestock.

TVA power production fell off after V-J day, but by the middle of 1946 wartime peak records were being exceeded and total production in the fiscal year ended June 30, 1946, exceeded 12,-000,000.000 kw.hr. of electricity. Large amounts of hydro power were delivered to interconnected electric systems under interchange agreements. Gross power revenues were \$35,265,000, somewhat less than in the previous fiscal year. Net income from power operations was \$16,214,000. The return on the average net power investment was 4.2%.

The combined gross revenues of the 138 municipal and co-operative electric systems which distribute TVA electricity was more than \$43,500,000, and the net earnings were \$8,280,000. The locally owned and operated systems sold nearly 3,400,000,-000 kw.hr. The average use per residential consumer for the fiscal year was 1,902 kw.hr. and the average cost per kw.hr. was 1.78 cents, as compared with national averages of 1,290 kw.hr. and 3.31 cents. Plans had been made and embarked upon to construct about 35,000 mi. of line to serve 150,000 new consumers, most of them on farms. On June 30, 1946, 669,000 consumers were being served. Rate reductions saving consumers \$880,000 annually were made during the fiscal year.

More than 256,000,000 ton-miles of traffic moved on the Tennessee in 1945, 31% more than in the previous record year of 1943, and the construction of new terminal facilities on TVA reservoir shores by private interests indicated rapidly increasing future growth. Shipment of automobiles was resumed and traffic in coal, grain and petroleum products increased.

In forestry activities, 4 large forest demonstrations and 56 farm woodland demonstrations, emphasizing sustained yield forest management, were established by private owners with TVA and state assistance and considerable progress was made in extending forest fire control.

In Dec. 1945 TVA paid into the general fund of the U.S. treasury about \$12,600,000, representing excess of receipts over requirements of programs financed from revenues. For the 1947 fiscal year, congress appropriated funds to resume construction on Watauga and South Holston dams, which would be the 17th and 18th to be built by TVA. Total appropriations from 1933 to June 30, 1947, were \$717,523,270. TVA employment on June 30, 1946, totalled 11,169.

In Oct. 1946, President Harry S. Truman appointed Gordon R. Clapp, TVA general manager from 1939, as chairman of the board to succeed David E. Lilienthal, who was appointed chairman of the Atomic Energy commission. The other TVA directors were Dr. Harcourt A. Morgan and James P. Pope. (See also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

(K. R. K.)

Tennis. Lawn tennis was completely resumed in most countries in the summer of 1946. The majority of prewar tournaments were held, and large crowds attended. The matches for the Wightman cup were contested at Wimbledon, England, after an interruption of six years, and won by the United States on June 14 and 15, seven matches to none. The English championships, held at the end of the month before large crowds, resulted in a victory for Yvon Petra, French star, in the men's singles. Petra was the first Frenchman to triumph at Wimbledon from the time Henri Cochet took the title in 1929. The men's doubles were won by John A. Kramer and Tom Brown of California, and the women's singles by Miss Pauline Betz, also of the United States.

For the first time after 1939, matches for the Davis cup were

JACK KRAMER, who won the national men's singles amateur tennis championship on Sept. 8, 1946, is shown racing in for a shot during the 20th annual Pacific Southwest tournament on Sept. 29, in which he also won the men's singles championship

also resumed. Sweden won the European zone, defeating Yugoslavia in the final round. The United States took the American zone, and then defeated Sweden five matches to none on Sept. 13, 14 and 15, at the West Side Tennis club, Forest Hills, L.I., N.Y.

The challenge round of the Davis cup was held at the Koo-yong stadium, Melbourne, Australia, on Dec. 26, 27 and 30, before crowds of 14,500. It resulted in an unexpected and decisive victory for the United States, the challenging nation, five matches to none. Not for years had a victory in international tennis been so one-sided.

The U.S. captain chose as his team two Californians, singles and doubles champions of the United States, Frederick R. Schroeder, who won the title in 1942, and John A. Kramer, who was victorious in 1946. Together they won four of the five matches. Schroeder began by defeating John Bromwich of Australia in five sets; the first and fourth being the only sets dropped by the United States in the three days' play. Kramer then beat Dinny Pails, and to the general surprise, the two Americans conquered the veteran Australian pair of Bromwich and Adrian Quist in straight sets on the second afternoon. It was the first defeat of an Australian team in doubles in a challenge round match from 1924.

The two remaining contests on the last day were easy victories for the U.S. side. Kramer beat Bromwich and Gardnar Mulloy, substituting for Schroeder, defeated Pails. Each match was won in three sets. Thus after an absence of seven years the Davis cup was again returned to the United States. It was the 13th time the United States had been victorious in the 34 years of play from the time the matches were started in 1900.

More than 62,000 spectators witnessed the 65th national singles championships held as usual at Forest Hills, L.I., beginning Aug. 31. Tom Brown, who was the tennis sensation of the sea-

son, defeated Frank Parker, champion in 1944 and 1945, in the round of eight, while Kramer defeated Don McNeill, champion in 1940, in the same round. In the finals, Kramer defeated Brown in straight sets, 9-7, 6-3, 6-0.

Mrs. Sarah Palfrey Cooke did not defend her title in 1946, and it was recaptured by Miss Pauline Betz who won it from 1942 to 1945 inclusive. She beat Miss Doris Hart in two sets, 11-9, 6-3. The doubles title of the United States was won by William Talbert and Gardnar Mulloy, who beat McNeill and Frank Guernsey, 3-6, 6-4, 2-6, 6-3, 20-18. (J. R. Tu.)

Texas. A west-south-central state of the United States, admitted to the union as the 28th state, Dec. 29, 1845. Popular name, "Lone Star state." Area, 263,644 sq.mi. of land, and 3,695 sq.mi. of inland water area. Population (1940) 6,414,824; white, 5,487,545; Negro, 924,391; other, 2,888. Native, 6,179,296; foreign born, 235,528. U.S. estimate of total population, July 1, 1946, 6,786,740. Principal cities with 1940 population: Houston (384,514); Dallas (294,734); San Antonio (253,854); Fort Worth (177,662); El Paso (96,810); Austin (capital) (87,930). Houston and Austin gained an estimated 30% and the other four cities about 25% after 1940.

History.—The year 1946 was characterized by continued readjustment of wartime to peacetime industry with reshifting of population to the rural areas, although the 500,000 migration from the country during the World War II period still remained largely concentrated in the cities. There was no session in 1946 of the biennial legislature. Chief political interest was in the governor's race in the Democratic primaries in which Beauford H. Jester was nominated in the runoff primary over Dr. Homer P. Rainey by a vote of 700,178 to 361,178. Because of the dominance of the Democratic party in Texas, nomination in it means election. There was intense public interest in the campaign because it was the culmination of a controversy between Dr. Rainey, who was deposed as president of the University of Texas in 1944, and the university board of regents.

At the general election, Nov. 5, and at a special election, Nov. 7, four constitutional amendments were adopted: (1) providing for issuance of \$25,000,000 in state bonds to assist war veterans to buy farms; (2) providing for a pension system for state employees; (3) restricting revenue from the gasoline tax to use in highway construction; and (4) allowing payment to a construction contractor for a state building whose contract had been voided by court decision. Principal state officers for the official biennium including the calendar years, 1947 and 1948, were: governor, Beauford H. Jester; lieutenant governor, Allan Shivers; attorney-general, Price Daniel; comptroller of public accounts, George H. Sheppard; treasurer, Jesse James; and superintendent of public instruction, L. A. Woods. Members of the state railroad commission, having jurisdiction over oil production and oil and gas pipelines, were Chairman Olin Culberson, Ernest O. Thompson and William J. Murray.

Education.—Scholastic population (6-17 years) was 1,498,306; average enrolment was 1,068,000. There were 1,075 independent and 4,500 common school districts. Total expenditures for public schools were \$157,000,000. The outstanding educational problem was the scarcity of teachers, resulting in an increase to \$1,500 of average salaries, a considerable advance over preceding years. There were approximately 37,000 classroom teachers. The state's higher educational system is headed by the University of Texas, and there are ten other state colleges of senior rank and a number of state and local supported junior colleges.

Social Insurance and Assistance, Public Welfare and Related Programs.—There were 185,983 persons on the old-age assistance rolls at the end of the fiscal year, Aug. 31, 1946.

BEAUFORD H. JESTER, elected governor of Texas on the Democratic ticket, Nov. 5, 1946

Payments averaged \$23.55. However, this was increased to \$27.35 at the beginning of the new fiscal year with provisions for another increase in early 1947. There was an average of approximately 24,000 children representing 11,000 families drawing assistance to dependent children, with an average per family of \$21. Approximately 4,800 blind persons drew an average pension of \$25. The state maintains institutions for blind, deaf and dumb and orphan children, in addition to a number of hospitals

for the insane and mentally handicapped.

Transportation and Communication.—In the fiscal year ended Aug. 31, 1946, the state expended \$43,315,184.94 for highway improvement and maintenance, and ended the year with a balance of \$23,808,348.88. The highway system of Texas consists of 25,000 mi. of improved designated highways and approximately 170,000 mi. of local roads in varying degrees of improvement. The rail system of the state at the end of the fiscal year ended Aug. 31, 1946, consisted of 15,591 mi. of first-main line and 21,454 mi. including second-main line and terminal facilities. Shipping through Texas ports during the calendar year 1945 amounted to 395,888 short tons of imports and 15,496,784 of exports; and 4,322,911 tons of receipts and 33,465,343 tons of shipments in coastwise trade.

Agriculture.—Texas had 384,977 farms; according to the census of 1945, with total acreage of 142,111,737, an average of 369.1 ac.

Table I.—Leading Agricultural Products of Texas, 1946

Crop	Acreage	Production	Value
Cotton lint (bales)	6,100,000	1,650,000	\$278,025,000
Wheat (bu.)	5,992,000	62,916,000	115,136,000
Corn (bu.)	3,236,000	55,012,000	83,618,000
Sorghum for grain (bu.)	4,613,000	73,742,000	103,976,000
Cottonseed (tons)	681,000	49,032,000
Rice (bu.)	412,000	17,716,000	38,798,000
Oats (bu.)	1,653,000	36,366,000	33,457,000
Grapefruit (boxes)	25,500,000	21,675,000
All other crops harvested	5,715,000	...	222,305,000
Total	27,721,000	...	\$946,022,000

Table II.—Number and value of Livestock in Texas, Jan. 1, 1946

Livestock	Number	Value
All cattle	8,058,000	\$453,459,000
Milk cows only	1,575,000	118,125,000
Hogs	1,857,000	34,005,000
Sheep	9,868,000	71,818,000
Goats	3,325,000	15,794,000
Horses	531,000	27,327,000
Mules	324,000	23,920,000
Chickens	34,134,000	36,523,000
Turkeys	959,000	4,699,000
Total	60,633,000	\$785,670,000

Mineral Production.—Total value of mineral production in 1946 was estimated at \$1,300,000,000. The bulk of this value came from petroleum production of 760,000,000 bbl. with an approximate value of \$920,000,000. Sulphur production was 2,945,199 tons. Other leading minerals were natural gas, natural gasoline, salt, stone and Portland cement.

Manufacturing.—The latest census, 1940, of manufacturing enumerated 5,376 manufacturing plants in the state with 126,996 wage earners drawing \$128,138,703 wages with a production

of \$1,530,220,676 total value of products. The industrial boom of the war period brought this to a peak of 380,000 wage earners and \$6,500,000,000 of products in 1944. Unofficial estimate for 1946 was 225,000 wage earners with \$4,100,000,000 value of products.

Banking and Finance.—Assets of Texas' 850 banks as of Sept. 30, 1946, were \$5,864,676,000. Of this total, 417 state banks had assets of \$1,041,390,000; 433 national banks, \$4,823,286,000. Total demand and time deposits were \$5,541,308,000, of which \$985,497,000 were in state banks; \$4,556,211,000 in national banks. (S. McG.)

Texas, University of. A coeducational institution of higher education at Austin, Tex., with seven schools and colleges and a graduate school. The 64th annual session opened Sept. 16, 1946, reverting to the two-semester prewar basis from the tri-semester wartime basis. There were more than 17,000 students enrolled, including more than 10,000 veterans of World War II. Emphasis was given to mathematics, natural sciences, engineering, business, law, social sciences and graduate work in all fields in which interest was shown by the veterans, and additional special housing was provided for this group within the resources of the institution. The navy V-12 training program in operation from July 1943 gave way to naval R.O.T.C. training on a prewar basis. The fourth co-operative summer field school was held in Mexico City in 1946 under the joint direction of the University of Texas Institute of Latin American Studies and the National university of Mexico, and the program of teaching of English as a second language was continued with a special six weeks' program for teachers. The medical school is located at Galveston, Tex., the dental school and the M. D. Anderson Hospital for Cancer Research are both in Houston, Tex., the college of mines and metallurgy is in El Paso, Tex., all of which are branches of the University of Texas. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (T. S. P.)

Textile Industry. The textile industry in the United States continued to enjoy a boom condition in production, prices and profits. It, in common with other consumer-goods industries, received more than its normal share of the national income. This was because of the still restricted output of durable goods, both consumer and capital, resulting from technical and labour difficulties involved in conversion of the latter industries from World War II status. Such problems were relatively minor in textile manufacture.

Textile-mill activity in 1946 increased approximately 5% over 1945. Profits of the industry showed a greater percentage gain than in any other major industry. That this could not be maintained indefinitely was apparent to students of the industry.

From the consumer's standpoint, the prospect was for more durable and versatile fabrics, at lower prices. Technical advance, through World War II research, promised more new fibres, and new mechanical and finishing processes, all of which were expected to react to the benefit of the consumer.

Within the industry, the march of the synthetics continued. Production of rayon and other synthetic fibres reached a new all-time high record in 1946. That even the relatively new but already old-line rayons faced increased competition themselves was indicated by the operation in 1946 of what was believed to be the first loom producing exclusively plastic-yarn fabrics.

From other countries, particularly those awakened to industrial consciousness, came the threat of sharp competition to the relatively high-wage textile industries of the United States. A typical example was Brazil, where approximately 400,000 work-

ers were engaged in textile manufacture and where production of fabrics for domestic use and for export assumed each year a more important role in the national economy. (D. G. Wo.)

Great Britain and Europe.—Before World War II, intensive research on the production of synthetic fibres had culminated in the synthesis of nylon in the United States. The remarkable properties of this new fibre stimulated research in other countries and, with the end of the war, an interesting new synthesis of nylon-like fibres in Germany was revealed. The name of the new material, which was similar to nylon in strength and dyeing properties, was Perlon L. Among other new fibres produced in Germany was Perlon U, a polyurethane; its chief use seemed to have been in the manufacture of bristles.

There was greater interest in modified nylons with high extensibility and an elasticity almost equal to that of rubber. Fibres of this type were likely to find extended use in the manufacture of underwear. Their elastic properties were similar to those of rubber but, unlike rubber, they absorbed and transmitted water vapour.

The Calico Printers' Association, Ltd., and Imperial Chemical Industries, Ltd., also announced the production of a new rayon, Terylene, from terephthalic acid and ethylene glycol. Fibres were obtained from the melted polymer by extrusion and subsequent cold drawing, just as in the case of nylon. Their properties were reported to be promising from a textile point of view.

As regards the older fibres, E. Race, following up earlier work on the proofing of cotton against attack by bacteria and fungi, developed a similar process for wool. It consisted in impregnating the material with a solution containing cuprammonium, potassium chromate and Permalin PW, followed by washing and drying at a moderate temperature.

Interest in the treatment of wool to minimize shrinkage during laundering continued, the latest process being one in which the fabric was treated with an acid solution of potassium permanganate. (See also COTTON; RAYON AND OTHER SYNTHETIC FIBRES; WOOL.)

Theatre. U.S.—The theatre in the U.S. in 1946 continued apace. Not only in New York but in the other cities was its prosperity undiminished. The small suburban and rural theatres which operated during the summer season reached the record number of 99; the college theatres bloomed afresh with the war now a thing of the past; the library theatres in the metropolis, designed to give the younger members of the Actors Equity association an opportunity to show their talents, proceeded happily about their business; and the impulse to create community and civic theatres in various sections of the nation indicated a hopeful resolve.

As in the directly previous years, the general quality of the new plays offered in the professional theatre left, however, much to be desired. Under the circumstances, the re-emergence of Eugene O'Neill after an absence of more than 12 years with one of the best plays of his career, *The Iceman Cometh*, came as a critical blessing. Dealing with social outcasts quartered in a low saloon in the New York of 1912 and vaguely suggesting the tone of Maxim Gorki's memorable *The Lower Depths*, it brought to the native drama the token of importance that latterly it had lacked, and reaffirmed its author's position as the foremost U.S. dramatist. Though nothing else was in any

SCENE from the third act of "State of the Union," a comedy by Russel Crouse and Howard Lindsay. It was awarded the Pulitzer prize on May 6, 1946, for the best original American play of the 1945-46 season

way dramatically comparable, there were several exhibits which were to be endorsed on a lesser level. Among these were a production of the Chinese classic, *Lute Song*, handsomely staged by Robert Edmond Jones; an amusing comedy, *Born Yesterday*, by Garson Kanin; one of George Kelly's intelligent and superior comedies on the fair sex, *The Fatal Weakness*; and at least, though critical failures, strivings toward merit by Maxwell Anderson and Lillian Hellman in, respectively, *Joan Of Lorraine* and *Another Part Of The Forest*.

In the alleged absence of new play manuscripts of worth, many revivals of old plays were rushed into production. Among these were George Bernard Shaw's *Candida*, with Katharine Cornell and Cedric Hardwicke; Molière's *The Would-Be Gentleman* in a very free version, with Bobby Clark; Oscar Wilde's *Lady Windermere's Fan*, Shakespeare's *The Winter's Tale*, along with a production of his *Henry VIII* by the newly founded American Repertory Theatre, which also offered Henrik Ibsen's *John Gabriel Borkman*, James Barrie's *What Every Woman Knows* and Shaw's *Androcles And The Lion*; Edmond Rostand's *Cyrano de Bergerac*, with José Ferrer; Aristophanes' *Lysistrata* with a Negro cast which woefully botched it; Leonid Andreyev's *He Who Gets Slapped*; John Webster's *The Duchess Of Malfi*, with Elisabeth Bergner; and John Synge's *The Playboy Of The Western World*, with Burgess Meredith. There were also such items as Ben Hecht's and Charles MacArthur's *The Front Page*, the Waters-Hopkins *Burlesque*, and Verneuil's *Jealousy*, retitled *Obsession*. The Old Vic Theatre company, imported from England, added to the revival list the two parts of *Henry IV*, *Oedipus*, Richard Sheridan's *The Critic* and Anton Chekhov's *Uncle Vanya*.

In the musical department, the better shows were Irving Berlin's and the Fields' *Annie Get Your Gun*, with Ethel Merman in the stellar role; *Call Me Mister*, an original and often witty affair involving former G.I.'s; an excellent revival of Jerome Kern's memorable *Show Boat*; and a likeable Negro show, *St. Louis Woman*. The general run, however, save for *Gypsy Lady*, which at least enjoyed a revival of Victor Herbert's scores for *The Fortune Teller* and *The Serenade*, were feeble and worse, embracing such lowlights as a snide revival of Sigmund Romberg's *The Desert Song*, a quick failure called *Nellie Bly* with William Gaxton and Victor Moore; a calamity known as *The Duchess Misbehaves* which expired after five performances; a minor revue, *Three To Make Ready*, relieved only by Ray Bolger's expert dancing; Orson Welles' poorly organized *Around The World* with a weak score by Cole Porter; a wretched revival of Franz Lehár's *The Land Of Smiles* renamed *Yours Is My Heart* which offered Richard Tauber as its

sole excuse; and the surprisingly inept *Park Avenue* by Nunnally Johnson and G. S. Kaufman.

The new foreign plays included Terence Rattigan's *O Mistress Mine*, a worthless comedy upon which the Lunts expended their talents; a modern paraphrase of Sophocles' *Antigone* by Jean Anouilh which failed to come off and which disappointed Katharine Cornell's high hopes for it; a juvenile treatment of the Mary Magdalen theme by Ernest Milton; a disastrous mystery play, *Hidden Horizons*, by Agatha Christie; a seedy sex comedy by Noel Coward called *Present Laughter*; and a study of tortured egos and sex in the Strindberg-Wedekind manner by the French apostle of Existentialism, Jean-Paul Sartre.

Of the better-known U.S. playwrights, Maxwell Anderson, in addition to the lacklustre *Joan of Arc* item called *Joan of Lorraine*, offered a windy, adolescent dramatic essay on the problems of returned servicemen titled *Truckline Café*. Robert Ardrey, treating in turn of the problems of a returned Negro serviceman, wrote in *Jeb* a moderately effective play, but one which suffered from thematic overdoing. Bella and Samuel Spewack came overnight croppers with a rubbishy farce called *Woman Bites Dog* satirizing an isolationist newspaper group; and Hecht and MacArthur hit the low watermark with *Swan Song*, a murder melodrama embroidered with schoolboy animadversions on art and criticism. A further contribution by Hecht, *A Flag Is Born*, was an overwrought, hysterical and tedious pageant designed in behalf of the American League For A Free Palestine. Moss Hart's appearance was with a highly emotional box-office excursion into the psyche of the child of divorced parents called *Christopher Blake*.

The two leading metropolitan experimental groups managed nothing of any account. In addition to the Milton failure noted, The Blackfriars offered a negligible "tragedy of manners" by Edwin M. Bronner titled *A Young American* and a feeble Irish comedy, *Derryowen*, by Michael O'Hara; while the American Negro Theatre contented itself with a wholly negligible item, *The Peacemaker*, by one Kurt Unkelbach.

That the public was beginning to be surfeited with propaganda drama became increasingly evident. S. N. Behrman's *Dunnigan's Daughter*, with its anticapitalistic theme, which was produced at the close of the previous year, managed to extend into 1946 with a total of but 37 performances, and to a heavy investment loss. *Home Of The Brave*, by Arthur Laurents, dealing with racial prejudice, collapsed despite a generally favourable critical press. The previously noted *A Young American*, inveighing against prejudice toward the Negro, lasted for only 22 performances, and the also noted *Jeb* for but 9. *Truckline Café* expired after 13 showings, and Don Appell's harangue against anti-Semitism, *This, Too, Shall Pass*, would have closed

overnight had not sympathizers rushed to its aid with sustaining funds, which at that prolonged its life but for a short time. And *On Whitman Avenue*, Maxine Wood's plea for equality for the Negro, survived only by the grace of cut-rate tickets.

Among the better-known actors and actresses, aside from those already mentioned, Helen Hayes reappeared in an indifferent comedy by Anita Loos called *Happy Birthday*; Louis Calhern made himself up to look like Oliver Wendell Holmes in a slipshod biographical play by Emmet Lavery titled *The Magnificent Yankee*; Walter Huston expended his efforts on a dated yokel comedy, *Apple Of His Eye*, by the Messrs. Kenyon Nicholson and Charles Robinson; and Cedric Hardwicke did himself proud in the Cornell productions of *Antigone* and *Candida*. Dennis King, essaying the role of the clown in *He Who Gets Slapped*, found himself at sea in it; Oscar Karlweis brought his comedy talents successfully to the unsuccessful *I Like It Here*, by A. B. Shiffren; Laurence Olivier and Ralph Richardson captured the public in the Old Vic repertory; Ruth Chatterton failed miserably in something called *Second Best Bed*; and Paul Muni, returning briefly from Hollywood, vouchsafed his vocal and manual undulations to *A Flag Is Born*.

Ferrer's *Cyrano* was of varying quality; Dudley Digges stood out from the rest of the cast of *The Iceman Cometh*; Elisabeth Bergner's Duchess in the Webster drama was a symposium of artificialities; Clifton Webb did what he could to imitate the Coward manner in the latter's *Present Laughter*; Eva Le Gallienne, Victor Jory and Margaret Webster exerted themselves in their customary manner in the interests of the newly founded American Repertory Theatre; Ina Claire turned in a brilliant comedy performance in *The Fatal Weakness*; and the screen actress, Ingrid Bergman, at least supplied visual beauty, if not experienced dramatic acting, to *Joan Of Lorraine*.

In conclusion, *Tobacco Road* played its 13th prosperous season on the road; *Life With Father* entered its eighth year of steady performances; and those old musical exhibits, *The Student Prince* and *Blossom Time*, continued still to operate at a profit outside New York after these many years. (G. J. N.)

Statistics of the Theatre in New York City, 1946 and 1945

	1946	1945
Productions	110	107
Musical comedies	28	29
Plays	82	78
Premieres	68	71
Successful productions	19	18
Performers employed	2,026	2,047
Tickets sold	8,600,000	8,840,000
Approximate cost of production	\$5,000,000	\$4,000,000
Number of shows booked for other cities	87	74

Great Britain.—To take light matters first, the events of the year were the triumphant return to revue in London of Beatrice Lillie in *Better Late*, the popular combination of Jack Hulbert and Bobby Howes in *Here Come the Boys*, the huge success of Cicely Courtneidge in a gay "musical" called *Under the Counter* and the intimate revue, *Sweetest and Lowest*, enjoyed the favour shown to its two predecessors.

In the more serious drama the "Old Vic" remained established at the New theatre, except for an early summer visit to New York which was successful. For its autumn program the "Old Vic" chose the bleakest of Shakespeare's tragedies, *King Lear*, a piece of rather faded French romanticism, Rostand's *Cyrano de Bergerac*, and a quiet piece of modern English realism, *An Inspector Calls*, by J. B. Priestley. This was a nicely balanced program and gave first-rate opportunities to its two leading players, Laurence Olivier as Lear and Ralph Richardson as *Cyrano* and the Inspector.

A feature of the year was the number of classical novels seen in dramatic adaptation. Of the English classics, versions of *Jane Eyre*, *Sense and Sensibility* and *Vanity Fair* were offered, and both the major Dostoevski stories, *The Brothers Karama-*

SCENE from "Lute Song," which was produced in the U.S. during 1946 by Michael Myerberg, showing part of the unusual scene design. It was adapted from the famous 14th century Chinese drama *Pi-Pa-Ki*

zov and *Crime and Punishment*, were presented. John Gielgud chose the latter for his main appearance of the year and gave a fine performance as the embittered student.

Terence Rattigan, a dramatist who rarely makes a mistake, contributed a dramatization of a well-known English law case under the title of *The Winslow Boy* and this was the "hit" of the year as far as straight plays were concerned. Plays of the seamy side of life included *No Room at the Inn*, an exposure of the modern baby-farmer, and *Pick-up Girl*, a relentless study of what is officially called "juvenile delinquency."

The Shakespeare festival at Stratford-on-Avon, under the direction of Sir Barry Jackson of the Birmingham repertory, proved very popular and new methods and personalities were employed to freshen and enliven what had come to be something of a cultural routine. It was plain, from his work elsewhere as well as at Stratford, that the name of Peter Brook was likely to become important in the English theatre.

The Liverpool repertory renewed its old existence under the direction of John Fernald and the "Old Vic's" provincial work was transferred to Bristol where its company was the tenant of the Theatre Royal, the very beautiful Georgian theatre preserved from destruction by the Arts council. (I. BR.)

Tibet. A country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a

Chinese dependency, it is in practice independent. Area: c. 450,000 sq.mi. Estimates of the population vary, but 2,000,000 is a probable figure. The religion is Lamaism, a late form of Buddhism modified by animism and primitive magic, and education is in the control of the many monasteries. The ruler is the 14th dalai lama (born 1933) enthroned in 1940 as Lingerh Lamutanchu.

On March 3, 1946, a Tibetan good-will mission consisting of five monks and three lay officials was received in Delhi by the viceroy of India, through whom they conveyed to King George VI presents and congratulations on the Allied victory. The mission also called on the U.S. commissioner and sent through him a congratulatory message to President Truman.

Tin. Data on world tin production continued to be incomplete in 1946, with many gaps that could be filled only by approximations or estimates; mine production, as compiled and estimated by the U.S. bureau of mines, is shown in Table I.

Table I.—World Production of Tin, 1939–45

	(Thousands of short tons)						
	1939	1940	1941	1942	1943	1944	1945
Argentina	1.9	1.7	1.0	1.1	0.8	0.9	0.6
Australia	3.4	3.9	3.9	3.3	3.0	2.8	2.8
Belgian Congo	10.0	14.0	18.8	18.1	19.6	17.3	19.1
Bolivia	30.5	42.5	47.3	42.9	45.1	43.4	47.6
Burma	9.5	6.0	?	?	1.1	0.5	0.2
China	11.7	7.0	?	?	6	3	1.5
Indo-China	1.6	1.6	1.6	1.6	1.1	0.6	0.2
Malaya	57.9	95.6	87	17	17	11	2.2
Netherlands Indies	31.1	48.4	57	11	16.9	6.8	0.9
Nigeria	10.6	13.5	17	14	14.2	14.0	12.9
Portugal	1.7	1.9	2.6	3.0	3.9	2	0.7
Siam	19.4	19.5	18	13	8	6	3
Great Britain	1.8	1.8	1.7	1.5	1.5	1.4	1.1
Total	196	264	269	140	142	118	98

As is indicated by the 1945 total, production in areas occupied by the axis was even more disorganized at and after the close of the war than it had been during occupation, but most producers outside of the occupation areas maintained output. After reoccupation, small tonnages of tin were found in the occupied areas and shipped out to replenish the depleted stocks.

Production during the first half of 1946 showed a slight improvement over the 1945 rate, but readjustments toward normal operation were expected to be slow, especially where rehabilitation of mining and smelting facilities was required.

The salient features of the industry in the United States are shown in Table II.

Table II.—Data of the Tin Industry in the United States

	(Thousands of short tons)						
	1939	1940	1941	1942	1943	1944	1945
Imports, total	79.1	143.1	189.9	62.4	41.0	54.8	47.0
In concentrates	0.6	3.4	32.1	32.4	27.5	39.8	35.6

Secondary recovery	29.0	33.3	42.0	38.0	37.9	32.6	35.2
Consumption, total	92.3	108.8	150.9	96.0	90.0	100.8	93.6
Primary	74.6	81.0	115.5	63.0	51.8	66.3	62.3
Secondary	17.7	27.8	35.4	32.9	38.2	34.5	31.3
Stocks, total	?	133.3	147.5	149.6	130.9	111.8	95.4
In ore	?	—	26.0	41.1	45.1	46.0	36.4
Metal	?	133.3	121.5	108.5	85.8	65.6	59.0

Metal imports had almost ceased in 1946, except for small tonnages from the Belgian Congo and China. The Congo supplies both ore and metal, in almost equal amounts, but the bulk of the ore imports come from Bolivia. Stocks of metal had been declining from the beginning of the war, but ore stocks had been kept fairly uniform; 1945 was the first year to show a decline. It was believed the government-owned smelter in Texas would have to be kept in operation until smelting facilities in the orient and Netherlands Indies were restored to good working condition, but whether it would be maintained beyond that point would be the subject of international negotiation.

With the release of price control in Nov. 1946 the price of tin in the United States was advanced to 70 cents per lb., as compared with the controlled price of 52 cents. It was expected some controls on the use of tin would have to be maintained until the supply approached normal demand. (See also METALLURGY; MINERAL AND METAL PRODUCTION AND PRICES.)

(G. A. Ro.)

Titanium. In 1942 and 1943 the former heavy imports of ilmenite from India were largely replaced by domestic output, making the U.S. much more nearly self-sufficient in its supply of titanium. However, in spite of the heavy increase in domestic output, demand exceeded supply, and in 1945 imports were back almost to the prewar level. The salient statistics of the industry from 1939 are shown in the table.

Statistics of Titanium Industry, 1939–45

	Shipments		TiO ₂ content		Total	Imports	
	Ilmenite	Rutile	Ilmenite	Rutile		Ilmenite	Rutile
1939	16,872	?	7,668	?	?	287,191	787
1940	20,702	2,657	9,505	2,475	11,980	223,891	2,164
1941	21,526	3,431	9,930	3,192	13,122	170,689	6,291
1942	93,397	2,649	41,328	2,466	43,794	10,407	10,525
1943	211,715	3,941	94,283	3,639	97,922	78,093	14,338
1944	280,791	6,770	128,095	6,312	134,407	108,948	10,019
1945	308,518	6,837	141,852	6,414	148,266	210,066	10,602

Of the total ilmenite supply in 1945, 98% went into pigments, and most of the remainder into alloys and cemented carbides; of the rutile, 80% was used in welding rod coatings, and most of the remainder in alloys.

In the first half of 1946 the production of ilmenite dropped to 139,179 tons, but imports soared to 209,690 tons or almost as much as in the full year 1945. Consumption was 199,430 tons, leaving a considerable balance in stocks which increased to 397,430 tons. Rutile production dropped to 2,840 tons and imports to 2,759 tons; consumption was 2,994 tons, with stocks increasing to 12,643 tons.

Canada.—Production of ilmenite concentrates in Canada had been declining sharply with the passing of war demand. Output dropped from 69,437 short tons in 1943 to 33,973 tons in 1944, and 13,306 tons in 1945.

Tobacco. Another all-time high record crop of tobacco was produced in the United States in 1946 following the large crops of 1944 and 1945. The harvested total of all types was estimated by the United States department of agriculture at 2,235,328,000 lb. compared with 1,997,808,000 lb. for 1945 and an average of 1,479,621,000 lb. 1935–44. This was the first crop to exceed 2,000,000,000 lb. The total acreage was 1,938,000 ac., 6.4% above the 1,821,000 ac. of 1945 and compared with an average of 1,554,000 ac. 1935–44. All types showed an increase. The average yield per acre of all types was also a record of 1,153 lb. per acre compared with 1,095 in 1945 and an average of 952 lb. 1935–44. The crop was divided between the types about as usual, more than 55% flue-cured, 30% air-cured and the rest in other classes.

The large crop raised the stock of tobacco to high levels although consumption was being well maintained. The large supply of flue-cured types was needed for cigarettes and at the same time exports of these types in June 1946 was the highest after 1931 at 487,000,000 lb. for the year. Exports were expected to continue large since Great Britain was the principal buyer and the British loan was expected to support buying in all sterling areas. Burley stocks were at the highest level on record in the fall months. Burley exports were far ahead of 1945 and expected to continue. Total supplies compared with a

year earlier were: fire-cured 7% above; burley 8%; Maryland 19%; cigar fillers 1½%; binders 6½%; and wrappers 2%.

The 1946 flue-cured crop was estimated at 1,322,000,000 lb., almost 150,000,000 lb. above the big crop of 1945. The average crop 1935-44 was 841,907,000 lb. The total of Kentucky-Tennessee fire-cured type was 96,264,000 lb. compared with an average of 89,642,000 lb. The yield averaged 1,085 lb. The air-cured or burley crop amounted to 580,509,000 lb. compared with 576,886,000 lb. in 1945 and 361,784,000 lb. average. Kentucky's crop was 403,025,000 lb. compared with an average of 252,610,000 lb. in 1935-44. Tennessee doubled its crop over the average of 69,024,000 lb., 1935-44 to 108,000,000 lb. in 1946 but was a little short of the 1945 crop. All of the dark air-cured types increased except that of Tennessee.

Cigar fillers, binders and wrappers all showed increases in 1946 over 1945. All cigar types amounted to 148,794,000 lb. in 1946, compared with 123,074,000 lb. in 1945 and an average of 120,071,000 lb. 1935-44. This was the first year of a decided gain in cigar types. Louisiana-grown Perique declined to 100,000 lb. from 192,000 lb. in 1945 and an average of 158,000 lb. 1935-44. The average farm price of all types of tobacco was estimated at 36.3 cents per pound on Jan. 15, 1946. By June this price had advanced to 59 cents, then declined slightly to 43.8 cents in November compared with 46.7 cents a year earlier. By types the prices varied through 1945 as follows: Flue-cured 43.7 cents per pound; burley 39.4 cents; Maryland 55 cents; dark 25 cents; and cigar 55.7 cents. The relatively high prices of tobacco in 1942, 1943 and 1944 were considered a factor in stimulating the increased acreage in 1946 as well as the sustained rate of consumption in the post-World War II period. The 1946 acreage was not a record however, having been exceeded in 1939, 1931 and 1929.

Consumption of tobacco continued to increase after World War II. The average of cigarette consumption in the fiscal years 1943-45 was 328,000,000,000 cigarettes and in 1945-46 331,000,000,000. Retail prices of cigarettes advanced slightly without checking consumption, principally because of the high rate of employment. Tax receipts for the first six months of 1946 were 33% greater than for the same period in 1945. In 1945 however, the amount of tax-free cigarettes distributed was much higher. Cigar consumption which had declined sharply in 1932 continued to recover and increased during the first half of 1946 over the same period in 1945. Consumption of smoking tobacco dropped sharply. In the first five months of 1946 production was cut about half as demand declined. This decline was attributed to the plentiful supply of cigarettes and the end of smoking regulations in war industries. The long time decline in the use of chewing tobacco which had been checked during World War II began again after hostilities ceased. Snuff consumption which had increased during the war also dropped in 1946. Warnings were issued looking to a reduced export demand for tobacco from the United States in a few years due to the competition of foreign grown tobaccos. Every government considers tobacco a good taxable product and is encouraging production. For the year 1946 exports were at the highest level in 15 years. Foreign governments were expected to encourage imports for a year or two as a source of tax revenue.

U.S. Tobacco Production by States, 1946 and 1945
(In Pounds)

State	1946	1945	State	1946	1945
North Carolina . . .	904,270,000	814,800,000	Ohio . . .	21,203,000	22,670,000
Kentucky . . .	475,535,000	437,695,000	Indiana . . .	12,440,000	13,540,000
South Carolina . . .	168,200,000	139,520,000	Massachusetts . . .	10,789,000	8,172,000
Virginia . . .	167,000,000	153,315,000	Missouri . . .	6,210,000	6,800,000
Tennessee . . .	159,949,000	141,940,000	West Virginia . . .	3,520,000	3,729,000
Georgia . . .	114,747,000	105,975,000	New York . . .	1,080,000	1,000,000
Pennsylvania . . .	58,808,000	46,355,000	Minnesota . . .	875,000	910,000
Wisconsin . . .	41,449,000	36,084,000	Alabama . . .	360,000	335,000
Maryland . . .	40,500,000	21,600,000	Kansas . . .	309,000	300,000
Connecticut . . .	25,733,000	22,830,000	Louisiana . . .	100,000	192,000
Florida . . .	22,251,000	20,082,000			

World tobacco production was estimated in July at 6,654,000,000 lb. for the season 1945-46 which was about 93,000,000 lb. larger than the 1935-39 average and 10% more than the 6,028,000,000 lb. crop of 1944-45. Production was restricted in Europe and Asia by the need for food crops. The greatest increases in 1946 occurred in the United States, Canada, Brazil, South Africa and the Philippines.

Togoland: see BRITISH WEST AFRICA; FRENCH COLONIAL EMPIRE; MANDATES.

Tokyo. The capital and largest city of Japan. Pop. (1940), 6,778,804; area, 223 sq.mi.; situated at 35° 45' N. and 139° 45' E. at the head of the bay of the same name on the southeastern coast of Honshu, largest of the Japanese islands. In 1938 there were 1,057,921 buildings in the city.

An official enumeration for the occupation authorities on Nov. 1, 1945, recorded a population of 2,777,000. A census taken April 26, 1946, showed a then-resident population of 3,442,000. Rebuilding of damaged structures, of an inferior temporary nature, proceeded more slowly than in other Japanese cities. Of 769,049 dwelling units (46.5% of the total) destroyed during World War II, 9%, or 65,157 units, had been rebuilt by Aug. 15, 1946, a year after the surrender. Comprehensive reconstruction plans were much debated but not implemented.

From Sept. 1945, Tokyo was the headquarters of General of the Army Douglas MacArthur as supreme commander for the Allied Powers (SCAP), advised in his wide executive powers over the Japanese government by a four-power (U.S., British, Chinese, Russian) Allied council in Tokyo. The International Military tribunal for the far east, with seven nations participating, was appointed in Feb. 1946 and began prosecution of Japanese leaders charged with war crimes. No serious incidents

JAPANESE MOTHER in Tokyo casting her ballot in the April 1946 national election while her baby slept in a sling on her back; in this first postwar election in Japan, women were allowed to vote for the first time

between occupation forces and the Japanese civilian population were reported during 1946.

Telephonic communication between Tokyo and the United States was resumed in Jan. 1946, and limited postal service with all countries (except Germany) in September.

Problems confronted on a nationwide scale by the new Japanese government organized in May, following the first post-war general election in April, were sharply instanced in Tokyo by black-market activities, food crises and economic and political protests. Cost of living indexes for Tokyo (using 1937 as a base) rose from 2,670 in January to 4,000 in June. By July the city's staple food stocks had fallen to a 4.2-day supply, black-market activities culminated in street fighting and for August, 90% of the ration was met by SCAP-released food imports. Newly permitted union organization and activity, notably among seamen and communications and transport workers, led to numerous strikes, usually peaceful, of short duration and frequently in the form of union assumption of production control rather than work stoppage.

Revised textbooks, purged of nationalistic material, made possible the resumption of history teaching in the schools in October. Before World War II there had been 107,302 students in Tokyo's 104 institutions of higher learning, including 22 universities. At the end of 1938, 45,573 factories employed 531,179 operatives; and of these 30,154 were small workshops with 5 or fewer workers employing 48,240. (T. F. M-O.)

Tomatoes. The tomato crop of 1946 reached a new high record. The production for the fresh market was estimated at 34,074,000 bu. compared with 32,169,000 bu. in 1945 and a 10-year average of 24,674,000 bu. 1935-44. The crop for processing was 3,194,800 tons compared with 2,688,400 tons in 1945 and a 10-year average of 2,343,200 tons 1935-44. This was about 19% above 1945 and 36% above the average.

The fresh-market tomatoes output was increased for the spring and summer crops while the late fall production was doubled in Florida where more of this crop is raised. The yield was below 1945 but the increase in acreage more than offset this reduction. The acreage was 301,270 ac. in 1945 compared with the 10-year average of 209,840 ac. 1935-44.

U.S. Tomato Production for Fresh Market 1946, 1945 and 10-year Average
(In bushels)

Crop	1946	1945	Average 1935-44
Winter	1,820,000	2,655,000	1,716,000
Spring	11,679,000	10,678,000	6,889,000
Summer	15,133,000	13,710,000	12,962,000
Fall	5,442,000	5,126,000	3,108,000
Total	34,074,000	32,169,000	24,675,000

The acreage of tomatoes grown for processing was 579,590 ac. in 1946 compared with the 10-year average of 470,000 ac. The yield was high, 6.09 tons per ac. compared with an average of 4.98 tons. California reported an average yield of 10 tons per ac. on an acreage of 132,000 ac. Better than average yields were harvested in Ohio, Michigan and Indiana. Considerable damage from blight reduced returns in some areas.

Prices of fresh tomatoes were lower in 1946 than in 1945 except for the winter Florida shipments. The average of all shipments was \$2.91 per bu. compared with \$3.32 in 1945. The average season prices for processing tomatoes was \$30 per ton compared with \$27.58 per ton in 1945. (See also VEGE-TABLES.) (J. C. Ms.)

Tornadoes: see DISASTERS.

Toronto. In 1793, in colonial days, the British governor, John Graves Simcoe, chose the present site of Toronto for the capital of the province of Upper Canada (now Ontario), and named it York. Earlier the British settlement had succeeded a French trading post called Fort Rouillé. In 1834 it was incorporated as a city and its name changed to Toronto, the old Indian name, meaning "a place of meeting." The city grew steadily and soundly until in 1946 it covered some 35 sq.mi. and had a population of about 700,000 persons. Toronto manufactures and distributes goods in a large way, having excellent advantages in location and communications; it is also the centre of the large mining industry of Ontario. The city corporation, in addition to the usual municipal services, owns and operates through commissions the city and suburban street railway and bus system and the local hydroelectric system, with exclusive distribution of electricity for light and power. Railway service and air service by trans-continental and local routes are good as are facilities for freight and passenger traffic by water. The Royal Agricultural Winter fair which was not held during World War II had a highly successful re-opening. It was expected that the Canadian National exhibition would resume operations in 1947; it was founded some 70 years before and was held annually, lasting for two weeks, until the exigencies of war necessitated the use of its large grounds and many buildings by the armed forces. (G. R. G.)

Toronto, University of. A provincial institution in Toronto, Ontario, Canada. The year 1946 marked the opening of Ajax division, a transformed munition plant, 30 mi. from the university campus, for students in engineering; the commencement of a \$7,000,000 building; special convocations for conferring honorary degrees on General of the Army Dwight David Eisenhower, Field Marshal Montgomery, His Excellency Viscount Harold Alexander, Governor-General of Canada, General H. D. G. Crerar, Air Marshal Leckie, Colonel Agnes Neill, Admiral Nelles, Captain Adelaide Sinclair, Lieutenant-General Montague. An Institute of Industrial Relations and courses in diplomacy were established and courses were organized in public safety. Many large benefactions were received, notably \$500,000 for the Faculty of Medicine by bequest of Dr. Chisholm of Saskatchewan. There was a notable expansion of research, especially in the Connaught Medical Research laboratories. Special courses in arts, commerce, engineering, business administration and institutional management were organized for ex-service personnel, as well as a new course for teachers in the conservatory of music, and post-graduate facilities were expanded. The departments of archaeology and fine art were combined and a new department of art and archaeology was established. There was a general increase of salaries and a new pension plan was arranged for staff members. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Town and Regional Planning. The year 1946 saw a revival of town and regional planning activities in most of the nations of the western world.

In the United States 28 of the 48 states had passed urban redevelopment acts, 12 to authorize redevelopment corporations, 6 to authorize housing redevelopment agencies and 10 to provide redevelopment land agencies. Congress passed for the Dis-

trict of Columbia an urban redevelopment act of the latter type. Many cities issued plans (some listed below). Federal agencies extended services to local communities. In the Public Works agency the Public Roads administration extended federal aid for the first time for express highways in urban areas; the Public Buildings administration co-operated with local planning commissions in the location and design of federal buildings; the bureau of community facilities continued to advance funds for local planning and by 1946 had advanced more than \$2,600,000 to 2,174 public bodies entailing estimated construction costs of nearly \$1,000,000,000. In addition, state and local plan preparation, without federal aid, included plans for public works to cost approximately \$4,000,000,000. Most U.S. cities studied downtown congestion and plans for offstreet parking of automobiles. The American Institute of Planners held an annual meeting on Feb. 16 and 17 at Cleveland, O.; the American Planning and Civic association held a citizens' conference on planning at Dallas, Tex., on April 21-24, preceded by a city planning clinic at Oklahoma City, Okla. The American Society of Planning Officials met on May 6-8 in New York and the Community Building council of the Urban Land institute met Nov. 8-13 at Atlantic City, N.J.

In Great Britain, parliament in 1946 passed the New Towns act which provided for the establishment of about 20 self-dependent communities, 10 of them in the London area. The new communities were designed to decentralize congested urban areas and were to be limited to 60,000 population. The London County council proposed to reduce the population within its borders by removing industries and about 600,000 or 700,000 workers to areas outside a green belt which was to surround the metropolitan area. Among official plans were those for Bath, Belfast, Canterbury, Cork, Dublin, Durham, Edinburgh, London county and Manchester. In September more than 400 town planners attended the summer school of the Town Planning institute at Durham university. On Oct. 7-12, after a lapse of seven years, the International Federation for Housing and Planning held a congress at Hastings, England.

Most of the devastated countries in Europe were working on plans but shortages of materials and labour prevented much permanent building. In the Netherlands an effort was being made to reduce the congestion of the population. In an area in Rotterdam devastated by nazi air attack, only 4,500 families were to replace the 20,000 who lived there before World War II, but Dutch cities lay so close together that it was difficult to provide adequate green belts and to find space for displaced populations. In Italy an effort was made in 1946 to place the planning of devastated areas under a single joint commission which would revise national planning laws. In Poland the entire land area of Warsaw was being taken over by the city government. The War Reconstruction office was trying to preserve certain historical buildings and, at the same time, to build a modern city on the ruins of ancient Warsaw. In the soviet union at the end of 1945 a Council of People's Commissars (later changed to Council of Ministers) approved plans for many towns and during 1946 architects and engineers were busily working on details of residential sections. Most buildings were to contain two, four or eight flats, built on standard designs but with various architectural treatments. Every house was to have its own garden, large enough for vegetables and fruit trees as well as flower beds. It was expected to house 60 families to the acre. Residential sections were planned to be separated from main arterial highways by a protective belt 330 ft. wide. Public gardens would be provided. In France all during World War II many architects and planners worked on plans for reconstruction. Some of the plans were prepared by modernists, some were the result of superimposing a regional pattern on tradi-

tional plans. Since little permanent construction was accomplished, it was too soon to predict the result in 1946. In Sweden, immune from war damage, cities continued to utilize a modern architecture of better-than-average appearance. In Switzerland, also untouched by the ravages of war, a clearinghouse for information on all European construction was established.

The Pan American union in 1946 issued a *Provisional Directory of Housing & Planning Agencies* in the United States and Latin America which listed a growing number of official planning agencies. (See also HOUSING; RECONSTRUCTION PLANNING.)

(H. Js.)

Track and Field Sports. With athletes returning to their prewar form and eyeing the Olympic games of 1948, track and field competition received great impetus during 1946. Although Gunder Haegg (Haäg) and Arne Andersson, the Swedish middle distance stars, were barred from amateur competition, Sweden contributed another miler, Lennert Strand, to dominate U.S. competition.

One world record for a standard event was toppled in 1946. Bob Fitch of the University of Minnesota threw the discus 180 ft., 2 $\frac{3}{4}$ in. for a new mark in the Northwest Amateur Athletic Union meet at Minneapolis, Minn., and added a 179 ft., $\frac{1}{8}$ in. toss in the national A.A.U. tournament at San Antonio, Tex. Both throws shattered the former world mark, set at 174 ft., 10 $\frac{3}{4}$ in. by Adolfo Consolini of Italy in 1941.

Two other track performances stood out in 1946. Harrison Dillard of Baldwin-Wallace, Berea, O., tied the world 220-yd. low hurdle record of 22.5 seconds, and scored the only double of the National A.A.U. outdoor championships. Herbert McKenley of the University of Illinois, Urbana, a native of Jamaica, was timed in 46.2 seconds in the 440-yd. dash, but his possible world record was disallowed because of a favouring wind. Later McKenley set a 300-yd. record of 29.8 seconds in a special meet at Randall's Island, N.Y.

Strand, making his first track appearance in the United States, easily won the A.A.U. 1,500 metre title, defeating Leslie MacMittell by 30 yd. He wound up his U.S. tour by winning the mile event of a special meet at Randall's Island, N.Y., in four

minutes, nine seconds, fastest of the season.

Other outstanding track performances in the United States included: a toss of 71 ft., $\frac{7}{8}$ in. for the 8-pound shot by Bernie Mayer, New York university, N.Y., for a U.S. record; a mark of 14.1 seconds in the 150-yd. dash by Bill Martinson of Baylor university, Waco, Tex., equalling the world record set by Herbert Thompson in 1938; a jump of 6 ft., $6\frac{3}{4}$ in. by Kenneth Wiesner of Marquette university, Milwaukee, Wis., in the high jump, setting an intercollegiate record.

The University of Illinois stood out in collegiate track, winning the Big Nine and National Collegiate Athletic Association titles and capturing three events in the Pennsylvania relays. The New York Athletic Club won both the A.A.U. indoor and outdoor championships. Climaxing three years of service-team monopoly in the Intercollegiate Association of Amateur Athletes of America championship, Army won indoors and Navy outdoors.

On the European front, Sydney Wooderson, veteran British distance star, set a three-mi. British record of 13 minutes, 53.2 seconds. Sweden won the first European track meet after 1938, while the U.S.S.R., competing for the first time after 1923, captured the women's title. The International Amateur Athletic federation listed Haegg's world record of 4:01.4 despite charges he was a pro. Later both Haegg and Andersson were ruled professionals and barred for life by the Swedish Athletic association.

Charles Beaudry of Marquette won the national A.A.U. pentathlon title with 2,885 points, while Irving Mondschein of New York university was returned the decathlon victor with 6,466 points. Stylianos Kyriakides, 35-year-old bill collector from Athens, Greece, won the Boston marathon in 2 hours 29 minutes and 27 seconds. John Kelley of West Acton, Mass., and

Gerald Cote of Montreal, Que., both former winners, finished second and third, respectively. Cote won the National A.A.U. marathon at Yonkers, N.Y., in 2 hr. 47 min. and 53 sec.

Indoor Track.—Two middle distance stars, Leslie MacMitchell and Fred Sickinger, highlighted indoor track and field competition for 1946. Both returned from the wars to dominate their respective divisions, MacMitchell in the mile and Sickinger in tests from 600 to 1,000 yd.

MacMitchell established himself as the United States's number one miler with seven straight firsts in his specialty, including the National A.A.U. event. Sickinger also won 7 races during the 1946 indoor season—four 1,000-yd. events; 2 half miles, and the I.C.A.A.A. 600-yd. crown.

Eddie Conwell of Shore A.C. dominated the dash events and wound up with a tie for the world record in the 60-yd. dash at 6.1 seconds. Army won its third straight intercollegiate indoor track title with 53 $\frac{1}{2}$ points to 35 for New York university. The New York A.C. won the team championship of the A.A.U. tournament with 28 points to 26 for N.Y.U.

Women.—Once again Alice Coachman and her Tuskegee Institute, Ala., team dominated the women's A.A.U. track and field championships in 1946. Miss Coachman repeated her triple triumphs in the 50 metre, 100 metre and high jump to assist in Tuskegee's accumulation of 95 team points. Cleveland's Polish Olympics were second with 64 $\frac{1}{4}$ points.

Dorothy Dodson became the other triple champion of the tournament with firsts in the eight-pound shotput, discus and javelin. Stella Walsh, 35-year-old veteran of 20 years of track competition, scored firsts in the 220-yd. dash and broad jump and also added a second place in the 100-yd. dash to the Cleveland Polish Olympics' team total. (M. P. W.)

Outstanding U.S. Track and Field Performances (Outdoor), 1946

100 Yards

9.5 sec.—Martinson, Baylor; Lawlor, Texas
9.6—Guilbeaux, Nederland H.S.; Beaumont, Tex.; Pettit, Navy; LaBeach, Wisconsin; Dillard, Baldwin-Wallace; Mathis, Illinois

220 Yards

20.6 sec.—McKenley, Illinois
21—Patton, U.S.C.; LaBeach, Illinois
21.1—Ewell, Shannah Catholic club
21.2—Pierce, Illinois

440 Yards

46.2 sec.—McKenley, Illinois
47.8—Cochran, Los Angeles; Short, Michigan
48.4—Bolen, Southern univ.
48.5—Kash, Navy
48.7—LeLoach, U.S.C.; Ockert, Illinois

Trailers. Early in 1946 the trailer coach industry was requested by the U.S. government to help in providing living units for returning soldiers. How well the industry met this request is indicated by the fact that of all agencies, it came the closest to reaching the desired quota. It was estimated that 53,671 units were produced during the year 1946 by 96 trailer manufacturers reporting to the department of commerce.

Some 50 new manufacturers entered the trailer coach field in 1946 and the older manufacturers, for the most part, increased their production facilities. Production of the industry has increased 10% per month consistently. Trailer coach population, at the end of 1946, was known to be more than 300,000. Statistics show that 89% of trailer coaches in use were used as residences, whereas 11% were used as travel vehicles, either pleasure or business. The trend in size was in 1946 toward smaller coaches, that is, trailer coaches of 24 feet overall or less.

Ownership by occupational groups shows: 35.3%, production workers; 15.6%, sales and services; 15.4%, executive and professional; 12%, miscellaneous; 8% retired; 6.9 construction; 6.6%, government; .02%, unemployed.

During 1946 the Trailer Coach Manufacturers association carried on an extensive educational campaign in national magazines to improve trailer park accommodations.

A survey by the industry among people living in trailer coaches indicated that 75% preferred them to a return to living in apartments. Of the trailer coach owners, 54% either owned their own homes before buying trailers or still owned them, while 46% were renters.

The National Trailer Coach show was held in March 1946 with the largest display of equipment and house trailers in the industry's history. (P. E.)

Trans-Jordan. An Arab kingdom, bounded on the west by Palestine, on the north by Syria, on the northeast by Iraq, on the southeast and south by Saudi Arabia. Formerly a British-mandated territory, it was declared independent on March 22, 1946. Area 35,135 sq.mi.; pop. c 370,000; all Mohammedans except for c. 30,000 native Christians. Capital: Amman, the ancient Rabbat Ammon. Chief cities: Amman (45,000), Es-Salt (14,500), Ma'an (8,000). King: Abdullah ibn Hussein; prime minister (1946): Ibrahim Hachem Pasha.

History.—Trans-Jordan, formerly a part of the Ottoman empire, entered its formal existence as a political entity in 1922 when it was constituted an Arab principality under Emir Abdullah ibn Hussein under the British mandate over Palestine. The mandate, being an A mandate, obliged Great Britain to prepare the country for independence. This purpose was realized on March 22, 1946, when Great Britain recognized Trans-Jordan's full independence and signed a treaty of mutual assistance and alliance with the new state. Great Britain also promised to sponsor Trans-Jordan's application for membership in the United Nations organization. This application was transmitted on June 26 but was rejected for the time being.

The emir adopted the title of king at the declaration of independence.

The new kingdom was an active member of the Arab league and participated in all its meetings and deliberations. King Abdullah visited Iraq in September to prepare a scheme for closer

collaboration between these two neighbouring lands whose rulers were closely united by family ties. The scheme foresaw the closest possible collaboration in military, cultural and foreign affairs. A council of the two states would meet alternately in the two capitals to consider problems affecting both countries.

On Aug. 8 an agreement was signed in Amman between the government and the Trans-Arabian Pipeline Co. of America permitting the latter to construct and maintain an oil pipe line from the U.S. oil wells in Saudi Arabia through Trans-Jordan to Palestine and the Mediterranean; Trans-Jordan would receive an annual payment of \$250,000. (H. Ko.)

Communication, Finance, Trade and Agriculture.—There were 202 mi. of railroads in 1945. In 1946 there were 344 mi. of asphalt roads and 854 mi. of semi-macadamized roads passable in the dry season, and a total of 1,354 telephones, 305 mi. of telegraph lines and 900 radio receiving sets. Government revenues in 1945 amounted to \$11,518,000; expenditures \$10,401,000; national debt \$1,251,000. (Palestine £=British £=403.5 cents U.S.). Exports (1942) totalled \$3,124,000; imports \$8,874,000. Crop production in 1944 included 121,253 short tons of wheat, 44,092 tons of barley, 23,148 tons of grapes and raisins. Livestock numbered 560,000 poultry; 304,107 sheep; 349,323 goats. Exclusive of the products of the Dead sea, mineral production in 1944 amounted to 6,322 short tons of phosphate, 2,428 tons of kaolin, 198 tons of silica, 63 tons of ochre, 33 tons of manganese.

Trap-shooting. Capt. Frank Bennett, 36-yr.-old Miami, Fla., air line pilot, captured the \$10,000 Grand American handicap in a three-way shoot-off. Bennett, making his first appearance in the big event, tied with J. L. Nicolai, 66-yr.-old Denver, Colo., garageman, and John J. McHale, 33-yr.-old shoe manufacturer from London, Ont., with 98 targets out of 100. Bennett narrowly missed elimination because he shot from the 18-yd. line instead of his handicap of 21 yards. In the shoot-off he missed the first bird and hit the next 24 for win by 2. In a second shoot-off McHale defeated Nicolai, 23 to 22 out of a possible 25.

Almost every event required a shoot-off, and it was the first time in 47 years that the Grand American had to go an extra day. Walter Beaver of Conshohocken, Pa., won the North American championship by scoring a possible 25 in a shoot-off. He was tied at 199 with Fred Harlow of Newark, O., the Grand American champion in 1908, Don Engleby of Vermilion, O., Grand American champion in 1945 and Sterling Matson of Racine, Wis., in the regular shoot.

Mrs. Roy Meadows of Grimes, Ia., won the women's Grand American in a shoot-off after tying Rose E. Waite of Lakewood, O., with 94 out of a possible 100. Mrs. Rose Potter Palmer III, Chicago socialite, won the North American women's title in a shoot-off with Mrs. Frances Lee of Fayette, N.Y., after they had tied with 95 out of 100. Ruth Knuth of Indianapolis, Ind., defended her title as champion of champions with 96 out of 100.

Vic Reinders of Waukesha, Wis., University of Wisconsin biology professor, won the men's champion of champions with a perfect 100 and won the open title in a shoot-off with Herschel Cheek of Clinton, Ind., after each had scored 99 out of 100. Albert Peterson of Virginia, Ill., won the preliminary handicap in three extra shoot-offs against four other challengers.

Cliff Doughman of Morrow, O., won the doubles target event in a shoot-off with Mercer Tennille of Shreveport, La., and Julius and Paul Petty of England, Ark., topped the brothers' competition. Other winners were: father and son, Homer Clark, Jr. and Sr., of Alton, Ill., 194 out of 200; husband and wife, Mr. and Mrs. Clyde King of Atlanta, Ga., 190 out of 200; veterans, J. W. Braderick of Richmond, Ind., 97 out of 100; national juniors, Fred D. Waldock of Sandusky, O. Illinois won the team title in a shoot-off with Wisconsin, and Joe Hiestand of Hillsboro, O., had the best score for all events, missing 37 out of 800. A field of 1,487 competed, firing 1,317,500 shells.

Trieste. A city and port on the northeastern Adriatic (pop. 248,379 in 1936), and the chief city of the Italian province of Venezia Giulia e Zara (area 3,456 sq.mi.; pop. 977,257). This territory had formed part of Austria (Trieste from 1382) before World War I. It was then called Küstenland. After World War I the territory was claimed by Yugoslavia and by Italy. The Italian population was preponderant in the cities, the Yugoslav population, Croat and Slovene, in the rural districts. According to the census of 1910 there were 387,000 Italians and 435,000 Slavs.

The control of the territory was settled by the treaty of Rapallo of Nov. 12, 1920, between Italy and Yugoslavia, which gave the whole territory to Italy. After the collapse of the German armies in April 1945 Marshal Tito's Yugoslav forces occupied the territory, determined to unite it with Yugoslavia. Italy protested against this annexation of Venezia Giulia and especially of Trieste with its large Italian population and historical and emotional ties with Italy. In an agreement of June 9, 1945, the larger part of Venezia Giulia, and Fiume and Zara, were placed under Yugoslav administration, the smaller part, including Trieste, was put under Allied administration. The dividing line was known as the Morgan line.

The fate of Trieste formed one of the most disputed points in the long deliberations of the Council of Foreign Ministers during 1946. The Russian spokesmen backed the Yugoslav demands for the annexation of the whole of Venezia Giulia by Yugoslavia; the U.S. and British representatives suggested an ethnographic line which would leave predominantly Italian parts to Italy and give the predominantly Croat and Slovene parts to Yugoslavia. Finally, a French compromise plan was adopted which gave to the Yugoslavs the predominantly Italian cities of western Istria, among them the naval base of Pola, but formed of the other predominantly Italian parts, which consisted of the city and surrounding territory of Trieste, the Free Territory of Trieste.

This free territory was to have its integrity and independence guaranteed by the Security council of the United Nations which would also be responsible for maintenance of public order and security and for the observance of the entire permanent statute, in particular the protection of the basic human rights of the inhabitants. The governor of the free territory was to be appointed by the Security council after consultation with the governments of Yugoslavia and Italy, but he could not be a citizen of either country nor of the territory. The Security council of the United Nations voted on Jan. 10, 1947, to assume these responsibilities.

In the debates over the future of Trieste in Paris in Sept. 1946 the Yugoslavs demanded at least a customs and monetary union of the free territory with Yugoslavia and their control over its foreign policy. Sen. Tom Connally on behalf of the

THE DISPOSITION OF TRIESTE was one of the points of difference among the delegates who met at Paris in 1946 to discuss the proposed treaties with the axis countries. Leo Joseph Roche of the *Buffalo Courier-Express* points up this issue in "Hot Stew Coming Up"

United States replied that Trieste must be not merely a paper state but it must be free, free from Yugoslavia and free from Italy. This attitude was finally approved by the full conference of the 21 powers for drawing up the peace treaty with Italy on Oct. 10 by a vote of 15 to 6. The points still remaining in dispute were referred to the meeting of the Council of Ministers in New York in the late fall.

The statute of the free territory provided for democratically elected legislative and executive authorities and for full safeguards of the civil and political rights and freedoms of the citizens. The governor of the free territory was to be responsible for the maintenance of public order and security and for the observation of the constitution. He was to submit annual reports to the Security council.

At the end of November the Council of Foreign Ministers agreed that the occupation forces would be withdrawn from the free territory within 90 days after the signing of the treaty should the governor and the military experts of the Big Four regard the step as safe. The number of troops was to be limited to 15,000 men, of whom the United States, Britain and Yugoslavia would each furnish one-third. The troops were to be under the direction and at the disposal of the governor.

The Free Territory of Trieste was prohibited from entering into economic union or any exclusive association with any other nation. Its free port was to be administered by a director appointed by the governor from a list of candidates submitted by the Council of Government of the free territory. The director could not be a citizen of Yugoslavia or Italy. He was to appoint the other employees of the free port with preference to free territory citizens. He would be assisted by an international commission comprising one representative each from the free territory, Italy, Yugoslavia, Russia, United States, Britain, France, Czechoslovakia, Austria, Hungary, Poland and Switzerland. This commission would have the right to investigate and consider all matters relating to the operation and administration of

the free port and the transit between the free port and the states served by it. The Italian lira was to be the monetary unit.

(See also COUNCIL OF FOREIGN MINISTERS; PARIS PEACE CONFERENCE.) (H. Ko.)

Trinidad. An island and British crown colony situated a few miles off the South American mainland north of the Orinoco river delta. The separate island of Tobago, situated northeast of Trinidad, forms a part of the colony. Area (including Tobago, 116 sq.mi.), 1,978 sq.mi.; pop. (1946 census), 556,700. The population includes more than 180,000 East Indians, and the chief element other than the East Indian is Negroid. The capital and principal city is Port of Spain (pop., 1946 census, 92,368). The only other town of importance is Arima (pop. est., 7,500). A new constitution entered into force March 21, 1946. Governors and commanders in chief in 1946: Sir Bede Clifford, until Nov. 3; Sir John Shaw, following that date.

History.—The first census in a number of years was taken April 9, 1946. Trinidad early in 1946 adopted a bill for registration of voters in anticipation of legislative elections July 1. These elections, the first after 1938, resulted in capture of eight of the nine seats by left-wing party candidates. The government established a microbiological research station near Port of Spain during 1946 and also laid plans to try to eradicate leprosy, especially prevalent among the East Indian element, in from 15 to 20 years. A civil aviation conference met at Port of Spain, beginning June 1, with representatives from Trinidad, British Guiana, St. Lucia, the Leeward Islands, Jamaica, the Bahamas and Bermuda.

Education.—Trinidad and Tobago at the beginning of 1944 had 291 primary and intermediate schools with an enrolment of 82,137. Plans were advanced during 1946 for establishing a teacher training college in Trinidad, designed to serve the Windward and Leeward Islands as well.

Finance.—The monetary unit is the Trinidad or West Indian dollar, equivalent to 4s. 2d. and exchanging for approximately 84 cents U.S. Budgetary appropriations for 1946 were \$30,772,768 and a deficit was anticipated by late in the year. Revenues were ultimately expected to reach about \$31,000,000 and expenditures about \$31,400,000. The government decided during the year, as an incentive to industry and business, to abolish the excess profits tax; the anticipated revenue loss was approximately \$500,000. The West Indian monetary conference in Barbados in mid-May, in which Trinidad participated, recommended establishment of a common decimal currency, based on the Trinidad dollar, for the eastern group of British Caribbean colonies. Trinidad during the latter part of 1946 anticipated a sharp increase in its cost of living because of the Canadian decision to bring its exchange rate to par with that of the United States.

Trade and Communication.—Cacao exports in the first 11 months of the crop year (Oct. 1, 1945–Aug. 31, 1946) were 7,631,767 lb., of which 3,837,600 lb. went to the United States and 2,444,979 lb. to the United Kingdom. Venezuela early in 1946 suspended cattle exports to Trinidad because of increased demands in the republic. Trinidad's petroleum exports in 1945 were valued at \$43,600,000.

Trinidad had in 1946 approximately 123 mi. of railway and 1,067 mi. of roads. The British West Indian Airways began providing weekly plane service to Trinidad during the year and in July Pan American Airways inaugurated 12-hour flights from New York city. Plans developed in 1946 for improved communications, called for an expanded telephone system, an expenditure of \$4,800,000 on the Port of Spain airport, and \$1,000,000 to be spent on roads.

Agriculture.—Sugar production in 1946 was 109,602 long tons (1945: 76,347 tons). Citrus production in 1945 was estimated at 7,263 long tons (1944: 5,469 tons) and an increase was expected for 1946. Rice production in 1945 was 15,000 short tons, about the same as in 1944, but the annual consumption was about 30,000 short tons. The estimate of cacao production for 1947 was 10,000,000 lb. Copra production in 1945 reached the record figure of 35,000,000 lb.

Mining.—Crude petroleum production figures, withheld during World War II, were revealed during 1946 to have been as follows: 1939, 19,741,616 bbl.; 1940, 22,226,876 bbl.; 1941, 20,505,980 bbl.; 1942, 22,069,178 bbl.; 1943, 21,385,240 bbl.; 1944, 21,634,965 bbl. Trinidad and Venezuela took steps during 1946 to delimit the respective portions of the Gulf of Paria, between the two, in which each could undertake submarine drilling for petroleum.

Truman, Harry S. (1884–), 33rd president of the United States, was born on May 8 in Lamar, Mo. See *Encyclopædia Britannica* for an extended biography. President Truman underwent an understandable but, nonetheless, a far-reaching transformation during his first full year in the White House—1946. Whereas he had followed the Roosevelt (New Deal) program closely and faithfully in the earlier months, he subsequently made such sweeping changes in policies and personnel in both the domestic and foreign realms that the presidential family had become a "Truman administration" by the end of that period.

The November congressional elections, which returned house and senate control to the Republicans in a remarkable upset, undoubtedly hastened and influenced the president's decision. Indeed, he appeared to view the outcome as a mandate for his reversal. He said, in effect, that henceforth he meant to be president in his own right and that he would not feel himself beholden to any individual or faction.

His shift on major foreign and domestic questions antagonized Roosevelt liberals, who protested that he was scrapping his predecessor's program. In retaliation, they formed several so-called "progressive" organizations toward the end of the year with the expressed purpose of forcing a return to New Deal fundamentals. There was even talk of formation of a third, anti-Truman party for the 1948 presidential election.

In the domestic field Truman removed almost all price-fixing and priority controls over the U.S. economic system—food, clothing, housing construction, manufacture, etc. He proclaimed the end of "hostilities," which meant that many other wartime laws and restrictions were headed for discard.

He deemed it necessary to adopt a much firmer attitude toward organized labour. When the railroad brotherhoods threatened a nation-wide tie-up of the transportation system in August, he asked congress to enact a law drafting into the armed services members of unions who refused to work for key industries after they had been taken over by the government. His proposal angered labour leaders, but they cancelled plans for a strike.

When John L. Lewis, president of the United Mine Workers, set in motion strike machinery in bitter December weather, Truman invoked the injunction process against the coal miners. Lewis was found guilty of breaking a contract with the government. The U.M.W. was fined \$3,500,000, and Lewis was held personally liable for \$10,000 by the U.S. court of appeals of the District of Columbia. The mine leader appealed to the supreme court, but he halted the strike movement temporarily.

Truman immediately instructed his advisers to frame a legislative program for more drastic curbs on labour, which he submitted to the new, Republican-controlled congress early in 1947. It seemed clear that the prolonged honeymoon between the Democratic administration and organized labour had come to an end.

The principal change in foreign affairs concerned the soviet union. After pursuing a policy labelled by critics as "appeasement" of Moscow Pres. Truman and former Secretary of State James F. Byrnes voiced numerous protests at United Nations sessions on the soviet attitude on atom bomb control, general world disarmament, Poland, Germany, the Balkans and other international problems.

The impression that Truman had drawn away from the U.S.S.R. and closer to England was strengthened by an incident at Westminster college in Fulton, Mo. With Truman sitting on the platform Winston S. Churchill, Britain's wartime prime minister, urged an Anglo-U.S. alliance. His further reference to a "Russian iron curtain" over Europe and the Balkans suggested that he meant his proposed alliance to be directed against Moscow.

Truman refrained from any comment on the Churchill scheme. The White House, however, denied that the president had known in advance of the contents of his British guest's speech.

Washington's sterner policy toward the Kremlin helped to precipitate one of two cabinet rows and resignations. Speaking before an extremely pro-U.S.S.R. gathering at Madison Square garden in New York city, Henry A. Wallace, then secretary of commerce, seemed to criticize the Byrnes program. Wallace

PRESIDENT HARRY S. TRUMAN signing the \$3,750,000,000 loan to Great Britain on July 15, 1946, with one of the 26 pens he used to write the word "approved," the date and his signature. On the right is Lord Inverchapel, British ambassador to the U.S.

added that Pres. Truman had approved his utterance in advance.

Truman at first endorsed this statement. After a few days, however, he explained that he had merely approved the cabinet member's "right to make the speech." When Wallace subsequently made public a letter to the president, in which he had criticized the administration's soviet policy in great detail, the president asked for his resignation.

The other cabinet disagreement involved Harold L. Ickes, former secretary of the interior. When Pres. Truman named Edwin W. Pauley, a California oil man, to be under secretary of the navy, Ickes opposed the nomination. He testified before a senate committee that Pauley in the 1944 presidential campaign had told him that certain oil interests would contribute more generously to the Democrats if the government abandoned its suits claiming title to tidewater petroleum properties.

Ickes also said that, when he informed Truman of his plan to speak against the nomination on Capitol Hill, the president replied, "Go ahead and testify, but be as kind as you can to Ed Pauley." The chief executive declared that Ickes had been mistaken, whereupon the latter quit. Summoning one of the best-attended press conferences in Washington history, he assailed the calibre of Truman's more recent appointments.

The senate refused to confirm Pauley, who was then named as Truman's reparations agent. Ickes became a newspaper columnist and also took a leading role in the establishment of progressive movements.

When deaths and resignations provided vacancies, Truman turned for new men to personal friends of a generally conservative character. He replaced Wallace with W. Averell Harriman, former ambassador to the U.S.S.R. and a railroad magnate. Ickes' successor was J. A. Krug of Wisconsin, public power expert and former chairman of the War Production board. He appointed George E. Allen to a directorship of the Reconstruction Finance Corp., an appointment that provoked criticism.

When Justice Harlan F. Stone died in June, Truman chose Fred M. Vinson, then secretary of the treasury and an experienced Kentucky legislator and administrator, as supreme court chief justice. He gave the treasury post to John W. Snyder, a St. Louis banker and old friend.

The most important cabinet shift affected the state department. In a surprise move, Byrnes resigned because of ill health, and his place was given to Gen. George C. Marshall, World War II chief of staff and later special emissary to China.

Pres. Truman took hardly any part in partisan politics in 1946. He told party leaders as early as March that he would not participate in the November campaign, and he kept his word save for his home state of Missouri.

There, in the fifth congressional district, he openly opposed renomination of Roger C. Slaughter, Democratic representative, because the legislator had fought the White House program on Capitol Hill. Slaughter was defeated in the primary by the presidential entry, Enos Axtell, but the latter lost to his Republican opponent in the general election.

Relations between the White House and congress remained comparatively harmonious, although less than 50% of the original presidential proposals became law. But it was generally conceded that his stock in that body and throughout the nation rose after his quick response to November's ballot-box mandate and his removal of irksome, wartime restrictions. (See also UNITED STATES.)

(R. Tu.)

Tsaldaris, Constantin (1884-), Greek politician, was born in Alexandria. Graduated from the University of Athens law school, he studied law and political science at universities in France, England and Germany. He entered the government as minister in Crete (1920-

22). A royalist by conviction, he was imprisoned in 1926 for plotting against the republic. Elected to the Greek parliament in 1932, he was re-elected in 1933 and 1935.

Tsaldaris fled to Egypt after the German occupation. Returning to his homeland toward the end of World War II, he became one of the leaders of the pro-Royalist Populist party. He held five ministries in the short-lived Panayotis Poulitsas cabinet and on April 18, 1946, formed his own cabinet.

He submitted Greece's territorial and reparations claims before the Council of Foreign Ministers and the 21-nations peace conference in the summer and fall of 1946. The Big Four agreed to return the Dodecanese to Greece, but rejected his claims for territorial acquisitions at the expense of Albania and Bulgaria.

At home Tsaldaris was confronted with an incipient revolt in late 1946. His suspension of civil liberties and suppression of trade union activities resulted in leftist resentment which increased with the return of King George II. Popular unrest was climaxed in the fighting between leftist guerrillas and government forces in the border areas. As the fighting grew in intensity and scope, Tsaldaris notified the soviet *chargé d'affaires*, Nov. 30, 1946, that he would lodge a protest with the U.N. against the "foreign sources" that were fomenting disorders in Greece.

Tuberculosis. Tuberculin testing indicated that from 40% to 80% of the children of Poland and Czechoslovakia had primary tuberculosis in 1946. In Canada the mortality rate definitely decreased during the period of World War II, from 54.7 in 1938 to 45.8 in 1945.

W. S. Gilmour found that in the West Indies nearly 100% of adults and 20%-60% of children in urban areas reacted to tuberculin. In the rural areas 7%-33% of children reacted. In most Central and South American nations the rates remained high. In the United States the Metropolitan Life Insurance company's experience showed a mortality of 37.9 per 100,000 for the first three-quarters of the year, the same as in 1945.

In the United States in 1944, during the most productive age period of life, 15 to 44 years, almost 27,000 died from tuberculosis and slightly less than 26,000 from heart disease.

Diagnosis and Case Finding.—During the past few years slipshod and short-cut methods of diagnosis resulted in large numbers of diagnostic errors. As many as 15%-25% of the patients admitted to sanatoriums were found to have some other disease, or if tuberculosis was present it had already been controlled by nature. This was largely because of diagnoses made from X-ray shadows alone.

Ira Lewis demonstrated that films made through ordinary clothing are entirely satisfactory. This eliminates much waste of time. E. M. Schleicher presented a method of diagnosing generalized miliary tuberculosis from the bone marrow before it could be detected by any other phase of the examination. C. A. Palmer re-emphasized the importance of differentiating when possible, between calcification caused by primary tuberculosis and that resulting from other conditions, such as fungus infection.

R. J. Dubos *et al.*, described a liquid medium in which tubercle bacilli grew much more rapidly than in the media previously used. Growths had developed from specimens of sputum, blood, spinal fluid and urine in which it had not been possible to find acid-fast bacilli by microscopic examination of concentrated material. Thus, specific diagnostic evidence of tuberculosis might be obtained in a few days rather than several weeks.

In Kansas City, Mo., 17,000 persons, mostly children, received histoplasmin and tuberculin tests and X-ray inspection of the chest. About 2% of the six-year-old white school children reacted to tuberculin. Throughout the school years a slow

rise was observed to slightly more than 10% by the age of 18 years. Among Negro children the incidence of tuberculin reactors was three times as high. About 5% reacted to histoplasmin at the age of 2 years, and 60% at 18 years. Definite or probable evidence of pulmonary calcification was found in 23.8% of those who reacted to both histoplasmin and tuberculin and 26.4% of those who reacted to histoplasmin but not to tuberculin and 11.4% of those who reacted to tuberculin but not to histoplasmin. Among the children who did not react to either of these tests only 2.6% showed evidence of calcification.

The Committee on Tuberculosis of the American Student Health association reported that during the year 1944-45, 312 colleges had some type of tuberculosis program, where 389 cases of tuberculosis were discovered. More than 12 times as many cases of tuberculosis were found in schools which had a regular tuberculosis program as in those which had not yet participated in this work. The committee strongly recommended testing with tuberculin all entering students and annual retesting of nonreactors.

Treatment.—O. A. Sander pointed out that tuberculosis complicated by silicosis is not so serious as was believed. Not all such cases are rapidly progressive. There are times when tuberculosis is held in check by the fibrous tissue caused by silicosis. A number of silicotic foundrymen made satisfactory arrest of their tuberculosis while working in departments where they were not exposed to excessive amounts of silica dust.

A. L. Barach reported good results in the treatment of pulmonary tuberculosis through the use of residence of patients in the equalizing pressure chamber. This results in continuous immobilization of the lungs, which permits so much local lung rest as to promote the process of healing in areas of disease. Favourable response was observed in patients for whom no other form of treatment was possible or who had not responded to other forms of treatment.

H. C. Hinshaw, W. H. Feldman, K. H. Pfuetze and others found that streptomycin definitely suppresses certain forms of tuberculosis, such as meningitis, miliary and even chronic pulmonary disease. No definite proof was adduced that it destroys all tubercle bacilli.

Richard Davison reported 1,868 thoracoplasty operations on 933 patients. Among 888 patients operated on before Jan. 1, 1945, of those that could be traced, 64% were classified as apparently arrested. This is an excellent result, since all patients were in an advanced stage before operation. The surgical removal of lobes and entire lungs for tuberculosis was employed in a number of centres. However, Duane Carr *et al.*, warned against overenthusiasm and insisted that these procedures be reserved for those patients in whom the various lung collapse procedures would obviously prove ineffective.

Control.—Approximately one-third of all deaths from tuberculosis in the United States occurred in homes. In nine southern populous states this was true of 55%-77% of deaths.

About 30,000 veterans of World War II developed tuberculosis. There were 9,425 beds available through the Veterans' administration. Plans were in progress which would provide for a total of 14,600 beds by Jan. 1, 1948. Dr. John Barnwell, of the University of Michigan, was appointed director of the tuberculosis division of the Veterans' administration. The National Research council organized a subcommittee on tuberculosis which would have an important function in advising the federal agencies in a broad program of professional conduct and research in the field of tuberculosis. The division of tuberculosis of the United States public health service estimated a sanatorium bed deficiency of 44,388. This did not apply everywhere. For instance, in one state there were 600 vacant beds

in 1946.

The committee on tuberculosis of the American School Health association continued to promote the certification of schools on the basis of tuberculosis control work in progress. In Minnesota approximately 200 schools were certified during 1946, and it was anticipated that all schools in the state would be certified in approximately five years. Committees were drawing up qualifications for certification in other states.

Sarah I. Morris reported the results of a case-finding and follow-up study among women medical students over a period of 12 years and presented an effective control program. The total number of students observed was 449, of whom 12.5% developed clinical tuberculosis while under observation. All the students who entered this school as nonreactors to tuberculin became reactors before graduation. In one class of 36 students, 27% developed clinical tuberculosis and 5.5% died.

The controversy regarding the efficacy of BCG (*Bacillus Calmette Guérin*) in immunizing against tuberculosis continued. J. D. Aronson, R. G. Ferguson and S. R. Rosenthal reported results of observation which indicated that a smaller number of vaccinated children die from tuberculosis than the unvaccinated, while M. I. Levine observed no difference whatsoever in the mortality among vaccinated and unvaccinated children. In September, H. E. Hilleboe arranged a conference on this subject. From all of the reports throughout the world it was evident that no well-controlled study over a sufficient period of time had been reported. Therefore, the subject was still in the experimental stage. It was decided that a scientific and well-controlled study of a limited group should be instituted in the United States.

In 1946 there were national tuberculosis associations in 33 nations, 27 of which used seal sales in their fund-raising campaigns. In the United States the gross income from the Christmas seal sale in 1945 was \$15,638,755.37, and more than \$16,000,000 was expected in 1946. Hilleboe pointed out that more than \$100,000,000 was spent annually to maintain sanatorium beds in the United States. This, plus other actual expenditures for the tuberculous, amounted to about \$150,000,000 per year. Congress appropriated \$7,994,000 for federal tuberculosis control in the fiscal year 1946-47. Of this amount, \$6,880,000 was allocated to states and the remainder used for program operation of the division of tuberculosis of the United States public health service. *Public Health Reports*, the weekly bulletin of the United States public health service, issued one all-tuberculosis number each month after March 1. These contained excellent and timely information. In the province of Quebec the government granted \$10,000,000 to combat tuberculosis. The International Union Against Tuberculosis suspended its meetings in 1939 and held its first postwar session in Paris on Nov. 7.

Tuberculosis in Animals.—At the end of the fiscal year, June 30, 1946, the total number of tuberculin tests that had been administered from 1917 to the cattle of the United States in the tuberculosis eradication program of the United States bureau of animal industry was 287,689,953. The number of reactors slaughtered from 1917 to 1946 was 3,911,414. In the fiscal year ending June 1946, 8,454,463 cattle were tested with tuberculin and only 0.23% reacted. This was the most effective tuberculosis control program among animals that had ever been conducted.

On Jan. 14, Dr. M. P. Ravenel died. He was the first person to prove conclusively that the bovine type of tubercle bacillus causes serious disease in man. A problem confronting the veterinarians was that humans with tuberculosis infect cattle. It was suggested that adequate examinations be made of owners, farm hands and all others who come in direct contact with or handle the food of cattle. An extensive campaign was also waged against tuberculosis in other domestic animals, particularly in swine and poultry. (See also X-RAY and RADIOLOGY.)

Tulane University. This coeducational institution, located in New Orleans, La., was founded in 1834. It includes the colleges of arts and sciences, engineering, law, commerce, Newcomb College for Women, the graduate, social work and medical schools, University college (the night division) and the summer session.

In 1946 the academic structure had been reorganized on the divisional plan, including the undergraduate colleges and the graduate school, but not the professional schools of medicine, law and social work. Five divisions were created, the Humanities, the Fine Arts, the Social Studies, the Physical Sciences and the Biological Sciences, each to be headed by a director.

With the termination of the navy V-12 program in July 1946, the university returned to the regular two-semester schedule with the opening of the 1946-47 session on Sept. 23, 1946. Registration reached a new high, and more than one-half of the students were veterans. Because of crowded conditions, the university inaugurated a "swing shift" which held classes from 4 p.m. to 10 p.m. and offered a full program for 300 freshmen in the colleges of engineering and arts and sciences, who could not be accommodated in the regular classes.

To relieve the housing situation, emergency housing units were erected on the campus by the Federal Public Housing authority and administered by the university. Plans for many physical improvements on the campus were made, though actual building could not begin. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. C. H.)

Tung Oil: see VEGETABLE OILS AND ANIMAL FATS.

Tungsten. The output of tungsten concentrates containing 60% WO₃ for the major producing countries is shown in Table I, so far as data were available in 1946.

Table I.—World Production of Tungsten Concentrates (Short tons)

	1937	1939	1941	1943	1944	1945
United States . . .	3,500	4,287	6,566	11,945	10,283	5,715
Canada	—	4	35	681	517	—
Argentina	955	1,443	1,896	2,668	2,743	577
Bolivia	1,986	3,678	4,798	7,608	8,747	4,245
Brazil	7	8	39	1,393	2,448	2,471
Peru	86	187	371	796	700	349
Portugal	2,281	4,245	6,431	8,242	4,506	—
Spain	276	406	457	4,301	2,638	237
Burma	7,599	9,081	?	?	?	?
China	19,726	12,765	?	13,272	9,906	?
Total	43,124	44,000	?	?	?	?

In order to cover a longer period, data are shown for alternate years previous to 1943. The extent to which production was built up in so many countries is one of the marvels of the war production program. The results in the U.S. are especially noteworthy since, so far as is known, the U.S. became the leading producer in 1944. In the earlier years of World War II, Portugal and Spain furnished most of the German supply, but later the buyers of the United Nations adopted the policy of outbidding the German buyers, to reduce the German supply, thus accounting for the marked rise and abrupt fall of output in these countries. When the Burma road was closed, and it was necessary to fly war supplies to China, considerable

Table II.—U.S. Tungsten Statistics, 1939-45 (Short tons of metal content)

	1939	1940	1941	1942	1943	1944	1945
Production . . .	1,715	2,436	3,210	4,489	5,736	4,882	2,696
Shipments . . .	2,040	2,531	3,125	4,441	5,684	4,893	2,720
Imports	1,556	4,833	6,576	7,705	9,339	9,119	4,320
Consumption . .	?	4,978	8,350	8,695	9,657	9,583	7,073
Stocks	1,548	4,157	5,393	6,652	11,988	14,920	12,388

amounts of tungsten were brought out on the return trips.

United States.—Statistics of the tungsten industry in the U.S. are shown in Table II.

The newly discovered deposits which supplied most of this increase were mostly mined out to supply war demand, and production was expected to drop back to something like the prewar level. The figures for 1945 show the beginning of this break, which continued into 1946. Production of concentrates dropped from 1,693 tons in the first quarter of 1946 to 625 tons in the third quarter, with a total of 3,297 tons, in three quarters, as compared with 4,371 tons in the same period of 1945. Imports dropped about 20% below the 1945 rate, but consumption declined by 60%. (See also MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

Tunisia: see FRENCH COLONIAL EMPIRE.

Tunnels. Tunnel work throughout the world slowly resumed in 1946 following virtual cessation, except for military projects, during World War II. Progress resumed on some shut-down operations, numerous new bores were started and a great many were planned as near-future construction projects.

Work continued on the 1.2-mi. Brooklyn-Battery twin-bore vehicular tunnel in New York. Shields driving the south half from Brooklyn approached Governors Island, midway in the project and northern terminus of the south section, at the end of the year. In the north section, all in rock, the contractor worked mostly on enlarging the centre pioneer bores, completed prior to the war shut down, to full size and the shields were being erected to place the permanent cast-iron lining.

In Colorado, the 13.1-mi. Alva B. Adams tunnel under the Continental divide was completed with the finishing of the concrete lining. This was the longest tunnel in the world driven from two portals. Two other tunnels on this same Colorado-Big Thompson irrigation project were started on the east side of the divide: Rams Horn (6,924 ft.) and Prospect mountain (5,650 ft.), both scheduled for completion in 1947.

San Diego joined the Metropolitan Water district of Southern California and started a 71-mi. aqueduct to bring Colorado river water into the city from the existing metropolitan system. Included in the aqueduct were seven tunnels: San Vicente, Fire Hill, Poway, Rainbow, Lilac, Red Mountain and Oats Hill. These ranged from 500 to 5,700 ft. in length.

In Chicago, work continued on a 23,000-ft. section of a 12x 20-ft. intercepting sewer, started late in 1945, and contract was let in September for an additional 17,000 ft. of similar tunnel on the same project. Bids were taken on extending the Dearborn street subway tunnel in Chicago but were rejected as too high. New bids were to be asked under a revision of plans.

A mile-long sewer tunnel was completed in Baltimore and work started on a 5.5-mi. water tunnel in Boston.

The Columbia basin irrigation project in Washington would eventually call for 14 tunnels. Bacon tunnel, 1.9 mi. long, was started in 1946 and 3 more were included in the first phase of the project under way.

Greatest of all tunnels outside the United States under way in 1946 was sec. 4 of the Moscow subway, a 12.5-mi. loop intersecting the previous 3 routes. Shields, compressed-air drills, pneumatic spades, electric locomotives and other modern equipment were being used on this project. In London, the eastward extension of the Central London subway was resumed. Sidney, Australia, started work on a 7-mi. extension to its subway.

In Mexico, driving was completed on the 7-mi. El Mirador tunnel on the Valsequillo irrigation project near Puebla. Only connecting work remained to be done on this 16-ft. bore. The Tequiquiac sewer tunnel, also 7 mi. long, was 80% complete

at the end of the year. Longest of all Mexican tunnels, the 10-mi. Lerma tunnel for Mexico City's water supply was 50% finished. Work started in 1946 on the Cañon del Pato hydroelectric project in Peru, which included a 5.7-mi. tunnel to be driven through extremely hard rock.

Driving of Blackwell No. 2 tunnel in London and the Thames Estuary tunnel below the city was resumed. Progress on both of these vehicular tunnels was disrupted by World War II.

Contract was let for a 2-mi. water tunnel on Oahu to supply additional water for Honolulu. Before work got under way the contractor revoked because of adverse labour and materials conditions induced by several strikes. The project was expected to be readvertised in 1947. (H. W. RN.)

Turkestan, Chinese: see SINKIANG.

Turkey. A republic in the southeastern Balkans and in Asia Minor. Area, 296,185 sq.mi.; pop. (Oct. 20, 1940) 17,820,950. Capital: Ankara. Chief cities: Istanbul (Constantinople) 793,949; Izmir (Smyrna) 183,762; Ankara (Angora) 157,242; Seyhan (Adana) 88,119; Bursa (Brusa) 77,598; Eskişehir 60,742; Gaziantep 57,132. Religion: predominantly Mohammedan. President: Ismet İnönü. Prime minister (1946) Recep Peker.

History.—During 1946 Turkey found itself in the centre of international attention as a result of soviet Russia's demand for the annexation of Turkish territory and for the establishment of Russian military bases in the Turkish straits dominating Constantinople. This demand was consistently rejected by the Turks. Internally Turkey ended the one party system which Mustapha Kemal, the great renovator of Turkey, established when the country was transformed from an empire into a national republic. In Jan. 1946 a new Democratic party under the leadership of Jelal Bayer, who was Turkish premier from 1937 to 1939, was formed and entered the electoral campaign against the Republican People's party which was backed by the government. The elections were held on July 21 based on universal suffrage and the secret ballot. In the large cities the Democratic party was favoured. Both parties were agreed upon the country's foreign policy. Both rejected not only Russia's

RUSSIAN demands for military bases on the Dardanelles were the subject of "Peace Meal," drawn in 1946 by Carl Somdal of the *Chicago Tribune*

MILITARY HONOURS being accorded the body of Mehmet M. Ertegun, former Turkish ambassador to the U.S., in Istanbul during April 1946. He had died in the U.S. in 1944, and his body was returned aboard the U.S. battleship "Missouri"

territorial demands but also Russian suggestions to adopt a pro-Russian line as Bulgaria and Yugoslavia had done and to join with those states against Greece and the western democracies, whereupon Russia would abandon its territorial claims. In domestic policy, however, the two parties were violently opposed and the Democrats accused the government party of undue influence on the electorate. The government party won an overwhelming victory at the polls, with 396 seats against 62 for the opposition.

At the beginning of August the cabinet of Sükrü Saracoğlu resigned and was replaced by one headed by Recep Peker, a former minister of the interior who retained in his cabinet Hassan Saka as foreign minister.

The new government rejected Russian proposals for establishing joint Russian-Turkish defense of the Dardanelles and for the narrowing of the control of the Dardanelles to the Black Sea powers alone. To the Russian note of Aug. 7 the Turks replied on Aug. 23 that the United Nations should be trusted to guarantee the straits' security; that changing the existing form of defense of the straits would be a denial of the existence and aims of the United Nations charter and would imply a distrust of the efficacy of the United Nations to which Turkey declared itself firmly attached. On the other hand the Turks agreed to the rewording of the convention of Montreux of 1936, though the pact had been intended to live unchanged at least until 1956. The pact had been signed by Russia, Turkey, Britain, France, Rumania, Bulgaria, Yugoslavia and Japan. Turkey insisted that in any new negotiations the United States must take part.

The United States, in its notes of Aug. 19 and Oct. 9 to the soviet foreign office, supported the Turkish point of view. It emphasized that the regime of the straits was a matter of concern not only to the Black sea powers but also to other powers,

including the United States, and that the Potsdam agreement between Russia, the United States and Britain had contemplated a conference of all the interested powers, including the United States, to consider the revision of the Montreux convention. It pointed out that in the opinion of the U.S. the Turkish government should continue to be primarily responsible for the defense of the straits. Should they become the object of attack or threat of attack by an aggressor, the resulting situation should be dealt with by the Security council of the United Nations. Britain and France, who were signers of the Montreux convention, supported the U.S. point of view. Turkish friendship towards the United States was marked at the time of the visit of the U.S. battleship "Missouri" in Istanbul.

Even more determined was Turkish resistance to Russia's territorial demands. The Russian government demanded on behalf of soviet Armenia and of soviet Georgia large parts of northeastern Anatolia and of the Turkish Black sea coast. There were also reports of Russian support for Kurdish autonomy demands, for the Kurds in Turkey as well as for those in neighbouring Iran. The Russian advance in Iranian Azerbaijan was also felt as a threat to Turkey. All these claims were, however, not officially raised by the soviet government, and by the end of 1946 Russia seemed, at least for the time being, to have dropped them. The withdrawal of Russian troops from Iranian Azerbaijan which flanks Turkey also helped to ease the situation considerably.

Education.—In 1942 there were 11,413 schools with 29,854 teachers and 769,555 male and 331,706 female students. The total expenditure on education by the government in 1941-42 was \$32,837,515. There were 20 institutions for higher education with 11,779 male and 3,011 women students.

Finance.—Government revenues for 1945 were \$721,209,000, expenditures \$761,948,000; the national debt (1943) amounted to \$1,114,010,000. The monetary unit is the Turkish pound (£ T), divided into 100 piastres. The Turkish pound was

stabilized on the basis of 521 piastres to the English pound and was valued at approximately 80 cents (U.S.).

Trade and Communication.—In 1943 imports to Turkey amounted to \$162,400,000; exports from Turkey to \$197,600,000. Before World War II the chief exporters to Turkey were Germany, followed by the United States, Italy and Great Britain. The same order prevailed among the countries to which Turkey exported. There were 4,551 mi. railroads in 1944; 25,393 mi. highways (1942); 28,857 telephones (1945); 18,795 mi. telegraph lines (1944); 176,262 radio sets (1945).

Agriculture and Minerals.—Production of principal crops (1944) included: wheat 3,525,592 short tons; sugar beets 676,101 tons; barley 1,546,581 tons; potatoes 211,352 tons. There were 22,450,000 sheep; 12,250,000 goats (ordinary); 4,975,000 goats (mohair); 9,549,000 cattle. Mineral production was: coal 4,099,454 short tons (1944); cement 299,689 tons (1945); chrome 86,313 tons (1945); mineral water 173,708 gal. (1945).

Ukraine. The Ukrainian Soviet Socialist Republic was one of the 16 constituent members of the Union of Soviet Socialist Republics. In 1939 its area was 170,998 sq.mi. with a population of 30,960,221. Capital: Kiev (pop. 846,293). Other important cities: Kharkov (833,432), Odessa (604,223), Dnepropetrovsk (500,662). The Ukrainian Soviet Socialist Republic later extended its territory by about 50,000 sq.mi. through the annexation of southeastern Poland (1939), of parts of Rumania's eastern provinces (1940) and of Czechoslovak Carpatho-Ukraine (1945).

The Ukrainian Soviet Socialist Republic formed, in number of population and in economic importance, the second of the 16 constituent republics, ranking immediately after the Russian Socialist Federal Soviet Republic, though having only about one-third of the latter's population and only one-thirty-fifth of the latter's territory.

During 1946 the Ukraine took a very active part in all the United Nations deliberations. The chairman of its delegation, Dmitry Zackarovich Manuisky, one of the well known old bolshevik leaders and prominent member of the former Communist International, could be always relied upon to present with great skill and ability the soviet and communist point of view.

The Ukraine and the neighbouring Byelorussian Soviet Socialist Republic received valuable assistance during 1946 from the U.N.R.R.A. The U.N.R.R.A. program of relief and rehabilitation included foodstuff, farm tools of all kinds, repair tools, small plants and medical supplies.

In March 1946 a number of members of the Ukrainian Uniate Church in the territories annexed by the soviet union after the outbreak of World War II decided to dissolve their ties with the Catholic Church in Rome and to join the Russian Orthodox Church of Moscow. In a letter sent to Generalissimo Joseph Stalin the 216 delegates of the Uniate Church of the western Ukraine gathered in Lwow (Lemberg), Poland, declared on March 8 that they abandoned the Brest union with the Vatican which had been concluded in 1595 and that they returned "to the bosom of the Holy Russian Orthodox Church of our forefathers, whose light shone from Russia's Kiev, the historic cradle of the Russian, Ukrainian and Byelo-Russian peoples." The letter accused "proud and power-loving Rome" of dreaming of

establishing "its own dictatorship in the Christian world."

The Ukrainians and even many of their Communist leaders had for many years fought for greater national independence against Moscow centralization. After World War II Ukrainian nationalism and striving for independence again agitated the country violently. On behalf of the Moscow politbureau of the Communist party, Nikita Khrushchev visited Kiev at the end of Aug. 1946, and under his leadership a thorough purge of the Ukrainian Communist party was carried through. About one-half of the Communist leaders in the Ukraine were replaced. It was found that the central committee of the party in the Ukraine had failed to resist "a hostile bourgeois nationalist ideology."

Union of Soviet Socialist Republics. The former Russian empire, an Eurasian state covering the whole of eastern Europe and Northern Asia and much of central Asia, is a federation of soviet socialist republics. In 1939 its area was 8,173,557 sq.mi., its pop. (Jan. 17, 1939, census) 170,467,486. The union then consisted of 11 republics of which the Russian Soviet Federated Socialist Republic was by far the largest (78% of the whole territory and 64% of the population). Of the remaining 36% of the population, almost one-half lived in the Ukrainian S.S.R. (2% of the territory) and the other half in the 9 other union republics (20% of the territory). The soviet union is inhabited by almost 100 different nationalities speaking different languages. In Jan. 1939 Great Russians constituted 58.4% of the population, Ukrainians 16.6% and Byelorussians 3.1%. None of the other nationalities, all of them non-Slavic and most of them non-European, reached 3% of the total population.

In 1939 the U.S.S.R. consisted of the following union republics: Russian S.F.S.R. (capital Moscow; area 6,372,860 sq.mi.; pop. 109,278,914); Ukrainian S.S.R. (Kiev; 171,777 sq.mi.; pop. 30,960,221); Byelorussian S.S.R. (Minsk; 49,022 sq.mi.; pop. 5,567,976); Azerbaijan S.S.R. (Baku; 33,196 sq.mi.; pop. 3,209,727); Georgian S.S.R. (Tiflis; 27,020 sq.mi.; pop. 3,542,289); Armenian S.S.R. (Erivan; 11,580 sq.mi.; pop. 1,281,599); Turkmen S.S.R. (Ashkhabad; 171,384 sq.mi.; pop. 1,253,985); Uzbek S.S.R. (Tashkent; 145,908 sq.mi.; pop. 6,282,446); Tadzhik S.S.R. (Stalinabad; 55,584 sq.mi.; pop. 1,485,091); Kazakh S.S.R. (Alma-Ata; 1,059,184 sq.mi.; pop. 6,145,937); Kirghiz S.S.R. (Frunze; 76,042 sq.mi.; pop. 1,459,301). In the years between 1939 and 1945 the U.S.S.R. expanded its territory considerably. It annexed in Europe the three Baltic republics of Estonia (18,353 sq.mi., pop. 1,126,413), Latvia (20,056 sq.mi., pop. 1,950,502) and Lithuania (22,959 sq.mi., pop. 2,879,070) and acquired from Finland 16,173 sq.mi. with a pop. of c. 500,000; from Poland 77,703 sq.mi. with a pop. of c. 12,775,000; from Rumania 19,300 sq.mi. with a pop. of c. 3,500,000. In 1945 the U.S.S.R. added to its territory the Carpatho-Ukraine from Czechoslovakia (12,617 sq.mi. with a pop. of 725,357) and the northern part of eastern Prussia from Germany (c. 7,000 sq.mi. with a pop. of c. 1,000,000). From Japan the U.S.S.R. acquired in 1945 Karafuto (southern Sak-

halin), an area of 13,935 sq.mi. with a pop. (1935 census) of 331,943, and the Chishima or Kurile Islands (47 islands of 3,944 sq.mi.). In addition the formerly "independent" republic of Tannu Tuva in Outer Mongolia (64,000 sq.mi.) was annexed and transformed into the Tuvan Autonomous Region.

As the result of the territorial expansion and of events of World War II the U.S.S.R. formed in 1946 a federation of 16 republics. To the 11 republics existing in 1939 were added: the Karelo-Finnish S.S.R., consisting of the territory ceded by Finland and of the former autonomous S.S.R. Karelia (cap. Petrozavodsk; area 75,656 sq.mi.), the Moldavian S.S.R. consisting of most of Rumanian Bessarabia and the former Moldavian autonomous S.S.R. (area 13,124 sq.mi.), the Estonian S.S.R., the Latvian S.S.R. and the Lithuanian S.S.R.

On the other hand several former autonomous republics and regions in the U.S.S.R. were liquidated during World War II as a result of the disloyalty of the populations who found their national aspirations not satisfied within the U.S.S.R. and, therefore, when the opportunity offered itself, collaborated with the invading Germans. These regions were the Crimean Tatar A.S.S.R., the Kalmyk A.S.S.R., the Chechen-Ingush A.S.S.R. and the Karachaev Autonomous Region. The populations were dispersed, the indigenous languages doomed, the towns and places received Russian names. In the belief that race is stronger than class allegiance and indoctrination, the U.S.S.R. government liquidated the German Volga A.S.S.R., one of the oldest autonomies in the soviet union, although the German invaders never reached the territory.

In addition to the vastly increased territory of the U.S.S.R. proper the soviet union exercised in 1946 an ideological, political and military sway as a result of World War II over the people's republic of Bulgaria, the federated people's republic of Yugoslavia, the people's republic of Albania and the people's republic of Mongolia, and to a lesser degree over the kingdom of Rumania and the republic of Czechoslovakia. The influence of the soviet union expanded widely partly through communism (*q.v.*), partly through pan-Slavism and in some cases through their combined appeal.

The capital of the U.S.S.R. and of the Russian S.F.S.R. is Moscow (pop. 4,137,018). Ten other cities had a population of more than 500,000 in 1939: Leningrad, formerly St. Petersburg

(3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,347); Gorki, formerly Nizhni Novgorod (644,116); Odessa (604,223); Tashkent (585,005); Tbilisi or Tiflis (519,175); Rostov-on-Don (510,253); Dnepropetrovsk (500,662). In 1939 there were 81 cities in the U.S.S.R. with a population of more than 100,000 inhabitants and 92 cities with a population of 50,000 to 100,000 inhabitants.

On Feb. 10, 1946, the first elections after 1937 were held throughout the soviet union for the supreme soviet, the bicameral highest legislative body. In each electoral district only one candidate was presented. No opposition was allowed. Nevertheless, a great official propaganda extolling the achievements of the Communist party was made, and the voting day was celebrated as a public holiday. Generalissimo Joseph Stalin himself and other leaders agreed to stand for election in various districts where the people received the news with "enormous enthusiasm and unlimited happiness." The members of the Politburo, the supreme political body of the Communist party, delivered election addresses on the newly gained strength of the U.S.S.R. L. M. Kaganovich warned in a speech in Tashkent, however, that "we must always remember, our country continues to be within a capitalist encirclement. Therefore we should not relax but strengthen Bolshevik vigilance."

Generalissimo Stalin himself reviewed in a glowing tribute the tremendous military strength gained by the U.S.S.R. under Bolshevik leadership. He predicted a number of five-year plans to strengthen further the soviet union. As was expected the elections resulted in an overwhelming national plebiscite confirming practically unanimously the policy of the party in power and the only party in existence. Of the registered voters 99.7% actually did vote, and 99.18% voted for the only candidate officially presented.

On Feb. 25 the U.S.S.R. unified its armed forces and transformed the People's Commissariat for Defense into the People's Commissariat of the Armed Forces of the U.S.S.R., uniting thus the land armies, air forces and the navy. Commissar of the armed forces remained Generalissimo Stalin, who had been appointed people's commissar of defense on July 19, 1941. In March Gen. N. A. Bulganin was named vice-minister of the

WOMEN FARMERS stacking hay on a collective farm in the Moscow region during 1946

CHILDREN playing outside the nursery of Borets Collective farm near Moscow in the U.S.S.R., during 1946

armed forces and the command was divided into four units—land, air, navy and rear—each one under a vice-minister. On the soviet union's Navy Day, Sunday, July 28, the official speeches emphasized the need for a strong navy in the Pacific and Arctic oceans and in the Baltic sea. The soviet union had gained in the annexations of World War II new important naval bases in Port Arthur and the Kurile Islands in the Pacific, in Koenigsberg and Memel in the Baltic and in Petsamo in the far north.

When the supreme soviet met after the elections, it decided to change the title of people's commissar introduced by Lenin's revolution into the old title of minister. Generalissimo Stalin who had been chairman of the council of people's commissars from May 27, 1941, now became chairman of the council of ministers or prime minister; Foreign Commissar Vyacheslav Molotov became foreign minister. The same change of title was also carried through in the various constituent republics and autonomous parts of the soviet union. Mikhail Ivanovich Kalinin resigned as the result of illness as chairman of the praesidium of the supreme soviet, a position corresponding to that of a president of the soviet union (Kalinin died soon afterwards) and was replaced by Nikolai Mikhailovich Shvernik. Kalinin had filled his position for 27 years. Molotov and seven other leading members of the party were elected deputy prime ministers. The whole tendency was to fuse more and more the supreme command of the party with the supreme administration of the state. The same process was followed in all the constituent republics and autonomous parts. All elections were unanimous.

On March 14 the supreme soviet received a report on a new five-year plan for reconstruction and development of the national economy for the years 1946-50. The plan called for an all-round increase of the nation's production and wide scientific research. In his report N. A. Voznesensky, head of the state planning department, stated that by taking advantage of the superiority of the soviet system, the U.S.S.R. could outstrip the capitalist countries in all types of progress, including technology.

Throughout the year the soviet government, engaged in a tremendous task of reconstruction and of stepping up production in all fields, was most anxious to combat shortcomings in the realization of its plans. How much production of some of the most essential primary materials suffered as a result of World War II could be seen from the fact that the new five-year plan foresaw as its goal for 1950 a yearly production of 35,400,000 tons of oil, while the third five-year plan had demanded for 1942 a yearly production of 48,500,000 tons, and the actual production in 1940 reached 31,147,000 tons. Yet in addition to the older oil fields in the Caucasus and along the Caspian sea the discovery of new oil and natural gas fields in the territory between the Ural and the Volga and in the Middle Urals was reported.

Though the new five-year plan would devote much attention to housing and consumer goods, the greater stress continued upon heavy industry, military preparedness and transportation. But the progressive demobilization of the soviet army would help the reconstruction of the country by reinforcing the available labour force. Housing and agricultural machinery especially were found lacking. The managements of many industries and of the collective farms were thoroughly overhauled and many leaders were purged for grave violations of the laws, for fraud or graft or gross inefficiency.

The new five-year plan found its concrete expression in the new budget submitted to the supreme soviet by Minister of Finance A. G. Zverev on Oct. 15. According to it, total expenditure in 1946 would reach 319,269,000,000 rubles. Of this amount, 102,237,000,000 rubles were for the national economy: 63,806,000,000 for industry, 12,552,000,000 for agriculture, 10,841,000,000 for transport and communication, 3,877,000,000 for municipal economy and 3,153,000,000 for trade stocks and grain deliveries. For social and cultural purposes 83,294,000,000 were earmarked, of which 35,160,000,000 were for education, 5,000,000,000 for scientific research, 14,823,000,000 for health and physical culture and the remainder for social insurance and pensions. The military budget for 1946 amounted to 72,208,000,000. Income in the new fiscal year was estimated at about 335,-

000,000,000, of which more than 60% was derived from a turnover tax on all economic enterprises, the tax on industry and the income tax on individuals playing a minor role.

The growing anxiety in the soviet union over the international situation was relieved when Generalissimo Stalin answered on Sept. 24 questions by an English newspaper correspondent. In his answers he declared that he did not believe in a real danger of a new war and repudiated the widely-held and expressed belief of a "capitalistic encirclement" of the U.S.S.R. by the democracies. "I do not think," he was quoted as saying in the official statement, "the ruling circles of Britain and the U.S.A. could create a capitalistic encirclement of the soviet union even if they wanted to do this which, however, we cannot affirm." Premier Stalin expressed his unconditional belief in the possibility of a friendly and lasting collaboration of the soviet union and western democracy despite ideological discord and his faith in the possibility of "communism in one country." Regarding the atomic bomb he did not share the widespread exaggeration of its importance for war or peace and for international relations. He did not think it "to be as serious a force as certain politicians are inclined to regard it. Atomic bombs can not decide the outcome of war, since they are by no means sufficient for this purpose."

These reassuring declarations were especially welcomed because they came after the dismissal of Maxim Litvinov, well known as an adherent of collaboration with democracy, from his post as deputy minister of foreign affairs on Oct. 24 and after a mass purge of many Communist leaders in the Ukraine, the soviet's most important economic bastion. Their removal was explained by their support for Ukraine's national aspirations as against the official Communist ideology. On the other hand, however, the official soviet press continued to maintain the thesis that capitalism by necessity breeds imperialist aggression and world wars. The "inevitable" depression in the United States, it was declared, would sharpen the class struggle and thus force the country into "imperialist reaction." Col. Gen. Andrei Alexandrovich Zhdanov, secretary of the Central committee of the Communist party, chairman of the supreme soviet and a member of the Politburo, declared on Nov. 6 in celebration of the 29th anniversary of the Bolshevik revolution, that the soviet union was unafraid of any exponents of aggressive expansionism who were undermining international collaboration. He pointed proudly to "the invincibility of our cause and the strength of our system." On the same day Generalissimo Stalin, who personally did not participate in the celebrations, told the armed forces that during World War II the soviet order "has proved quite obviously its uncrushable might and its excellence over the capitalistic order."

A definite improvement, however, came in the international atmosphere by the end of the year. Minister of Foreign Affairs Molotov and his deputy, Andrei Vishinsky, showed at the conclusion of the meetings of the United Nations assembly and of the Council of Foreign Ministers in New York in Dec. 1946 a more conciliatory attitude toward collaboration with the democracies than had been visible throughout the year.

Efforts to broaden contact between the U.S.A. and the U.S.S.R. were not very successful in 1946. The U.S.A. was represented in the U.S.S.R. only by the embassy in Moscow and the consulate in Vladivostok and a temporary attaché in Odessa dealing with United Nations Relief and Rehabilitation administration deliveries to the Ukraine and Byelorussia. Upon soviet request the U.S. naval attachés were withdrawn from Archangel and Vladivostok in August. By the end of the year the soviet authorities had not yet agreed to the request for the opening of U.S. consulates in other cities. At the beginning of 1947 the U.S.A. made a third effort to induce the U.S.S.R. to

"FOUR-HEADED BEAR," a cartoon by Rube Goldberg which appeared in the *New York Sun* on Nov. 19, 1946

settle its lend-lease account of more than \$11,000,000,000 as Britain, France and other countries had done. Two previous efforts in that direction in the fall of 1946 had received no reply from the soviet government. (See also UNITED NATIONS.)

The close co-operation of the soviet government and of the Russian Orthodox Church continued in 1946, not only in the soviet union but also among the members of the Orthodox faith abroad. When the head of the Russian Church in western Europe, Metropolitan Eulogius died in France, the patriarch of Moscow appointed Metropolitan Serafim as his successor though Serafim had during World War II worked for Hitler's victory over the soviet union and only afterwards submitted to Moscow. Most of the Russian Orthodox Christians in France refused to recognize Serafim who wished to co-ordinate the church of western Europe completely with Moscow's policy. They followed Archbishop Vladimir who requested, instead of the Moscow patriarch, the oecumenical patriarch of Constantinople to approve his election. Generally, the soviet government made persistent efforts to induce Russian émigrés living outside the soviet union to accept soviet citizenship. Even more than on the Russian Church the Soviet government relied upon pan-Slavism and appeals to racial loyalty for extending its influence abroad. A pan-Slav congress in Belgrade in Dec. 1946 tried to mobilize not only the public opinion of the various Slav nations (Poland, Yugoslavia, Bulgaria and Czechoslovakia), but also of citizens of Slav descent or race in non-Slav countries, especially in the United States, Canada, Latin America and Australia, for support of, and loyalty to, the pan-Slav movement under soviet leadership and Communist inspiration.

In its domestic policy the soviet union continued to re-emphasize the Communist doctrine of Leninism and Stalinism but did not abandon the more conservative appeal of national traditional pride, praise of large families, of discipline in education and of patriotic work. A new amalgam seemed to emerge in which soviet nationalism with many of its historical values and aspirations was closely fused with Communist ideology.

They seemed to strengthen each other. They were united in promoting the struggle against "alien" or "western" ideas and their penetration into the U.S.S.R. The return to the traditional militancy and strictness of Communist ideology was carried on above all by the organ of the propaganda bureau of the Communist party, *Culture and Life*, which in 1946 devoted much of its attention to warning representatives of all branches of culture and public life—writers and poets, musicians and dramatists, producers in theatres and movie studios—against imitation of "alien" examples, accusing them of lack of political understanding, of disinterestedness in the great constructive tasks of the soviet union and of indulgence in "decadent" interest in artistic forms. Even the leading official newspapers did not escape sharp censure.

On May 21 a comprehensive five-year plan for soviet film production was announced. The new films were to stress the advantages of the soviet regime over capitalism, the role of the Communist party, the people's vigilant patriotism and duties to the state. They were to praise the soviet way of life, the family, mothers who had ten children or more and to commemorate outstanding war heroes. For not fulfilling these tasks the editors of the leading movie magazine, among them S. M. Eisenstein and V. I. Pudovkin, were dismissed in Sept. 1946. The soviet theatre was asked not to present plays which would demoralize the audiences with bourgeois ideology like Somerset Maugham's *The Circle* and Moss Hart's *The Man Who Came to Dinner*, or would encourage escapist tendencies. The deficiency was not confined to the artistic professions. The Moscow board of attorneys was dissolved on Nov. 15 for failing to halt "grafting and other amoral acts" which stemmed from an "almost complete absence of ideological political work" among Moscow's attorneys. Even Dmitri Shostakovich, who was highly praised for his Fifth and Seventh symphonies, was condemned in *Culture and Life* for the ideological emptiness of his Ninth symphony which to the critic seemed to reflect the "unwholesome influence" of Igor Stravinsky, "an artist without a fatherland." Thus the soviet union found itself at the end of the year in an energetic campaign for the elimination of ideological deficiencies and for the unceasing perfection of political knowledge. The whole cultural and intellectual life of the vast and victorious land was mobilized, together with all its social energies and economic resources, for the great goal of the fulfilment of the new tasks set by the man who was incessantly praised as the unique and infallible leader, Generalissimo Stalin, and by the Communist party, the undisputed and absolute master over the destinies of its almost 200,000,000 inhabitants. (See also BULGARIA; FINLAND; POLAND; RUMANIA; UNITED NATIONS.)

Unitarian Church. The year 1946 was marked by rapid extension of the influence of the Unitarian faith in many parts of the world, along lines laid down during the years before World War II. Notably the work of the Unitarian Service committee, with branches in Canada, Great Britain, the Netherlands, Czechoslovakia and Hungary, and with programs of nonsectarian, nonpolitical humanitarian service in many other lands, showed evidence of growing effectiveness. It became apparent during 1946 that the work of this committee, organized in Boston, Mass., in 1940, had become the permanent service arm of Unitarianism on a world-wide scale.

The most important single project of the Unitarian Service committee in 1946 was the Medical Teaching mission to Czechoslovakia, of which Dr. Paul D. White, of Boston, was chairman and Dr. Erwin Kohn was administrative officer. The influence of this mission upon medical education, not only in Czechoslovakia but in time throughout central Europe, was likely to prove of great value.

On the American continent, where the American Unitarian association was the central organization of the Unitarian churches of the United States and Canada, the outstanding record of 1946 was in the field of publications, especially the inauguration of a new program of book publishing, with volumes such as *Together We Advance* and *Liberal Voices* giving new and forceful expression to the growing sense of power within the denomination.

An item of basic importance for the Unitarian movement during 1946 was the successful completion of the United Unitarian appeal, an incorporated body that directs the co-operative campaign to raise funds for the annual operations of all Unitarian agencies in the United States and Canada. In 1946 the amount raised was approximately double that of 1945.

Within the organizational structure of the American Unitarian association, the election of Dr. Winfred Overholser, superintendent of St. Elizabeths hospital, Washington, D.C., to the position of moderator, is noteworthy. This was the first time a physician had been chosen as the lay head of the denomination. It is also important to note that 1946 saw a reorganization of the work of the general alliance, the Unitarian women's society, and a marked increase in the effectiveness of its program.

(F. M. E.)

United Church of Canada. The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches of Canada, reported for 1945 a membership of 749,374 with 1,771,966 persons under pastoral oversight, a Sunday school enrolment of 474,248 and 6,784 preaching places. The church owned property worth more than \$89,253,554 and raised a total of \$16,021,138 for all purposes. The missionary and maintenance givings of the church in 1945 totalled \$1,872,363, an increase of \$132,571 over the previous year. It was estimated that the church would need a budget of \$2,750,000 by 1950.

Among the important features in the life of the United Church during 1946 was the commendation for study of a report whereby the ministries of the Church of England in Canada and the United Church of Canada can be conferred each upon the other; the adoption of a "Basis of Agreement" whereby the Canada Conference of the Evangelical Church may enter the United Church; the raising of \$4,450,000 for the capital of the pension fund; the provision for a full-time secretary to promote lay activities; the reappointment of an Inter-Board Committee on Radio with necessary budget; and the adoption and publication of a notable report of a commission on "Christian Marriage and the Christian Home."

Rev. T. W. Jones, of Montreal, was elected moderator for the biennium.

United Kingdom: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

United Nations (U.N.). **Initial Organization.**—The preparatory commission created to make provisional arrangements for the first sessions of the principal organs of the United Nations met in London, Nov. 23–Dec. 23, 1945. Its report provided the basis for subsequent

decisions regarding the permanent organization of the United Nations, including the relation of the United Nations to the League of Nations. The first meeting of the general assembly was held at Church house in London on Jan. 10, 1946. The Security council held its initial meeting on Jan. 18 and the Economic and Social council on Jan. 23 in London. The International Court of Justice held its first meeting on April 3 in the Peace palace at The Hague. The Trusteeship council was not constituted until December. Under arrangements approved early in the year the League buildings in Geneva, including the library, were transferred to the United Nations on Aug. 1, 1946. Since it was found impracticable to transfer League functions and personnel *en bloc*, it was decided to make transfers on a selective basis, each case being covered by a special arrangement.

Membership.—The original members of the United Nations (article 3 of the charter) were as follows: Argentina, Australia, Belgium, Bolivia, Brazil, the Byelorussian Soviet Socialist Republic, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, the Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, India, Iran, Iraq, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Panama, Paraguay, Peru, the Philippine Commonwealth, Poland, Saudi Arabia, Syria, Turkey, the Ukrainian Soviet Socialist Republic, the Union of South Africa, the Union of Soviet Socialist Republics, the United Kingdom, the United States of America, Uruguay, Venezuela and Yugoslavia.

The following nine states, in the order of the receipt of their applications, applied for membership during 1946: The People's Republic of Albania, the Mongolian People's Republic, Afghanistan, the Hashemite Kingdom of Trans-Jordan, Eire, Portugal, the Republic of Iceland, Siam and Sweden. Afghanistan, Iceland, Siam and Sweden were admitted to membership by vote of the general assembly during the second part of the first session following recommendation by the Security council. The other applicants failed to receive the approval of the Security council.

General Assembly.—The preparatory commission recommended that the first session of the general assembly should be divided into two parts—the first part to be devoted primarily to organizational matters and the second part to the consideration of substantive items on the agenda. It was found impossible in practice to adhere closely to this division of labour.

The first part of the first session was held in London, Jan. 10–Feb. 14, 1946. The permanent organization of the general assembly was determined and its rules of procedure adopted. Paul-Henri Spaak of Belgium was elected president. The chief

PRIME MINISTER CLEMENT ATTLEE addressing the first session of the general assembly of the United Nations in Central hall, Westminster, London, Jan. 11, 1946

delegates of China, France, the Union of South Africa, the Soviet Union, the United Kingdom, the United States and Venezuela were elected vice-presidents. Six main committees, with elected chairmen as indicated, were established to consider items on the agenda and make recommendations to the general assembly: (1) Political and Security (Dmitri Z. Manuisky, the Ukrainian S.S.R.); (2) Economic and Financial (Waclaw Kondorski, Poland); (3) Social, Humanitarian and Cultural (Peter Fraser, New Zealand); (4) Trusteeship (Roberto MacEachen, Uruguay); (5) Administrative and Budgetary (Fares el Khoury, Syria); and (6) Legal (Roberto Jimenez, Panamá). A general committee was established, consisting of the seven vice-presidents, the chairmen of the main committees and the president of the general assembly, to serve as a steering committee.

In addition, two *ad hoc* committees were established: a headquarters committee to consider the permanent site of the United Nations, and a League of Nations committee to consider the possible transfer of League assets and functions to the United Nations.

The general assembly performed certain elective functions necessary to the constitution of other principal organs of the United Nations. These included the appointment, upon recommendation of the Security council, of a secretary general; the election of 6 nonpermanent members of the Security council and the 18 members of the Economic and Social council; and the election, concurrently with the Security council, of the judges of the International Court of Justice.

In addition the general assembly adopted resolutions providing for the establishment of "a commission to deal with the problems raised by the discovery of atomic energy," reminding members of their obligations under chapters XI and XII of the charter dealing with non-self-governing territories and trusteeship matters, reasserting previously adopted principles governing relations with the Franco government in Spain, supporting the work of the United Nations Relief and Rehabilitation administration, urging all governments and peoples to take immediate and drastic action to conserve food supplies and to ensure maximum production of grain and referring the problems of refugees and displaced persons to the Economic and Social council for examination and report with specific recommendations as to principles to be applied.

The general assembly also adopted resolutions setting forth rules and principles to govern the organization and functioning of the secretariat, establishing necessary budgetary and financial arrangements, approving a draft convention on the privileges and immunities of the United Nations and establishing the permanent headquarters of the United Nations "near to New York city," and the interim headquarters in New York city.

The second part of the first session of the general assembly was held Oct. 23—Dec. 15 at Flushing Meadows, Long Island. The date originally set for the opening meeting was Sept. 2, but a postponement was found to be necessary because the peace conference was in session in Paris. During the second part of its first session the general assembly admitted 4 new members, thus increasing total membership to 55, approved the revised estimate of \$19,390,000 for its 1946 budget and the estimate of \$27,740,000 for the 1947 budget, determined the scale of contributions of member states and finally decided upon the location of permanent headquarters in New York city. In addition it discharged its elective functions by choosing three new members of the Security council to succeed those whose terms would expire at the end of 1946, six new members of the Economic and Social council and two elected members of the Trusteeship council.

Within the general field of peace and security the general assembly adopted a resolution recommending that the Security council give prompt consideration to formulating practical and effective measures for the general regulation and reduction of armaments and armed forces. As an essential step to this end the general assembly urged the expeditious fulfilment by the Atomic Energy commission of its terms of reference and the expeditious consideration by the Security council of the reports of the commission and the preparation of a convention effectively controlling atomic energy to the extent necessary to ensure its use only for pacific purposes. The general assembly recognized the problem of security as closely connected with that of the regulation of armaments and recommended that the Security council accelerate the conclusion of agreements for placing armed forces at its disposal. It also recommended that members undertake the "progressive and balanced withdrawal" of forces stationed in former enemy countries and the immediate withdrawal of forces stationed in the territory of members without their consent.

On the question of Security council voting procedure the general assembly recommended the early adoption by the Security council of practices and procedures, consistent with the charter, to assure the prompt and effective exercise of its functions. All proposals to amend the charter in this connection were rejected. The general assembly adopted a resolution expressing sympathy with the Spanish people and recommending that the Franco government be debarred from membership in United Nations agencies and conferences and that members immediately recall

from Madrid their ambassadors and ministers plenipotentiary stationed there.

The general assembly gave much time to urgent economic and social problems. By a majority vote it approved the constitution of a temporary specialized agency to assist refugees and displaced persons, to be known as the International Refugee organization. Recognizing the continued seriousness of the world food situation, it recommended specific measures to increase world food production. To fill the gap which would be created by the termination of U.N.R.R.A. relief activities at the end of 1946 the general assembly recommended the establishment of a special technical committee of ten governments to study relief needs and ways of meeting them. It unanimously decided to take over from U.N.R.R.A. its advisory social welfare functions and voted to establish the International Emergency Children's fund for the rehabilitation of children and adolescents of countries victims of aggression. On the question of alleged discriminatory treatment of Indians in South Africa the general assembly affirmed that the treatment of Indians should conform to charter provisions and requested that the governments of India and South Africa report at the next session on measures adopted.

Important action was taken on trusteeship matters. Draft trusteeship agreements were submitted to the general assembly by Australia for New Guinea, by Belgium for Ruanda-Urundi, by France for Cameroun and Togoland under French mandate, by New Zealand for Western Samoa and by the United Kingdom for Tanganyika, the Cameroons and Togoland under British mandate. These territories were formerly administered as mandated territories under the League of Nations. The eight agreements, as modified in the course of committee consideration, were approved by the general assembly. This made possible the constitution of the Trusteeship council. The general assembly declared itself unable to accede to a request of the Union of South Africa that it be allowed to incorporate South-West Africa into its territory and instead recommended that the territory be placed under trusteeship.

Various legal and administrative matters were considered. A committee was established to study methods to be followed in

"BEFORE THE GLUE HAS TIME TO SET." Daniel Bishop of the *St. Louis Star-Times* saw a lack of cohesion among the United Nations during 1946

"CAUGHT STEALING BASE," comment by Shoemaker of the *Chicago Daily News* on Russia's international policy in 1946

encouraging the development and codification of international law. A resolution was adopted condemning genocide as a crime under international law. Agreements with four specialized agencies were approved. The secretary general was authorized to investigate possible arrangements for common fiscal controls and budgetary practices with the specialized agencies. The transfer to the United Nations of several of the nonpolitical functions of the League of Nations was approved. The date of the yearly session of the general assembly was set at the third Tuesday of September.

Security Council.—Under the charter the Security council was primarily responsible for the maintenance of international peace and security. It was composed of five permanent members—China, France, the soviet union, the United Kingdom and the United States—and six nonpermanent members elected by the general assembly. At the beginning of its first session in London the general assembly elected Egypt, Mexico and the Netherlands for one-year terms, and Australia, Brazil and Poland for two-year terms. In the second part of its first session at Flushing Meadows the assembly elected Belgium, Colombia and Syria for two-year terms to succeed Egypt, Mexico and the Netherlands, whose terms expired at the end of the calendar year 1946.

The first 23 meetings of the Security council were held in London. Subsequent meetings were held at Hunter college, N.Y., and at Lake Success, Long Island. The first president of the council was the Australian representative (Norman J. O. Makin) who presided for one month. He was followed by representatives of other members in alphabetical order (by country), each serving one month. The Security council conducted its business under provisional rules of procedure drawn up by the preparatory commission until its own committee of experts presented drafts of additional provisional rules.

During the year 1946 the Security council was called upon to consider several disputes and situations brought before it under articles 6 and 7 of the charter on the ground of endangering in some degree international peace and security. The first of these

was the Iranian question raised by the Iranian government in the form of an allegation, addressed to the council on Jan. 19, that the soviet union was intervening in the internal affairs of Iran. The charge, subsequently repeated, was denied by the soviet representative, who, for a period, withdrew from the council in protest against continued consideration of the matter. The council decided to keep the matter before it even after the Iranian government had withdrawn its complaint and reports indicated that soviet troops had been withdrawn from Iranian territory.

The Greek question was first brought before the council on Jan. 21 by the soviet representative who alleged that the presence of British troops in Greece endangered peace and security. After being temporarily concluded it was raised again by the Ukrainian representative who, in a telegram of Aug. 24, charged Greek violation of the Albanian frontier and persecution of minorities. After the council had acted inconclusively on this claim the Greek government on Dec. 3 requested council consideration of alleged support given by Albania, Bulgaria and Yugoslavia to guerrilla warfare in northern Greece. The council decided on Dec. 19 to appoint a commission of investigation to establish the facts.

On Jan. 21 the Ukrainian government presented to the council the claim that the presence of British troops in Indonesia and their use against the local population endangered peace and security. Ernest Bevin, the British foreign minister, vigorously defended the British position. A proposal that a commission of investigation be appointed was defeated and the matter was declared closed.

On Feb. 4 the heads of the Lebanese and Syrian delegations to the general assembly asked that the presence of British and French troops in their countries be brought before the Security council for action. After becoming involved in some particularly difficult procedural questions the council was unable to take any decision because of the refusal of Andrei Y. Vishinsky, the soviet representative, to accept the U.S. proposal expressing confidence that the troops would be withdrawn as soon as practicable, though it received the necessary majority support. The British and French representatives stated that their governments would give effect to the majority view, which was subsequently done.

The Spanish question had been a recurring topic of discussion since the drafting of the charter at San Francisco. On April 9 the Polish representative charged that the activities of the Franco government endangered international peace and security. He asked that the council call upon members to sever diplomatic relations with Spain. After extended discussion the council decided to appoint a subcommittee to consider the charges and report on what practical measures might be taken. The subcommittee, reporting on May 31, did not find that a threat to peace existed, but recognized a potential menace, and suggested recommendations to improve the situation which the Security council finally accepted in substance. On Nov. 4 the Security council voted to remove the Spanish question from the list of questions before it in order that the matter might be brought before the general assembly for action.

While actual disputes and situations involving some degree of threat to the peace occupied most of the time of the Security council during 1946, other important matters were before it for consideration. The council considered nine applications for membership and recommended favourable action on four. At its second meeting on Jan. 25 the council adopted a directive to the military staff committee, and the committee was organized when representatives of the chiefs of staff of the permanent members of the Security council met in London on Feb. 4. Numerous meetings, all secret, were held after that date. No substantial

progress was apparently made in the drafting of special agreements regarding military forces to be placed at the disposal of the Security council. On Aug. 29 Andrei A. Gromyko, the soviet representative, proposed that members make available complete information regarding locations and sizes of armed forces and facilities in the territory of other states. The proposal was interpreted by other members of the council as political in purpose and was not adopted.

Atomic Energy Commission.—The Atomic Energy commission was established under the terms of the general assembly resolution of Jan. 24, 1946. It was composed of one representative of each member of the Security council and Canada. It reported to and in general was responsible to the Security council. The commission was charged to enquire into all phases of the problem of atomic energy and specifically to make definite proposals for: (a) the exchange of basic scientific information; (b) the control of atomic energy to the extent necessary to ensure its use only for peaceful purposes; (c) the elimination of national armaments, atomic or other, adaptable to mass destruction and (d) effective safeguards by inspection or other means to protect against the hazards of violation or evasion. Chairmanship of the commission was held by members in rotation in the alphabetical order of their names.

The commission had before it two principal proposals: (1) a U.S. proposal, presented by Bernard Baruch, calling for the creation of an International Atomic Development authority to be entrusted with all phases of the development and use of atomic energy, and for the establishment of a rigorous system of inspection and enforcement and (2) a soviet proposal, presented by Gromyko, envisaging an international convention prohibiting the production and employment of weapons based on the use of atomic energy for purposes of mass destruction and providing

for domestic enforcement. After general discussion the commission decided on June 25 to form a working committee "to examine the various proposals and make recommendations to the Commission."

In the discussion of the U.S. and soviet proposals there was fundamental disagreement between the U.S. and soviet representatives on the question whether or not the great-power veto might be invoked in connection with enforcement action. The soviet position was that the charter provision should be respected, while the U.S. representative, supported by the great majority of the members of the commission, took the view that no single state should have a veto over any action of the proposed authority, including enforcement action. On Dec. 30, with the soviet union and Poland abstaining, the commission approved a report incorporating the U.S. proposals for submission to the Security council.

Economic and Social Council.—Under the charter responsibility for discharging the functions of the United Nations in the field of economic and social co-operation was vested in the general assembly and in the Economic and Social council, acting under the authority of the general assembly. The council consists of 18 members elected by the general assembly—6 being elected each year for 3-yr. terms. In the first part of its first session in London the general assembly elected the 18 members of the council as follows: for 3-yr. terms—Belgium, Canada, Chile, China, France and Peru; for 2-yr. terms—Cuba, Czechoslovakia, India, Norway, the soviet union and the United Kingdom; for 1-yr. terms—Colombia, Greece, Lebanon, the Ukrainian S.S.R., the United States and Yugoslavia. In the second part of the first session the general assembly elected the following six states to succeed those whose terms expired at the end of 1946: the Byelorussian S.S.R., Lebanon, New Zealand, Turkey, the United States and Venezuela.

The council held its first session in London from Jan. 23 to Feb. 16. Sir Ramaswami Mudaliar (India) was elected president

REPRESENTATIVES of the 12 nations on the atomic energy commission listening to the U.S. plan for world atom control presented by Bernard M. Baruch at the United Nations council chamber at Hunter College, N.Y., in June 1946

to serve for the year; Dr. Andrija Stampar (Yugoslavia) and Dr. Lleras Restrepo (Colombia) were chosen first and second vice-presidents. The second session was held in New York from May 25 to June 21 and the third at Lake Success, Long Island, Sept. 11–Oct. 3.

The council set up nine permanent commissions to advise it on matters within their particular terms of reference: the Economic and Employment commission, the Transport and Communications commission, the Fiscal commission, the Statistical commission, the Population commission, the Social commission, the Commission on Human Rights, the Commission on the Status of Women and the Commission on Narcotic Drugs. Members of the United Nations were chosen to nominate the individuals who served on these commissions. To secure balanced representation in all fields the secretary general was directed to consult with governments chosen for membership before their representatives were finally nominated. States entitled to nominate commission members were chosen at the third session of the council, and these nominations were confirmed at a special meeting of the council on Dec. 10.

The work of the Economic and Social council during 1946 covered a wide and varied range of matters, many of them of an urgent character. The Sub-Commission on Reconstruction of Devastated Areas of the Economic and Employment commission prepared a detailed report on war devastation and the progress of recovery in Europe and made recommendations with a view to the reconstruction of Europe as a whole. The report was approved by the council and forwarded to the general assembly and members of the United Nations, together with specific recommendations. On Feb. 18 the council approved a resolution proposing an international conference on trade and employment. A preparatory committee was established which met in London

from Oct. 15 to Nov. 26 and agreed upon proposals for an International Trade organization.

In the field of transportation and communications important preliminary work was done better to co-ordinate various activities already in progress. The council decided to convene a meeting of experts to prepare for a world conference on passport and frontier formalities. It also drew the attention of interested governments to the need of improved international machinery for the better co-ordination of European railways. The council also pointed out the need of improvement in Europe's inland waterways and recommended the holding of a conference of representatives of interested states to discuss resumption of international traffic on the Danube and the establishment of provisional regulations. The soviet union and Yugoslavia refused, however, to take part in such a conference.

The proposed termination of U.N.R.R.A. activities at the end of 1946 raised some important questions with regard to the transference of certain functions to other agencies. The Economic and Social council, at the request of the director general of U.N.R.R.A., recommended to the general assembly that the United Nations assume the social welfare functions of U.N.R.R.A. and that an International Children's Emergency fund be established to assist in the rehabilitation of children and adolescents in countries victims of aggression. Following the general assembly resolution of Feb. 12 on refugees and displaced persons the council established a special committee to make a thorough investigation and report at its next session. The committee recommended the creation of an international refugee organization to take over the work of U.N.R.R.A., the Inter-

SECURITY COUNCIL of the United Nations, in session on March 29, 1946. At the far right is Hussein Ala, Iranian delegate, who had been invited to the council table to present his country's case in the Iranian-soviet dispute

governmental Committee on Refugees and the high commissioner of refugees of the League of Nations. The program which the council finally approved and recommended to the general assembly embodied in general the committee's recommendations.

Establishment of an international health organization was envisaged in a resolution adopted by the council on Feb. 15. A preparatory committee of experts was appointed which met in Paris in March. An international health conference was called to meet in New York on June 19 and was in session until July 22. The participants in the conference agreed to the establishment of a world health organization and the representatives of 61 states signed the proposed constitution.

In the field of human rights important preliminary work was done under the council's direction by the Commission on Human Rights on the subjects of civil liberties, freedom of information and protection of minorities. The general principle was adopted that, pending the adoption of an international bill of rights, "international treaties involving basic human rights, including to the fullest extent practicable treaties of peace, shall conform to the fundamental standards relative to such rights set forth in the Charter."

The functions of the League of Nations in connection with the control of narcotics were taken over by the United Nations. The Commission on Narcotic Drugs was empowered, when first established, to carry out the functions of the League Advisory Committee on Opium and Other Dangerous Drugs. By resolution of Feb. 16, 1946, the Economic and Social council empowered the secretary general to take necessary steps for the assumption and continuance of the work of the Opium section of the League and of the Permanent Opium board and the Drug Supervisory body. Full responsibility for the administration of international narcotics control was assumed on Sept. 1.

Taking note of a resolution adopted by the general assembly in London, the Economic and Social council took steps to establish suitable arrangements for consultation with nongovernmental agencies. Under the arrangements adopted on June 21 organizations were divided into three categories: (a) those with a basic interest in most of the activities of the council; (b) those concerned with only a few of the activities of the council; and (c) those primarily concerned with development of public opinion and the spreading of information. All might send observers to public meetings and consult with a standing committee of the council, but only those in category (a) had the right without special invitation to circulate written communications to members. The World Federation of Trade Unions, the International Co-operative alliance, the American Federation of Labor and the International Chamber of Commerce were admitted to category (a).

Trusteeship Council.—Article 86 of the charter provided for a Trusteeship council to assist the general assembly in the performance of its functions with regard to trusteeship matters and further provided that the council should consist of members of the United Nations administering trust territories, permanent members of the Security council and as many additional members elected by the general assembly as might be necessary to create an equal division between members administering trust territories and those who did not. Because no trust agreements existed at the time the general assembly met in London, it was impossible then to set up the Trusteeship council on the charter basis. A proposal to establish a temporary trusteeship committee was not accepted, and consequently it was not until December, after the general assembly had approved the trusteeship agreements submitted by members responsible for the administration of League-mandated territories, that the Trusteeship council could be constituted. Its composition was as follows: (1) members administering trust territories—Australia, Bel-

gium, France, New Zealand, United Kingdom; (2) other permanent members of the Security council—China, soviet union, United States; (3) elected by the general assembly for three years—Iraq and Mexico.

The general assembly voted that the Trusteeship council should meet not later than March 15, 1947.

International Court of Justice.—The International Court of Justice was one of the principal organs of the United Nations. At the United Nations conference at San Francisco it was decided to set it up as a new court, though in all essential respects it was to be the same as the Permanent Court of International Justice.

The court consisted of 15 judges, elected by the general assembly and the Security council voting independently. Following the initial elections judges would be elected for 9-yr. terms with the terms of 5 judges expiring every 3 yrs. As the result of the elections of the general assembly and the Security council on Feb. 6, the following judges were chosen: for three-year terms—Badawi Pasha (Egypt), Hsu Mo (China), J. E. Read (Canada), Bogden Winiarski (Poland) and Milovan Zoričić (Yugoslavia); for six-year terms—Fabela Alfaro (Mexico), Green H. Hackworth (United States), Helge Klaestad (Norway), Sergei B. Krylov (soviet union) and Charles de Visscher (Belgium); for nine-year terms—J. Philadelpho de Barro Azevedo (Brazil), Alejandro Alvarez (Chile), Arnold D. McNair (United Kingdom), Jules Basdevant (France) and José G. Guerrero (El Salvador).

The first meeting of the court was held on April 3 at the Peace palace at The Hague and the inaugural sitting on April 18. The court elected Judge Guerrero as president and Judge Basdevant vice-president. Edvard Hambro was appointed registrar. The court formed a chamber of summary procedure consisting of the following members: Guerrero (president), Basdevant, McNair, Krylov and Hsu. The court adopted rules of procedure based largely upon the 1936 rules of the Permanent Court of International Justice.

The Security council, at its meeting of Oct. 15, determined that states not parties to the statute may have access to the court if they accept the court's jurisdiction, undertake to comply with the decisions of the court and accept the obligation of members of the United Nations under article 94 of the charter.

Secretariat.—The secretariat was headed by the secretary general, who, by the terms of the charter, was the principal administrative officer of the United Nations. He served in this capacity to each of its organs, had important political functions and had responsibilities in connection with the co-ordination of the work of the United Nations and the specialized agencies. The secretary general was appointed by the general assembly, upon the recommendation of the Security council, for a term of five years. He received an annual tax-free salary of \$20,000 with an additional \$20,000 for expenses. Trygve Lie of Norway was elected the first secretary general.

The secretariat was divided into eight departments for purposes of administration, each headed by an assistant secretary general. For 1946 these were as follows: Administrative and Financial Services (John Hutson, United States); Conference and General Services (Adrian Pelt, the Netherlands); Department of Security Council Affairs (Arkady Sobolev, soviet union); Department of Economic Affairs (David K. Owen, United Kingdom); Department of Social Affairs (Henri Languier, France); Department of Trusteeship and Information from Non-Self-Governing Territories (Victor Hoo, China); Department of Public Information (Benjamin Cohen, Chile); and Legal department (Ivan Kerno, Czechoslovakia).

During the first part of the first session of the general assembly the secretariat was in London. It was then moved to Hunter

college, N.Y., and in August was again moved to Lake Success, Long Island.

Specialized Agencies.—The charter of the United Nations envisaged that economic and social co-operation would to a large extent be carried out through specialized agencies; *i.e.*, intergovernmental organizations with wide international responsibilities set up for special purposes, but that these agencies should be brought into relation with the United Nations by agreements negotiated by the Economic and Social Council and the appropriate organ of the specialized agency in question and approved by the general assembly.

During 1946 the constitutions of seven of these agencies were actually in force: the International Labour organization (I.L.O.), the Food and Agriculture organization of the United Nations (F.A.O.), the International Bank for Reconstruction and Development, the International Monetary Fund, the Provisional International Civil Aviation organization (P.I.C.A.O.), the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) and the United Nations Relief and Rehabilitation administration (U.N.R.R.A.). Instruments were drafted, adopted and signed calling for the establishment of two additional specialized agencies: the World Health organization (W.H.O.) and the International Refugee organization (I.R.O.). Preliminary work was done looking to the establishment of the International Trade organization (I.T.O.).

Agreements were negotiated by the Economic and Social Council with the I.L.O., the F.A.O., P.I.C.A.O. (applicable to I.C.A.O.) and U.N.E.S.C.O. These agreements were approved by the general assembly with the provision that they should be reviewed at the end of three years. They defined working relationships in respect to such matters as representation at meetings and exchange of information and envisaged increasing administrative co-operation in personnel, budgetary and other matters.

International Labour Organization.—See separate article.

Food and Agriculture Organization.—See FOOD SUPPLY OF THE WORLD.

International Monetary Fund.—See separate article.

International Bank for Reconstruction and Development.—See separate article.

Provisional International Civil Aviation Organization.—The organization was set up following the Chicago 1944 conference to start work, pending the establishment of a permanent organization and for a period of not more than three years, on the complex issues arising from the extension of air routes over the world. Edward Warner (United States) was elected president of the interim council. The organization consisted of an interim assembly, an interim council and a secretariat. The council, because of the technical character of its work, was in almost continuous session during 1946. The assembly met in Montreal, Quebec, on May 21. Its deliberations covered general policy, technical aspects of air navigation and transport, legal questions, administration and finance. In addition, a series of regional conferences were held during 1946: a North Atlantic Regional conference in Dublin, Eire, March 4–28; a European and Mediterranean Regional conference in Paris, France, beginning April 24; a Caribbean Regional conference in Washington, D.C., beginning Aug. 26 and a Near Eastern Regional conference in Cairo, Egypt, beginning Oct. 1. Numerous meetings of technical subcommittees were also held.

United Nations Educational, Scientific and Cultural Organization.—The constitution of U.N.E.S.C.O. was signed by delegates of 44 nations at London, Nov. 16, 1945, as the concluding acts of a conference called for the purpose of setting up an organization to promote international co-operation in educational and cultural matters. At the same time a preparatory

commission was established to work out plans for putting the constitution into effect. The preparatory commission subsequently held a series of meetings in London in the course of which a detailed program was developed. This program was submitted to the general conference which met in Paris, the permanent headquarters of the organization, from Nov. 19 to Dec. 10 and was accepted as the basis of discussion. The conference acted on a wide range of organizational and substantive matters. The internal organization of the conference was completed. The 18 members of the executive board were chosen. Dr. Julian Huxley (United Kingdom) was elected director general. A \$6,000,000 budget for 1947 was approved. The conference approved a program for 1947 which placed special emphasis upon the development of a world-wide program in fundamental education, the exploration of the possibilities of a world-wide network for radio broadcasting and reception and a survey of existing channels of world communication with a view to determining their adequacy.

United Nations Public Information Services.

The establishment of a department of public information was the subject of expert examination by the special Technical Advisory Committee on Public Information set up by the preparatory commission of the United Nations in London. On the basis of its recommendations, which were approved by the general assembly on Feb. 13, 1946, and submitted to the secretary general for his guidance, the policies, functions and organization of the Department of Public Information were defined.

The Department of Public Information, like the other departments of the secretariat, was headed by an assistant secretary general who advised the secretary general on all problems of information policy of the United Nations and who maintained continuous liaison with the other departments concerning information problems.

The policy of the department was to publicize fully the aims and activities of the United Nations and of the specialized agencies, in order to promote an informed understanding of them among the peoples of the world. The media of information developed considerably, and the department was called upon to work not only through the press, but through radio, films and all the most modern media of information. All these media were therefore given every facility at the U.N. headquarters both for gathering and distributing information. The department, however, did not limit itself to making facilities available to correspondents at the U.N. headquarters; it complemented the work of the press, radio and film representatives accredited to the United Nations by itself distributing information away from headquarters.

The Department of Public Information was organized into five divisions: press, radio, film and visual information, liaison and reference and publications. The divisions were further subdivided into sections. By resolution of the general assembly

there was to be established an Information Advisory committee, composed of expert representatives of the various media of information of the member states, which would be in a position to reflect the needs and desires of the general public for information on the aims and activities of the United Nations. The Consultative Committee on Public Information for the United Nations and the Specialized Agencies was established. This committee provided machinery for co-ordination of information activities and for certain general joint services.

In order to ascertain how the various divisions of the Department of Public Information were carrying on their tasks, a more detailed outline of their functions and activities follows.

Press Division.—The Press division was the official link between the United Nations and the press of the world. It arranged facilities for news correspondents representing newspapers and press associations in nearly all of the member nations.

The division was composed of a director and a staff of press officers assigned in groups to cover the activities of the general assembly, the councils, the commissions and committees and the departments of the secretariat.

The division issued an average of 10 or 15 press releases daily, ranging from brief announcements of forthcoming events to comprehensive background papers on the principal and subsidiary organs of the United Nations. The division also arranged general press conferences with delegates to the United Nations and with key figures in the secretariat.

There was established at the headquarters a teletype system which made it possible for the press releases and other informative material to be sent simultaneously to the participating agencies at any hour of the day or night.

Primarily for newspapers which had no correspondents at the U.N. headquarters and no wire service coverage, the division issued in English, Spanish and French a weekly clip-sheet containing a variety of articles about the work of the United Nations. Along with the clip-sheet the division provided plastic plates and matrices to editors who requested them.

Radio Division.—The Radio division was guided by a director and a chief radio officer who supervised the activities of the Liaison section and the Production section. To the Radio division was attached the Advisory committee on Tele-communications for the United Nations. After the convening of the second part of the first session of the General assembly on Oct. 23, 1946, the Department of Public Information was broadcasting in the name of the United Nations and using U.N. personnel. The meetings of the General assembly, the councils, commissions and committees were broadcast in the two working languages (English and French) and in addition there was a daily broadcast in Chinese, Russian and Spanish.

The British Broadcasting Corp., the Canadian Broadcasting Corp. and the Office of International Information and Cultural Affairs of the U.S. department of state provided the transmission and relay facilities necessary to broadcast U.N. programs. The programs included accounts of proceedings of conferences, background information on the United Nations, reports on activities of the various specialized agencies and interviews with delegates of member states and members of the secretariat. Broadcasts in 1946 went out over 11 transmitters.

Film and Visual Information Division.—The Film and Visual Information division made arrangements for and promoted the production of documentary films, newsreels, photographs and visual information materials illustrating the work of the United Nations and promoted the use in periodicals, books and other media of photographs, charts, etc., relating to the activities of the United Nations. The division was organized into the Film and Television section and the Section of Graphic and Photo-

graphic Media.

The division saw to it that all important meetings of the organs of the United Nations were filmed. The meetings were covered by newsreel companies working in rotation; the resulting footage, both silent and sound, was pooled and made available to film companies of any of the member nations. Local television companies provided coverage for live audio-video broadcasts.

The division also produced posters and poster charts describing the activities of the various organs of the United Nations and gave advice on display material, visual education and the setting up of private exhibits. The division had its own official photographic unit, and documentary photographs were taken of the meetings of the various organs of the United Nations and also of the general activities of the United Nations.

Liaison Division.—Liaison division provided for overseas information services and maintained liaison with nongovernmental organizations, educational institutions and the general public. It provided lecturers, schools and nongovernmental agencies with information about the United Nations.

The Liaison division was organized into Headquarters Services and External Services. The Headquarters Services covered liaison with voluntary organizations, youth groups and speakers. The External Services was divided into a European section, a near, middle and far east section, a Latin-American section and also operated through information centres which would eventually form a world-wide network.

Information centres were established in London and Washington and were opened in Geneva, Paris and Copenhagen (Denmark). The objectives of these information centres were, *inter alia*, to provide reference centres for background and documentary information on the United Nations and the specialized agencies, to answer questions on day-to-day activities of the organization and to maintain files of photographs, films and radio recordings, etc., made at the headquarters by representatives of the countries in the region where the centres were situated. The centres were not only concerned with the dissemination of information to the public, but also transmitted to the headquarters material for the survey of public opinion taken from local press and radio comments on questions concerning the United Nations.

Reference and Publications Division.—The Reference and Publications division was a very important division in the Department of Public Information. The duties of the division fell into two classes. First, it aided authors, publishers, governmental agencies and individuals who produced or planned to produce books, pamphlets or articles relative to the activities of the United Nations or of the specialized agencies. Secondly, it supplemented the publication of official documents issued by the various organs of the United Nations by producing its own publications and similar material. To achieve these results, the division was organized into four sections—Publications section, Reference section, Opinion Survey section and Research section.

The Publication section was responsible for all publications of the Department of Public Information. The section issued in French, English and Spanish a magazine called the *United Nations Weekly Bulletin* which constituted a progress report of the activities of the organization and of the specialized agencies.

The Reference section was responsible for maintaining full files of official documents of the United Nations and of the specialized agencies. The section had taken over from the former New York United Nations Information office its library of information and further developed it. All of the material of the library was available to the general public.

The Opinion Survey section compiled a weekly survey of opinion on the United Nations.

The Research section prepared and edited information papers on the purposes and principles, structures and procedures, functions and powers, resolutions, reports and activities of the organs of the United Nations and the specialized agencies; on the history and evolution of international organizations; and on international political, economic and social problems. It assisted writers and publishers in writing articles and books dealing with the United Nations; it wrote articles on the United Nations for magazines, encyclopaedias, annuals, almanacs, etc. The Research section prepared the *United Nations Yearbook*. (B. Cn.)

United Nations Relief and Rehabilitation Administration.

The United Nations Relief and Rehabilitation administration (U.N.R.R.A.) was organized to provide relief and rehabilitation to the people of the liberated countries of Europe and the far east. Established Nov. 9, 1943, as the first service agency of the United Nations, it was primarily devoted to assisting those nations with inadequate foreign exchange resources for the financing of their own relief imports. This assistance took the form of relief supplies such as food and clothing, health and welfare services. The U.N.R.R.A. services were also extended to assist in the repatriation of displaced persons and to furnish rehabilitation supplies

and services, such as basic farm tools, transportation and raw materials, as well as numerous other items and services.

U.N.R.R.A. was expanded to 48 nations by 1946, and each member state participated in the policy-making council. A central committee comprising the United States, the United Kingdom, the U.S.S.R., France, China, Canada, Australia, Brazil and Yugoslavia was empowered to make emergency decisions affecting policy whenever the council was not in session.

U.N.R.R.A.'s executive branch consisted of a director general aided by a staff of about 12,000 persons. Herbert H. Lehman, the first director general, served from the administration's inception until March 1946, when he resigned because of ill health. He was succeeded by Fiorello H. La Guardia. On Dec. 13, 1946, Maj. Gen. Lowell W. Rooks succeeded La Guardia.

To finance the relief services and supplies, each member nation which had not been under enemy occupation was assessed 1% of its national income the year ending June 30, 1943. Later a second assessment was made in the same amount. All member states contributed their share to U.N.R.R.A.'s administrative budget. The total operating and administrative contributions authorized by the U.N.R.R.A. administration amounted to \$3,693,509,914 as of Sept. 30, 1946. The largest subscribers were: United States \$2,700,000,000; United Kingdom \$624,650,000; and Canada \$138,738,739.

General relief during 1946 was extended to Albania, Austria, the Byelorussian S.S.R., China, Czechoslovakia, the Dodecanese Islands, Greece, Italy, Poland, the Ukrainian S.S.R. and Yugoslavia; limited aid was granted Finland, Hungary and the Philippine Islands. Ethiopia, through a special program, was assisted with medicine, welfare and transport.

While the military had over-all responsibility for the care of

displaced persons in Germany and Austria, U.N.R.R.A. personnel assisted in the care and maintenance of more than 1,000,000 D.P.s and ran hundreds of assembly centres for displaced persons.

U.N.R.R.A.'s activities during the first half of 1946 were seriously hampered by the world-wide food shortage. Unable to obtain sufficient allocations of bread grains to meet its minimum commitments, the U.N.R.R.A. council, holding its fourth session in March 1946, urged all countries to take all possible measures to conserve and make available more food to distressed areas to avert wide-spread famine in Europe and the far east.

The food crisis was ameliorated later as a result of the arrival of harvests in the liberated countries and through the increasing grain shipments made by the major wheat-growing nations. U.N.R.R.A. officials continued to warn, however, of the possible danger of recurring famine in 1947.

The extent and acceleration of U.N.R.R.A.'s activities are illustrated by the estimated cumulative total of 4,032,000 long tons of supplies shipped abroad by the end of Sept. 1945, which figure was increased to 16,633,000 long tons by Sept. 1946.

Recognizing the need for adoption of policies covering the termination of the organization and the transfer of its remaining functions to permanent international bodies, U.N.R.R.A.'s council at its fifth session, in Geneva, Aug. 1946, adopted the following resolutions:

1. To transfer U.N.R.R.A.'s major health activities to the World Health organization or its interim commission.
2. To transfer to the United Nations whatever social welfare functions that body desired to undertake.
3. To continue displaced persons operations until undertaken by the International Refugee organization, or some other appropriate organization.

CRANES lifting a 185-ton tugboat aboard a vessel at New Orleans on June 27, 1946. The tugboat was one of two being sent to Shanghai, China, for use by the U.N.R.R.A.

CRATED DIESEL ELECTRIC GENERATORS floating on barges in Soochow creek, Shanghai, China, where they were brought in 1946 by the U.N.R.R.A. for transshipment to interior points. They were to be used in rehabilitating China's municipal and industrial power plants

tion, provided that none of these operations was to be continued by U.N.R.R.A. after June 30, 1947.

4. To create the International Children's fund for the rehabilitation of children and adolescents of liberated countries.

5. To recommend that the United Nations General assembly establish an appropriate agency to review the need for financing urgently required imports for 1947 after the termination of the U.N.R.R.A. program and to estimate the financial requirements for such future relief needs.

In Oct. 1946 U.N.R.R.A. began the gradual reduction of its activities and personnel. After making preparations for the transfer of its functions to permanent international bodies, Director Gen. La Guardia submitted a report to the United Nations on the accomplishments of U.N.R.R.A.

The report warned of possible economic distress for China and eastern and southern Europe upon the termination of U.N.R.R.A.'s operations in 1947. But it also remarked that "by the end of its operations U.N.R.R.A. would have delivered about three and a half billion dollars worth of supplies (including freight). This is more than three times the value of relief after World War I." (See also FOOD SUPPLY OF THE WORLD; RECONSTRUCTION PLANNING; REFUGEES.)

United Nations War Crimes Commission: see WAR CRIMES.

United Service Organizations. The United Service Organizations, Inc., (U.S.O.) was formed in the U.S., Feb. 4, 1941, by the following agencies: Young Men's Christian associations, National Catholic Community service, The Salvation army, Young Women's Christian associations, National Jewish Welfare board and National Travelers' Aid association. From its inception to Nov. 1, 1946, nearly 1,500,000,000 men and women of the armed forces had been served by U.S.O. This figure includes attendance at U.S.O.-camp shows, clubs, troops-in-transit services and mobile services. More than 1,000,000 men and women of the U.S. served as volunteers in U.S.O. and more than \$200,000,000 was contributed to carry on its work. At its peak in March 1944, the total of U.S.O. operations stood at 3,035, but after that, as men were moved overseas, the number decreased although the volume of over-all work increased.

On the fifth anniversary of U.S.O. in 1946, it was announced

that since U.S.O. had been set up as a war organization, it could not be continued as a peace organization beyond Dec. 31, 1947. Through 1946, a steady reduction of the work was carried on. As a result, there were on Oct. 15, 1946, but 605 operations, of which 407 were U.S.O. clubs.

The U.S.O. club has always been the heart and soul of the organization. Called from its beginning the "home away from home" of the members of the armed forces, it replaced to some extent the familiar surroundings most missed by the men of the nation's civilian armies. The volunteers, who staffed the thousands of clubs, lounges, information centres, mobile service vehicles and other U.S.O. facilities, represented the "home-folks" and were a living tie to the American people both at home and at the offshore and overseas bases. In the various war theatres the members of the U.S.O.-camp shows units served the same function.

To finance U.S.O. through its final year, it was estimated that \$19,000,000 would be needed, about one-third of the amount spent for that purpose in 1946. A campaign to raise that sum was set in motion in the closing months of 1946.

The accomplishments of U.S.O. in the conduct of the war were officially recognized by the United States government. In May 1946, "in appreciation of patriotic services," a joint war and navy department citation was presented to the organization at an impressive ceremony in Washington, D.C. Similar citations went to the six member agencies. Then, in October, the medal for merit, highest award a president of the United States may bestow upon a civilian, was granted to former U.S.O. President Chester I. Barnard, to U.S.O. President Lindsley F. Kimball, and to the six vice presidents of U.S.O., who, during the war, headed the member agencies of the organization.

Among U.S.O. officers in 1946, were Dr. Lindsley F. Kimball, president; Walter Hoving, chairman of the board; and C. Frank Kramer, Jr., secretary. National headquarters were in the Empire State building, 350 Fifth avenue, New York, N.Y.

(L. F. K.)

United States. The official figures of the census bureau in Aug. 1946 showed that the population of the United States had passed the 141,000,000 mark, representing a gain of 10,000,000 from the beginning of the decade. If outlying possessions and dependencies were added—including the Philippines, which, though granted independent status on July 4, remained the peculiar responsibility of the U.S. until they recovered from the ravages of World War II—the total population would approach 160,000,000. In recent years the rate of increase in population showed a tendency to decline. Whereas in the early days of the republic, decennial gains of 20% or 25% were registered, the average gain was in 1946 about 7%, and demographers said that the population might be expected to be stabilized at about 170,000,000 by 1980. A second trend was toward a larger proportion of elderly people because of a falling birth rate and the longer expectancy of life made possible by the advance of medical science and the government's benefits to the aged and infirm. For example, in the decade 1930-40, while the population as a whole gained 7.3%, the number of persons of the age of 65 or more increased by 35%. If this trend continued, it would mean that a generation hence about 10% of the population would be in this "aged" class, as against 4% at the beginning of the 20th century.

History.—The year 1946 was one of mingled satisfaction and disappointment. Its all-inclusive task was reconversion from wartime to peacetime economy and policy on both the domestic and the international front. On the credit side of the ledger were record-breaking crops, increasing herds of food animals,

steadily improving business, marvelous achievements in science and technology, a rapid augmentation of the national wealth and income and a promising, if slow, progress toward the implementation of the plans for co-operation among the nations pledged to the principles of the San Francisco charter. On the other side of the ledger, however, must be set persistent strife between labour and management, vacillating governmental policies on price controls, unpardonable food shortages resulting from the speculative withholding of meat, sugar and cereal products from the market and the continuing difficulty of bringing the soviet union and the western powers into agreement on such questions as the veto power in the Security council, the number of occupation troops in the countries liberated from the nazis, the spheres of influence in strategic regions in the near and far east and the responsibility for the control of the use of atomic energy. The first full calendar year after the guns ceased firing revealed in startling and disconcerting clearness the tremendous problems of recovery and readjustment which so unprecedented an upheaval as World War II was certain to bring in its aftermath.

Congress.—The second session of the 79th congress met on Jan. 7, 1946, with a roster of 243 Democrats and 189 Republicans in the house and 57 Democrats and 38 Republicans in the senate. On Jan. 21 congress listened to an extremely long message from President Truman, reviewing the achievements of the year 1945 and recommending more than a score of measures for consideration in 1946. Though congress remained in session until Aug. 2, it showed little disposition to implement the president's program. Of the 27 major measures asked for by the White House only 10 were passed, most of the 600 new laws put on the statute books being of a trivial nature. The reasons for the lack of legislative vigour were political, economic and personal. Enough southern Democrats who were opposed to the continuance of the New Deal policies joined with the Republican minority to form a bloc which was strong enough to thwart the president's recommendations but not strong enough to override his vetoes. Again, there was much disagreement among the top administration men on such subjects as price control, labour legislation and subsidies. And, finally, the coming mid-term elections made members of congress wary about committing themselves to action which might militate against the chances of their return to Washington. In February nearly 1,500,000 workers were out on strike in such essential industries as steel, motors, electrical equipment and communications; and public indignation at these interruptions of the recovery program reached a high peak. President Truman's plan was to deal with the situation through fact-finding commissions which would study the merits of both sides and recommend arbitration. But the house took the bit in its teeth and passed (by a vote of 258 to 55) a drastic strike-curbing bill introduced by Rep. Francis Case of South Dakota. The Case bill, adopted by the senate with some changes, was the first measure to revise the prolabor Wagner act of 1935. It provided for a cooling-off period of 60 days between the calling of a strike and its execution, for penalties for workers who struck during that period, for a mediation board to intercede in labour disputes and for union liability for damages resulting from strikes. On June 11 President Truman vetoed the bill, and the house failed to override the veto by only five votes of the two-thirds necessary. He also vetoed a bill for the extension of the Office of Price Administration on June 29 (the day before the expiration of price controls) and consented to sign a second and no more satisfactory bill after six weeks of wild inflation of prices. In both of the vetoes cited the president was upheld only by the grace of Republican votes. This meant that with the mid-term elections approaching, the president was at serious odds even with his own party members

in congress. To be sure, congress did pass some important bills before its adjournment on Aug. 2. It extended the draft until March 31, 1947, exempting the 18-year-olds; created an atomic energy commission; provided \$400,000,000 for housing subsidies; approved a loan of \$3,750,000,000 to Great Britain; passed a weakened OPA extension bill; "streamlined" the procedure of congress by greatly reducing the number of standing committees and (the senate) approved by a vote of 60 to 2 the proposition to abide by the decisions of the world court established by the United Nations charter. But its continual squabbling and its failure to cope courageously with such vital problems as labour unrest, inflated prices, the black market, veterans' housing and strikes which were not only sabotaging the recovery program but were bringing unpardonable inconveniences and suffering to millions of citizens so discredited it that the people of the country rose in revolt on election day (Nov. 5) and turned the Democrats out of both houses of congress, where they had held substantial majorities from Franklin D. Roosevelt's first election. The 80th congress, to meet on Jan. 3, 1947, would contain 246 Republicans and 188 Democrats in the house and 51 Republicans and 45 Democrats in the senate.

The Budget.—Contrary to custom President Truman combined his budget message with his annual message on the state of the union. He held out the hope that, with the paring down of various war expenditures and with increased revenue from income taxes, the fiscal year 1946-47 might see a balanced budget for the first time after 1930 and even a treasury surplus to apply to a reduction of the huge national debt of \$278,000,000,000. The estimate for the government expenses for 1946 was about \$70,000,000,000 and for 1947 about \$37,000,000,000, as compared with a peak of \$99,000,000,000 in 1945. It was the purpose of the administration to continue tax rates unchanged, with the expectation that with growing prosperity, taxes would yield 40% of the expenses in 1946 and 65% in 1947. However, two considerations weighed against the optimistic estimates of the president. In the first place there was a margin of only 14% of the government's expenses in which substantial economies could be made; for the fixed charges for the service of the debt, the cost of the veterans' program, international commitments and national defense (between January and August the budgets of the army and navy were increased by \$3,700,000,000) accounted for 86% of the federal expenses. Furthermore, in the event of the capture of congress by the Republicans (which actually happened in the November elections) there was the possibility that they would redeem their campaign promise of reducing income tax rates, perhaps by as much as 20%. A few days after the election, prominent Republicans like Robert A. Taft, who was to be the majority leader in the senate, and Harold Knutson, who was to be chairman of the ways and means committee in the house, expressed confidence that a balanced budget for 1947-48 would be compatible with a 20% reduction in income taxes. The country had to await the action of the new congress on tax rates and governmental economies to see whether or not the hopes of the president and the predictions of the Republicans could be fulfilled.

Industry.—The U.S. industrial giant, crippled by strikes in the early months of the year, began in midsummer to show its strength. Steel production for July was more than 7,000,000 tons, exceeding for the first time the average monthly rate of 1941; and before the end of the year production had advanced to more than 90% of capacity. Only 500,000 tons of bituminous coal were mined in April as compared with 50,000,000 tons in July. The 1,350,000,000 barrels of oil produced in the U.S. were almost double the 800,000,000 produced by all the rest of the world. In January and February the number of man-days lost amounted to more than 20,000,000; in August to

STATUE OF LIBERTY overlooking some of the 400 ships which lay idle in New York harbour in Sept. 1946 because of a nation-wide strike of maritime union workers

only 3,300,000. In November, Civil Production Administrator John D. Small reported only 2,000,000 unemployed out of the total labour force of nearly 60,000,000. There were twice as many men and women in the factories as there were in 1939. The people, with savings of \$150,000,000,000 were able and eager to buy; but many were deterred by the high costs of commodities caused by the leapfrog process of wages and prices. The threats of John L. Lewis and other union leaders in the autumn (especially after the Republican victory in the elections) to reopen contracts in order to gain wage increases made it uncertain whether the pace of industrial recovery could be maintained. During the entire year a battle was waged in congress and the country over the wisdom of continuing price controls, which from the spring of 1942 had covered almost every commodity that the War Production board had allowed to be produced. Those who favoured the extension of OPA argued that without a renewal of its controls (which would expire on June 30) prices would soar to fantastic heights. On the other hand, the relatively small, but financially powerful minority who clamoured for the termination of OPA contended that the flood of production thus released would inevitably drive prices down. Unable to get a satisfactory renewal bill from congress, President Truman allowed the controls to lapse on July 1, and immediately thereafter prices rose sharply. A second OPA extension bill was passed on July 25, which was signed by the president, although no more satisfactory to him than the one vetoed a month before since it removed controls on meat, poultry, grain, dairy products and other commodities. It set up a three-man decontrol board, authorized to re-establish ceilings if it found that prices had risen unreasonably. A vacillating policy followed, in which ceilings on meat were reimposed (Aug. 21) without improving the supply to householders at reasonable prices. With the elections approaching and buyer resistance increasing, meat became the topic of the

nation. President Truman and his cabinet spent several days in early October wrestling with the problem. Finally, on the 14th, the president addressed the country over the radio: "The Secretary of Agriculture and the Price Administrator are removing all price controls on livestock and food products therefrom tomorrow." He recommended "speeding other decontrol plans to an extent compatible with our economic security"—whatever the last phrase might mean. This foreshadowed the virtual end of OPA, which at its peak in 1945 had controlled more than four-fifths of the nation's industries through its 68,000 agents. The problem was whether or not voluntary co-operation would avail to avert the seesaw of wages and prices until full production in industry and the resulting competition should restore the normal operations of supply and demand.

Labour.—That the end of hostilities would bring major upheavals in the field of labour was to be expected. Reconversion from wartime to peacetime production was attended by problems such as the shift of workers in many plants, the return of millions of men from service in the armed forces and the readjustment of wages because of the cutback in overtime pay and the rising prices of commodities. Labour, anxious to retain its "take-home" wages and its favoured position for a decade under the Wagner act, began even before V-J day to make its demands for increased pay. In Nov. 1945 a series of crippling strikes in key industries was inaugurated when 200,000 employees of the General Motors Corp. walked out. They were followed in Jan. 1946 by 700,000 of the nation's steelworkers and 200,000 workers in the electrical industry. On April 1, 400,000 soft coal miners failed to show up at the pits, and the next month a strike of 300,000 engineers and trainmen threatened to tie up the whole transportation system of the country. A strike of 200,000 maritime workers set for June 15 led President Truman to declare that he would use the army, the navy and the coast guard if necessary to keep the ships moving. The strikes in the vital industries of coal and transportation were settled, with wage increases of 18½ cents an hour, but not until

the government had taken over the mines and plans had been made for the Office of Defense Transportation to run the railroads. It was evident that legislation was needed to prevent strikes which seriously delayed economic recovery, ignored the government's remonstrances and caused great inconvenience and suffering to millions of citizens. The coal strike alone, according to the testimony of Civil Production Administrator Small, cost the nation \$2,000,000,000 and set back the production of consumers' goods by 3 months.

A divided congress, in which a combination of conservative Democrats with the Republican minority was able to pass bills unacceptable to the president but not able to pass them over his veto, could find no solution to the problem. The veto of the drastic antilabour Case bill was upheld by the narrow margin of five votes in the house. The president's own emergency program, proposed to congress on May 25, provided that workers failing to return to their jobs in government-seized plants should be deprived of their seniority rights under the Wagner act, that they and union officials might be drafted into the army, that wages and conditions of employment should be fixed by the president during the period of government operation and that injunctions might be sought to compel compliance with these orders. The house immediately accepted this program by a vote of 306 to 13; but after the senate had eliminated the punitive provisions of the measure, no agreement could be reached. The president's defenders in congress maintained that a strike against a seized plant was a strike against the government and could not be tolerated; while his opponents declared that the proposed legislation was an invasion of the rights of labour and management in their bargaining procedure and that it was "autocratic" in that it left to the president alone the decision as to when a strike was "against the government." With congress deadlocked, there was no progress in labour legislation during the summer; but in the autumn, with prices rising all along the line, Lewis and other labour leaders threatened new strikes unless the spring contracts were reopened to allow further wage increases. Suddenly, on Nov. 15, Lewis made good his threat by arbitrarily declaring void the contract which he had negotiated with the solid fuels administrator, Secy. of the Interior Julius A. Krug, on May 29. Without ordering the miners to strike, which would have exposed him to the penalties of the Smith-Connally act, he virtually recommended a walkout of the miners by his termination of the contract; and most of the 400,000 men of his union quit work on the principle "no contract, no work." This time the government was determined to test the question of the power of one man to cripple the country's industries and bring suffering to millions of citizens. Lewis was ordered by a U.S. district court to revoke his annulment of the Lewis-Krug agreement; and when he refused, he was cited for contempt of court. His lawyers argued that the injunction issued against him was a violation of the Clayton act of 1914 and the Norris-LaGuardia act of 1932, which forbade injunctions in labour disputes; but the government replied that this was not a labour dispute but a defiance of the government's authority. Judge T. Alan Goldsborough handed down the decision of the court on Dec. 4, fining Lewis \$10,000 and the United Mine Workers \$3,500,000. With an appeal to the supreme court pending and the president scheduled to address the nation on the evening of the 8th, Lewis surrendered on Dec. 7 and ordered the miners to return to work under the terms of the contract of May 29 until March 31, 1947, when the negotiation of a new contract would be due. The country breathed a sigh of relief; President Truman cancelled his address; and the miners, with the Christmas season approaching, were glad to get their pay checks again. The crisis was passed; but a consistent government policy for the curbing of indus-

trial strife was yet to be found.

What effect the capture of both houses of congress in the elections of Nov. 5 would have on the framing of such a policy remained to be seen. The unions were strongly entrenched. Their membership had grown from 3,400,000 in 1930 to nearly 15,000,000 in 1946. They had millions of dollars in their treasuries. Their leaders were determined to maintain the favoured position won for labour by the Wagner act and other New Deal legislation. However, jurisdictional disputes and mutual raiding were still rife in their ranks, and popular resentment against the dislocation of the U.S. economy by persistent strikes was strong.

Agriculture.—In an address at New York on Dec. 6, 1945, Secy. of Agriculture Clinton P. Anderson predicted exceptional prosperity for the farmer. His prophecy was confirmed just a year later (Dec. 17, 1946) by a report of the department of agriculture which showed that 1946 had been a banner year in the production of food stuffs of every sort. The aggregate volume of crops was 7% more than the high figure of 1945. Of corn 3,287,927,000 bu. were raised, as against 2,880,224,000 in 1945 and a 10-year average of 2,600,000,000 bu.; and the 1,155,715,000 bu. of wheat raised compared with the 1,108,000,000 of the previous year and the 10-year average of 843,692,000 bu. There were more cattle, sheep and hogs in the country than ever before; and the meat production was ample to feed U.S. troops abroad, supply the U.S. quota of relief to the United Nations Relief and Rehabilitation administration and leave a per capita of several hundred pounds for U.S. consumption. The production of cane and beet sugar reached 2,000,000 tons, an increase of 15% more than 1945. More fruit was grown than ever before. More than 9,000,000 tons of fresh vegetables were raised, exceeding by 9% the record set in 1945.

At the height of the depression the farm income had sunk to \$4,700,000,000, or less than 10% of the national income; but by 1946 it had risen to a net of \$13,000,000,000, representing a per capita income to the farmer of more than \$1,500 a year, as compared with an average of \$550 for the period 1936-41. Farm mortgages were reduced by half from their peak figure of \$10,700,000,000 in the deep depression days; and the department of agriculture estimated that the total assets of the farms had increased from \$53,700,000,000 in 1940 to \$82,800,000,000 in 1946. The one disturbing fact in the picture was the prevalence of farm tenancy, especially in the south. President Roosevelt called it "America's Problem Number One." In 1940 no less than 42% of the country's farmers were landless tenants or share croppers, and loans by the Federal Farm Security administration for the purchase of land or homes under the Bankhead act of 1937 provided relief for only a tiny fraction of them.

Notwithstanding the superabundance of food in the country, the public was confronted with the paradox of scarcity. Those who were unable or unwilling to pay such outrageous black-market prices as \$1.25 a pound for beef, \$1.00 a pound for butter or \$1.00 a dozen for eggs found their diet as restricted as though the country were in a state of siege. Opponents of OPA insisted that it was the price ceilings that encouraged the black market, and if these were removed a wholesome competition would force the speculators to release their hoarded supplies and bring down prices to normal levels. The supporters of OPA, on the other hand, contended that if the ceilings were removed prices would soar to fantastic heights. The administration vacillated, now relaxing, now reimposing and finally removing price controls (except for rents and sugar). As the grocers' shelves began to fill again and meat began to appear in the butchers' shops toward the close of the year, prices came down slowly. That they would recede to prewar levels was

not to be expected, but the indignant consumer would have felt better had the increases he paid gone to the farmers and ranchmen and dairymen instead of to the middlemen and the speculators.

The Armed Forces.—It was natural that soldiers, sailors and marines should be eager to return to their homes after fighting for many months on battle fronts in Europe, Africa and the Pacific area. The surrender of Germany and Japan in the summer of 1945 seemed to them to mark the end of the need for their further service. But Presidents Roosevelt and Truman at Yalta and Potsdam had committed the United States to co-operation with Great Britain and the U.S.S.R. in the military and civilian control of Germany until peace should be made with that country, and in preserving order in the states liberated from nazi domination until they should establish governments based on the will of the people. Since men who had earned their discharges from the armed forces had little relish for this job of policing, and veterans were arriving home by the hundreds of thousands each month, the country was confronted with the problem of finding replacements for them, either through voluntary enlistments or extension of the draft. The latter method, vigorously backed by the war department, met with the traditional opposition in congress and the nation to conscription in the time of peace; and after a week of wrangling all that the senate and house conferees could agree upon was an emasculated bill permitting the draft of men more than 18 (excluding fathers) from July 1, 1946, to March 31, 1947. The session of congress came to an end without action on the proposal, and President Truman in December appointed a commission to study the question of what he called "universal" (rather than "military") training. Even if the draft produced 9,000 men a month, it was estimated that, if the army were to reach the proposed strength of 1,070,000 men on July 1, 1947, a monthly quota of 30,000 to 40,000 recruits would be needed. But during the first two weeks of Nov. 1946 there were less than 10,000 voluntary enlistments, despite the encouragement of a boost in pay.

The returning veterans were faced with a desperate housing situation. More than 1,000,000 of them were living "doubled up" according to Housing Expediter Wyatt Wilson. The Patman bill of April 1946 provided for the construction of 2,700,000 housing units by the end of 1947; but even if that figure were attained, it would satisfy only less than half the pressing demand. To aggravate the situation, the scarcity of building materials and the high cost of labour raised the prices of available houses to such heights that neither the veteran nor the retired war worker could afford to buy them. Only 16% of the veterans could pay more than \$6,000 for a house or \$50 a month for rent; but less than half the houses to be made available by the Patman plan could be had for so low a figure.

During the entire year a proposal favoured by the president and the army, but strenuously opposed by the navy, was before congress. That was the merger of the two departments under a single chief, called the secretary of common defense, with a seat in the cabinet, with three non-cabinet chiefs of staff representing the army, navy and air forces. There would be a single budget and a single intelligence agency for the three services; but within this framework they would be independent of one another. The supporters of the merger argued that not only did the separate services of army and navy often duplicate each other's work, but that they were a hindrance to the planning of over-all strategy. Pearl Harbor was cited as a confirmation of this opinion. On the other hand, the navy chiefs believed that unification of the services would mean the subordination of the navy to the army as the stronger branch of the service. It seemed likely that some compromise would pre-

vail: perhaps the suggestion of Sen. H. Styles Bridges of New Hampshire that a secretary of the air forces be added to the cabinet posts of the army and the navy, co-operation among all three to be promoted by a civilian co-ordinator appointed by the president.

Latin-American Relations.—Though widespread political and economic unrest prevailed in 1946 in the South American republics, notably in Bolivia, Venezuela, Uruguay and Paraguay, it was in the relations with Argentina that the good-neighbour policy was severely tested. The obvious reluctance of that country to fulfil its pledges made at various Pan-American congresses to eradicate nazi influences drew from the U.S. state department on April 8 a statement, reaffirmed six months later by Secy. of State James Byrnes, that the U.S. should judge Argentina by its actions and not by its words. In May George S. Messersmith was sent to Buenos Aires to succeed Spruille Braden, who returned to Washington to become assistant secretary of state in charge of American republics affairs. Meanwhile, the election of Juan D. Perón to the Argentine presidency had not only served as a rebuke to Braden's "hard-boiled" policy toward Argentina, but encouraged among the other Latin-American republics a revival of animus against the "Colossus of the North." On Dec. 23 Messersmith returned from Buenos Aires, where for eight months he had been pursuing a course much more conciliatory than that of Braden. The ostensible object of the return of the ambassador was a conference with Secretary Byrnes, but popular opinion saw in it a move to influence the state department to a more trustful co-operation with the Perón regime. If the secretary were persuaded to modify his position taken in the statements of April and October, it would mean the practical recognition of Argentina as the southern complement of the United States in the system of hemisphere defense and solidarity and a generous continuance of economic and military assistance to it. It would

BODIES of five U.S. airmen lying in state while taps are sounded at the Amphitheatre chapel in Arlington National cemetery, Arlington, Va. The fliers were shot down over Yugoslavia in August 1946

mean also, since the defeat of Germany had neutralized the activities of such nazi agents as remained in Argentina, that the U.S. could collaborate with that most powerful member of the Latin-American family without the interference in its domestic affairs which had so often justified in its own and its neighbours' eyes the charge of "Yankee Imperialism."

International Problems.—The year 1946 was characterized by an uninterrupted series of international conferences, with diplomats and delegations hastening from one capital to another: London, Paris, New York. There were two main objectives of these meetings: first, framing treaties of peace for the countries liberated from nazi domination (Finland, Italy and three Balkan states), and second, setting in motion the machinery of the United Nations as formulated in the San Francisco charter. The first of these tasks had been entrusted to the foreign ministers of the United States, Great Britain and the U.S.S.R. (with France and China joined as occasion demanded) by the Potsdam conference of July 1945. The next month the ministers held their first meeting at Moscow, and in succeeding sessions at London, Moscow, Paris and finally at the Waldorf-Astoria hotel in New York completed the drafts of the treaties (Nov.-Dec. 1946), dealing with the vexed questions of boundaries, reparations, minorities and political procedures. The first meeting of the general assembly of the 51 United Nations met at London on Jan. 10, 1946, the United States delegation consisting of Secy. of State Byrnes; former Secy. Edward R. Stettinius, Jr.; Sen. Tom Connally, chairman of the Foreign Relations committee; Sen. Arthur Vandenberg of Michigan and Mrs. Franklin D. Roosevelt. In its five weeks' session the assembly elected the 11 members of the Security council, created a United Nations Atomic Energy commission, established the International Court of Justice, chose New York as its interim headquarters and elected Trygve Lie of Norway to the important post of secretary general. The second session of the assembly convened at Flushing Meadows, Long Island, N.Y., on Oct. 23, 1946, and adjourned on Dec. 16, leaving to the Security council at Lake Success (Long Island) the task of working out a plan for the reduction of the armed forces of the world and especially for the control and use of the terrifying new discovery of atomic power. The main results of the incessant labour of the assembly were: agreement on the outlawing of the atomic bomb in warfare, the establishment of a rotation trusteeship council for the administration of the former League of Nations mandates, recommendation that the U.N. members recall their ministers and ambassadors from Spain until Gen. Francisco Franco should be ousted from power, advice to the Big Five of the Security council to make sparing use of the veto power guaranteed to them by the San Francisco charter, plans for the continuance of famine relief on the expiration (Dec. 31) of U.N.R.R.A., adoption of a budget of \$47,130,000 for the expenses of 1947, enlargement of the Security and the Social and Economic councils, the admission of four new members to the U.N. and the acceptance of John D. Rockefeller's \$8,500,000 gift of 6 blocks of land along the East river in central Manhattan as the permanent site for the capital of the United Nations.

A disturbing element pervading the session of both the assembly and the Security council was a clash of interests between the supporters of the Anglo-American and the Russian points of view on various subjects, such as the limitation of the veto power, the numbers and conduct of the troops in occupied countries and above all the method of control over the production and use of the atomic bomb. The Russians, conscious of the long hostility of the western nations to their communistic regime, believed that their safety demanded friendly governments in their neighbouring states in Europe and Asia, while

the western nations regarded Russia's policy in China, Iran, Poland and the Balkans as evidence of a growing Muscovite imperialism. The Russian press, wholly subservient to Generalissimo Joseph Stalin, made conciliation difficult by a constant emphasis on the "ganging up" of the western world against the soviet union. Vyacheslav Molotov in the Allied Council of Foreign Ministers and the assembly and Andrei Gromyko in the Security council so vigorously upheld the Russian contentions that it looked at times as though the meetings would be completely deadlocked. The most serious of all the problems (not settled when the year came to a close) was the method of control of atomic power. On June 14 Bernard Baruch, the U.S. representative on the U.N. Atomic Energy commission, presented his plan. It called for the creation of an atomic development authority to take over the world's supply of the materials for the production of atomic power, to have sole right to inspect atomic activities in all countries and to punish any nation or individual found guilty of using atomic power illegally. The action of the A.D.A. would not be subject to veto. Five days later Gromyko came forward with a very different plan. The control of the bomb should rest in the hands of the Security council and the right to veto penalties for the infraction of the council's prescriptions should remain. Meanwhile, as an earnest of good faith, the United States should cease to manufacture the bomb and destroy its stockpile. In a word, Gromyko was countering the advantage of the U.S. in the exclusive possession of the bomb with the plan to transfer the control of the bomb not to an independent authority but to the Security council itself with the right of veto intact. The Atomic Energy commission, having agreed that there must be a complete prohibition of atomic weapons and a system of international inspection to prevent their illegal manufacture, planned to present to the Security council by New Year's eve a report which would meet with its approval and later that of the general assembly.

Several other unsolved problems of international import con-

THE "BIG GUNS" of the first line of national defense were suggested by Fred O. Seibel of the *Richmond Times-Dispatch*, Richmond, Va., in this cartoon, which appeared in 1946

Table I.—U.S. Foreign Trade in Merchandise, by Continents, 1944 and 1943

	U.S.A.	Europe	N. America	Asia	S. America	Africa	Oceania
1944 exports		9,321,565,000	2,041,286,000	994,062,000	535,342,000	859,670,000	409,602,000
imports		285,274,000	2,037,749,000	321,940,000	922,813,000	221,189,000	130,305,000
1943 exports		7,617,046,000	2,022,560,000	837,541,000	411,480,000	1,507,353,000	568,927,000
imports		233,512,000	1,688,359,000	234,814,000	775,887,000	203,400,000	245,376,000

fronted the United States at the opening of the year 1947, and much criticism was visited upon the state department for alleged mishandling of foreign policy. As seen above, U.S. relations with Latin-America and especially with Argentina had hardly justified in the eyes of the U.S. sister republics (or of Sumner Welles in his book *Where Are We Heading?*) the promise to be a "good neighbour." In China the U.S. had in 1946 done little or nothing to compose the civil war between Chiang Kai-shek and the Communists, Gen. Joseph W. Stilwell and Ambassadors Clarence Gauss, Patrick Hurley and George Marshall acting at cross-purposes and winning neither the full gratitude of Chiang nor the trust of the regime at Yenan. Germany, divided into its four zones and without a government of its own with which to deal, was at the mercy of the conflicting policies of the occupying powers: Great Britain stressed the need for its economic recovery; France would separate the Rhineland and the Ruhr from the reich; the U.S.S.R. was suspected of plotting to win the country for communism; while the United States was endeavouring to rid its zone of nazi sympathizers in the administrative jobs, the courts and the schools. Complaints came back to the United States of reprehensible behaviour of U.S. troops and officers there; of enormous profiteering in black market operations, collusion with nazi agents and even insubordination to the commander of the U.S. army of occupation, Gen. Joseph T. McNarney. Until a settlement of the anarchy in Germany should be made (a problem which the Allied Council of Foreign Ministers was expected to take up in its meeting in Moscow in March 1947) there could be no hope for a peaceful Europe. In spite of these disturbing questions waiting solution, it was the conviction of the statesmen and peoples of the world generally that the work of various agencies of the United Nations during the year was fruitful of results and a promise of still more fruitful accomplishment in 1947.

Communication.—For statistics, see the articles AIR TRANSPORT COMMAND; AVIATION, CIVIL; CANALS AND INLAND WATERWAYS; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; POST OFFICE; RADIO; RAILROADS; ROADS AND HIGHWAYS; SHIPBUILDING; SHIPPING, MERCHANT MARINE; TELEGRAPHY; TELEPHONE; TELEVISION.

Agriculture.—Statistical material pertaining to this subject may be found under AGRICULTURE, FOOD SUPPLY OF THE WORLD; also in the articles on separate crops and agricultural products.

Mineral Production.—Preliminary estimates prepared by the U.S. bureau of mines valued the 1945 mineral production in the U.S. and Alaska at \$8,067,000,000. This represented a decrease of 4.6% from the 1944 all-time high of \$8,452,000,000, resulting largely from a 19% decline in the output of metals, which was the result of lessened military demands. The other two major classes of mineral products, mineral fuels and nonmetallic minerals, both showed an increase in production in 1945. Studies by mining engineers and geologists of the department of the interior revealed the advanced stage of depletion of many of the important mineral reserves of the U.S.

Table III.—Leading Mineral Products of the U.S., 1944 and 1943

Mineral	Value, 1944	Value, 1943
Petroleum	\$2,030,500,000	\$1,812,560,000
Bituminous coal	1,819,753,000	1,568,597,000
Pig iron	1,278,981,313	1,273,634,210
Natural gas	824,542,000	753,810,000
Coke	527,921,506	476,117,472
Pennsylvania anthracite	354,582,884	306,816,018
Copper (domestic ores only)	236,797,000	257,934,000
Cement	151,996,646	202,460,328
Stone	175,642,157	184,320,034

United States Employment Service. The United States Employment service is a bureau within the U.S. department of labour, created under the Wagner-Peyser act of 1933, to establish and assist in maintaining a nationwide system of state employment service offices. The state systems were federalized in Jan. 1942 and integrated into the United States Employment service which throughout the war period served as the operating arm of the War Manpower commission in the mobilization of the nation's labour force. Administration of the state and 1,800 local USES offices was returned to the 48 states and the territories of Alaska and Hawaii on Nov. 16, 1946. Local offices in the District of Columbia and Puerto Rico continue under USES operation. The federal government finances the state employment service systems 100%.

During the war period and the first 15 months of reconversion local USES offices made 50,000,000 placements in war production establishments and peacetime industry. The peak load in USES offices was reached in March 1946, when 14,499,000 visits were made to them for various services. In July 1945, the last full month of war, the total was 4,900,000. In the fiscal year ended June 30, 1946, these visits totalled 128,000,000.

The Servicemen's Readjustment act of 1944 imposed special responsibilities upon USES in behalf of veterans, including employment counselling, preferential referral to job openings for which the veteran is qualified, and selective placement for disabled veterans. These services are available in all offices of the federal-state employment service. The Veterans Placement Service board, composed of the veterans' administrator, the director of selective service and the secretary of labour, establish the policies which are carried out by the Veterans Employment service of the USES. This service maintains an extensive force in the field, and at headquarters in the department of labour.

With return of local office administration to the states and territories the employment service again became a federal-state system. The federal government, under the statutes, is required to establish and maintain minimum standards for state employment service operations; engage in program development to improve the services; obtain and make available to other states the best current experiences of each state; provide technical assistance; maintain a uniform reporting system and exchange of labour market information among local offices; review and approve state plans of operations; allocate funds and audit expenditures of monies; and evaluate state operations to determine effectiveness of performance.

In turn the states are obligated, under regulations promulgated by the secretary of labour to: maintain an effective placement service for veterans, displaced former war workers, youths entering the labour market, disabled veterans and other handicapped workers, old workers, women and all other job-seekers; provide employment counselling to veterans and other workers; provide special services to veterans as required under the statutes; assist employers and labour organizations in use of personnel tools and techniques developed by the USES; disseminate labour market information and analysis to all interested groups; aid training authorities and community groups affected by manpower considerations; and co-operate with community organizations and government agencies in programs for increasing economic activity and maintaining high levels of stabilized employment.

United States Housing Authority (USHA): see HOUSING.

U.S. Investments Abroad. At the middle of 1946 the total value of private U.S. investments in foreign countries was estimated at approximately \$11,200,000,000 and the outstanding value of the loans and advances of the U.S. government aggregated an additional \$3,600,000,000.

Although both private and government advances to foreigners increased during the year, the rise in government credits was by far the more impressive.

Government Credits.—During 1946 the extension and use of U.S. government credits to foreign governments became one of the major factors in financing the large volume of U.S. exports required to meet the postwar needs of foreign countries. The virtual termination of lend-lease aid on Sept. 2, 1945, had meant that the extraordinary needs of foreign countries for goods, which included foodstuffs and other commodities necessary to the civilian economies, would be met partly through the United Nations Relief and Rehabilitation administration but mainly through the extension of large-scale credits to those countries.

Although it had been expected that the International Bank for Reconstruction and Development would be the main source of international loans, delays in ratification, and later in operation, required that credits be obtained elsewhere.

Consequently, the burden of providing such credits fell principally upon the United States, although that country was by no means the only source of international credit. During the first half of 1946 it was estimated that of approximately \$10,000,000,000 of total postwar credits either granted or awaiting signature or ratification by all countries, the U.S. share exceeded \$7,000,000,000. As the year progressed, these figures were revised upwards, the U.S. share alone reaching about \$9,500,000,000. Yet despite the additional commitments of several billions in long-term loans during the balance of the year, actual disbursements by the United States during 1946 proceeded at a moderate pace. The department of commerce estimated these at (net) \$1,670,000,000 in the first half of the year and at (net) \$1,860,000,000 during the second half of the year. The relatively slow utilization of credits, particularly in the first quarter of the year, reflected the continued strong U.S. demand for commodities that remained in short supply.

Loans to Britain and the Philippines.—Of the loans granted by the United States during 1946 by far the most important was one of \$3,750,000,000 to the United Kingdom in July. The loan, which in reality was a line of credit available up to the end of 1951, was repayable over a 50-yr. period beginning in that year. It bore no interest during the first 5 yrs. and the rate was 2% thereafter. The utilization of this loan for commodities in the United States, like others granted by the United States, was relatively slow. By the end of 1946 the British had drawn \$600,000,000 of the credit.

The 79th congress also enacted legislation during the summer authorizing a loan of \$75,000,000 to the Philippine Republic. Unlike other foreign loans, this was to meet a budgetary deficit rather than to provide funds for the purchase of U.S. commodities and services.

Export-Import Bank.—During 1946 the Export-Import bank continued to grant reconstruction credits—to the extent of \$1,157,000,000 during the first half of the year. This compared with commitments of \$1,040,000,000 in the last half of 1945. Of the additional \$2,800,000,000 granted to it during 1945, the bank had utilized all but about \$800,000,000, and of the uncommitted balance, \$500,000,000 had been earmarked for possible Chinese credits. The near exhaustion of the loanable funds of the bank was the basis for a recommendation by the National Advisory council to the congress on March 1, 1946, for

an additional \$1,250,000,000 of lending authority for the bank to meet the most urgent needs of foreign countries for dollar credits pending the granting of loans by the International bank. The proposal was not considered by congress in 1946.

Among the loans granted by the Export-Import bank were \$650,000,000 to France and \$200,000,000 to the Netherlands for equipment, materials and services. Other loans went to the Netherlands Indies, China, Greece, Saudi Arabia, Finland and Italy. Private U.S. banks participated in the Netherlands loan to the extent of 50%. Actual disbursements on all Export-Import bank loans, however, aggregated only \$500,000,000 in the first 6 mo. of 1946.

Lend-Lease Settlement Loans and Surplus Property Credits.—Agreements were concluded in 1945 and 1946 with a number of countries that had received lend-lease aid during World War II. In many instances these were part of over-all settlements of the wartime lend-lease and reverse lend-lease transactions and provided long-term credits for the transfer from the United States of lend-lease inventories and goods in the pipe line.

The terms of credit were typically $2\frac{3}{8}\%$ with amortization periods running from 30 to 50 yr. The loan agreement with France, dated May 28, 1946, provided for an obligation of \$420,000,000 for inventories, goods in the pipe line and for the settlement of war claims.

At the time of this loan agreement another loan of \$300,000,000 was made to France (at similar terms) to cover the purchase of surplus properties and installations (with an original cost to the United States of \$1,400,000,000). This loan was part of a total of \$900,000,000 of credit extended to foreigners by the U.S. government during 1946 for the purchase of surplus properties including surplus ships. The vessels were under the jurisdiction of the maritime commission, acting under the authority of the Merchant Ship Sales act of 1946. Credit terms under this program called for a cash down payment of 25%, amortizations within 20 yr. and interest at $3\frac{1}{2}\%$.

International Organizations.—During 1946, \$316,000,000 of U.S. government capital was invested in the International Bank for Reconstruction and Development which, with the International Monetary fund, was being organized for full-fledged operations. No investment was made in the latter organization in 1946 although it was contemplated that \$2,750,000,000 would be invested by March 1, 1947, when the fund was to begin foreign exchange transactions.

Further U.S. government investments in the International bank of \$316,000,000 were scheduled by May 26, 1947, although it was contemplated that the bank would call upon private capital markets (mainly in the United States) for the bulk of the funds to be loaned by that organization to needy foreign coun-

tries. Toward the end of the year the president of the bank stated that it had received loan applications for about \$2,000,000,000 and that commercial banks in the United States under current regulations could alone purchase about \$600,000,000 of the bank's obligations, if issued.

Short-Term Credits.—The government also initiated a program of short-term advances to Japan and Germany in the form of commodities for further processing, such as raw cotton to be manufactured into yard goods by those countries. The cotton "advances" were to be repaid from the proceeds of the sales of the finished products in foreign countries. Sales were to be made against dollars. Approximately 40% of the gross was to revert to the United States as payment for the raw cotton. Such arrangements served the function of re-establishing production in certain industries in those countries.

Private Investments.—Within a year after the end of World War II there were several indications of a reviving U.S. interest in making private loans and investments in foreign countries, in addition to Canada. (U.S. people had been purchasing Canadian securities during World War II, and during the first 6 mo. of 1946 made net purchases of an additional \$113,000,000, Canadian dollars, according to official Canadian statistics.) New investments in U.S. direct investment enterprises operating in foreign countries were estimated by the commerce department to have reached a net figure of up to \$200,000,000 during the first 9 mo. of 1946, as contrasted with net withdrawals of capital in previous years. However, during the next 3 mo. two major liquidations aggregating \$120,000,000 were reported. For the first time in a number of years long-term loans were made by the general public to a foreign country other than Canada, and other loan requests awaited favourable conditions.

Direct Investments.—Among the new direct investments in 1946 announced were the following:

The American Anglo-Transvaal Corp., a \$20,000,000-enterprise for the development of mining and industrial activities in the Union of South Africa, to be financed jointly by U.S. and British capital.

The investment of \$7,000,000 by Sears, Roebuck and Co. in retail merchandising establishments in Mexico and Brazil, as a first venture of this company to establish its merchandising techniques outside of the United States.

The formation of International Hotels Corp. by Pan American Airways to carry out a program of hotel construction in Latin America.

The development of a company to manufacture low-cost Westclox alarm clocks and pocket watches in Scotland.

Among the important liquidations during the year was the announced sale by the International Telephone and Telegraph Corp. to the Argentine government of certain of its properties in that country for \$95,000,000. This marked the third major liquidation within a 6-yr. period of this company's direct investments abroad—others being a liquidation of Rumanian interests in 1941 for \$14,000,000 and certain Spanish properties in 1945 for \$88,000,000. The sale by the Barber Asphalt Corp., a U.S. company, of its Venezuelan oil royalties to the Shell Petroleum Co., Ltd., of London, for \$25,000,000 represented another major withdrawal of U.S. interests from abroad.

At the close of 1946 the future of U.S.-controlled properties both in Japan and in several Allied countries still remained unsettled.

Foreign Dollar Bonds.—The successful offering of \$20,000,000 of commonwealth of Australia $3\frac{1}{4}\%$, 10-yr. bonds in the summer of 1946 pre-saged the offering of a number of overseas loans for the first time in many years and was followed by a \$25,000,000-Australian issue in December. Temporarily withheld pending favourable market conditions, a \$50,000,000-Netherlands issue and a \$100,000,000-Norwegian issue were expected to be offered to the public in 1947. Two encouraging developments among defaulted loans were the announced intention of Czechoslovakia to pay full interest on arrears and current coupons and the Polish reaffirmation to resume in 1947 payments on its loans suspended during World War II.

At the end of 1945, 30% of the \$2,499,000,000 (par value) of U.S.-owned foreign dollar bonds were in default. In the latter part of 1946 the Argentine government's redemption of more than \$100,000,000 of its bonds held in the United States (which had not been in default) served to increase this ratio somewhat. (See also EXPORT-IMPORT BANK OF WASHINGTON; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; INTERNATIONAL MONETARY FUND; LEND-LEASE.)

Universities and Colleges. The following eight pages carry a selected list of nationally or regionally accredited universities, colleges, junior colleges, and technical schools of college grade in the U.S. and Canada, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes, for the academic year 1946-47. The symbol * denotes 1945-46 data; || denotes data previous to 1945-46. (See also EDUCATION.)

*Estimated Value of United States Investments in Foreign Countries,
June 30, 1946*

(In billions of dollars)

Type	Value
Private:	
Long-term	
Direct (book value)*	7.8
Dollar bonds (market value)	1.8
Miscellaneous	1.1
Total long-term	10.7
Short-term	.5
Total private	11.2
Government:	
Long-term	3.3
Short-term	.3
Total government	3.6
Total U.S. investments abroad	14.8

*No allowance was made for war damages to U.S. properties in foreign countries inasmuch as the full extent of such damage was unknown. It might, however, run into several hundred million dollars.

Source: U.S. Department of Commerce.

Note: The above data would require considerable revision when the results of a comprehensive survey of U.S. investments in foreign countries by the U.S. treasury department become known.

Uranium. Supplementing the previously known use of uranium for the production of a new isotope U-239, and its conversion into element No. 93, neptunium, and then into element No. 94, plutonium, it was reported that the bombardment of uranium with neutrons also resulted in the formation of two more elements, Nos. 95 and 96, and that some 150 isotopes of about 35 other elements had been identified as by-products of the reactions taking place in the chain reaction piles for the conversion of uranium into plutonium. As of 1946, little information had been made public concerning these by-products, but some of them had been collected in quantities large enough to permit them to be used in medical and biological experimentation. (See also ATOMIC ENERGY; CHEMISTRY; METALLURGY.)

(G. A. Ro.)

Urology. Wide experience in the use of antibiotic agents during 1946 demonstrated their value in the treatment of infections of the genitourinary tract. Penicillin was found to be of specific value in combating urinary infection caused by gram-positive organisms. Although penicillin did not replace the sulfonamides and mandelic acid preparations in the treatment of urinary infections, it often was successful when those drugs failed. Generally, penicillin was administered by intermittent intramuscular injection at three-hour intervals, and administration was continued until the infection was controlled. Intramuscular injection of penicillin combined with beeswax and peanut oil in one or two massive doses was used to an increasing extent. Oral administration also was employed more frequently, but only as an adjunct to parenteral methods of treatment and for prophylactic purposes. Penicillin, like other antibiotic agents, was more effective in eliminating acute, uncomplicated infections than chronic infections.

The production of streptomycin increased to such an extent during 1946 that limitations of distribution were removed. It was used successfully in the treatment of infections of the urinary tract caused by organisms that do not stain with the gram stain. It was found that streptomycin was administered best parenterally, because, when it was given by mouth, practically none of it was absorbed from the gastrointestinal tract. It was best administered in a dose of one or two grams daily by intramuscular injection, at intervals of three hours. It was found that it was advisable to employ an initially high dose of streptomycin in the presence of an acute infection of the urinary tract. If the infection were not eliminated when streptomycin was so administered, continued administration was useless. It was found that sensitivity to streptomycin often was acquired by gram-negative organisms, particularly if the dose were inadequate. Recurrence of infection often was observed after the administration of streptomycin was discontinued.

Systemic reaction to the administration of antibiotic agents received considerable attention, and cases were reported in which severe allergic reactions were noted. In many cases streptomycin produced a moderate degree of toxicity, sometimes with histamine-like reactions. When the use of streptomycin in high doses was long continued, the drug had a deleterious effect on the nervous system and specifically on the eighth cranial nerve. As a result, patients complained of ringing in the ears with a variable degree of deafness and ataxia. These complications were controlled by immediate cessation of the treatment. In most cases the hearing would gradually improve, although a moderate degree of deafness sometimes remained.

Continued experience with streptomycin in the treatment of inoperable renal tuberculosis established its value in some cases. The results in a series of 14 cases were reported after long-continued treatment with streptomycin. Definite symptomatic improvement was noted in eight cases, and in two cases *Mycobacterium tuberculosis* was apparently eliminated.

Penicillin largely replaced the sulfonamides in the treatment of gonorrhoea. In many cases it was efficient in overcoming infection resistant to the sulfonamides. A single injection of a solution of from 100,000 to 300,000 units of penicillin in beeswax and peanut oil often was sufficient to overcome gonorrhoeal urethritis. A second or third injection was advisable, however, in order to eradicate completely the infection. In fact, unless the disease were adequately treated and checked by cultures, recurrence of gonorrhoeal urethritis resulted and was difficult to overcome. The administration of antibiotic agents as well as other substances always should be under the supervision of a physician. (W. F. BR.)

Uruguay. A republic in the southeastern part of South America, bounded on the east, south, west and north, respectively, by the Atlantic, the Río de la Plata, Argentina and Brazil. Area, 72,172 sq.mi. (the smallest of any South American republic); pop. (1944 est.), 2,235,000. Racial distribution is estimated at 90% white and most of the rest mestizo; large numbers of Europeans, especially Italians and Spaniards, live in Uruguay. The capital and chief port is Montevideo (pop., 1945 est., 747,665); other important cities (with 1945 pop. ests. unless otherwise stated) are Paysandú (50,000), Salto (48,000), Mercedes (33,000), Minas (1942 est., 32,000), Tucuarembó (30,000), San José (1942 est., 30,000), Rocha (28,500), Melo (28,000), Durazno (1942 est., 27,000) and Santa Lucía (1942 est., 27,000). The government is headed by a popularly elected president and vice-president, with the congress and cabinet filled on a basis of proportional representation; the senate includes 30 and the chamber of deputies 99 members. President in 1946: Juan José Amézága.

History.—The climax of developments in 1946 came in the presidential election in November. The capital suffered from a one-day general strike Feb. 28, involving about 60,000 people, in protest against living costs. The government in April moved to expropriate and nationalize the British-owned Montevideo waterworks. On July 1 the government announced that it had suppressed an antigovernment coup led by a former head of the air force and apparently supported by the Asociación Pro-Renovación del Espíritu, an allegedly totalitarian lodge of army officers. About 30 arrests followed but Pres. Amézága obtained a 30% pay increase for commissioned officers and instituted an obligatory retirement scheme to make room for younger officers. Uruguay's troubles with food were serious because the second consecutive poor wheat harvest left an estimated deficit of 130,000 metric tons of that grain. The bank of the republic contracted for a 90,000-ton purchase from Argentina but the latter country on April 22 refused to honour its commitment, because of alleged prior sales obligations. U.S. Ambassador William Dawson then informed the foreign minister that the United States would ship emergency supplies of wheat, beginning with 8,000 tons in May.

Presidential and congressional elections were scheduled for Nov. 24. The Nationalist party on Sept. 29 nominated its aging leader, Luis Alberto Herrera, as presidential candidate, with Martín Echegoyen as running mate; Herrera, long the leader of an aggressive opposition, had been freely accused in years past of being pro-nazi and sympathetic to the Perón regime in Argentina. The *Batllista Colorado* party (in control of the government) on Oct. 3 nominated Public Works Minister Tomás Ber-

reta and Deputy Luis Batlle Berres as its candidates. Former Pres. Alfredo Baldomir and a Perónist politician, Rafael Schiaffino, also ran for the presidency but were conceded little chance. Early unofficial returns gave Berreta the election with 264,626 votes to 176,628 for Herrera. Communists polled about 10% of the vote and elected one senator and four deputies.

Finance.—The monetary unit is the peso, valued on Nov. 15, 1946, at from 52.63 to 56.02 cents, U.S. currency, depending on the type of exchange. The public debt June 30, 1946, totalled 654,900,000 pesos, an increase from the figure of 629,100,000 for Jan. 1. By Sept. 30 the debt had grown still further, to 661,600,000 pesos. Total U.S. Export-Import bank commitments, as of June 30, were \$32,000,000, of which the amount outstanding was \$9,400,000 and the undisbursed balance \$22,600,000. The official cost-of-living index at the beginning of 1946 was 141 as against 100 for 1929. Inflation was even more serious by the middle of 1946.

Trade.—Exports in 1945 were \$122,012,000 (1944: \$97,559,000) and imports \$114,759,000 (1944: \$72,446,000) leaving a favourable balance of \$7,253,000 (1944: \$25,113,000). The principal export items (with 1944 figures in parentheses) were: wool \$57,196,000 (\$40,919,000); meat and meat products \$31,160,000 (\$29,721,000); hides and hair \$11,888,000 (\$11,133,000); textiles and textile products \$8,583,000 (\$5,056,000). Principal destinations of 1945 exports were: United States \$55,757,000 (\$46,326,000); United Kingdom \$28,949,000 (\$31,323,000); Sweden \$5,143,000 (\$3,843,000). Chief imports in 1945 were: prime materials \$29,975,000 (\$22,199,000); fuel and lubricants \$12,034,000 (\$14,721,000); general merchandise \$10,752,000 (\$9,781,000). Sources of imports included: United States \$47,607,000 (\$18,856,000); Brazil \$19,327,000 (\$16,046,000); Argentina \$11,777,000 (\$9,279,000). Exports in the first eight months of 1946 were 1,474,829 metric tons valued at \$99,531,946; imports were 1,211,588 tons valued at \$83,643,464; the United States was again the largest buyer and supplier. Uruguay made arrangements with Cuba early in 1946 to purchase 25,000 metric tons of Cuban sugar. The government later contracted with the U.S. Commodity Credit corporation to sell the current and last linseed crops up to 110,000 metric tons. Uruguay's first shipments of wool were sent to the U.S.S.R. in June. By mid-1946 much import merchandise was arriving in Uruguay but consumer prices remained high.

Production.—The estimate of 1946 grape production was 120,000 metric tons (1945: 81,529 tons); wine production in 1945 was 53,100,000 l. (1944: 71,800,000 l.). The 1945-46 linseed crop estimate was 112,000 metric tons from 185,000 ha. (1944-45: 103,000 tons from 163,000 ha.). The 1945-46 wheat estimate was 210,000 metric tons but an enormous deficit was in prospect. The 1946 rice crop, it was thought, would cover all normal requirements, although demand was up because of wheat shortages. One new textile mill organized during 1946 had a capital of 6,000,000 pesos. Textile production in 1945 included: woolsens and worsteds 5,500,000 sq.m.; woolen yarns 3,500,000 net kg.; worsted yarns 750,000 net kg.; cotton fabrics 2,800,000 net kg.; carded cotton yarns 2,100,000 net kg.; rayon fabrics 28,000 net kg.

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky Mountain state, admitted to the union in 1896, popularly known as the "Beehive state." Area 84,916 sq.mi. (82,346 sq.mi. land; 2,570 sq.mi. water); pop.

(Dec. 1, 1946) 633,464; (U.S. census 1940) 550,310. The rural (nonfarm) population was 150,465 in 1940; (farm) 94,352; urban 305,493; with the following origins: white (native) 510,662; (foreign-born) 32,298; Negro (native) 1,225, (est. 1946, 2,400); (foreign-born) 10. Farm population decreased considerably after 1940, and urban population increased about 60%, because of war conditions. Capital, Salt Lake City (pop. est. 1946, 183,000). Other principal cities with 1946 est. pop.: Ogden (60,000), Provo (22,000) and Logan (14,000). In 1945 the Mormon church gave its membership total as 979,454, about one-half in Utah, or 414,621, and 106,689 in Salt Lake City.

History.—In 1946 the administration of Governor Herbert B. Maw co-operated with federal authorities in essential war and postwar measures and in all vital reconversion programs, particularly the return of Utah's gigantic Geneva steel plant to private industry, and in initiating the preliminary work on the great reclamation project of central Utah, known as the Central Utah project, and further development of the Colorado river, while aiding business and industrial interests in the expansion of manufacturing, mining, metallurgical and transportation industries and in encouraging eastern and Pacific coast industrialists and manufacturers to establish their branch factories in Utah.

In 1946 E. E. Monson continued as secretary of state; Ferrell H. Adams was auditor; Reese M. Reese, treasurer; Grover A. Giles, attorney general; and Dr. E. Allen Bateman, superintendent of public instruction.

Education.—There were 150,622 children of school age in Utah in 1945, there being an average daily attendance of only 126,687 out of an enrolment of 144,605. The total cost of education was \$18,229,948.90, with \$16,049,045.89 devoted to operating expenses. There were 4,330 teachers and 430 principals.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total obligations of \$8,614,848.08 incurred in 1945 for public assistance exclusive of administration, were distributed as follows: old-age assistance, \$5,906,901.40; aid to dependent children, \$1,617,402.06; aid to blind, \$62,055.62; aid to employables, \$18,877.46; aid to unemployables, \$664,776.15; other assistance \$344,835.39. A total of 14,895 households were receiving assistance in June 1945, as compared with 14,990 households in June 1944. From Jan. 1 to June 30, 1946, \$4,575,366.98 was distributed for public assistance. The 1945 legislature passed legislation increasing the gratuities to old-age recipients from \$30 to \$40 per month.

Communication.—Highway mileage in 1946 was as follows: state, 5,428; county, 15,531; city, 2,539; federal, 5,370; total 28,868. There were 157 mi. of electric railway and 1,820 mi. of steam railway in 1946. Utah was actively engaged in road building for national defense during the war years, 1942 through 1945, the highway department expending \$9,600,000 for construction, of which \$8,400,000 was federal funds. Highway traffic attained an all-time high in 1946 with receipts from the four-cent gasoline tax during the calendar year approximating \$5,500,000 and from motor vehicle registration \$1,600,000.

The state highway department was to expend an average of \$6,750,000 for construction of federal-aid projects in each of the first three postwar years, of which \$4,600,000 would be federal funds. Utah had 52 airports and landing fields in 1946, comprising 48 civilian and 4 military. The 1945 special session of the legislature appropriated \$500,000 for construction of airports in co-operation with Utah communities and the federal government.

Banking and Finance.—The 59 banks, 47 state and 12 na-

tional, had total assets of \$563,291,143.46 on Sept. 30, 1946, and total bank deposits reached \$532,320,554.76. On June 30, 1946, the state's 19 building and loan associations, (13) state and (6) federal, had aggregate assets of \$56,677,494.00. State receipts for the year ending June 30, 1946, were \$52,203,574.66; expenditures were \$47,542,029.60.

The total of outstanding bonds in 1946 was \$1,370,000, with this amount available from the state liquor control fund for retirement of all outstanding bonds. Thus the state was out of debt.

Agriculture.—Figures not yet final showed cash income from farm marketings in 1945 was \$35,275,000 for crops and \$85,701,000 for livestock and livestock products, as compared with \$35,376,000 for crops and \$81,658,000 for livestock and livestock products in 1944.

Preliminary value of truck and canning crops was \$8,207,000 for 1945; for 1944 \$7,049,000. Preliminary value of canning tomatoes in 1946 was \$1,593,000 and shipping tomatoes \$165,000.

Table I.—Principal Agricultural Products of Utah, 1946 and 1945

Crop	Preliminary 1946	1945
Wheat, tons	208,620	205,740
Hay (tame and wild), tons	1,067,000	1,178,000
Potatoes, bu.	3,570,000	3,366,000
Sugar beets, short tons	602,000	437,000
Celery, crates	618,000	287,000
Tomatoes, fresh, bu.	54,000	45,000
" processing, tons	75,000	54,800
Onions, 100-lb. sacks	412,000	425,000
Peas, tons	17,190	24,020

To offset partly the loss of agricultural workers, 1,100 German prisoners of war supplemented by 600 Mexican farm labourers were being used as of July 1, 1946. However, when the prisoners were repatriated, the number of Mexican nationals was increased to 1,300 during the fall harvest.

Manufacturing.—The average employment in 1946 (total wages paid and total value of products) remained substantially the same as in 1945. The average monthly workers numbered about 23,441 in 1945 as compared with 24,376 in 1944. During the last quarter of 1946 however, employment was running at a rate of more than 28,000.

This was 10,000 more employees than in the immediate pre-war period, and was largely because of the Geneva steel plant getting back into operation.

Total pay rolls in manufacturing were \$51,141,556 in 1945 as compared with \$51,345,876 in 1944, and it was estimated they would reach \$55,000,000 in 1946.

Mineral Production.—In 1945 production of copper, gold, lead, molybdenum, zinc and iron in Utah was maintained; gilsonite, tungsten, manganese and fluorite mines continued in commercial production, and labour shortages were made up partly by the use of labour-saving machines. However, mineral production as well as exploration and development work to find additional ores was materially curtailed in 1946 due to labour disputes, price controls and critical labour shortages. In 1945 the state had a production of 279,979 fine oz. of gold and 6,106,545 fine oz. of silver, as compared with 344,223 fine oz. of gold and 7,593,075 fine oz. of silver in 1944. The peak production year for copper was 1943.

Table II.—Mineral Production of Utah, 1945 and 1944

Mineral	1945	1944
Copper, lb.	452,752,000	565,150,000
Lead, lb.	81,634,000	105,038,000
Zinc, lb.	67,260,000	77,988,000
Value of all ores	90,018,641	111,036,247

The 1945 coal production was 6,738,462 tons; the estimated 1945 coke production was 854,246 tons. (J. C. AR.)

Utilities, Public: *see* PUBLIC UTILITIES.

Valentine, Lewis Joseph (1882–1946), U.S. police official, was born on March 19 in Brooklyn, N.Y., and after attending the local schools, became a wagon boy for a department store at the age of 16. Head of a company agency at 20, he left the merchandising business to become, in 1903, a policeman. Ten years later, he was promoted to the grade of sergeant and upon the election of Mayor James J. Walker became successively a captain, deputy inspector, inspector and deputy chief inspector. Reduced to captain and transferred from police headquarters during the tenure of police commissioner Grover H. Whalen, he returned to headquarters in 1934, upon the election of Mayor Fiorello LaGuardia, becoming chief inspector. Later that year, he was appointed police commissioner of New York city and received the mayor's full endorsement to "clean-up" the police department. During his first years in office, he thoroughly reorganized the police system, vigorously fought gambling and vice, cleaned up election poll frauds and helped to correct the city's traffic problems. He had held his post for 11 years when he retired from the force to conduct "Gang Busters," a radio program on crime topics. In March of 1946, at the request of Gen. MacArthur, he went to Japan to reorganize the Japanese police, fire and prison systems. Successfully completing his mission within three months, he returned to the U.S. to resume his radio work. An autobiography, *Night Stick*, was completed before his death. Mr. Valentine died in New York city, Dec. 16.

Vanadium. The trend of the vanadium industry in the United States during late years is indicated by the following data, in short tons of vanadium content.

	1939	1940	1941	1942	1943	1944	1945
Mine shipments	992	1,081	1,257	2,220	2,793	1,764	1,482
Imports	1,066	1,287	1,069	1,288	1,058	662	789
Consumption	?	?	?	3,468	3,631	2,678	2,547

Domestic ore received at mills and government stock piles in the first half of 1946 declined to 375 short tons of contained vanadium. Imports during the same period were 300 tons, and consumption 483 tons. The chief source of outside supply for the U.S. is Peru.

The metals reserve stockpile, which reached a peak of about 1,200 tons of contained vanadium pentoxide in 1944, was all sold out during 1945.

Production by other important world sources is given below, so far as available, in short tons of contained vanadium.

	1939	1940	1941	1942	1943	1944	1945

World total	3,190	3,330	3,100	4,300	4,950	3,000	2,870

Several other countries produce minor amounts, figures for which were lacking.

(G. A. Ro.)

Vandenberg, Arthur Hendrick (1884–), U.S. senator and statesman, was born March 22, in Grand Rapids, Mich. He studied at the University of Michigan law school, Ann Arbor, Mich., for one year, and joined the *Grand Rapids Herald* as a reporter, becoming editor and general manager of the paper. He was appointed to fill a U.S. senate vacancy in 1928, and was re-elected in 1934, 1940 and 1946.

Before the United States entered World War II, Vandenberg, a noninterventionist, attacked the lend-lease bill and aid to Britain. After the Japanese struck Pearl Harbor, Vandenberg generally approved the administration's foreign policy.

In 1945 President Roosevelt appointed him delegate to the

United Nations conference in San Francisco, Calif. Vandenberg subsequently urged the senate to ratify the U.N. charter which he supported because "this plan regardless of its infirmities, holds great promise that the United Nations may collaborate for peace as effectively as they have made common cause for war."

Vandenberg's advice at U.N. parleys and at the sessions of the Big Four foreign ministers was sought by Secretary James Byrnes. Although Vandenberg repeatedly called for a firm stand toward the soviet union, after returning from the U.N. sessions in London he stated (Feb. 27, 1946), that the United States and the soviet union could live together in "reasonable harmony if the United States speaks as plainly on all occasions as Russia does."

After the Republican triumph in the Nov. elections of 1946, Vandenberg was regarded as one of the outstanding G.O.P. candidates for the presidential nominations of 1948. On Dec. 30, 1946, Vandenberg was named president *pro tempore* of the senate.

Vassar College. A college for women at Poughkeepsie, N.Y., founded by Matthew Vassar in 1861. In the fall of 1946 Vassar returned to the traditional four-year course for the bachelor's degree, abandoning the three-year course adopted in 1943 as an emergency wartime measure. On Oct. 11 the college inaugurated its sixth, and first woman, president—Sarah Gibson Blanding, who succeeded Dr. Henry Noble MacCracken upon his retirement July 1 after 31 years of service. President Blanding, a Kentuckian and a political scientist, came to Vassar from Cornell university, Ithaca, N.Y., where she was dean of the college of home economics. She is a graduate of the University of Kentucky, Lexington, Ky., where she served as dean of women and associate professor of political science. She received her A.M. from Columbia university and studied at the London School of Economics. At her inauguration, President Blanding was decorated by the war department for her contribution to the welfare of U.S. servicewomen as a member of the Joint Army and Navy Committee on Welfare and Recreation. In July she was appointed by President Truman to the National Commission on Higher Education. In April Vassar became the first women's college to make temporary room for veterans. There were 90 veterans enrolled as non-resident students at the college in 1946. Throughout the year the faculty carried on its studies for a revision of the curriculum that would keep the course of study in line with Vassar's traditional objective of education for social use. New experimental courses were initiated. The wartime co-operative system, under which all students shared in college housekeeping, was adopted as an integral part of the college's educational policy. (For statistics of endowment, enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.)

Vatican City State. A sovereign independent state, established by the Lateran treaty between the Holy See and the Italian government on Feb. 11, 1929. The treaty is recognized in international law; and the reigning pope is the sovereign. The area of Vatican City is 108.7 ac., excluding the papal estate of Castel Gandolfo and certain basilicas in Rome which are extraterritorial. Executive powers are exercised by the governor, responsible to the pope.

The Vatican in 1946 maintained diplomatic relations with 36 states. The status of relations with several additional countries was unsettled because of disturbed conditions. The Vatican had 31 nuncios, representatives of ambassadorial rank, and 4 internuncios, representatives of lesser rank, in as many countries.

There were regents in two countries, and regents *ad interim* in two others, namely Iran and Yugoslavia. The Vatican sent apostolic delegates, representatives without accredited rank, to 18 countries, including Canada, Great Britain and the United States. Missions to several countries, including Germany, were managed by chargés d'affaires. At the Vatican during 1946 there were 34 ranking representatives of as many governments. Four other posts were vacant. The president of the United States was personally represented by Myron C. Taylor, to whose mission considerable objection was raised by some Americans on the grounds that it violated the principles of separation of church and state.

On Oct. 26, Mgr. Nicola Moscatello, who had served with the Yugoslav delegation for 22 years and was at the time acting as Yugoslavian counsellor to the Holy See, resigned in protest against the prison sentence imposed on Archbishop Stepinac. Bishop Joseph P. Hurley of Saint Augustine, Fla., continued as regent *ad interim* in Belgrade. The Vatican reacted to the trial and imprisonment of the Yugoslav archbishop by announcing that those participating in the trial had incurred the penalty of excommunication.

During 1946 the Vatican felt considerable anxiety about the status of its future relations with the Italian government. On Dec. 19 a subcommittee of the constituent assembly finally approved an article reaffirming the validity of the 1929 Lateran treaty as the basis of relations.

On May 23 the Vatican announced that the Catholic Church in China was raised from missionary status and had its own hierarchy with Thomas Cardinal Tien as first archbishop of Peiping. China gave its representative at the Vatican, the Catholic jurist Dr. John C. Wu, the title of minister.

The year 1946 saw several futile attempts to improve the relations of the Vatican with the U.S.S.R. In March the *Osservatore Romano*, semiofficial Vatican daily newspaper, praised Stalin's statement that all nations want peace, calling it "Christian" and indicating that to question his motives is "less Christian." Moscow papers, however, continued to charge the Vatican with harbouring nazis and favouring fascists, saying that it wished to drive a wedge between Russia and the western world.

At the beginning of August it became known that some delegates to the World Council of Churches, meeting in Cambridge, England, favoured joint action with the Vatican to put a "world Christian point of view on peace" before the United Nations. Other delegates did not approve such a course.

On July 16 a new agreement, based on the 1851 concordat, was reached between the Vatican and the Spanish government. On April 7 the Vatican officially recognized the Lebanese republic.

In March the Moscow radio announced that the assembly of the Uniate church in western Ukraine in Lwow had repudiated the 1596 Brest union with the Vatican. In reply the Vatican radio made it clear that the assembly was not free to act as all higher church officials in those regions were imprisoned. (See also PIUS XII; ROMAN CATHOLIC CHURCH.) (J. LAF.)

Veal: see MEAT.

Vegetable Oils and Animal Fats. The 1946 production from domestic materials of fats and oils in the United States was estimated at 8,800,000,000 lb. compared with 9,434,000,000 lb. in 1945, the record of 10,847,000,000 lb. in 1943 and an average of 8,230,000,000 lb. 1937-41. The declines in 1944 and 1945 were chiefly due to the reduction in the pig crop from the high level of 1942 and 1943. Butter and flaxseed output had also shrunk. The world shortage of oils and fats became apparent in 1945

PORK LARD being stowed in cargo vessel for shipment to France, where it was needed to maintain a ration of food fats in 1946

and 1946 when the needs of Europe became evident. World supplies were short and exports exceeded imports by over 200,000,000 lb. in 1945 and by a large amount in 1946. U.S. stocks had reached a high peak in 1944 from the large hog slaughter. By mid-1946 stocks were 50% smaller than in mid-1944. Most of the exports were for European relief.

The oil and fat production of 1946 included about 1,480,000,000 lb. of butter. This compared with 2,211,000,000 lb. average produced in 1937-41. Butter production declined steadily through the war period. The lard and pork fat production was 2,130,000,000 lb. which compared with the top of 3,203,000,000 lb. of 1944 and a prewar average of 1,964,000,000 lb. 1937-41. All animal fats totalled 3,730,000,000 lb. compared with 4,386,000,000 lb. in prewar. The edible vegetable oils, including corn, cottonseed, olive, peanut and soybean oils amounted to 2,670,000,000 lb., which was about 503,000,000 lb. more than was produced in prewar years because of the increase in soybean oil. The cottonseed crop declined during World War II and other oils increased little. Soap fats made up 1,840,000,000 lb.; drying oils 500,000,000 lb. and other oils 30,000,000 lb. of the 1946 total.

Consumption of fats and oils in 1946 was estimated at about 62 lb. per capita compared with 67 lb. in 1935-39. Food fats made up 38 lb. of the total compared with 45 lb. per capita in prewar. Stocks were reduced by mid-year by 350,000,000 lb. to the smallest amount at this season for 20 years. The demand for oils for industrial uses was strong, particularly drying oils for building paints, etc. Importation (Jan.-June 1946) of only about 2,000,000 bu. of flaxseed, compared with average imports of about 15,000,000 bu. annually before the war. A larger crop of flaxseed in Argentina for 1946-47 was expected to provide a larger export surplus.

Prices of all oils and fats advanced rapidly in 1945 and 1946, following a fairly stable level through 1942-44. A comparison of prices in Sept. 1946 showed large increases amounting to about 33% over June prices for butter, lard and linseed. When price ceilings were released on Oct. 15 the prices of the 8 principal oils and fats advanced from an index of 235 in early October to 297 in November. Edible oils advanced slowly but

flaxseed rose to \$7.25 per bu. above the October ceiling of \$4.00. Lard declined as hog slaughter increased in late fall.

U.S. Production of Principal Fats and Oils, 1943-1946

(In millions of pounds)

	1946	1945	1944	1943
Butter	1,450	1,699	1,818	2,015
Lard	2,130	2,132	3,203	3,056
Edible tallow	140	202	198	259
Edible vegetable oils	2,700	2,969	2,703	2,949
Soap fats and oils	1,830	1,923	2,149	1,817
Drying oils	510	463	735	720
Other oils	30	40	33	31
Totals	8,790	9,427	10,839	10,847

The international agreement for the joint purchase of oils and fats set up under the Combined Food board in 1942 was discontinued but allocations were to continue among importers to the United States as prevailed during World War II. Soap fats were somewhat more plentiful in late 1946 and soap manufacture increased slowly, though there was a general shortage of soap during the last quarter of 1946. Increasing imports of coconut oil was expected to give further relief to this shortage. These imports amounted to more than 240,000,000 lb. from Jan. to Sept. 1946, compared with 182,000,000 lb. imported during the entire year 1945. (See also BUTTER; COCONUTS; COTON; MARGARINE; PEANUTS; SOYBEANS.) (J. C. Ms.)

Vegetables. Another record crop of vegetables, both for fresh market and processing, was produced in the U.S. in 1946. The 25 commercial truck crops grown for the fresh market and the 11 crops produced for canning, freezing and other processes, exclusive of dehydration, were the fifth large crop in succession and more than 38% above the prewar average. The acreage grown to vegetables in 1946 was estimated at 4,025,000 ac., for 21 kinds grown both for processing and fresh market, not including potatoes of which 2,577,600 ac. were grown. In 1939 the comparable figure was 2,852,000 ac. Yields were also high, many crops making new top records.

Prices of vegetables sold in the fresh market rose rapidly after 1939 to a peak in 1943, then declined to recover in 1945, and declined about 15% in 1946. Processing crops averaged higher in 1946 than in 1945. With the end of ceiling prices in 1946 the prices of vegetables for fresh market declined although farm prices in general rose rapidly.

Commercial Truck Crop for the Fresh Market.—The total tonnage of 25 commercial truck crops grown for sale fresh in 1946 established a new record of 9,217,100 tons, 9% above the 8,446,200 tons raised in 1945 and 38% above the average 1935-44. The acreage was 8% greater than the record of 1945 and 21% above the average, 2,087,000 ac. in 1946, and 1,725,800 ac. average 1935-44. The yield was about 1% above 1945 and 14% above the average, reflecting the definite gain in production resulting from better seed and culture.

Table I.—U.S. Vegetable Production for Fresh Market, 1946 and 1945

Crop	Unit	1946	1945
Artichokes	boxes	700,000	682,000
Asparagus	crates	9,414,000	8,627,000
Beans, lima	bu.	1,549,000	1,391,000
Beans, snap	bu.	18,349,000	17,445,000
Beets	bu.	2,249,000	2,136,000
Cabbage	tons	1,475,000	1,582,000
Cantaloupes	crates	15,379,000	12,009,000
Carrots	bu.	27,759,000	31,043,000
Cauliflower	crates	12,629,000	11,640,000
Celery	crates	22,722,000	19,316,000
Corn, sweet	ears	319,860,000	314,810,000
Cucumbers	bu.	6,869,000	5,527,000
Eggplant	bu.	1,919,000	1,538,000
Escarole	hmp.	935,000	868,000
Honeyball melons	crates	260,000	252,000
Honeydew melons	crates	4,958,000	4,356,000
Kale	bu.	556,000	665,000
Lettuce	crates	34,504,000	29,767,000
Onions	sacks	51,182,000	36,594,000
Peas, green	bu.	5,327,000	6,045,000
Peppers, green	bu.	7,288,000	6,563,000
Shallots	bu.	710,000	609,000
Spinach	bu.	14,023,000	14,593,000
Tomatoes	bu.	33,750,000	32,975,000
Watermelons	melons	81,237,000	72,949,000

Record crops were grown of cantaloupes, cauliflower, celery, eggplant, honeydew melons, lettuce, onions, peppers and tomatoes. Near records were made by beans, sweet corn, cucumbers, escarole, shallots and watermelons. The lighter crops were artichokes, honeyball melons, kale, green peas and spinach. The summer crops made the largest production, 17% above 1945, while the spring crop was only 9% above 1945, fall crops 8% and winter crops 6% less than the previous year.

The average value of sales of fresh truck crops was 15% below 1945 and nearly one-fourth lower than the record year 1943 but still higher than the average 1935-44. Carrots and artichokes were the only crops to set new high records in 1946. The price declines more than offset the increased crops so that the total value of the fresh truck crops in 1946 was about 7% smaller than the record of 1945. The decline of prices in the fall months of 1946 led to a reduction in planting for the winter season and that crop in 1947 was expected to be about 4% below 1946, though still above the average.

Commercial Truck Crops for Processing.—The total production of vegetables for all processing except dehydration at 6,315,900 tons was 8% above the previous record of 1942, 18% above the 1945 crop of 5,339,330 tons and 47% above the 1935-44 average. This was the fifth year when more than 2,000,000 ac. of truck crops for processing were harvested. The acreage planted to cucumbers, green peas and lima beans were new high records. The tomato crop made a record in spite of heavy losses from blight in some regions. Yields were very unusual in California, more than 10 tons per acre and 6.09 tons on the average of all states. The record-breaking crops were tomatoes, peas, cabbage for kraut, cucumbers for pickles and lima beans. Sweet corn and asparagus made near records.

Table II.—U.S. Production of 11 Vegetables for Processing, 1946, 1945 and 10-year Average

(In tons)

Crop	1946	1945	Average 1935-44
Asparagus	63,960	53,300	50,080
Beans, lima	39,550	33,330	27,720
Beans, snap	200,500	221,500	146,800
Beets	131,400	186,700	91,700
Cabbage	264,800	233,300	152,400
Corn, sweet	1,222,900	1,131,600	935,300
Cucumbers	241,540	191,830	156,460
Peas, green	515,650	496,620	309,940
Pimentos	22,000	12,650	17,060
Spinach	85,000	89,300	66,910
Tomatoes	3,528,600	2,689,200	2,343,200

Prices of processing vegetables were at a new high level through 1946 for all crops except beets, cabbage for kraut and spinach. The total value of processing crops was 22% above the previous record of 1945. The large quantities of frozen and canned vegetables put up in 1946 were expected to cause a reduction in acreage in 1947. The canned vegetable output of 1946-47 was expected to be about 262,000,000 cases which would be 12% above the previous record of 1942. The carry-over stocks of canned vegetables was estimated at 290,000,000 cases. The pack of frozen vegetables of 1946 was estimated at 380,000,000 lb. compared with the previous record of 308,000,000 lb. put up in 1945. Cold-storage stocks of frozen vegetables on Dec. 1, 1946, were at a record of 350,000,000 lb. compared with 199,000,000 lb. a year earlier. The large production and pack of frozen vegetables was depressing prices in late 1946, indicating that production was running ahead of demand.

The consumption of canned vegetables was on a domestic basis since the military and relief requirements were no longer an important item in demand. Exports never took more than 5% of the supply and were expected to decline from that level. Government subsidies terminated July 1 on the 1946 pack and no purchase programs were in effect for the 1946 pack

Table III.—U.S. Cold Storage Holdings of Frozen Vegetables,
Dec. 1, 1946 and 1945

Crop	1946	1945
Asparagus	18,609,000	8,836,000
Beans, lima	28,280,000	15,030,000
Beans, snap	28,470,000	18,095,000
Broccoli	13,781,000	4,522,000
Cauliflower	7,237,000	3,842,000
Corn, sweet	40,271,000	23,169,000
Peas, green	115,355,000	63,363,000
Spinach	26,242,000	15,413,000
Brussels sprouts	5,253,000	2,172,000
Pumpkin and squash	12,005,000	7,336,000
Vegetable purées	127,000	446,000
Other vegetables	54,436,000	34,906,000

such as for 1945. Commercial stocks were low at the beginning of the year. (See also AGRICULTURE; CORN; HORTICULTURE; LETTUCE; POTATOES; TOMATOES.) (J. C. Ms.)

Velloso, Pedro Leão (1887–), Brazilian diplomat and government official, was born Jan. 13 in Pindamonhangaba (São Paulo state), Brazil. He attended the University of Rio de Janeiro, graduating in 1907 with a degree of bachelor of laws, and entered the ministry of foreign affairs that same year in a minor post. Later he was transferred to the diplomatic service and held a number of legation or embassy posts in Europe. He was minister plenipotentiary to China (1929–35) and ambassador to Japan (1935–39). In 1939 he was transferred to the Brazilian embassy in Rome and two years later he returned to Rio de Janeiro to become secretary general in the foreign ministry. In Aug. 1944 he became acting foreign minister in the Getúlio Vargas government. He was Brazil's delegate to the Inter-American Conference on the Problems of War and Peace at Mexico City (Feb. 21–March 8, 1945). He headed the Brazilian delegation at the United Nations conference in San Francisco, Calif. (April–June 1945) at which he campaigned for admission of Argentina to the United Nations. He also represented his country at the U.N. Security council sessions that opened in New York city, March 25, 1946. Andrei Gromyko's charges (Sept. 23) that the presence of U.S. troops in Brazil constituted a menace to peace brought a statement from Velloso that the handful of U.S. technicians in Brazil were there at his government's request.

Venereal Diseases. Throughout the eastern hemisphere, restoration of health services, widely disrupted during World War II, proceeded toward reduction of war-induced increases in venereal disease incidence and prevalence. In the western hemisphere, where established venereal disease control programs had been enlarged during the war, the problem was less acute but not without difficulties.

Studies completed by the U.S. public health service during the year 1946 indicated that, despite the adverse influences of World War II, measurable progress had been made in venereal disease control since enactment of the Venereal Disease Control act in 1938. These studies showed that the number of deaths due to all forms of syphilis declined steadily from 15 per 100,000 population in 1939 to a new low estimated at 10.7 in 1945. Infant deaths due to syphilis were reduced from 57 per 100,000 live births in 1939 to 27 in 1944. Admissions to institutions and recorded deaths indicated a steady decline in the incidence of late forms of neurosyphilis. The paresis death rate was reduced from 6.3 per 100,000 in 1920 to 3.5 in 1944, and the *tabes dorsalis* death rate dropped from 2.1 per 100,000 in 1920 to 0.4 in 1944.

Because of the extremely complex and variable factors influencing morbidity and mortality reporting of venereal diseases it is difficult to determine incidence rates precisely. It is even more difficult to determine by comparison of data available from year to year whether or not attack rates are increasing or decreasing. For example, increased casefinding activities and better reporting could result in larger numbers of cases being re-

ported for any period even though the actual number of new cases occurring per 100,000 population decreased during the same period. Furthermore, declining death rates for all forms of syphilis reflect attack rates or casefinding and treatment activities of earlier years, and may or may not be accompanied by declining incidence rates.

For this reason, there was no certainty whether venereal disease rates were going up or down in the first year following World War II. During the fiscal year 1946 a total of 760,000 cases of venereal disease were reported from all sources¹ to state and territorial health departments, an increase of 12.4% over the number of cases reported for the previous year. These included 372,000 cases of syphilis, 375,000 cases of gonorrhoea, and 12,000 cases of other venereal diseases, representing an increase of 0.7% for syphilis and an increase of 26.4% for gonorrhoea. Clinics¹ admitted a total of 499,000 patients, an increase of 18.4%. This included 254,000 admissions for syphilis, a decrease of 8.8% and 237,000 admissions for gonorrhoea, an increase of 16.4%.

Rapid treatment centres¹ admitted 176,000 patients, an increase of 37.5%, including 120,000 cases of syphilis, an increase of 94%, and 32,000 cases of gonorrhoea, a decrease of 53%.

The number of cases of primary and secondary syphilis reported was 97,000, and the number admitted to clinics was 57,000, of which 47,000 were referred to rapid treatment centres. The number of cases of early latent syphilis reported was 111,000, and the number admitted to clinics was 89,000 of which 46,000 were referred to rapid treatment centres.

The number of clinics receiving federal, state and local finan-

¹Cases reported to state and territorial health departments are cases reported for the first time. Clinic admissions and rapid treatment centre admissions include cases which may have been reported previously. Clinic admissions include rapid treatment centre admissions.

CHILD being given a sample blood test during a venereal survey in Oklahoma City. The survey was conducted by the U.S. public health service in co-operation with the city and state during April-May 1946. Submission to the test was voluntary, and free treatment was offered to persons found infected

cial assistance was 3,324, or 153 fewer than in the previous years. For the fiscal year a total of \$17,240,000 in federal funds was appropriated for venereal disease control. Of this total, \$5,647,000 was designated by congress for expenditure in connection with rapid treatment centres and other inpatient care, and \$8,756,876 was allocated to states for operating clinics and laboratories, casefinding and similar purposes.

The large proportion of early syphilis patients treated in rapid treatment centres reflected the ascendancy of intensive, inpatient therapy employing penicillin in combination with arsenical drugs and bismuth and the emergence of the rapid treatment centre as an integral part of the over-all venereal disease control programs in 38 states, the District of Columbia and 1 territory. Treatment employed at rapid treatment centres included schedules extending over periods from 9 to 14 days and providing from 1,200,000 to 4,200,000 units of penicillin in aqueous solution or in oil and beeswax administered intramuscularly in from 9 to 168 injections from 2 to 24 hours apart, with a maximum of 300 mg. of arsenoxide administered in 5 equal doses at equal intervals, and 600 mg. of bismuth administered in 3 equal dose-intervals.

In a small number of clinics initial trials of methods for treating syphilis patients with penicillin in oil and beeswax on an ambulatory, outpatient basis were undertaken.

Although optimum time dosage relationships for the treatment of syphilis with penicillin, and the final evaluation of the efficacy of the drug remained to be determined, penicillin, after three years of use, was regarded as the safest antisyphilitic drug developed up to 1947 for the treatment of infectious syphilis. The increasing uniformity of the commercial product, along with the prospect that synthesized penicillin or possibly even more effective synthetic penicillin-like antibiotics might be developed, strengthened early hopes that the problem of safe, effective and rapid treatment of syphilis was near solution.

In the treatment of gonorrhoea, penicillin administered in one injection of a beeswax oil mixture or in several injections of aqueous solution had been established as the drug of choice.

One of the critical problems in venereal disease control remaining at the end of 1946 was that of casefinding. The fact that no decrease in the incidence of syphilis and gonorrhoea was discerned despite remarkable advances in treatment made it evident that progress toward elimination of these diseases would be made at a rate dependent upon the ability of health workers to find and render noninfectious by treatment, persons with syphilis more rapidly than new infections could be spread.

In a series of intensive 45-day programs of information and public education large proportions of the entire populations of five cities and counties were persuaded to appear voluntarily for physical examinations for venereal disease or for blood serologic tests for syphilis. The programs were conducted as demonstrations by state and local health departments, with medical societies and the U.S. public health service co-operating. Paid newspaper, radio, billboard, car card, motion picture theatre, sound truck and other forms of advertising were used to inform the people of the prevalence, dangers, symptoms and cure of venereal diseases, and to urge persons in susceptible age groups to report for diagnosis and treatment if necessary. The communities in which demonstrations were conducted and the results of the demonstrations are shown as follows:

	Estimated Population 1943	Number tested or examined	New cases syphilis dis- covered	New cases gonor- rhea dis- covered	Total new cases venereal disease dis- covered
Oklahoma City, Oklahoma county, Okla.	257,000	48,623	846	697	1,543
Columbus, Muscogee county, Ga. . . .	97,000	52,992	1,531	425	1,956
Macon, Bibb county, Ga.	101,800	53,193	1,195	854	2,049
Augusta, Richmond county, Ga. . . .	88,870	37,555	766	218	984
Louisville, Jefferson county, Ky. . . .	432,775	6,205	752	1,907	2,659

A total of 5,090 new cases of syphilis, and 4,101 new cases of gonorrhoea were discovered in the five demonstrations.

Great Britain and Europe.—Social conditions in Great Britain and Europe during the war years favoured considerably the spread of venereal diseases. Sexual promiscuity was rife and, according to the report by the chief medical officer of the ministry of health in Great Britain, on a scale never previously attained in that country. The incidence of venereal diseases in 1946 was still high, especially when compared with what it was in 1939. There was, however, every indication (at least in Britain) that the marked increase during the years of World War II had been checked.

In Norway and Denmark the figures for the first six months of 1946 indicated that the incidence of both gonorrhoea and syphilis would be higher than in 1945. The incidence of venereal disease in Poland in 1946 showed a marked rise (gonorrhoea 300%, syphilis 700%) when compared with what it had been in prewar years.

Defense regulation 33B in Britain (which provided for the notification of persons alleged to have spread disease) was shown to have been even more effective than in the war years in bringing contacts forward for examination, as unofficial action was usually taken after one notification. The Central Council for Health Education continued its educational and enlightenment campaign in conjunction with the work of the local authorities through whom advertisements appeared in magazines and daily papers.

Large numbers of patients who had run the risk of infection attended clinics, and, although many were free from disease, there was a definite increase in the early attendance of infected persons.

Advances in treatment continued. There were known to be at least four varieties of penicillin, one of which, 4, or K as it was known in the U.S., being relatively inactive. Fortunately the method of manufacture in Britain produced very little of this inactive fraction. The chemical structure was completely elucidated opening up considerable scope for the making of therapeutically more active drugs, as had been in the case of sulfanilamide. Since M. J. Romansky and G. E. Rittman suggested a suspension of penicillin in peanut oil and beeswax to delay absorption of the drug and prolong its therapeutic action, various other vehicles including ethyl oleate were introduced. Instead of multiple injections (usually four or five at two-hourly intervals) many venereologists treated gonorrhoea with one injection of penicillin in one of these suspensions. Syphilis, too, was being treated with one or two daily injections of high dosage, but many workers continued to give three-hourly injections of penicillin in aqueous solution over a period of seven or more days, a method which has the disadvantage of making admission to hospital necessary. The gonococcus is very sensitive to penicillin and several workers obtained excellent results in the treatment of gonorrhoea by oral administration of the drug, the method being especially useful in the treatment of young children.

It had previously been considered that penicillin could not be administered orally, as it was destroyed by the hydrochloric acid in the stomach and by penicillinase in the intestines. Penicillin was the drug of choice in the treatment of gonorrhoea but the incidence of syphilis was still high and there was always the danger of the small dosage, effective in curing gonorrhoea, masking the development of a concomitantly acquired syphilis. There is, therefore, much to be said in favour of the few who

still prescribed in the first place the sulfonamide drugs in the treatment of gonorrhoea and only employed penicillin in the treatment of the failures, after a thorough clinical examination had shown the absence of the primary lesion of syphilis. The sulfonamide drugs were still used in the treatment of chancreoid or soft sore and *lymphogranuloma inguinale*: they were only occasionally effective in the treatment of nongonococcal urethritis.

The incidence of nongonococcal urethritis in 1946 was still high in all parts of the world, but great advances were made in elucidating the causation of this disease. Pleuropneumonia-like organisms were cultured from the urethral discharge in a small percentage of cases and evidence accumulated to show that, though they were pathological in men, they were to be found in 10% to 20% of apparently normal women. Several workers also found inclusion bodies in epithelial cells and considered that the disease in some cases was due to a virus. These inclusions might, however, be a phase in the development of pleuropneumonia-like organisms. No outstanding advances were made in the treatment of nongonococcal urethritis. (See also EPIDEMICS AND PUBLIC HEALTH CONTROL.) (A. H. Hs.)

Venezuela.

A north-coast South American republic, bounded on the west, south, east and north, respectively, by Colombia, Brazil, British Guiana and the Caribbean. Area, 352,143 sq.mi.; pop. (1942 est.), 3,996,095, including 100,670 forest-dwelling Indians and 23,320 Venezuelans living abroad. Racial distribution has never been officially calculated or estimated, but important fractions are mestizo, Negro and mulatto; about 80% of the population is rural. The capital is Caracas (pop., 1942 est., 269,930); other important cities (with pop. by 1941 census) are Maracaibo (112,519), Valencia (53,938), Barquisimeto (54,176), San Cristóbal (31,447), Maracay (32,992), Cumaná (25,893), Ciudad Bolívar (19,789), Coro (18,962), Puerto Cabello (22,087, town), Carúpano (16,548). The constitution of 1936 established a federal republic with 20 states, headed by a congressionally elected president; the bicameral congress was composed of a senate of 40 members and a chamber of deputies of 98 members. However, a new constitution was being drafted at the close of 1946. President in 1946: Rómulo Betancourt.

History.—The revolutionary junta which had controlled Venezuela after the upset of the Medina Angarita regime in Oct. 1945, had originally promised a new constitution within six months. On March 2, 1946, however, it enacted a law setting elections for a constituent assembly of 160 members for Aug. 26; the election was later postponed to Oct. 27. The state of siege which had been imposed in Oct. 1945 was lifted March 15, 1946, and on the following day the government freed all political prisoners. The next few days, however, brought serious disturbances between communists and police. The third quarter of 1946 brought a tightening of political lines as between the conservatives and the liberal Acción Democrática (which had spearheaded the 1945 revolution) and also between the latter group and the Communist party. Some 50 U.S. businessmen in Venezuela were reported on Aug. 10 to have appealed to the U.S. state department to combat a rising communist tide in Venezuela; the report soon turned out to have been exaggerated, but it resulted in considerable temporary criticism of the U.S. Political tension grew in September. Four persons were killed Sept. 17 in a small-scale and abortive barracks uprising. Communist criticism of U.S. Ambassador Frank P. Corrigan and of U.S., British, and Dutch oil interests in Venezuela increased and the leftist Acción Democrática was forced into a definite split with the communists. Frequent later conspiracies were allegedly discovered and the government charged

supporters of ex-Pres. Isaías Medina Angarita with a share of the responsibility. The strongest opposition party in the October elections was the conservative Copei, supported by the Catholic Church. The elections resulted in an overwhelming victory for Acción Democrática.

The constituent assembly met subsequently to begin drafting Venezuela's 21st constitution.

Education and Religion.—School enrolment in 1946 exceeded 300,000. The revolutionary junta made substantial educational appropriations in 1946, including 22,000,000 bolívares for the new university city; 10,063,000 bolívares for five high schools, 14 grade schools and a normal school; and almost 5,000,000 bolívares for 140 small rural schools. Total cost of the university city plans was estimated at 70,000,000 bolívares; work on the development slackened in March, however, pending readjustment of contracts.

The government made a supplementary appropriation of 10,000,000 bolívares for a housing project for the faculty of medicine of the Central university.

Venezuela is predominantly Roman Catholic.

Finance.—The monetary unit is the bolívar, valued Nov. 15, 1946, at 29.85 cents, U.S. The 1946-47 budget as presented totalled 787,109,000 bolívares, the largest original budget in Venezuelan history; that of 1945-46 was 860,888,283 bolívares (an original budget of 495,376,395 and supplements of 365,511,888 bolívares). Federal revenues in the first nine months of 1946 were 641,254,000 and expenditures 660,761,000 bolívares; the treasury surplus Sept. 30 was 212,105,000 bolívares as against a bonded domestic debt (there was no foreign debt) Jan. 31 of 24,500,000 bolívares. The government on Dec. 31, 1945, decreed a graduated surtax on excess profits; the estimated revenues of 120,000,000 bolívares were earmarked for low-cost housing, a merchant marine and industrial and agricultural development. It enacted a decree Feb. 16 nationalizing the funds and properties of the German and Japanese governments and nationals in Venezuela as reparations.

Trade and Communication.—Exports in 1945 were 50,364,000 metric tons valued at 1,026,000,000 bolívares (petroleum exports accounted for 50,300,000 tons valued at 965,000,000 bolívares); imports were valued at 580,980,000 bolívares. Coffee exports in the first seven months of the crop year (beginning Oct. 1, 1945) were 253,858 bags of 60 kg. Gold exports in 1945 were valued at 7,382,000 bolívares (1944: 7,124,000). The government in 1945 renewed most-favoured-nation trade agreements with Brazil, Canada, Chile, Spain, Haiti, Switzerland and Colombia.

Venezuela took steps to establish jointly with Colombia and Ecuador a merchant marine, operated by an official corporation with a capital of \$20,000,000 contributed 45% each by Venezuela and Colombia and 10% by Ecuador. TACA (Transportes Aereos Central Americanos) planned to open plane connections between Caracas and Curaçao, the Dominican Republic, Cuba, Florida, Colombia and Brazil.

The government on Jan. 29 established an autonomous state railways administration.

Mining.—Petroleum production in 1945 was 323,361,253 bbl. (1944: 255,549,128 bbl.), thus giving Venezuela second rank in the world. In 1945, 509 new wells were completed. Venezuela reached an agreement with Trinidad to delimit their respective areas for submarine oil drilling in the Gulf of Paria between the two. The republic expanded its refining industry, the goal being 225,000 bbl. daily. The government took steps to exploit coal deposits in the state of Anzoátegui, and began iron ore explorations in the Orinoco delta.

Vermiculite.

Sales of vermiculite in the U.S. increased from 46,645 short tons in 1943 to 54,116 tons in 1944, and another new record of 64,808 tons in 1945. Its use as a fire retardant in building construction, as an admixture in plaster for walls and ceilings, and in concrete flooring, increases materially the time required for a fire to pass from one room to another, through walls, ceiling or floor.

It is also used as a heat and sound insulator in walls and ceilings, and as an oil absorbent, paint extender, refractory and soil conditioner.

(G. A. Ro.)

Vermont.

A north Atlantic state of the United States of America, the only one of the New England states without a sea coast; popularly known as the "Green Mountain state"; admitted to the union in 1791. Area, 9,609 sq.mi., of which 331 sq.mi. are water. Population (1940), 359,231 (including 235,992 rural, 123,239 urban); 327,079 native white, 31,727 foreign-born, 384 Negro, 41 of other races. On July 1, 1945, the U.S. bureau of the census estimated the civilian population of the state at 310,211. Montpelier is the capital city, with a population (1940) of 8,006. The chief cities are Burlington (27,686), and Rutland (17,082).

History.—The general assembly met in special session, Sept. 26–28, 1946. Legislation enacted or amended included bills relating to student housing at the Vermont Agricultural college, Burlington, and public welfare. George D. Aiken and Warren R. Austin were U.S. senators from Vermont; elected in Nov. were Ralph E. Flanders, senator, and Charles A. Plumley, representative to congress. U.S. Senator-elect Ralph E. Flanders was appointed by President Truman to complete the unexpired term of Sen. Warren R. Austin, who had been appointed U.S. delegate to the United Nations Security council. Chief state officers elected were: Ernest W. Gibson, Jr., governor; Lee E. Emerson, lieutenant governor; Rawson C. Myrick, secretary of state; and Levi R. Kelley, state treasurer.

Education.—There were 896 elementary schools in the state in 1946, with a teaching staff of 1,723 and enrolment of 38,608; of these schools, 608 were one-room rural schools. There were 86 approved public high schools, with a teaching staff of 613 and enrolment of 14,874. The three state normal schools had a total enrolment of 187 and a teaching staff of 28. State superintendent of schools in 1946 was the commissioner of education, Ralph E. Noble.

Social Insurance and Assistance, Public Welfare and Related Programs.—Relief in general was administered by the overseer of the poor in each town. A total of \$1,601,258 was expended by the old-age assistance department; 5,439 persons received aid from the department in Dec. 1946. Dependent children receiving aid from state funds during the year ending June 30, 1946, numbered 1,620 in 609 cases; 1,136 children were committed as wards of the state. Blind assistance funds

were distributed to 165 persons. There were 3 state correctional institutions and training schools with a total of 369 inmates. Payments of unemployment compensation benefits made amounted to \$800,201; those individuals establishing benefit years and receiving one or more checks in 1946 were 4,027 in number.

Communication.—Total mileage of the public highways system (state, state-aid, and town highways) as of June 30, 1946, was 14,227.87, of which 1,807.68 mi. were in the state highway system and 2,709.74 mi. in the state-aid highway system. Maintenance expenditures for state highways amounted to \$1,633,357.15 during the fiscal year ending June 30, 1946, and for state-aid highways in the same period, \$508,124.92. There were 954.79 mi. of steam railroads and 4.25 mi. of electric, Dec. 31, 1946. There were 18 operating airports in Vermont, including municipal and private. Mileage of airways was 207. Telephone subscribers numbered 67,721.

Banking and Finance.—The number of state and national banks as of June 30, 1946, was 80, of which 41 were state banks with total deposits of \$195,457,183.89. There were 9 building and loan associations with total resources of \$2,858,133.85.

Total receipts of the state as of June 30, 1946, were \$23,359,251.36; disbursements \$23,478,003.90; outstanding obligations \$2,682,031.90; unappropriated surplus \$2,151,891.90.

Agriculture.—Total acreage of harvested crops in 1946 was 1,163,000 compared with 1,162,000 in 1945. There were 390,463 head of cattle in the state in 1946; of this number 279,076 were cows and heifers 2 years old and over; there were 464,944 hens more than 3 months old; 9,000 colonies of bees produced 424,000 lbs. of honey.

Table I.—Leading Agricultural Products of Vermont, 1946 and 1945

Crop	1946 (est.)	1945
All corn, bu.	2,320,000	2,331,000
Hay, all, tons	1,499,000	1,582,000
Oats, bu.	1,530,000	1,408,000
Potatoes, late, bu.	1,392,000	1,225,000
Maple syrup, gal.	607,000	351,000
Apples, bu.	329,000	106,000

Manufacturing.—The total output value of manufacturing and processing industries, exclusive of minerals and public utilities, as reported to the state department of industrial relations, was \$287,215,503 for the year ending June 30, 1946; 34,214 persons were employed in these industries and a total of \$7,001,488 was paid in wages; 40,028 were employed in all manufacturing industries, and the over-all total of wages paid was \$17,959,030.

Table II.—Principal Manufacturing Industries of Vermont, 1946 and 1945

Industry	Value of products 1946	1945
Machines and machine tools	\$71,520,380	\$93,481,640
Dairy products	53,167,512	51,418,265
Woolen and cotton goods	40,610,595	41,520,650
Paper and paper products	19,107,551	18,405,560
Woodworking	17,462,350	16,267,418

Mineral Production.—Total output value of mineral products of the state as reported to the state geologist for the year

Table III.—Principal Mineral Products of Vermont, 1946 and 1945

Mineral	Value, 1946 (est.)	Value, 1945
Granite	\$12,682,000	\$10,731,000
Marble	3,308,000	1,537,000
Lime products	1,263,170	1,276,865
Talc	763,834	841,012

ending June 30, 1946, was \$21,134,274 (est.). (C. E. Fe.)

Veterans' Administration. The rapid demobilization of the armed forces during 1946 raised the number of veterans of all wars from 6,700,000 at the end of July 1945 to 16,800,000 by June 30, 1946, and to 17,900,000 by Nov. 30, 1946. In order to take care of the tremendously expanded volume of business which resulted, activities of the Veterans' administration were largely reorganized and decentralized to 13 branch offices covering every part of

the United States and its possessions.

Medicine and Surgery.—Medical activities of the Veterans' administration were reorganized under authority of public law 293, 79th congress, approved Jan. 3, 1946. Standards of qualifications and pay for professional personnel were improved; research programs were initiated; residency training was inaugurated at Veterans' administration hospitals; and sites for new hospitals were being chosen near centres of medical progress.

There were 119 Veterans' administration hospitals by Nov. 30, 1946, with 92,214 authorized standard beds, and more than 13,000 beds being allotted by other agencies, in addition to 9,354 emergency beds available for service-connected cases through contracts with state and civil hospitals.

As of Nov. 30, 1946, approximately 53% of all hospitalized veterans were neuropsychiatric cases, for whom 33 hospitals existed, with 2 under construction, 9 more to be built and 1 to be acquired from the navy. Mental hygiene clinics were treating those not needing hospitalization.

VA was operating 14 tuberculosis hospitals and 40 tuberculosis departments in general and neuropsychiatric hospitals and was treating some 8,950 tubercular patients. Periodic surveys of all patients at the end of each 12 months' residence in hospitals and X-rays of outpatients, serve to ensure prompt diagnosis and treatment.

There were 72 general medical and surgical hospitals in 1946. Treatment for medical conditions also was furnished in tuberculosis and neuropsychiatric hospitals. As the medical and surgical care of patients is carried out, an intensive course in medical rehabilitation also is provided to aid the veteran in adjusting satisfactorily after he leaves the hospital.

Outpatient treatment for service-connected medical conditions, or conditions aggravating a service-connected condition, was being rendered in VA regional and subregional offices.

Veterans requiring artificial aids may choose the prosthetic appliances they need, and amputees may obtain immediate repair service, up to \$35, with VA paying the bill.

Agreements or contracts were arranged with 33 state-wide medical groups to provide hometown outpatient medical service to eligible veterans, at government expense. VA also had contracts with mental hygiene clinics, outpatient departments of hospitals, general medical and surgical clinics and dentist groups for treating outpatients.

Of the 346,036 veterans admitted to VA hospitals during the fiscal year 1946, 67.6% were World War II veterans. 28.9% World War I veterans and 3.5% were veterans of other wars and men discharged or retired from all branches of the regular military service. General medical and surgical cases constituted 80.3% of the total; pulmonary tuberculosis cases, 4.4% and neuropsychiatric, 15.3%. Of all admissions 16% were for service-connected disabilities.

Domiciliary Care.—To be admitted to a VA home, a patient must have a condition essentially chronic in character, not susceptible of cure or decided improvement by hospital treatment, and must be incapacitated from earning a living for a prospective period. As of Nov. 30, 1946, there were 11 homes with a total capacity of 14,991 authorized beds. Almost 13,000 veterans were receiving domiciliary care on November 30, 1946. Admissions during the fiscal year totalled 14,056. Of this total, 2,445 were World War II veterans, 10,395 served in World War I and 1,216 were other eligible veterans.

Pensions and Compensation.—Death pensions and compensations may be paid to the widows, children and dependent parents of veterans who served in the Mexican, Civil and Indian Wars, Spanish-American War, Boxer Rebellion, Philippine Insurrection and World Wars I and II, as well as to dependents of those who served in the regular establishment during peace-

time.

At the end of the fiscal year June 30, 1946, 36% of the death pension and compensation benefits paid by VA were based on World War II service; 42% were for World War I service; 3% for peacetime service and 19% for service in the Spanish-American and prior wars. Disbursements for compensation and pension from July 1, 1945, to June 30, 1946, totalled \$1,254,000,000 of which \$732,000,000 was for World War II service; \$346,000,000 for World War I service; \$24,000,000 for service in the regular establishment and \$152,000,000 for service in the Spanish-American and previous wars. On June 30, 1946, compensation or pension at an average monthly rate of \$59.33 was being paid to the dependents of 180,938 veterans of World War II.

Vocational Rehabilitation and Education.—Education and training for World War II veterans is authorized by two laws. Public law 16, 78th congress (as amended by public laws 346, 78th congress and 268, 79th congress) pertains to eligible disabled veterans with handicaps removable by training with the purpose of restoring employability. Title II of the Servicemen's Readjustment act of 1944 (public law 346, 78th congress), amended by public law 679, 79th congress, pertains to all veterans of World War II.

Veterans with service-incurred or aggravated disabilities, who need training to restore employability, can enroll under public law 16. They must have extensive, scientific advisement and guidance by VA trained personnel in selecting their courses and throughout their training. While in training, and for two months after employability is determined, they receive a subsistence allowance of \$65 a month if without dependents or \$90

NUMBER OF VETERANS remaining in all hospitals from 1919-46 by types of disability, as compiled by the Veterans' administration

a month with dependents, in addition to their disability pensions. If pension plus allowance does not total \$105 for a veteran without dependents, or \$115 for one with dependents, an additional sum is paid to make up the difference. The sum is increased further if there is more than one dependent.

Veterans choose their own course of study or job training under public law 346. The place where they enroll must have the approval of the appropriate state agency. The training or education to which a veteran is entitled depends upon his length of active service and ranges up to 48 months. If he enrolls in an educational institution, VA will pay his tuition, fees, book and supply costs up to a \$500-a-year maximum. If he takes a full-time course, he will receive a \$65 a month subsistence allowance if he has no dependents, or \$90 a month with dependents. In accordance with public law 679, 79th congress, income limitations are imposed which in some cases reduce the subsistence allowance payable under these programs.

By Nov. 30, 1946, 100,341 disabled veterans were in educational institutions under public law 16, and 78,156 were taking on-the-job training—at the same time, 1,465,558 veterans were in educational institutions under public law 346, and 614,882 were taking on-the-job training.

Insurance.—The National Service Life Insurance act of 1940 (public law 801, 76th congress) authorized insurance for all members of the armed forces ordered to active duty for more than 30 days. It could be obtained in amounts of not less than \$1,000 or more than \$10,000 in multiples of \$500. National service life insurance originally was issued as term insurance on the five-year level premium plan to provide the maximum amount of temporary protection at the lowest cost. The term period for all N.S.L.I. issued prior to Jan. 1, 1946, was extended three more years by public law 118, 79th congress, July 2, 1946. It was stipulated that on policies issued after Dec. 31, 1945, conversion to a permanent plan must be made within five years of date of issue.

The Insurance act of 1946 (public law 589, 79th congress, Aug. 1, 1946) liberalized the provisions of the National Service Life Insurance act of 1940, as amended, to meet the needs of veterans under peacetime conditions. Restrictions were removed from the choice of beneficiaries; three endowment plans were added to the ordinary life, 20-payment life and 30-payment life plans to which conversion had already been authorized; provision was made for additional optional settlements; and protection against total disability for six months or more was made available in a separate policy provision for an extra premium and compliance with health requirements.

The Armed Forces Leave Act of 1946 (public law 704, 79th congress, Aug. 9, 1946) authorized VA to accept "terminal leave" bonds of former enlisted personnel, in lieu of cash, for the payment of premiums on all forms of government life insurance.

VA's life insurance business is the largest mutual insurance system in the world. Within six years (to Nov. 30, 1946) it had written about 19,000,000 national service life insurance policies having a total face value of about \$149,000,000,000. As of Nov. 30, 1946, almost one-third of this still was in force, or an estimated 5,675,000 policies for \$34,560,000,000. As a direct result of war casualties and other deaths of 376,155 insured veterans, monthly instalments were being paid to beneficiaries on more than \$3,500,000,000 of insurance awarded on death claims up to the end of Nov. 1946.

United States government life insurance, originally known as War Risk insurance in the days of World War I, was authorized by amendment to the War Risk Insurance act (public law 90, 65th congress, Oct. 6, 1917), to enable those who served in World War I to purchase insurance from the government in

amounts from \$1,000 through \$10,000, in multiples of \$500. About 4,500,000 persons applied for this insurance between Oct. 6, 1917 and Nov. 11, 1918, for an amount of nearly \$40,000,000,000. Under provisions of the original act, conversion from term to permanent United States government life insurance could not be made until after the close of World War I. As of Nov. 30, 1946, there were in force 542,759 United States government life insurance policies representing nearly \$2,400,000,000.

Article IV of the Soldiers' and Sailors' Civil Relief act of 1940 (public law 861, 76th congress), as amended by public law 732, 77th congress, provided a method whereby the government under certain conditions, upon application by the insured, guaranteed commercial life insurance policies against lapse for the nonpayment of premiums while the insured was in active service and for two years after discharge. By Nov. 30, 1946, approved applications under this provision totalled 89,071 for an amount of \$222,031,818.

Finance.—Disbursements for fiscal year 1946 from appropriated funds are listed below.

Total	\$4,425,000,511.64
National service life insurance	1,380,001,457.81
Readjustment benefits	1,351,525,422.02
Army and navy pensions	1,258,863,619.89*
Salaries and expenses	382,598,916.84
Hospital and domiciliary facilities	34,313,351.79
Military and naval insurance	15,384,969.36
Printing and binding	1,124,752.31
Penalty mail costs	624,392.40
Vocational rehabilitation revolving fund	479,291.69
Others	84,337.53

*Includes \$5,173,410.98 for readjustment benefits paid from army and navy pension appropriated funds.

It was estimated that in the fiscal year beginning July 1, 1946 disbursements would approximate \$7,000,000,000.

Readjustment Allowances.—The program of readjustment allowances, in operation under title V, public law 346, 78th congress, provides financial assistance up to a maximum of 52 weeks for eligible veterans during periods of unemployment, or when self-employed and earning less than \$100 per month. The program is administered by state unemployment compensation commissions under individual contracts with VA, which reimburses them both for the allowances and for administrative expenses.

At the end of Nov. 1946, 964,748 veterans were drawing readjustment allowances for unemployment. During November, state unemployment compensation offices paid out \$74,402,000. For the month of November, 172,295 self-employed veterans drew \$15,591,000 in readjustment allowances. For the year as a whole, about 43% of veterans applied for readjustment allowances.

Guaranty and Insurance of Loans.—Title III of public law 346, 78th congress, amended by public law 268, 79th congress, made provisions, within certain limitations, for the guaranty of loans or insurance of credit through private lending institutions to World War II veterans who desired to purchase or construct homes, farms and business property.

Amount of guaranty may not exceed 50% of the loan, or a maximum of \$4,000 on real estate and \$2,000 on non-real estate loans. If a veteran receives loans of both types, the maximum guarantee is prorated on these amounts. Farm realty loans must be paid off within 40 years, other real estate loans within 25 years, and non-real estate loans within 10 years.

As of Nov. 25, 1946, 540,549 veterans received loans amounting to nearly \$3,000,000,000. VA guaranteed and insured about \$1,300,000,000 of this amount. More than 88% of these veterans, or 478,049, borrowed more than \$2,600,000,000 to buy or build homes; 44,267 borrowed \$139,000,000 for business purposes; and 18,233 borrowed \$68,000,000 for farms and farm equipment. At the same time, 5,750 loans had been repaid in

full, relieving VA of commitments amounting to more than \$8,000,000. Only 1,564 veterans defaulted on their loans, resulting in the payment by VA of more than \$375,000 for 400 net claims to lending institutions to Nov. 25, 1946. The bulk of defaults, 843, were for business loans. Home loans accounted for 668 and farm loans for 53.

Construction, Supply and Real Estate.—Since VA was estimated to have about 20,000,000 potential applicants for hospital service, it embarked upon the world's greatest hospital construction program, a program which was expected to cost nearly \$1,000,000,000 and to provide about 89 new hospitals and a number of additions to existing hospitals, located near medical centres as far as possible.

Guardianship.—VA's guardianship load rose from 100,974 wards on Nov. 30, 1945 to 137,728 wards one year later. Of the 137,728 wards 86,279 were entitled to benefits because of service by veterans of World War I and other wars; and 51,449 wards were entitled to benefits on account of service by veterans of World War II.

The total number of full-time employees rose from 90,371 on Dec. 31, 1945 to 215,747 on Nov. 30, 1946. Of these totals, employees appointed with veterans' preference comprised 40.0% and 60.0%, respectively.

Personal Contact Service.—Contact representatives are located in populated areas throughout the United States and in insular and overseas possessions to assist and advise veterans, their dependents and beneficiaries as to their rights and benefits. More than 2,000,000 personal contacts were made with veterans and their beneficiaries during Aug. 1946 alone.

Insular and Foreign Relations.—This office was established on April 1, 1946 to carry out an effective program for veterans in the Philippine Islands and in foreign countries through liaison offices or representatives in co-operation with the state department. (See also MEDICAL REHABILITATION OF DISABLED VETERANS.) (O. N. B.)

Veterans of Foreign Wars. The position of nearly 2,000,000 overseas veterans during 1946 on issues of national and international import was forcibly expressed in resolutions adopted at the 47th national encampment of the Veterans of Foreign Wars of the United States at Boston, Mass., Sept. 1-6.

With 15,000 registered delegates and another 15,000 visitors in attendance, the encampment demonstrated the growth in size and power of the V.F.W. during the year. The accession of World War II veterans to places of responsibility in the "old line" organization was significant.

Encampment delegates showed greatest interest in matters affecting national security. The heads of the army, navy and air forces—Gen. Dwight D. Eisenhower, Adm. Chester W. Nimitz and Gen. Carl Spaatz—appeared before the encampment to urge maintenance of strong military forces, and the delegates backed them up in resolutions.

One resolution placed the V.F.W. on record as favouring extension of selective service and universal military service; another called for integrated and balanced land, sea and air forces large enough to deal with any emergency; still another asked for maintenance of stockpiles of strategic materials needed in wartime.

At the same time the V.F.W. members reiterated their faith in the United Nations as an agency for preserving world peace and called upon all United Nations members to renounce war as a sovereign right.

On the subject of atomic power, the V.F.W. held fast to its previous stand that the U.S. should retain exclusively the processes and equipment used in making atom bombs.

Decision on the V.F.W. stand on the issue of unification of the armed forces was reserved until further evidence could be obtained.

Some of the most strongly worded resolutions adopted by the V.F.W. were directed at the activities of communists, fascists and all exponents of un-American ideologies within the U.S. The overseas veterans went on record with a demand that members of the Communist party be denied a place on federal and state ballots.

The V.F.W. urged that the existing veteran housing program be revised to place greater control in the hands of a single administrator and eliminate bottlenecks. A congressional investigation of diversion to nonessential construction of materials which should go to veteran housing was asked.

Warm endorsement was given the proposed National Employment and Economic Development Corporation act, designed to create new jobs and open opportunities to veterans through a lending agency similar to the Reconstruction Finance corporation.

Officers' reports to the encampment revealed that V.F.W. membership had increased from approximately 1,000,000 at the 1945 national assembly to nearly 2,000,000 as of Sept. 1, 1946, and that the number of posts had grown from 4,500 to more than 8,000.

Louis E. Starr of Portland, Ore., was elevated by unanimous vote from the post of senior vice commander in chief to commander in chief. Other 1946-47 officers were: Ray H. Brannaman, Denver, Colo., senior vice commander in chief; Lyall T. Beggs, Madison, Wis., junior vice commander in chief; R. B. Handy, Jr., Kansas City, Mo., quartermaster general; Ed McAloon, New York city, judge advocate general; Dr. Matthew S. Levitas, Brooklyn, N.Y., surgeon general; and the Rev. Gerald M. Dougherty, Chicago, Ill., national chaplain. (B. Y.)

Veterinary Medicine. Because of the rapid increase in the purebred dog population and phenomenal growth of the fur-farming industry the nutrition of the fast-growing and short-lived carnivora concerned became so closely tied to modern dietetics and medical practices that the manufacture of chemically and biologically assayed foods on a vast scale was developed to provide their alimentary needs on the basis of economic and scientific feeding.

Utilizing and supplementing the abundant materials available in large meat-packing plants, research chemists aided by expert caretakers and bioassayers of experimental dogs succeeded in producing balanced rations that fulfil the alimentary needs for growth and maintenance at all ages and concurrently prevent the deficiency diseases and digestive disorders arising from table leavings and rejected cuts of the butcher's block. The achievement was based upon selecting ingredients for their biological values and bringing up their mineral and vitamin components to uniform standards.

From 1937 to 1941 the production of canned dog foods increased from 412,436,000 lb. to 700,000,000 lb. and of the dry, packaged type from 128,681,000 lb. to 300,000,000 lb. The production of the latter type in 1945 was 500,000,000 lb.

Penicillin in Mastitis of Milk Cows.—Important developments in medicinal dosage, method of use and results obtained were signalized widely in periodical veterinary literature during the year. Quite generally, penicillin was pronounced the most dependable treatment yet employed for reducing the incidence of latent mastitis in dairy herds. Ten thousand to 30,000 Oxford units freshly dissolved in 50 to 100 cu.cm. of sterile water were infused into the udder after milking every 24 hr. to 48 hr. Clinical cures after the second infusion were reported. In "dry" cows one infusion of 30,000 units was generally sufficient to rid

the udder of *Streptococcus agalactiae*, the usual causative agent. Severe cases required several treatments. No benefit was derived from oral administration, nor in mastitis, because of the staphylococcal type of mastitis.

Pneumoencephalitis (Newcastle Disease of Poultry).—This serious virus disease, in mild form, was detected for the first time in the United States during 1946. It was diagnosed in 20 or more states. Known only as an exotic poultry plague, its appearance in widely separated places caused alarm among U.S. poultrymen and poultry pathologists. The chief of the U.S. bureau of animal industry convened a conference at St. Louis in July for the purpose of planning a vigorous control program. The survey of the situation revealed that the disease had existed in California, after 1935 at least, without being identified as the fowl plague of Europe and southern Asia known as Newcastle disease. Poultry pathologists of the University of California reported the disease under the name of pneumoencephalitis and described it as a highly contagious virus infection. The malady is an acute, respiratory-neurotrophic infection capable of causing a mortality of 100%. In the main, the enzootics in the United States took the mild, or respiratory, form. The trend the disease would take in the U.S. was not foreseeable.

Listerellosis in Farm Animals.—The meningo-encephalitis known as listerellosis, or "circling disease," which was regarded as a disease of laboratory animals only until identified in farm animals in New Zealand (1931), in Indiana (1932), in Iowa (1939), in Illinois (1945), in Pennsylvania (1943-44, 1946) and in Ohio (1946) was reported in 1946 to be a grave microbial disease of unknown potentiality among U.S. livestock, in view of these scattered outbreaks, the high mortality and reports in the literature (*q.v.*).

Canine Rabies.—The incidence of rabies remained high in the United States. In the absence of federally directed regulations, control measures were left for local functionaries to enforce. The morbidity was lowest in the large cities where vaccination was quite extensively practised compared with that among the free-roaming dogs of the country, few of which were immunized. Not being classed as livestock in the federal statutes, dogs did not come under the jurisdiction of the U.S. bureau of animal industry. A bill before the 79th congress designed to effect the long-desired change was not advanced for passage because of alleged protests of certain elements of the dog-owning public. The sanitary problem involved 13,000,000 dogs (*Dog World* est.) more or less at liberty to spread disease. In 1946, the dominion of Canada and the Union of South Africa prohibited the importation of U.S. dogs while the other species of domestic animals continued to be accepted unchallenged, as a token of confidence in their health.

The Insecticide DDT in Veterinary Medicine.—DDT (2,2, bis[parachlorophenyl]1,1,1-trichloroethane) came into use in veterinary medicine in 1943 and in the following three years its worthiness in animal production was proved by large-scale trials on farms and ranches. Independent of their role as vectors of infections, insects keep many a ton of meat, leather and milk off the market. The estimated figures in terms of deaths and lost poundage were extraordinary. To name two out of many insect pests other than vectors of specific infections, there are the horn fly (*Haematobis serrata*) and the ubiquitous stable fly (*Stomoxys calcitrans*). The former literally drive pastoral animals to cover and run them thin, reducing meat and milk production by one-half during the fly season. The latter, or common, blood-sucking stable fly, unless effectively controlled, is a nuisance of the highest rank, especially in dairy farming. DDT, as demonstrated by extensive trials, disposed of both. Its value in veterinary medicine may be summed up from these two examples, since there were few ectoparasites that did not respond to its

diligent use.

Brucellosis.—Despite vigorous control programs, bovine brucellosis continued to hinder normal productivity among the congested dairy cattle populations of the world. The attenuated culture of *Brucella abortus* (vaccine) developed by the animal disease research laboratory of the U.S. bureau of animal industry was released in 1940 for general use after five years of trials in the field but in the absence of uniform regulations to restrict its use among the states and its promiscuous use in nonprofessional hands, the benefits derived were disappointing up to 1946; that is, morbidity had not diminished and human brucellosis continued to show increases in the public health reports. In the U.S. corn belt, an area of intensive swine production, swine brucellosis which proved to be more virulent for the human being than the bovine type was more effectively subdued.

Leptospirosis Transmitted from Dogs to Man.—That leptospirosis (Weil's disease) was contracted directly from dogs was long suspected but proof to that effect was lacking. Human cases that could not be connected with exposure to rats or rat-contaminated swimming pools were suspected but not proved to be of direct canine origin. The two species of *Leptospira* involved—*L. icterohaemorrhagiae* and *L. canicola*—having slightly different serologic and clinical attributes were thought to be strictly host specific. Late studies, however, showed that there is but one leptospirosis. That the two specific spirochetes are interchangeable among rats and dogs and man was shown in critical studies made in France. In short, man may contract the disease by exposure to infected dogs. The spirochetoses of dogs and man designated leptospirosis, Weil's disease, Stuttgart disease, canine typhus, infectious icterus or spirochetosis icterohaemorrhagiae are one and the same disease.

The Histamine Theory of Founder.—When founder-like phenomena were produced experimentally in horses and oxen by injections of histamine and, moreover, spontaneous cases in horses were found to be associated with a marked histaminemia which responded to the administration of antihistaminic drugs, the pathology of a baffling disease was clarified.

Founder, formerly named laminitis in English veterinary literature is caused by overeating, overwork, tiresome journeys, difficult parturition and sundry extreme exposures which lead to the formation and liberation of toxic debris in the digestive or genital tracts. The experimental work with histamine indicted that product of catabolism as the toxic agent. The chemically complex phenylic and pyridinic compounds, antergan and neo-antergan, under trial for use in human medicine were used in foundered horses with remarkably good results. As prior biochemists had shown, the horse, because of its vast muscular system and its use under extreme stress, was found to be an excellent animal for the study of histamine and also for the action of antihistaminics.

Swine Erysipelas in Turkeys.—Although isolated cases of *Erysipelotrix rhusiopathiae* infection in animals other than swine were casually reported from time to time, the outbreak in a flock of 5,000 turkeys in Colorado with a 20% mortality put new values to the potentiality of that organism in turkey breeding. The onset resembled the cutaneous erysipelas of swine: swollen head, nasal discharge, sinusitis, anorexia, loss of weight, stiff gait, cyanosis, diarrhoea, tibiometatarsal arthritis and subnormal temperature.

The necropsy revealed enlarged liver with necrotic areas, purplish spleen, brownish lungs, blotchy ecchymosis and petechiation of the heart, striated musculature and serosa. The specific organism was isolated in the heart blood, bone marrow, liver, spleen, kidneys and subcutaneous tissue. Emphasis was placed on the fact that swine erysipelas in turkeys was infectious to human beings and that precautions should be taken to prevent

it among those killing, plucking and dressing these birds.

Vickery, Howard Leroy (1892-1946), U.S. naval officer, was born on April 20 in Bellevue, O. He attended the U.S. Naval academy at Annapolis and was graduated in 1915 with the commission of an ensign. During World War I, he was assigned to a ship escorting the first convoy to France. He served with the Haitian government, 1925-28, as a treaty engineer, was a member of the navy bureau of construction and repair at Washington, D.C., 1928-29, was head (1934) of the war plans section of the bureau's design branch and served, 1937-40, as assistant to Adm. Emory S. Land, U.S. maritime commissioner. He was appointed a member of the maritime commission in 1940. During World War II, Adm. Vickery, who played an important role in construction of the U.S. merchant fleet, was appointed chairman (Aug. 1943) of a newly-created postwar planning committee designed to develop long-range postwar plans for the U.S. shipping industry. Adm. Vickery resigned from the maritime commission in Dec. 1945. He died at Palm Springs, Calif., on March 21.

Victor Emmanuel III (1869-), former king of Italy, was born at Naples, Nov. 11, the son of King Humbert I and Margherita of Savoy-Genoa. He formally assumed the throne of Italy on Aug. 9 and 11, 1900. See *Encyclopædia Britannica*. Toward the end of World War II, he relinquished (June 5, 1944) the duties of the throne to his son, Crown Prince Humbert, whom he named lieutenant general of the realm; Victor Emmanuel, however, retained his nominal status as king. Never popular with republican elements in Italy because of his association with Benito Mussolini, the king was the target of increasing antiroyalist criticism after the close of the war. The strongly pro-Republican trend of the Italian municipal elections between March 10 and April 7, 1946, indicated that the days of the house of Savoy in Italy were numbered, but it was not until the Christian Democratic party at its convention (April 25) voted three to one in favour of a republic that Victor Emmanuel lost his last base of mass political support. Two weeks later (May 9), he abdicated, concluding a reign of 45 years and 9 months, and went into exile in Alexandria, Egypt. In an effort to save the tottering house of Savoy, he named his son as King Humbert II; Humbert's reign was as brief as his father's was long and after a rule of little more than a month, Humbert, too, went into exile.

Victoria. A state of the Australian commonwealth. Area: 87,884 sq.mi.; pop. (est. June 30, 1945): 2,013,489. Chief cities (pop., Dec. 31, 1943): Melbourne (cap., 1,107,000); Geelong (40,250); Ballarat (38,600); Bendigo (30,200). Governor in 1946: Major General Sir W. J. Dugan.

History.—The Labour government under the premiership of John Cain remained in office throughout 1946. Among bills introduced were ones for workmen's compensation, providing larger benefits for the dependents of workers; the abolition of late shopping on Friday nights; the provision of 14 days' paid annual holiday for all workers; and an increase in the government guarantee for building loans to co-operative housing societies from £A5,000,000 to £A10,000,000. The government plan for reafforestation began with the planting of softwoods at the rate of 10,000 ac. *per annum*. This would continue until a total of 250,000 ac. had been reached. Plans to spend £A25,000,000 over ten years to double the state's water storages by the construction of an immense earth dam at Eildon weir were announced.

Among other postwar development plans the Melbourne harbour trust started work on re-equipping Melbourne's port facilities which promised to make it one of the world's finest ports. Heavy planting of grain and favourable weather conditions combined to produce an estimated wheat crop of more than 1,815,000 short tons, the highest for 30 years.

The term of office of Sir Winston Dugan as governor was extended for another term to Jan. 1948.

Education.—In 1941: number of schools (state) 2,640, (private) 518; teachers (state) 8,868, (private) 2,744; scholars (state) 225,023, (private) 81,308; average attendance (state) 187,316, (private) 76,305.

Finance.—In 1944-45: revenue £A35,272,800; expenditure £A34,924,000; debt outstanding (June 30, 1945) £A179,405,000. (£A1 = \$3.2 U.S.)

Communication.—Roads (1941) 110,000 mi.; railways (1945) 4,758 mi. Motor vehicles licensed (Dec. 31, 1945): cars 141,856, commercial vehicles 96,088, cycles 21,480. Wireless receiving set licences (Dec. 31, 1945) 413,492. Telephones (June 30, 1941) 228,936.

Agriculture, Manufacturing, Mineral Production.—(In short tons) Wheat (1945-46) 975,000; wool (1944-45) 88,500; coal, brown (1942) 5,526,000; gold (1942) 101,497 fine oz. Industry and labour (1944-45): factories 9,669; employees 258,573; gross value of output £A287,421,875; unemployment (trade union returns) (Feb. 1946) 1.3%. (W. D. MA.)

Vinson, Frederick Moore (1890-), U.S. politician and jurist, was born Jan. 22 at Louisa, Ky. He was graduated from Kentucky Normal college, 1908, received his B.A., 1909, and his law degree, 1911, from Centre college and practised law in Louisa in 1911. He served seven terms in the national house of representatives, and was a key man in congress during the early days of the Roosevelt administration. In 1937, he accepted President Roosevelt's offer of the post of associate justice in the U.S. court of appeals for the District of Columbia, and in May 1943 he was named director of the Office of Economic Stabilization. Vinson changed posts three times in 1945. President Roosevelt made him federal loan administrator in charge of the Reconstruction Finance corporation, March 5, and director of the Office of War Mobilization and Reconversion, April 2. President Truman appointed him secretary of the treasury, after Henry Morgenthau's resignation, and Vinson was sworn in office, July 23. He signed the Anglo-U.S. agreement Dec. 6, under which Britain was to secure loans from the United States totalling about \$4,400,000,000.

On June 6, 1946, Vinson was appointed by President Truman

FREDERICK M. VINSON being sworn in as the 13th chief justice of the U.S. supreme court on June 24, 1946

to become chief justice of the U.S. supreme court. A skilled conciliator, the new chief justice was expected to bring harmony to the court, which was split into "conservative" and "liberal" blocs at the time of his appointment. Vinson took office June 24.

Virginia. One of the 13 original United States, Virginia is known as the "Old Dominion" and as the "Mother of Presidents." Southernmost of the middle Atlantic states, it has an area of 40,815 sq.mi., including 916 sq.mi. of water. Pop. (1940) 2,677,773, 35.3% urban and 64.7% rural. On July 1, 1944, the bureau of the census estimated the state's civilian population at 3,199,115. Capital, Richmond (193,042 in 1940 and 225,000 in July 1944). Other cities include Norfolk (144,332 and 167,900), Roanoke (69,287 and 66,641) and Portsmouth (50,745 and 59,472).

History.—The general assembly convened in regular session in Jan. 1946 and wrote 400 new laws before its adjournment in March. Legislation was enacted creating a state Water Control board to reduce pollution in public waters, and a state board of elections to maintain general supervision over all public elections. An increase in the state gasoline tax was approved, with funds earmarked for improvement of secondary roads. The first step was taken toward abolition of the state poll tax by constitutional amendment. A state Apple commission was created to boost the production and sale of Virginia apples; other agricultural laws included regulatory measures for the sale of seed, eggs and fertilizer, and for the operation of frozen food plants. Pay raises were voted for state employees and public school teachers, and a budget was adopted providing for more than \$30,000,000 in construction work at state institutions. Virginia's Senator Carter Glass died in May; Congressman A. Willis Robertson, of Lexington, was chosen to succeed him at the general election in November. Three new members of the house of representatives and seven incumbents, all Democrats, also were named to congress. As 1946 ended, Governor William M. Tuck called the assembly back in extraordinary session to grant teachers a further raise in pay and to consider bills guaranteeing a right to work despite "closed shop" labour union agreements and prohibiting strikes in public utilities. L. Preston Collins was lieutenant governor in 1946; G. Tyler Miller was superintendent

of public instruction.

Education.—In 1945-46, elementary school enrolment was 426,595 with a teaching staff of 12,526; secondary school enrolment was 131,728 with a teaching staff of 5,858.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1946, 11,817 persons received \$904,126 in general relief; 17,452 received \$2,670,412 in old-age assistance; 5,086 families with 14,799 dependent children, \$1,445,096; 1,135 blind, \$218,867; and in 1946 from Jan. 1 through Dec. 21, 339,975 civilian unemployment compensation checks were written for \$5,538,239, and 706,521 war veterans' checks were written for \$19,532,386. The civilian payments were more than 500% greater than for the same period of 1945. An average daily population of 4,499 was in six penal institutions for adults, and of 621 in four industrial schools for juveniles at the end of the fiscal year in June 1946.

Communication.—On Jan. 1, 1946, there were 9,075.82 mi. of highway in the state's primary system; on July 1, 1946, there were 37,834.32 mi. in the secondary system. During the year ended June 30, 1946, the state spent \$29,850,653 on its highways. The total railroad mileage was 4,093.5 on Jan. 1, 1946. There were 397,289 telephones in Virginia on Nov. 30, 1946.

Banking and Finance.—On June 29, 1946, Virginia had 184 state banks with 54 branches and two "facilities" and 130 national banks and branches. On June 29, 1946, deposits of national banks were \$1,079,295,000 and assets, \$1,152,101,000. On June 29, 1946, deposits in state banks totalled \$719,956,740 and assets, \$773,874,688. Resources on Dec. 31, 1945, of 14 industrial loan associations were \$7,989,291; of 56 building and loan associations, \$37,988,776; of 26 credit unions, \$1,208,283. For the fiscal year ended June 30, 1946, the state treasury received revenues of \$198,828,495, some 16% more than in the previous year. The gross debt on June 30 was \$15,578,052; there was no net debt, since a sinking fund of \$17,373,675 left an excess of \$1,794,623. The fiscal year ended with a general fund surplus of \$21,602,085.

Agriculture.—A phenomenal growing season in 1946, beginning early in March and continuing until mid-November, boosted the value of Virginia's principal crops to a record \$302,870,000, an increase of 20% over 1945. Farmers harvested 3,657,000 ac., a decline of 5.4% from 1945. The tobacco crop, valued at \$73,447,000, had the greatest value and second largest volume in history. The shortage of farm labour improved slightly during the year, but a scarcity of farm equipment provided a severe handicap. The state department of agriculture noted a sharp increase in acreage planted to hybrid corn, and a survey found steadily increasing use of soil building and land conservation practices. Cash receipts to Virginia farmers in 1946 from the sale of crops and livestock products were estimated at 8% more than in 1945, when receipts were \$347,603,000.

Table 1.—Leading Agricultural Products of Virginia, 1946 and 1945

Crop	1946	1945
Tobacco, lb.	167,000,000	153,315,000
Cotton, lint, bales	16,000	16,000
Corn, bu.	36,368,000	39,270,000
Oats, bu.	4,260,000	3,976,000
Barley, bu.	2,272,000	1,836,000
Apples, commercial, bu.	13,680,000	3,900,000
Peaches, bu.	2,407,000	536,000
Wheat, winter, bu.	8,344,000	7,595,000
Hay, all tame, tons	1,744,000	1,794,000
Lespedeza seed, lb.	6,200,000	6,700,000
Potatoes, bu.	10,676,000	8,772,000
Sweet potatoes, bu.	3,250,000	2,940,000
Peanuts for nuts, lb.	187,500,000	149,460,000
Soybeans for beans, bu.	1,106,000	1,264,000

Manufacturing.—The total value of manufactured products for the year ended Dec. 31, 1945, was \$2,197,718,834. Wage earners received \$307,672,769 in this period and total salaries amounted to \$70,338,849; an estimated 210,000 persons were engaged in manufacturing during this period, a marked decline

from the war years. Principal industries were tobacco products, food and kindred products, transportation equipment, textiles, paper and printing and chemical products.

Table II.—Principal Industries of Virginia, 1945 and 1944

Industry	Value of products	
	1945	1944
Tobacco products	\$790,582,323	\$760,800,542
Food and kindred products	308,793,770	298,882,246
Textiles and their products	400,185,194	377,549,300
Wood products	95,684,644	105,860,200
Paper and printing	134,072,940	142,556,943
Chemical products	121,750,914	111,694,596
Metals and machinery	78,910,459	70,437,607
Transportation equipment	200,419,947	244,324,461

Mineral Production.—The production value of raw mineral resources in the year ending Dec. 31, 1945, fell off slightly to \$84,081,000, compared with \$88,528,000 in 1945 and \$50,003,672 in 1940. Coal production in 1945 was valued at \$61,140,000, off 5% from the \$64,476,000 of 1945 primarily because of two strikes aggregating nearly ten weeks. Approximately 4,000 bbl. of petroleum and 54,000 cu.ft. of natural gas were produced. The nonmetallic minerals had a production value in 1945 of \$17,210,000. The value of metallic ores exclusive of coal, chiefly zinc, titanium and manganese, was about \$5,731,000.

(J. J. Kt.)

Virginia, University of. A state institution for higher education at Charlottesville, Va. Dr. John Lloyd Newcomb, the second president of the University of Virginia, submitted his resignation, and Edward Reilly Stettinius, Jr., succeeded R. Gray Williams as rector of the University's Board of Visitors during 1946. The Woodrow Wilson School of Foreign Affairs and a new school of geography were added to the other schools in the college department, and plans for a school of business administration were announced. Temporary housing units and a naval ordnance research laboratory were under construction at the end of the year, and plans had been drawn for a student activities building, substantial additions to the University hospital, and dormitories. The opening of the 125th session of the university in October marked a return to a regular nine-month session after four years on an accelerated program. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

(J. L. N.)

Virgin Islands. A United States dependency in the West Indies, east of Puerto Rico, comprising St. Thomas (pop. 12,902); St. Thomas (11,265) and St. John (722) islands. Area, 133 sq.mi.; pop. (1940) 24,889, 13.1% more than in 1930 with whites 9%, Negroes 69% (1930: 78.3%), "mixed and other races" 22% (1930: 12½%). The chief cities are: Charlotte Amalie, the capital on St. Thomas, 9,801 (1930: 7,036); Christiansted 4,495 (1930: 3,767) and Frederiksted, 2,498 (1930: 2,698) on St. Croix. The governor in 1946 was William Henry Hastie.

History.—President Truman's appointment in 1946 of a Negro as governor of an area where the population is predominantly Negro was of unusual importance and interest. The appointment was received with great enthusiasm in the islands. Hastie was federal district judge in the Virgin Islands in 1939-40. He was dean of Howard University Law school, Washington, D.C., immediately prior to his appointment as governor.

The year showed a steady improvement in shipping to St. Thomas and prospects were good for continued improvement. The tourist trade, dormant during World War II, was only beginning to revive.

Because of excessively high bids, coal and shipping strikes and material shortages, the Federal Works agency was unable to start construction of public works for which \$2,200,005 was

WILLIAM HENRY HASTIE, first Negro to be appointed governor of the Virgin Islands, assumed that office on May 17, 1946

appropriated by the congress in 1944 and 1945.

Education.—The public school enrolment in St. Thomas was 2,494, of which 781 pupils were enrolled in the junior and senior high school grades. In St. Croix the enrolment was 1,528 with 346 in high school grades. The average salary of teachers in St. Thomas was \$1.200 per annum, and in St. Croix \$889.69.

Finance.—The monetary unit is the United States dollar. Because of the decrease in revenues from income taxes paid by the distilling industry during the war, the municipalities were encountering difficulties in maintaining essential government operation. It was necessary for the municipality of St. Croix to request a deficit appropriation from congress. St. Croix receipts during the fiscal year 1946 were \$262,258; budgeted expenditures, \$421,658; U.S. subsidy \$150,000. Receipts of the municipality of St. Thomas and St. John were \$1,112.002; budgeted expenditures \$1,083,852.

Trade.—Three hundred and fifty-three ocean-going vessels entered the St. Thomas harbor, as compared with 204 vessels in 1945. The prewar peak, however, was reached in 1941, when 1,220 vessels called at St. Thomas. Imports into the Virgin Islands from the United States during the calendar year 1945 totalled \$4,575,865; exports from the Virgin Islands to the United States for the same period amounted to \$4,117,624, of which \$2,127,308 represented 929,912 proof gallons of rum.

Communication.—External communication is by steamer and Pan American airways and Caribbean Atlantic airlines. St. Thomas and St. Croix are adequately provided with roads. There are no roads on St. John, which has only trails. Radio telephone service to the continental United States through Puerto Rico was installed during 1946.

Agriculture.—Agriculture supplements shipping to support St. Thomas, St. Croix and St. John are largely agricultural. In 1940 (census) there were 828 farms of 3 ac. or more totalling 55,228 acres. St. Croix produces almost the entire sugar crop of the islands amounting to 4.970 short tons in 1946 (4,040 short tons in 1945).

A co-operative association of cattlemen in St. Croix, operating the federally-owned abattoir, exported 921 beef carcasses as

compared with 720 during the preceding year, and 360 sheep and 45 hog carcasses as compared with 277 and 171, respectively, in the preceding year. These meats were slaughtered under rigid government inspection. Exports were chiefly to Puerto Rico, but the municipal market and cold storage plant in St. Thomas procured part of the meats for sale in St. Thomas from St. Croix. (E. G. A.)

Viruses: see INFANTILE PARALYSIS; MEDICINE; PNEUMONIA.

Vishinsky, Andrei Y. (1883–), soviet statesman, jurist and diplomat, was born in Kiev of an ancient Polish family. He studied law at the University of Kiev and joined the Menshevik group of the Social Democrats in 1902. He participated in the revolt of 1905 and served a year in prison. When the Bolsheviks took power, Vishinsky deserted the Mensheviks, served in the red army for a year and joined the Communist party in 1920. He was professor of jurisprudence at Moscow university, 1925–27, was named the all-union deputy public prosecutor in 1933 and was public prosecutor from 1935 to 1939. He rose to fame as the public prosecutor in the treason and purge trials, 1936–38, and was appointed vice chairman of the council of peoples' commissars and deputy commissar for foreign affairs in 1940. He attended virtually all of the important inter-Allied and United Nations conferences in 1945–46. At the U.N. sessions in London (Jan.–Feb. 1946) he and Ernest Bevin engaged in a series of bitter debates, with Vishinsky opposing a council probe of Iran's accusations of soviet interference in its internal affairs. In turn, he demanded withdrawal of British troops from Greece and asked for an investigation of the Indonesian situation.

Throughout the 1946 meetings of the Allied Council of Foreign Ministers and the peace conference in Paris, Vishinsky opposed the western Allies on many important issues, although he showed a more conciliatory mood at the U.N. meetings at Lake Success, N.Y. He declared Nov. 29, 1946, that the atomic bomb was a "sword of Damocles suspended over our heads by a single thread," and said that disarmament must be premised on prohibition of its manufacture.

Vital Statistics: see BIRTH STATISTICS; CENSUS DATA, 1946; DEATH STATISTICS; INFANT MORTALITY; MARRIAGE AND DIVORCE; SUICIDE STATISTICS.

Vitamins. The chemical structure of the vitamin known as folic acid was announced in 1946. It was found to be composed of a molecule each of a pteridine, para-aminobenzoic acid and glutamic acid, and the name pteroyl glutamic acid was proposed for the complete compound. It had been found the year before that folic acid was quite effective in the treatment of macrocytic anaemias and sprue. The effect of cooking on the folic acid content of a variety of meats was reported. Losses ranged from 54% to 90%. These data placed folic acid in the same group as thiamin, biotin, pyridoxine, inositol and pantothenic acid, all of which are more easily destroyed than riboflavin, niacin or choline. The destruction of B-vitamins during cooking may have serious consequences in many human dietaries.

The type and activity of micro-organisms inhabiting the alimentary tract, especially the large intestine, definitely influence animal nutrition and are probably of profound importance in human nutrition. If the synthesis of vitamins by organisms in the intestine is a normal and necessary method of supplementation of the diet, then the inhibition or change of this flora as a result of disease, drugs or diet would predispose man to nutri-

tional disease. The extent of the synthesis of nutrients in the alimentary tract was emphasized by a study in which the intake and excretion of B-vitamins in seven healthy young men on a normal diet during a 12-week period were reported. The dietary intake of thiamin, riboflavin, pyridoxine and niacin exceeded the combined urinary and faecal output. The reverse was true with all of the other B-vitamins. Studies were needed on the availability of nutrients made by the intestinal flora for it was not known if the body could make effective use of them.

In studies on the effect of vitamin deficiencies on the course of malarial infection it was found that in chicks vitamin A deficiency caused a somewhat milder infection, and choline deficiency appeared to have the opposite effect. Thiamin deficiency had no influence on the infection, and nicotinic acid deficiency resulted in a much more severe infection.

Studies at the research laboratory of the Children's Fund of Michigan added much to the knowledge of the vitamin content of human milk. The vitamins studied were vitamin A and carotene, ascorbic acid, thiamin, riboflavin, nicotinic acid, pantothenic acid and biotin. The results showed that there was considerable variation in the concentrations of vitamins in human milk during the first ten days and then relatively constant concentrations were reached. Vitamin A and carotene were in high concentration in the colostrum and decreased to half of the initial value in mature milk. Ascorbic acid was about the same in colostrum and mature milk, while the other vitamins mentioned above were low in colostrum and gradually obtained maximum values in mature milk. A somewhat parallel study on the vitamin composition of cow's milk was carried on at Cornell university, Ithaca, N.Y. Of considerable interest to public health workers were the investigations on the relation of pasteurization and exposure to sunlight upon the vitamin content of milk. No losses of niacin, pantothenic acid or biotin were observed during either pasteurization or exposure to two hours of February noonday sunlight. Previous studies showed that riboflavin in milk is readily destroyed by exposure to sunlight.

The vitamin content of body tissues is of interest particularly as it may be affected by disease. In 1946 a study on biotin, choline, inositol, para-aminobenzoic acid and pyridoxine content of mouse skin during the experimental production of cancer was reported. No significant changes were observed in these vitamins except in the case of biotin which was reduced about one-third. Previous studies of tumour tissues have shown specific findings of biotin changes; however, the exact significance of biotin to carcinogenesis or to tumour metabolism is not yet clear.

In considering the vitamin sources for man, one should have data on the vitamin content of foods after they are cooked, that is, just as the food is consumed. Most of the vitamin values as given in food composition tables are on raw foods. In a study of the vitamin content of restaurant food it was found that riboflavin and nicotinic acid allowances were readily met by varied restaurant diets. Thiamin allowances could be met if care was taken in selecting the foods; it was necessary to include fresh fruit juices to obtain desired amounts of ascorbic acid. The vitamins most readily lost in cooking were thiamin and ascorbic acid. Foods from three separate restaurants were assayed, and though the foods differed as to cost and attractiveness as served, there was no essential difference in the vitamin content.

Vitamin supplementation of the diets of industrial workers is frequently suggested as a desirable procedure. A study on this problem was under way in an aircraft factory in California and in general no impressive benefit was found by the routine provision of large vitamin supplements to industrial workers.

For those interested in following progress in vitamin research and other phases of nutrition, attention should be called to the journal, *Nutrition Reviews*. This is published monthly by the

Nutrition Foundation, Inc., Chrysler building, New York city, and provides an authoritative, unbiased review of the world's current research progress in nutrition. (See also BIOCHEMISTRY; CHEMISTRY; CHEMOTHERAPY; DIETETICS; FISHERIES; FLOUR; FOOD RESEARCH; MEDICINE.)

Vocational Education: see EDUCATION.

Vocational Rehabilitation, Office of. Physically and mentally handicapped civilians of working age, who require vocational rehabilitation services in order to obtain or retain employment commensurate with their potential capacities, in 1946 numbered at least 1,500,000 in the United States, not including veterans of the armed forces with service-incurred disabilities. The number increases at the rate of 200,000 a year. To help the civilian disabled achieve their best possible vocational usefulness, the 48 states, the District of Columbia, Puerto Rico and Hawaii entered into partnership with the federal government to provide the necessary services and facilities, and Alaska had plans to inaugurate a program.

There were during the year 51 general rehabilitation agencies administered by the state boards of education through divisions of vocational rehabilitation. In 34 states, there were agencies authorized by state laws to provide vocational rehabilitation services to rehabilitate blind persons. In 16 states, general rehabilitation agencies provided services for all types of handicapped clients, including the blind.

Services furnished by the states comprise thorough physical examinations; necessary medical, surgical, psychiatric and hospital treatment; necessary prosthetic devices such as artificial limbs, hearing aids, braces and the like; individual counselling and guidance; training for jobs; maintenance and transportation during rehabilitation, if necessary; occupational tools, equipment and licences; placement on the right job and follow-up after placement to make sure workers and jobs are properly matched. The states and territories actually operate the programs, purchasing rehabilitation services from existing facilities and necessary medical care from general practitioners, specialists, clinics, hospitals and other sources—either public or private—available in the communities. The federal government, through the Office of Vocational Rehabilitation in the Federal Security agency, assists the states and territories through financial grants-in-aid, establishment of standards of service, and technical aid. The federal government assumes all necessary administrative costs incurred by the states as well as their expenditures for guidance and placement of disabled individuals. Medical examinations and treatment, training and the costs of other services are shared equally by the states and the federal government. The states are fully reimbursed by the federal government for cost of services to disabled civilians such as merchant seamen, members of the Civil Air Patrol and the aircraft warning service injured in performance of duty.

During the fiscal year 1946, 36,106 clients—27,066 men and

9,040 women, including the blind—were rehabilitated into employment and their cases were closed to the mutual satisfaction of themselves and their employers. Total annual earnings—not including those of clients who became self-employed and whose earnings were difficult to estimate—increased almost 400% after rehabilitation, rising from an estimated \$11,600,000 before rehabilitation to an estimated annual rate of \$56,300,000 afterward. Of this group, 27,022 or 75% were unemployed when they applied to the states for services, 5,734 never having worked before and 6,993 only part-time.

In addition, 27,276 other clients made vocational adjustments during the same period without requiring major rehabilitation services, and 101,450 were still in process of rehabilitation at the close of the fiscal period.

Clients found employment in professional and semi-professional fields, and in skilled, semi-skilled and unskilled occupations. Included were accountants, auditors, teachers, draftsmen, laboratory technicians, retail managers, bookkeepers, secretaries, stenographers, clerks, office machine operators, waiters and waitresses, kitchen workers, barbers and beauticians, hospital attendants, guards and watchmen, jewellers, shoe makers, machinists, welders, carpenters, aeroplane mechanics, auto mechanics, textile workers, bus and truck drivers, filling-station attendants, construction workers, farmers and household workers.

Clients' disabilities were varied. Persons with orthopedic involvements, amputations and congenital absence of members constituted almost half of the completed rehabilitations. Other major categories of disability were: cerebral palsy, poliomyelitis, pulmonary tuberculosis, cardiac, hernias, vision defects, hearing defects, speech defects, mental disorders, epilepsy,

AMPUTEE who learned to paint while a patient at the army's Thomas M. England General hospital during 1946, uses a brush attached to the hook of his artificial hand

BLINDED VETERAN, who was learning to be a piano tuner and repairman during 1946, is shown listening to a tuning fork held by an instructor

asthma and fibroid tumours.

During the fiscal year 1946, the states purchased the following services for the number of clients indicated:

Examinations—medical, 53,512; psychiatric, 1,050; psychological, 2,109.

Treatments—medical, 1,834; psychiatric, 268; surgical, 4,331; dental, 558; other, 226.

Prosthetic appliances—artificial limbs, 3,473; braces, 1,002; hearing aids, 1,081; glasses, 1,592; orthopedic shoes, belts, trusses, etc., 776; repair of appliances, 337.

Training—educational institutions such as colleges or universities, business colleges, private trade schools or public vocational schools, 25,028; on-the-job, 4,311; correspondence courses, 1,707; tutors, 2,501.

Maintenance—during training, 15,366; during medical treatment, 686.

Transportation—for examinations, 1,865; for medical treatment, 1,790; for training, 4,243.

Auxiliary services—training supplies and equipment, 16,218; placement equipment, 1,208; occupational licences, 234.

There were 5,570 clients who received hospitalization; 107 who were treated in convalescent homes; 364 who received occupational therapy.

State-federal vocational rehabilitation programs were conducted during the 1946 fiscal year at a total cost of \$14,136,000, of which the federal share was \$10,239,500. The states' participation totalled \$3,896,500, which represented state and local governmental funds supplemented by contributions from interested welfare, health, fraternal and other organizations. (See also VETERANS' ADMINISTRATION.) (M. J. Sy.)

Von (in personal names): see under proper names.

WAC: see WOMEN'S ARMY CORPS.

Waesche, Russell Randolph (1886–1946), U.S. coast guard officer, was born on Jan. 6 at Thurmont, Md. He studied electrical engineering at Purdue university and later entered the Coast Guard academy, from which he was graduated in 1906 with the rank of ensign. Thereafter, he served as a line officer in Atlantic, Pacific and Arctic waters and in 1916 became the first chief of the communications division. After the prohibition amendment became law, he was charged with combating rum-runners; in 1928 he became chief ordnance officer in Washington and in 1931 reorganized the field forces of the service. He was appointed commandant of the coast guard in 1936, with rank of rear admiral, and after the Neutrality act was passed in 1939, supervised the prevention of shipments of war materials from the United States to the European belligerents. Under his guidance the coast guard grew during World War II to ten times its original size. It reached a peak size of 170,000 men, many of whom manned troop and attack transports and participated in amphibious operations. On April 4, 1945, he became the first full admiral of the coast guard and on Dec. 31, 1945, retired from the service. Adm. Waesche died at Bethesda, Md., on Oct. 17.

Wages and Hours. During the first seven months of 1946 the manufacturing pay rolls of the U.S. were lower than in the corresponding months of 1945, but in August were higher (Table I). The index numbers for January were about one-third lower than the figures for Jan. 1945. In August they were 25 points lower. Reconversion, unprecedented strike idleness and shortages of materials, together with the disappearance of most of the overtime worked during World War II, combined to hold down employment. Hourly wage rates were higher than in 1945 in many industries but weekly earnings were a little lower.

Table I and the chart on page 817 show employment indexes for 1945 and the first eight months of 1946 in all manufactures, durable goods and nondurable goods. The table shows wage-earner employment and pay rolls in both durable and nondurable goods industries. These indexes were based upon 1939 as 100.

Table I.—Indexes of Production-Worker Employment and Pay Rolls in Manufacturing Industries
(1939 average=100)*

This table compiled from statistics released by the Monthly Labor Review, United States bureau of labour statistics.

*Indexes are based on 1939 average and adjusted to census of manufacturers. They are not comparable to indexes published prior to Dec. 1942 by the bureau of labour statistics.

Table II shows the average hours and earnings in July 1946 and 1945 in the principal manufacturing and nonmanufacturing industries. It is evident that a high level of wage earners' weekly "take-home" continued through July 1946, as the result of higher hourly earnings.

Incentive systems of wage payment were used extensively during World War II. This was another factor contributing to high weekly earnings in manufacturing. It was undoubtedly true that more wage earners were employed on an incentive basis than before 1941.

EMPLOYMENT and pay rolls for all manufacturing industries, 1919 to 1946, as compiled by the U.S. bureau of labour statistics (1939=100)

Table II.—Average Weekly Earnings, Average Weekly Hours and Average Earnings per Hour in Major Industrial Classifications, Month of July 1946 and 1945: U.S.

Industry	Average weekly earnings		Average weekly hours		Average hourly earnings	
	1946	1945	1946	1945	cents	cents

Table III shows a steady rise in average hourly earnings from 1941 to 1946. It was not possible to separate the increment added to hourly earnings by overtime work from the prevailing rates paid for standard hours of employment but increases of 15 cents to 20 cents per hour occurred in many industries in 1946.

It was apparent during the closing months of 1945 and in 1946 that the industries generally were eliminating overtime and returning to prewar standards of normal working hours.

Table III.—Rise in Hourly Earnings Rates in U.S.A., 1940-46

Industry	Hourly earnings in August						
	1940	1941	1942	1943	1944	1945	1946

The much higher hourly earnings in some industries were the result of one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill; (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers; (3) degree to which union working conditions prevailed and (4) necessity of paying high wages to attract labour supply.

Weekly earnings measure wage-earner welfare better than do hourly rates. There were 9 industries of the 34 studied in which average weekly earnings exceeded \$50 per week in July 1946. The maximum was \$54.60 in street railways and buses. But their 48.4 hr. per week was the reason for having the highest weekly earnings. The lowest weekly earnings were in hotels: \$26.70. Of course, hotel earnings are supplemented by tips, and the statistics do not reveal this part of the employees' income. In July 1946, there were 26 industries in which average weekly earnings were between \$40 and \$54.60 and 7 industries between \$30 and \$40. The average weekly earnings of durable goods manufacturers were \$46.15 in July 1946 compared with \$53.54 in 1945.

The wages of farm labour, both monthly and daily wages, rose a little from 1945 levels, judging by the reports of the U.S. bureau of agricultural economics; adequate statistical data was not yet available. (See also AGRICULTURE; BUSINESS REVIEW; CANADA; CENSUS DATA, 1946; LAW.) (D. D. L.)

Great Britain.—In Sept. 1946 the ministry of labour published a volume. *Time Rates of Wages and Hours of Labour*,

showing the wage rates and hours in force for the principal occupations in Aug. 1946. In agriculture, minimum time rates for men more than 21 were 80s. in England and Wales and 70s. in Scotland for a week of 48 hr., with higher rates for special classes of workers in many areas. For women the corresponding minima were 60s. and 47s. In coal mining the national minimum wage was 100s. for underground workers for 6 (or in some areas $5\frac{1}{2}$) shifts of $7\frac{1}{2}$ hr. each; the surface workers' minimum was 90s. Higher rates were paid in some areas and, of course, most pieceworkers earned more. Skilled engineers' rates ranged from 107s. in London to 97s. in a few remote areas, 100s.-102s. being the commonest provincial rates. Engineering labourers received from 89s. to 84s., and women a national minimum of 62s.6d. The hours in engineering were 47 a week. Building workers' wages were on an hourly basis, usually with a week of 44 hr.: the craftsmen's rates ranged from 2s.7 $\frac{1}{2}$ d. to 2s.4d. an hour, the labourers' from 2s.1 $\frac{1}{2}$ d. to 1s.10 $\frac{1}{2}$ d., according to area. In printing, compositors had widely varying rates, from 186s. a week (London morning newspapers) to 96s. for general printing in small towns and rural areas; there were many different rates for higher and lower degrees of skill. Working hours varied, but the usual working week, except for newspapers, was 45 hr.; this, however, was to be reduced by stages under an agreement reached in Oct. 1946, and wages were to be increased. Wages in the textile trades depended mainly on piecework earnings and can not be simply stated: the working week was of 48 hr. On the railways, male porters ranged from 91s.6d. to 84s. and engine drivers from 126s.6d. to 113s.6d., for a week of 48 hr. Dockers got 19s. a day in the larger and 18s. in the smaller ports, with a working week of 44 hr. For road haulage, rates ranged from 89s. to 107s. in London, and from 82s. to 98s. in the provinces, with a few exceptional higher rates for a working week of 48 hr. Seamen had widely varying rates, with a week of 56 hr. Shop assistants were largely on graded age scales, rising to 80s. or more for men at 24 or 25, with a much wider range for women, whose rates at 24 or 25 varied from 54s. to 64s. for a 48-hr. week. In industries covered by the Wage Councils act (formerly Trade Boards act) the standard hours were usually 48, and hourly rates were usually from about 1s.6d. to 1s.8d. for men and from 11d. to 1s.3d. for women, though both higher and lower rates existed.

For earnings, as distinct from time rates, no figures were available at the end of the year for a date later than Jan. 1946. At that date average earnings for all types of workers were roughly 74% higher than in Oct. 1938. The official cost-of-living index was in Jan. 1946 only 31% higher than in 1938; but this grossly understated the actual rise in living costs, which could not be put at less than 60% for the average working-class household. In comparison with 1938 women and less skilled workers improved their relative position. During 1946 rates of wages rose in many industries, but much of the increase was offset by a fall in earnings because of the cessation of highly paid war work and to some fall in average hours actually worked, especially by women. Up to Aug. 1946 there had been during the 8 mo. an increase of £2,349,000 in the weekly wages of 6,697,000 workers, as compared with a rise of £1,422,000 in the wages of 5,825,000 workers during the corresponding months of 1945. In general, the trade unions in 1946 were restraining their members from asking for large wage increases in order to avoid embarrassing the government by setting inflationary forces in motion. (See also LABOUR UNIONS; PRICES.)

Walker, James J. (1881-1946), U.S. politician, was born on June 19 in New York city. He studied at the New York Law school and was admitted to the New York state bar in 1912. Gravitating easily into politics, he became a district captain, a member of the assembly, 1909, and under the tutelage of Alfred E. Smith, was elected to the state senate, 1914. With the backing of the Tammany organization and Gov. Smith, Walker was nominated in 1925 as the democratic mayoralty candidate in the primary elections. He served as mayor of New York city for two terms, 1925-32.

During his first term he created the department of sanitation, brought about unification of the city's public hospitals, made considerable improvements in the playgrounds and park systems and under his guidance the board of transportation approved contracts for the construction of an elaborate subway system.

Re-elected to office in 1929, his personal integrity and the soundness of his administration came under critical fire from several sources. In 1931 the New York legislature formed a committee to investigate the affairs of New York city. As a result of this investigation extensive corruption was revealed and 15 charges were levelled against Walker. Accused, among other things, of being actuated by improper and illegal considerations and of being unable to explain satisfactorily the large sums of money deposited in his bank account, he resigned Sept. 1, 1932. He was named chairman of the National Cloak and Suit industry in 1940; he later became the president of the Majestic Records company. Walker died in New York city Nov. 18.

Wallace, Henry Agard (1888-), U.S. statesman. (See *Encyclopædia Britannica*.) Wallace was secretary of agriculture in the cabinet of Franklin D. Roosevelt from March 4, 1933, until Sept. 5, 1940, when he resigned to campaign for the vice-presidency, to which he was elected the following Nov. 5.

President Roosevelt appointed him head of the Economic Defense board (later the Board of Economic Warfare) on July 31, 1941, and chairman of the Supply Priorities and Allocations board on Aug. 28 of that year. At the Democratic national convention in July 1944, Wallace was defeated for renomination as Roosevelt's running mate, but he played an active part in the campaign for the president's re-election. On Jan. 22, 1945, Roosevelt nominated Wallace to succeed Jesse Jones as secretary of commerce and directing head of the Reconstruction Finance Corporation and its affiliated lending agencies. The senate commerce committee rejected Wallace as head of the RFC; his nomination for secretary of commerce, however, was confirmed March 1.

On Sept. 12, 1946, Wallace delivered a speech in New York in which he denounced the administration's alleged "get-tough-with-Russia" policy. The address caused an uproar and resulted in charges that it embarrassed the position of Secretary of State James Byrnes at the Paris peace conference, in session at that time, and finally ended in President Truman's request for Wallace's resignation as secretary of commerce. Wallace complied Sept. 20, declaring that he felt that "winning the peace" was more important than holding public office. Later, he became editor in chief of the *New Republic*.

War Crimes. On Jan. 13, 1942, an Inter-Allied conference met in London with delegates present from the governments of Belgium, Czechoslovakia, Free France, Greece, Luxembourg, the Netherlands, Norway, Poland and Yugoslavia. Representatives of Great Britain, Australia, Canada, India, New Zealand, the Union of South Africa, the United States of America, the Union of Soviet Socialist Republics and China were present as guests. In a joint declaration on the punishment of war crimes the conferees resolved to "place among their principal war aims the punishment, through the channel of organized justice, of those guilty of or responsible for these crimes, whether they have ordered them, perpetrated them, or participated in them."

On Oct. 7, 1942, President Franklin D. Roosevelt for the United States and Lord John Simon, lord chancellor for the British government, in separate declarations announced "the intention to apprehend and punish war criminals, as well as to create an agency to investigate war crimes."

The following year on Oct. 20, 1943, at a meeting of the government representatives at the foreign office in London, the commission was brought into being under the title, United Nations War Crimes commission.

The commission consisted of 16 members—the representatives of the governments of Australia, Belgium, Canada, China, Czechoslovakia, France, Greece, India, Luxembourg, the Netherlands, New Zealand, Norway, Poland, the United Kingdom, the United States of America and Yugoslavia.

The commission was created as a fact-finding body, but was later also given advisory functions. Its purposes, according to the terms of reference, were to investigate war crimes committed against the nationals of the United Nations, recording the testimony available, and to report from time to time to the governments of these nations cases in which such crimes appeared to have been committed, naming and identifying wherever possible the persons responsible.

Some little time after the creation of the commission its functions were enlarged to include that of making recommendations to the governments on such matters as the methods adopted to ensure surrender or capture of persons wanted for trial as war criminals and the tribunals by which they should be tried. The U.S.S.R. was not represented.

The Hon. Robert C. Pell, formerly U.S. minister to Portugal and Hungary and former member of congress, was the first commissioner to represent the United States. He was succeeded on May 10, 1945, by Col. Joseph V. Hodgson, judge advocate general's department, army of the United States, who had served both as deputy and acting commissioner since Jan. 1, 1945. Lt. Earl W. Kintner, then deputy commissioner, served as acting commissioner after the resignation of Col. Hodgson on May 17, 1946. Col. Robert M. Springer, judge advocate general's department, U.S. army, was appointed commissioner by President Harry S. Truman on July 18, 1946.

National War Crimes Office.—It soon became apparent that the commission could not itself investigate the mass of charges and reports of war crimes. Shortly after its formation the commission, therefore, urgently recommended to each of the member nations that it establish a national war crimes office to investigate war crimes against the citizens of its own country. Each had a war crimes office which detected, investigated and recorded evidence of war crimes. When a national office determined that a case was reasonably complete it forwarded a summary of the same to the United Nations War Crimes commission or its subcommission in the far east which examined the information and materials.

The U.S. War Crimes branch was originally established in the judge advocate's office in Washington, D.C., under the direction

of Brig. Gen. John M. Weir, assistant judge advocate general. He was succeeded by Col. David Marcus, general staff corps, on Feb. 18, 1946. The mission of the U.S. War Crimes branch was:

To collect from every available source of evidence of cruelties, atrocities, and acts of oppression against members of the armed forces and other Americans, including the people of any dependencies of the United States, such as the Philippines; to examine, evaluate and organize such evidence; to arrange for the apprehension and prompt trial of persons against whom *prima facie* case is made out, and for the execution of sentences which may be imposed.

On March 4, 1946, the functions and duties of the War Crimes branch were transferred from the judge advocate general's department to the civil affairs division, war department special staff.

War Crimes Office of the European Theatre of Operations.—On Dec. 25, 1944, the war department directed that there be established a branch in the office of the theatre judge advocate to have as "its primary function the investigation of alleged war crimes, and the collection of evidence relating thereto, including, for transmission to the governments concerned, evidence relating to war crimes committed against nationals of other United Nations." It was also directed pending further instructions "no war criminals will be tried before military tribunals, except those cases in which the offenses involve the security or the successful carrying out of military operations of occupation." The first comprehensive directive concerning the trial of war criminals was issued by the joint chiefs of staff and was identified as J.C.S. 1023 series. The responsibility for the prosecution of war crimes in the European theatre was vested in the deputy theatre judge advocate, whose headquarters were located in Augsburg, Germany.

The secretary of the navy, upon the suggestion of the secretary of war, joined in the setting up of the office and provided for participation through a navy division and navy personnel under the judge advocate general of the navy. The agency thus established in the war department, by agreement between the state, navy and war departments, was authorized to act jointly for the three departments in handling war crimes matters. It thus performed the functions of the U.S. National War Crimes office.

Office of Chief of Counsel—Nuernberg.—On May 2, 1945, the president by executive order established the Office of Chief of Counsel, designating Associate Justice Robert H. Jackson "the representative of the United States as its Chief Counsel, in preparing and prosecuting charges of atrocities and war crimes against such of the leaders of the European Axis powers and their principal agents and accessories as the United States may agree with any of the United Nations to bring to trial before an international military tribunal." In the United States there was established a supporting unit under the office of the assistant secretary of war. In conformity with the Moscow declaration of Oct. 30, 1943, Justice Jackson completed in Aug. 1945 an agreement with the British, French and soviets for the prosecution and punishment of major axis war criminals.

International Military Tribunal—Nuernberg.—The tribunal at Nuernberg opened on Nov. 21, 1945. The four nations whose forces were occupying Germany were represented, viz., Great Britain, France, the United States and the U.S.S.R.

In Justice Jackson's report to the president June 7, 1945, he reported on the accomplishments after he was named chief of counsel. He outlined the necessity for the trial, procedure and defenses at the trial, named the defendants (individuals and organizations), the crimes to be charged, the legal charges, the legal position of the United States and the time and duration of the trial. Germans Hermann Wilhelm Goering, Rudolf Hess, Joachim von Ribbentrop, Robert Ley, Wilhelm Keitel, Ernst

Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Walther Funk, Hjalmar Schacht, Gustav Krupp von Bohlen und Halbach, Karl Doenitz, Erich Raeder, Baldur von Schirach, Fritz Sauckel, Alfred Jodl, Martin Bormann, Franz von Papen, Arthur Seyss-Inquart, Albert Speer, Constantin von Neurath and Hans Fritzsche were accused of war crimes and crimes against humanity and of a common plan of conspiracy to commit these crimes, as defined in the charter of the tribunal. The following named groups or organizations were indicted by reason of their aims and the means used for the accomplishment thereof and in connection with the conviction of such of the named defendants as were members thereof: *Die Reichsregierung* (reich cabinet), *Sozialistischen Deutschen Arbeiterpartei* (leadership corps of the nazi party), *Die Schutzstaffeln der Nationalsozialistischen Deutschen Arbeiterpartei* (commonly known as the SS) and including *Die Geheime Staatspolizei* (secret state police, commonly known as the gestapo), *Die Sturmabteilungen der Nationalsozialistischen Deutschen Arbeiterpartei* (known as the SD) and the general staff and high command of the German armed forces.

After more than 10 months and more than 1,000 hours of sessions—after about 200 witnesses had spoken and about 5,000,000 words of testimony heard, 21 of the available leaders and 7 organizations were called to account for their crimes against the world. Only 21 defendants were on the dock, although the indictment listed 24. Martin Bormann, who succeeded Hess as deputy party leader, was tried *in absentia*. He was believed to have died during the fall of Berlin. Robert Ley had committed suicide on Oct. 25, and the proceedings against Gustav Krupp von Bohlen und Halbach were postponed because of his physical condition. The tribunal had sought, through these defendants, to present the world with a vast documented study and judicial history of the nazi movement—a study which would make people know what that movement did to Germany and to the world and how it did it.

Hjalmar Schacht, Franz von Papen and Hans Fritzsche were acquitted by a 3-1 vote of the court. The judge representing the soviets filed a minority opinion, in which he stated that he was of the opinion that Schacht, von Papen and Fritzsche were guilty. Rudolf Hess, Walther Funk and Erich Raeder were

sentenced for life; Baldur von Schirach and Albert Speer were given 20 years, Constantin von Neurath, 15 years and Karl Doenitz, 10 years; the remainder of the defendants received the death penalty. Executions were carried out by hanging, except Goering, who committed suicide. The following organizations were declared noncriminal: the reich cabinet, general staff and high command and "SA."

The court ruled (1) that aggressive war was an international crime; (2) that individuals who are responsible for planning and waging aggressive war were individually responsible; (3) that the fact that a defendant had acted pursuant to order of his government or superior did not free him from responsibility and that the true test was not the existence of the order, but whether moral choice was in fact possible. The tribunal limited the meaning of aggressive war in defiance of treaties and assurances and ruled that a conspiracy must be clearly outlined in its criminal purpose—that is, must not be too far removed from the time of decision and action; that the planning to be criminal must not rest merely on a party program such as was found in the 25 points of the nazi party in Hitler's *Mein Kampf*; it must be found that a concrete plan to wage war existed and only the participants under that concrete plan could be guilty of conspiracy.

Brig. Gen. Telford Taylor succeeded Justice Jackson as chief of counsel, conducting trials in the zonal courts at Nuernberg. Twenty-three doctors had been indicted for crimes committed by the German medical profession.

International Military Tribunal—Tokyo.—The International Prosecution section in Tokyo was prosecuting the major Japanese war criminals before the International Military Tribunal for the Far East composed of members from 11 United Nations. In many respects the International Prosecution section setup was similar to the organization at Nuernberg. One major difference was that Joseph B. Keenan, the prosecutor, was appointed by Gen. Douglas MacArthur in his capacity as

DEFENDANTS at the war crimes trial at Nuernberg, Germany, where on Oct. 1, 1946, they received their sentences. Left to right, front row: Hermann Goering; Rudolf Hess; Joachim von Ribbentrop; Field Marshal Wilhelm Keitel; Ernst Kaltenbrunner; Alfred Rosenberg; Hans Frank; Wilhelm Frick; Julius Streicher; Walther Funk; Hjalmar Schacht. Back row: Grand Admiral Karl Doenitz; Grand Admiral Erich Raeder; Baldur von Schirach; Fritz Sauckel; Col. Gen. Alfred Jodl; Franz von Papen; Arthur Seyss-Inquart; Albert Speer; Constantin von Neurath; Hans Fritzsche

TOJO pleading not guilty on all counts, before the International Military tribunal at Tokyo on May 6, 1946

the supreme commander for the Allied powers (S.C.A.P.)

Outstanding judges were appointed from Australia, Canada, China, Great Britain, the Netherlands, New Zealand, soviet union, United States, France, India and the Philippine Islands. The prosecution, in its indictment charging certain Japanese leaders with the commission of war crimes such as plunging Japan into an unjust and illegal war in breach of treaty under international law, chose the technical weapon of the doctrine of conspiracy. But it did not employ a conspiratorial doctrine which was limited to any particular legal system. It adopted a generic concept of conspiracy which was suitable and just, according to international law, in a case of first impression, because it embraced juridical materials which were common to the great legal systems of the world. The date after which acts were regarded as war crimes by the tribunal was set as the Mukden incident of Sept. 18, 1931. Those accused were: Sadao Araki, Kenji Doihara, Kingoro Hashimoto, Shunroku Hata, Kiichiro Hiranuma, Koki Hirota, Naoki Hoshino, Seishiro Itagaki, Okinoro Kaya, Koichi Kido, Heitaro Kimura, Kuniaki Koiso, Iwane Matsui, Yosuke Matsuoka, Jiro Minami, Akira Muto, Osami Nagano, Takasumi Oka, Shumei Okawa, Hiroshi Oshima, Kenryo Sato, Mamoru Shigemitsu, Shigetaro Shimada, Toshio Shiratori, Teiichi Suzuki, Shigenori Togo, Hideki Tojo and Yoshijiro Umezu.

The legal section of S.C.A.P. was charged with the prosecution of all other war crimes. This section was under the direction of Col. Alva C. Carpenter. Its headquarters was in Tokyo, and it had a branch office in Manila. Trials were held in Yokohama and in Manila. The Tomoyuki Yamashita and Masaharu Homma trials were under the jurisdiction of this section. It was contemplated that during 1947 ten military commissions would be engaged in trying cases selected by the prosecution to ensure that the high U.S. standards of fair play and justice were incorporated into these trials. Gen. MacArthur by a regulation directed: (1) that accused should be entitled to have in advance of trial a copy of the charges clearly worded; (2) that accused should be entitled to be represented prior to and during trial by counsel appointed by the convening authority or by counsel of his own choice; (3) that accused should be entitled to testify in his own behalf, present evidence in his behalf and cross-examine adverse witnesses and (4) that proceedings

should be carried on in a language understood by the accused.

The War Crimes office of the U.S. navy at Guam was performing functions similar to those of the legal section of S.C.A.P. in the prosecution of war crimes. Beginning with the time the U.S. forces retook Guam, the navy was prosecuting various crimes committed on Guam during the Japanese occupation, also war crimes committed in the Kwajalein group and on Wake Island.

As of Dec. 1, 1946, in all theatres, 292 trials had been completed, involving 942 accused. Of these, 85 were acquitted and 857 convicted, 340 were given the death sentence, 102 received life imprisonment and the balance received prison terms ranging from 1-50 years. Offenses for which prisoners were tried included murder, cruelty and torture, starvation and neglect, other assaults and mistreatments, misuse of flag of truce, uniform or emblem and other offenses.

A total of 11,727 suspects were being held in custody under individual suspicion as of Dec. 1, 1946, of which 6,207 were being held for trial by the United States and 5,520 for trial by other nations.

War Mobilization and Reconversion,

Office of. The U.S. Office of War Mobilization and Reconversion was established on Oct. 3, 1944, by act of congress, to co-ordinate the mobilization of the United States

for war and to plan for and guide the transition of the nation from war to peace. By executive order at the same time, the president transferred to OWMR the functions and authority of the Office of War Mobilization, which had been created by executive order May 27, 1943.

Subject to the direction of the president, the director of war mobilization and reconversion is responsible for: co-ordinating and directing federal agencies in reconversion programs, and to this end, issuing orders and regulations to them, and settling disagreements among them; promoting and assisting the development of demobilization and reconversion plans by them; determining the need to simplify, consolidate or eliminate emergency war agencies; determining the need to relax or remove emergency war controls; recommending appropriate legislation to the congress; consulting and co-operating with state and local government, industry, labour, agriculture and other national and local groups on the problems of reconversion; submitting quarterly reports to the president, the senate and house of representatives on activities undertaken or contemplated under the provisions of the War Mobilization and Reconversion act of 1944.

On June 25, 1946, John Roy Steelman, special assistant to the president of the United States, was appointed director of war mobilization and reconversion. Previous directors had been Secretary of the Treasury John W. Snyder (July 1945 to June 1946), Chief Justice of the United States Fred M. Vinson (April 1945, to July 1945) and Secretary of State James F. Byrnes (Oct. 1944 to April 1945).

The act creating OWMR also authorized the president to delegate various powers to the director of reconversion. To advise with the director on reconversion policies, procedures and legislation, the act established an advisory board to represent the general public and the public interest. During 1946 members of the OWMR advisory board were: (public) Dr. George W. Taylor, chairman, Mrs. Anna M. Rosenberg, one membership vacant; (agriculture) Albert F. Goss, Edward A. O'Neal, James G. Patton; (labour) T. C. Cashen, William L. Green, Philip F. Murray; (business) Nathaniel Dyke, Jr., Eric A. Johnston and George H. Mead.

On July 25, 1946, the functions and personnel of the Office of Economic Stabilization were transferred to OWMR and Mr. Steelman became also director of economic stabilization. OES had been established Oct. 3, 1942, in the Office for Emergency Management by executive order of the president, to control as far as possible inflationary tendencies which would hamper the war effort and the operation of the domestic economy. The OES was also made responsible for formulating and developing national policy for the control of civilian purchasing power, prices, rents, wages, salaries, profits, rationing, subsidies and related matters in order to prevent avoidable increases in the cost of living.

On Aug. 15, 1946, when the first full year of reconversion was completed, the director of reconversion reported that considerable progress had been made toward achieving the nation's four major domestic economic goals. These had been set forth when reconversion began: (1) jobs for all those willing and able to work; (2) a steadily rising standard of living; (3) stabilization of the economy to avoid either inflation or deflation; and (4) increased opportunities for farmers and businessmen.

(1) Substantially full employment was reached a year after the surrender of the Japanese, with civilian employment in the United States at 58,100,000 in Aug. 1945, as against 51,200,000 in the slump that followed V-J day. (2) The annual rate of U.S. production of goods and services in Aug. 1946 for civilians was \$73,000,000,000, as against \$127,400,000,000 during the

third quarter, 1945. The rate of production of capital goods and materials going into business inventories had multiplied almost three times—from a rate of \$11,200,000,000 in the third quarter, 1945, to \$33,000,000,000 a year later. Total construction, residential and nonresidential, had increased from a rate of \$2,900,000,000 to \$10,000,000,000. Income payments to individuals reached a rate of more than \$163,000,000,000, or more than 60% above the previous U.S. peacetime peak. (3) Although 13,000,000 men and women had been demobilized by the armed forces (10,000,000 of them after V-J day) their absorption into the civilian economy had been generally smooth and rapid; the nation had avoided the deflation which threatened when war production ceased and readjustment to peacetime began. (4) Business profits before taxes, in most segments of the economy, continued good, while profits after taxes were at record levels. U.S. farmers were harvesting record grain crops and were selling at good prices all the foods and other crops they could produce.

The principal task of the OWMR in 1946 toward achieving these goals was to direct and co-ordinate activities of federal agencies toward securing stabilization of the economy at a high level of production. During this time it was necessary for OWMR-OES to retain some emergency stabilization controls, particularly affecting the relationship between wages and prices, as well as some production controls, as a safeguard against runaway inflation.

As special reconversion problems developed, the OWMR took steps to meet them. To deal with the scarcity of housing, particularly of homes for veterans, the OWMR recommended the appointment of a housing expediter. When the expediter was appointed in Jan. 1946, the director of reconversion delegated appropriate powers to him. The reconversion director took steps to bring scarce building materials under priority, and into construction of moderate priced housing. Throughout 1946 the OWMR co-ordinated activity of federal agencies in developing the Veterans Emergency Housing Program.

An OWMR pilot study on veterans' education, completed early in the year, indicated that 1946 fall enrolment of student veterans in U.S. colleges and universities would severely tax their facilities. To aid them in meeting the educational needs of as many veterans as possible, the director of reconversion drew up a nine-point program of federal interagency action. The OWMR study and program paved the way for appointment by the president of the National Commission of Higher Education to examine the long range problems of higher education in the United States.

On Aug. 5, 1946, the director of reconversion, in order to minimize the inflationary effect of government spending for deferrable public works construction, ordered a cutback in federal construction outlay for the 1947 fiscal year. He directed agencies to stop letting new construction contracts for 56 days, or until Oct. 1, and at the end of the moratorium to let new contracts only after projects had received a strict screening for essentiality.

As a result of these various actions, on Oct. 1, 1946, the director of reconversion was able to report, "We have a chance to maintain high levels of employment for extended periods, and to progress toward higher levels of production and a steadily rising living standard." Nevertheless, inflationary pressures persisted, and he warned: "But we do face an acute threat—the danger that we will be unable to shift from the present situation where demand exceeds supply to one where demand and supply are approximately in balance, without falling to a point of equilibrium on a far lower level of income and production than we now have." (See also CIVILIAN PRODUCTION ADMINISTRATION.)

BIBLIOGRAPHY.—An account of OWMR policies and actions of 1946 appears in the publications of the agency for the year, which include:

Battle for Production, fifth quarterly report of the director of reconversion to the president and the congress (Jan. 1, 1946); *Rubber*, first report of the OWMR Inter-Agency Policy Committee on Rubber (Feb. 19, 1946); *Production Moves Ahead*, sixth quarterly report (April 1, 1946); *The Veteran and Higher Education*, special report to the president (May 20, 1946); *At the Crossroads*, seventh quarterly report (July 1, 1946); *Rubber II*, second report of the OWMR Inter-Agency Policy Committee on Rubber (July 22, 1946). This included the committee's supplementary report, issued June 13, 1946, on the disposal of butadiene and copolymer plants; *The Second Year of Peace*, eighth quarterly report. (Oct. 1, 1946). (J. R. SN.)

War Production Board: see CIVILIAN PRODUCTION ADMINISTRATION; PRIORITIES AND ALLOCATIONS.

War Relocation Authority. The U.S. War Relocation authority, which had been created on March 18, 1942, to provide maintenance and useful employment for the people of Japanese ancestry evacuated from the west coast military zone, realized substantial completion of its wartime job with the closing of its last centre, at Tule Lake, Calif., on March 20, 1946. It had closed the eight remaining relocation centres according to schedule, late in the previous year. One centre was closed on June 30, 1944. During its four-year existence the agency had jurisdiction over a total of about 120,000 individuals. It directly assisted about 110,000 persons to relocate to normal outside communities, slightly more than 50% of whom returned to their west coast homes following revocation of the military ban on Jan. 2, 1945. The remaining few thousands included persons committed to various institutions, deaths and those who were designated by the department of justice as ineligible for relocation.

Certain of the WRA field relocation offices, particularly on the west coast, remained active for several weeks following the closing of the Tule Lake centre and completed the job of assisting the more recent resettlers, some of whom were still living in temporary housing projects, in making more permanent readjustments to life outside the centres. In all localities where any number had gone, the authority arranged for continuation of necessary services to resettlers through recognized local community services, both public and private.

The Washington office was closed June 30, 1946, on schedule. It was expected that final disposition of property and records would be completed by the end of the 1947 fiscal year. This activity was made the responsibility of a small liquidation unit within the department of the interior.

WRA completed its administration of the Emergency Refugee Shelter at Oswego, N. Y., early in Feb. 1946. Under a Dec. 22, 1945, decision by the president, the refugees had been declared eligible to apply for admission to the United States under the regular immigration laws and the quotas of their various countries. Of the shelter's 900 residents at that time, all but a very few elected and were permitted to enter the U.S. They were directly assisted in their resettlement problems by the National Refugee Service and co-operating agencies. (See also ALIENS.) (B. N. L.)

War Risk Insurance: see INSURANCE.

War Savings Stamps: see POST OFFICE.

War Shipping Administration. Established by presidential order Feb. 7, 1942, its wartime operation of the world's largest merchant fleet well done and the initial steps toward peacetime operation taken, the War Shipping administration, by congressional action, transferred its remaining tasks to the U.S. maritime commission at midnight Aug. 31, 1946.

WSA controlled, at the end of World War II, 4,286 ships manned by 250,000 officers and men, of whom 5,800 were killed or missing. About 733 major vessels were lost from direct war causes.

Of the 268,000,000 long tons of outbound cargo, 75% moved on U.S. flagships, but by Aug. 31, a short year from the war's end, WSA had reduced ship allocation to the army and navy from 2,695 to 713, to essential civilian programs from 1,062 to 713, to United Nations Relief and Relief administration and related programs from 1,040 to 655 and assigned 1,593 vessels to the nation's reserve fleet. About 700 government-owned ships had been interim-bareboat chartered to U.S. private operators, 835 redelivered to former private owners, 212 transferred to the army and navy, 56 sold for scrapping and 51 lost from various causes. On Sept. 1 the total ships under government control had been reduced to 1,672.

The domestic service fleet of 467 vessels bore the brunt of shipping needs at the outbreak of war and was reduced to about 200 vessels through war losses. To restore these vital coastwise, intercoastal and noncontiguous services WSA applied for and was granted authority by the Interstate Commerce commission. Unless further extended, this authority was to terminate Feb. 28, 1947. (W. W. SH.)

Washington. A state in the extreme northwest United States, popularly known as the "Evergreen state," admitted to the union Nov. 11, 1889. Total area, 68,192 sq.mi. of which 66,977 sq.mi. are land; pop. (1940) 1,736,191; native 1,525,812; foreign born 210,379. On July 1, 1945, the bureau of the census estimated the civilian population of the state at 1,953,725. Capital Olympia (13,254). According to 1945 estimates the three largest cities had grown perceptibly after 1940; Seattle from 368,302 to 470,000 (est.); Spokane from 122,001 to 144,000 (est.); Tacoma from 109,308 to 139,000 (est.). The urban population in 1940 was 921,969 or 53.1%; in 1945 it was 1,370,134 (est.) or 67.4%.

History.—Despite the largest registration of voters in the state's history, the numbers of votes cast at the primary and general elections were far below those of 1944. The incumbent United States senator and the six congressmen were all re-nominated in the primaries. Political reversals came in the general elections. Harry P. Cain, Republican, defeated Hugh B. Mitchell, Democrat, for the senate by a vote of 358,847 to 298,683. The Republicans elected five of the state's six congressmen. Whereas Democrats had substantial majorities in the 29th state legislature, the count in the 30th would be: house of representatives, Republican 71, Democrats 28; state senate, Republicans 23, Democrats 23.

The voters rejected one initiative measure and two referendum measures. Initiative measure no. 166, upon which the two largest utility companies in the state took opposite views, would have required the approval of voters in utility districts "as a prerequisite to acquisition of any operating electrical utility properties." Referendum measure no. 26 was intended to make the state game commission responsible to the governor, and referendum measure no. 27 was to create a state timber resources board. An amendment to the state constitution "to permit the state to tax the United States and its instrumentalities to the extent that the laws of the United States will allow" was ratified by the electorate.

State officers for 1947: governor, Mon C. Wallgren; lieutenant governor, Victor A. Meyers; secretary of state, Belle Reeves; treasurer, Russell H. Fluent; auditor, Cliff Yelle; attorney general, Smith Troy; state superintendent of public instruction, Pearl A. Wanamaker (elected on nonpartisan basis); chief justice of the state supreme court, Joseph A.

Mallery; speaker, house of representatives, Herbert M. Hamblen.

Education.—During the school year 1945-46, average daily attendance in elementary and secondary schools was 298,944; the total number of certified personnel was 13,353 whose average salary was \$2,529.99. Total expenditures were \$54,274,976.62 and the cost per pupil in attendance was \$181.29.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the period of Oct. 1945 to Sept. 1946 inclusive, the total amount spent for public assistance in the state, including federal direct expenditures and state aid, was \$64,084,446.88. An average of 109,015 persons received assistance to the total amount of \$60,874,727.89. An average of 24,886 persons per month received a total of \$8,276,305.22 for general assistance. An average number of 64,196 old persons received a total of \$45,673,630.01. An average number of 19,316 children received a total of \$6,492,602.67. An average number of 617 blind persons received a total of \$432,220. Ten state charitable institutions which on Nov. 30, 1946, had a total population of 9,606 cost the state \$4,188,063.91 during the year April 1, 1945, to March 31, 1946; four state correctional institutions at this date had a total population of 2,215 and spent \$1,283,043.27 during the above fiscal year.

Communication.—In 1944 there were 5,524 mi. of railroad in the state. In 1946 mileage of both state and rural highways, exclusive of cities or incorporated towns, was 46,049; federal aid funds apply to 8,260 mi. of these. During 1946 up to Sept. 30, the state spent \$10,323,267.84 for construction. In 1944 there were 174,734 business telephones and 275,057 residential units in the state.

Banking and Finance.—The total assessed valuation of all real and personal property subject to tax for the year 1945 was \$1,204,467,845; the bonded indebtedness was \$7,019,000, easily covered by various bond retirement funds. The state aggregate cash balance on Sept. 30, 1946, was \$132,908,861. Total treasury receipts during the biennium ending Sept. 30, 1946, were \$498,032,365, whereas disbursements amounted to \$448,835,071. One hundred and twenty-six banks in the state reported a total capital of \$37,158,000; capital surpluses and undivided profits of \$88,904,000; deposits of \$2,235,425,000 and assets of \$2,347,149,000.

Agriculture.—In 1945 the state had 82,437 farms whose acreage totalled 16,798,214 of which 4,160,000 acres were devoted to the average 52 crops, not including orchards. The total farm income was \$512,399,000; from crops \$311,546,000; from livestock \$159,219,000; from governmental payments \$12,747,000.

Cherries, tons	33,200	36,500
Oats, bu.	6,144,000	6,450,000

Manufacturing and Trade.—In 1939, the latest year for which figures were available in 1946, the total value of products was \$636,649,809; 101,136 salaried persons and wage earners received a total of \$143,412,064. In 1944 the six basic industries were general manufacturing, food products manufacturing, forest products manufacturing, logging, mining and construction. There were 869,200 salaried workers and wage earners; all industry employed labour for 1,003,431,671 man-hours; and the payroll for all industry was \$1,270,266,925. In 1945, all industry employed labour for 804,459,712 man-hours, and the payroll for all industry was \$1,008,495,496.

The Washington customs district reported \$310,879,000 of exports and \$115,072,000 of imports. Landings of sockeye salmon for 1946 exceeded by more than 250% the average for the previous ten years.

Mineral Production.—Mineral production in 1944 amounted to \$36,320,000; estimates for both 1945 and 1946 indicate \$30,000,000 each year. Value of leading metals for 1945 were: zinc, \$2,604,750; gold, \$2,012,500; copper, \$1,604,800; lead, \$619,200. Henry Kaiser acquired the Tacoma and Mead aluminum reduction plants and the Trentwood aluminum rolling mill—war plants.

(H. J. DE.)

Washington, DISTRICT OF COLUMBIA, national capital of the U.S.A., 11th largest of U.S. cities; pop. (1940) 663,091; estimated pop. in 1946, 930,000 and that of the metropolitan area 1,380,000. Government employees at the end of 1946 numbered about 250,000 in the district, more than twice the peak of World War I and 50,000 less than the peak of World War II.

In 1946 there was an acute housing shortage in Washington. Fairlington across the river in Virginia, with 3,439 housing units and McLean Gardens in the D.C. with 728 units, built by Defense Homes Corp., were sold at the close of 1946 to private real estate interests. The National Capital Housing authority continued to administer public housing built under the Alley Dwelling act and the National Housing act, that inherited from PWA and certain war projects—about 8,000 units in all.

Early in 1946, proposals to add permanent wings to the White House for executive offices were disapproved by congress. These would be provided for in the Old State building, across Executive avenue from the White House and the state department was to move into the first of the war department buildings authorized under the plan for the northwest quadrangle but not needed after the erection during World War II of the vast Pentagon building across the Potomac in Virginia.

New legislation in 1946 amended the Capper-Cramton act of 1930 to ensure the ultimate completion of the George Washington parkway from Mount Vernon in Virginia and Fort Washington in Maryland to the Great Falls of the Potomac.

For the year ending June 30, 1947, estimated expenditures for the District of Columbia were expected to amount to \$86,240,248.91. There had been no bonded indebtedness from 1924. The \$8,000,000 federal contribution authorized by congress in 1946 was less than 10% of the total. Once the federal contribution was half, then 40%. In the meantime, private lands were shrinking and in July of 1945 amounted to 15,385 ac. in a total of 31,016, exclusive of streets and alleys. The sole reason for establishing the city of Washington was to provide a seat for the federal government.

BIBLIOGRAPHY.—National Park Service, Department of the Interior, *Thomas Jefferson and the National Capital* (1946). (H. Js.)

Washington, University of (Seattle). In Jan. 1945 the board of regents formally established schools of medicine and dentistry. Instruction of the first classes, consisting of 50 members each, was begun on Oct. 2, 1946.

On Sept. 1, 1946, the resignation of President Lee Paul Sieg became effective and Dr. Raymond B. Allen, formerly executive dean of the Chicago colleges of the University of Illinois, was elected 21st president of the institution.

Due to the large postwar enrolment an appropriation was made by the state government to be used for increased building facilities. Construction was begun on two new buildings, David Thomson hall and C. C. More hall, in the fall of 1946. Further construction was to be started on a new administration build-

ing, a fine arts building, and a student union building.

Many organizations and individuals contributed gifts to the university in 1946; among these were a \$5,000 grant-in-aid from the Research corporation of New York, \$7,700 from the National Foundation for Infantile Paralysis, an E. I. DuPont De Nemours and company postgraduate fellowship in chemistry, and \$25,000 for the endowment of a professorship in pharmacy by Mrs. Edna J. Quick of Seattle. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

(R. B. A.)

Washington University (St. Louis). Washington university, nondenominational and co-educational, is located in St. Louis, Mo. The schools of the university are the college of liberal arts, the schools of engineering, architecture, law, social studies, fine arts, business and public administration, medicine, dentistry, nursing, botany, graduate studies and the university college (principally adult education).

The ninth chancellor, Dr. Arthur Holly Compton, Nobel prize winner and a leader in the development of atomic energy, was inaugurated Feb. 22, 1946.

A 70-family apartment building for faculty members was under construction during the year. Larger gifts during 1945-46 included \$1,564,205.29 for the school of medicine; \$1,250,000 for the establishment of a technological college; \$160,000 for a department of music; and \$40,000 for a new pipe organ for Graham memorial chapel. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Water Supply: see PUBLIC HEALTH ENGINEERING.

Wavell, Archibald Percival, 1ST VISCOUNT, OF CYRENAICA AND WINCHESTER (1883—), British army officer, was born May 5, the son of Maj. Gen. A. G. Wavell. He enlisted in the Black Watch in 1901 after studying at the Royal Military college and the staff college and saw action in the Boer War, in India and in World War I.

From 1937 to 1938 he commanded the British troops in Palestine and Trans-Jordan, and in 1940 he became commander in chief of the British forces in the middle east. His small force of empire soldiers swept the Italians out of Cyrenaica in Libya, and he supervised the operations in East Africa which recaptured British Somaliland and took Italian Somaliland, Eritrea and Ethiopia from the Italians. He suffered serious reverses at the hands of the Germans, however, in Libya, Greece and Crete, and on July 1, 1941, he was dispatched to India as commander of British forces there. On Jan. 3, 1942, he was named supreme commander of Allied armies in the far east, but in March of the same year, he was returned to command of his former post, the India-Burma area. On June 19, 1943, he was appointed viceroy of India and on July 1 was elevated to the peerage as Viscount Wavell. At the Simla conference at which proposals for Indian independence were discussed, Wavell appealed (June 25, 1945) to the Indians for assistance in advancing India "toward prosperity, political freedom and greatness." The conference came to no agreement. After further negotiations in early 1946 produced no results, Wavell and the British cabinet mission in New Delhi agreed to enforce independence and Wavell announced (Aug. 24) appointment of an executive council headed by Pandit Jawaharlal Nehru to govern India as an interim regime pending the drafting of a constitution. He also attended (Dec. 1946) the London parleys on Indian independence. (See also INDIA.)

WAVES: see WOMEN'S RESERVE OF THE NAVY.

Waymack, William Wesley (1888—), U.S. newspaper editor, was born on Oct. 18 in Savanna, Ill. After graduating from Morningside college at Sioux City, Ia., in 1911, he became a reporter for the *Sioux City Journal*, rose to the post of city editor, and was chief editorial writer when he left in 1918 to take a similar position with the *Des Moines Register and Tribune*. He was awarded the Pulitzer prize in 1937 for distinguished editorial writing. Named vice president of the Register and Tribune company in 1939, he became editor of the newspaper in 1942. Mr. Waymack devoted much of his career to public service and held numerous official assignments with the federal reserve bank, the National War Labor board, the War Food administration, the departments of state and agriculture and was a member of Pres. Roosevelt's Committee on Farm Tenancy. He also was a director of the Carnegie Endowment for International Peace, the American Association for United Nations, Freedom House, Inc., the Woodrow Wilson foundation, the National Conference of Christians and Jews, Council for Democracy, Russian War Relief, Inc., and a member of the Allied commission that observed the Greek elections in 1946. On Oct. 28, 1946, Pres. Truman named him to the U.S. Atomic Energy commission, created for the purpose of directing and controlling the development of atomic energy in the U.S.

Wealth and Income, Distribution of.

U.S.—A report on the distribution of liquid assets and income was published in 1946 by the U. S. bureau of agricultural economics for the federal reserve board. The report was entitled *National Survey of Liquid Asset Holdings, Spending, and Saving*, and provided data for the year 1945 on the basis of a small field canvass of family spending units.

The summary data on liquid asset holdings are provided in Tables I and II. The liquid assets covered by these data include government bonds and saving and checking accounts. The survey was unable to obtain satisfactory information on holdings of currency.

Table I.—Distribution of Spending Units and Liquid Assets by Amount of Liquid Asset Holdings*

Total liquid asset holdings	Proportion of spending units	Percent of total liquid assets held
None	24%	0%
1-399	26	3
400-1799	30	20
1,800-3,399	10	17
3,400 and over	10	60
All spending units	100%	100%

*The term "total liquid assets" is used to represent total holdings in U.S. government bonds and in savings and checking accounts.

Table I shows the distribution of the spending units—either single individuals or family groups who pool their major items of income and expense—according to their holdings of liquid assets. It may be seen that these holdings were very unevenly distributed over the spending units. The majority of spending units held either no liquid assets or only small amounts, while a small minority of the units held sizable amounts of government bonds and bank deposits. Almost one quarter of the spending units held no assets of the types covered by this survey, while the second quarter of the spending units held small amounts ranging up to \$400 and accounting for only 3% of total liquid assets. This means that 50% of the spending units had virtually no reserves of government bonds and bank deposits.

The unevenness of the distribution of liquid assets continues through the upper half of the spending units. In the group with asset holdings ranging from \$400 to \$1,800, there were 30% of

the spending units, but this 30% held only 20% of the total liquid assets. At the upper end of the distribution in the group holding \$3,400 and over, there were only 10% of the spending units, but they held 60% of the total liquid assets.

Table II.—Distribution of Spending Units and Liquid Assets by Income Classes

Income bracket	Proportion of spending units	Percent of total liquid assets held*
\$ 0-999	20%	7%
1,000-1,999	27	14
2,000-2,999	23	17
3,000-3,999	15	16
4,000-4,999	7	10
5,000-7,499	5	13
7,500 and over	3	23
All spending units	100%	100%

*The term "total liquid assets" is used to represent total holdings in U.S. government bonds and in savings and checking accounts.

Table II shows the distribution of spending units and liquid assets by the size of income of the spending units. It is readily apparent from these data that the 50% of the spending units holding negligible liquid assets is not so highly concentrated at the lower end of the income scale. While 20% of the spending units had incomes under \$1,000, they, nonetheless, held 7% of total liquid assets. The group with incomes of under \$2,000 contained almost 50% of the spending units, and these units held more than 20% of the assets total.

There was, however, a very marked tendency for the higher income groups to have substantially larger accumulated savings in the form of liquid assets. The group with incomes of over \$4,000 contained 15% of the spending units, but this group owned 46% of total liquid assets.

Interest in the distribution of liquid assets arose from its possible effect upon the postwar level of economic activity. Because the holdings of these assets were so concentrated, it must be concluded that the effect on the postwar economy would depend largely upon the decisions of a small part of the population. The survey inquired into the intentions of the spending units in regard to possible disposal of their liquid assets and found that the majority considered their liquid assets as a nest egg for long-range purposes. They did not intend to use those assets for their current expenditures even for durable goods and housing but planned to finance these outlays out of current income or borrowing. It is interesting to note that the majority of the savers expected to save much less in 1946 than they did during the war years, even though they did not plan to spend a sizable proportion of their accumulated holdings. The data on current savings in the year 1946 show that these intentions were carried out.

As the survey of liquid assets included information on the size distribution of income, the changes in the distribution over the past ten years can be traced by comparison with earlier studies. Such a comparison is presented in Table III. It can be seen that the distribution of income at the present time differs greatly from the prewar pattern.

Table III.—Distribution of Spending Units, Income, and Saving by Income Classes in 1935-36, 1941 and 1945*

Annual income (money income before taxes)	1935-36			1941			1945		
	Spending units	Total income	Total saving	Spending units	Total income	Total saving	Spending units	Total income	Total saving
Under \$1,000	53%	20%	30%	35%	9%	6%	20%	4%	1%
\$1,000-\$1,999	31	33	15	30	21	9	27	16	11
\$2,000-\$2,999	10	17	21	20	24	11	23	23	14
\$3,000-\$4,999	4	11	22	10	18	18	22	32	36
\$5,000 and over	2	19	72	5	28	68	8	25	40
All classes	100%	100%	100%	100%	100%	100%	100%	100%	100%

*Figures for 1935-36 and 1941 are taken from *Spending and Saving of the Nation's Families in Wartime*, Bureau of Labour Statistics Bulletin No. 723, Oct. 1942. Table I of this BLS bulletin gives the distribution of income by income classes, and Tables I and IV were used to estimate total net saving by income classes.

The 1935-36 data were originally developed in the *Study of Consumer Purchases, 1935-36*, made by the National Resources Committee. The material for 1941 represents a combination of the results of two surveys—the one a survey of spending units in urban areas made by the Bureau of Labour Statistics, and the other a survey of spending units in rural areas made by the Bureau of Home Economics, U.S. Department of Agriculture. For 1945, the data are taken from the national liquid assets survey.

Readers are cautioned that the findings of these three surveys are not strictly comparable. The various surveys differ somewhat in the definition of spending units, in the coverage of spending units and in the methods used in collecting the data. The figures in this table, therefore, can not be used to measure precise changes in income and saving by income classes. However, it is believed that the table accurately shows the nature of certain broad changes which occurred in the pattern of income and saving during the war years. In the table, income refers in all cases to money income before taxes and excludes income in kind.

The major trends over the war period were a shifting of spending units from the lower to the higher income groups and a large decline in the percentage of saving that was accounted for by the spending units with high incomes. In 1945, the spending units were relatively evenly distributed over the income classes up to \$5,000, while in both the earlier years for which data were available they were much more concentrated in the lower income groups. More than half of the spending units in 1935-36 had incomes of under \$1,000, but as economic conditions improved this income class declined to 35% in 1941 and to only 20% in 1945. A large change came in the number of units receiving over \$2,000. In 1945, more than half of the spending units had incomes of \$2,000 and over in contrast to 35% in 1941 and to only 16% in 1935-36. At

the upper end of the income scale in the group with earnings of \$5,000 and over, there were 8% of the spending units in 1945 compared with only 2% ten years earlier.

Inasmuch as the rise in incomes had the effect of shifting family units out of the smaller income groups, the families remaining in those groups received a much smaller proportion of the total income in 1945 than they did in 1935-36. For example, the spending units with incomes of under \$2,000 received 20% of total income in 1945, while the much larger number of units in this income class received 30% of total income in 1941 and 53 percent in 1935-36. This does not mean that the low income families failed to participate in the increase in income but rather that, by participating in the increase in income, they had been shifted out of the low income category.

State Distribution of Income Payments.—Estimates of income payments to individuals by states are presented in Table IV for the years 1940, 1944 and 1945.

Table IV.—Distribution of Income Payments by States

State and region	Aggregates (\$'000,000)			Percentage increase in total income payments		Per capita income payments (\$)	
	1940	1944	1945	1940-1945	1944-1945	1940	1945

*Less than five-tenths of 1%.

Owing to the severe decline in war production following the end of the war in the Pacific, state income payments increased by only 2% in 1945. This was the smallest gain in income since 1939. In all regions of the country, the change in income in 1945 was of small proportions. For six of the seven regions, the flow of income was equal to or slightly larger than the record levels of 1944, while in the far west there was a small decline. The change in the income pattern by states was similarly restricted to a narrow range, from a decline of 5% at one end of the scale to an increase of 16% on the other. However, 42 states had changes in total income that ranged from a rise of 7% to a decline of 3%. In the main, the agricultural states gained in income in 1945, while the states showing decreases were those accounting for large proportions of war production.

Over the entire war period from 1940 to 1945, the regional changes in income were much more varied. Only the central states region experienced an increase in income which was approximately equal to the national average. With income payments for the nation rising 101%

over this period, the central states recorded a rise of 97%. New England and the middle east states were the two regions which had gains significantly less than the national average, 75% and 77% respectively. On the other hand, the other regions had increases substantially exceeding the national average: 140% in the southeast; 133% in the southwest; 128% in the northwest; and 140% in the far west.

It may be seen that these changes in income involved a relative shift of income from higher income regions to lower income regions, thereby reducing the relative differences in the income levels over the country. This pattern of change is largely in accord with prewar trends, though these trends were accelerated during the war years.

Despite a tendency toward reduction of inequality among the states in per capita income—accelerated by war developments—broad differentials still existed, as shown by the table. In 1945, states in which per capita income was less than that of the country as a whole had a composite average two-fifths below the comparable average of states where per capita income exceeded the nation-wide average.

Underlying the differentials in per capita income were significant geographic differences in industrial structure. In general, states with per capita income above the national average showed relatively large proportions of the labour force employed in manufacturing, mining, construction, and the distributive and service industries; relatively small proportions were in agriculture and domestic service. Characteristics of the low-income states were exhibited in marked degree by the southeastern states, where average incomes were the lowest in the country. The southeast placed heavy dependence upon agriculture and domestic service as sources of income. On the other hand, it had relatively fewer workers in the manufacturing and distributive and service industries, where average earnings were considerably higher than in agriculture and domestic service. This "unprofitable" distribution of the southeast's working population explained in large measure the lowness of the region's per capita income. Furthermore, the level of farm income in this region was substantially lower than elsewhere. (See also INCOME AND PRODUCT, U.S.) (M. Gr.)

Great Britain, Commonwealth and Europe.—During 1946 reliable estimates of income distributions were published in Canada, Sweden and the United Kingdom only, but no distributions of wealth were published for recent years. The latest statistics available for Sweden

Table V.—Distribution of Incomes in Sweden, 1943

Ranges of income Kr.	Number of incomes 000's	%	Amount of income million kr.	%

analyzed the distribution for 1943, a summary of which is given in Table V.

In the United Kingdom a distribution of income was published for 1944 in the annual official estimates relating to national income and expenditure. This was in a form comparable with the similar distribution for 1938, and is given in Table VI. The Swedish estimates excluded incomes below a low level, mainly occasional incomes, but in the United Kingdom the amount of all incomes received by persons was included; it is, however, difficult to estimate the number of incomes in the lowest group, including incomes from social insurance and assistance funds, and a private estimate was added to complete the table.

Table VI.—Distribution of Incomes in the United Kingdom, 1944

Ranges of income £	Number of incomes 000's	%	Amount of income million £	%
Under 250	(20,000)	73.4	3,569	46.4
250–500	5,200	19.1	1,830	23.8
500–1,000	1,400	5.1	995	12.9
1,000–2,000	520	1.9	729	9.5
2,000–10,000	117	0.4	415	5.4
10,000 and over	8	0.03	155	2.0
TOTAL	(27,250)	100.0	7,693	100.0

Note: £1,301,000,000 of private incomes, consisting mainly of excess profits tax and undistributed profits of companies, could not be allocated to ranges of income and are not included in the total shown. Incomes from social insurance and assistance are included in the lowest range.

Source: National Income and Expenditure of the United Kingdom, 1938–1945 (Cmd. 6,784 1946). Figures in brackets are private estimates.

In Canada a pioneer study was published for 1942 in the annual official estimates relating to national income and expenditure. This distribution, however, excluded incomes derived from agricultural occupations which were impossible to estimate accurately. The Canadian estimates were based on a reconciliation of income-tax statistics and the census of 1941, and were prepared by academic and government statisticians in collaboration. Separate distributions were published for married men and others, and for each of the provinces. A summary is given in Table VII. The total covers about one-half of the national income.

A comparison of the three distributions given above can not be fruitful since the basis of estimates is to some extent different in different countries. But on the whole no significant differences can be observed between these distributions. It must be remembered, however, that the figures refer to incomes before tax, and that the incidence of taxation is not the same in these countries.

The estimates for Canada were the first of their kind. The estimates

for the United Kingdom can be compared with prewar figures and show a diminution of the inequality of incomes, due partly to full employment during the war and partly to a great rise in wages, while the higher incomes remained stable because of excess profits taxation and consequent limitation of dividends. The diminution of inequality seems even more marked when wartime changes in the incidence of taxation are also taken into account; taxation on all classes increased heavily but in the higher ranges of income it became almost prohibitive. But with a return to peacetime taxation the inequality of distribution was likely to increase again. (See also BUDGET NATIONAL; CENSUS DATA, 1946.)

Wellesley College. A four-year liberal arts college for women, founded in 1870 by Henry Fowle Durant and located in Wellesley, Mass. Facilities were taxed to the utmost in 1946 to accommodate 1,685 students, who comprised the largest enrolment in the history of the college. Pre-eminently for candidates for the B.A. degree, Wellesley offers also the degrees of M.A., M.A. in education, M.S. and a certificate in hygiene and physical education.

When in Feb. 1946 the Academic council voted unanimously to approve the report of the Faculty Committee on Long Term Educational Policy, Wellesley joined other colleges in adopting a revised curriculum after a prolonged study. While the revised curriculum includes no radical departures, it reiterates the faith of the college in a liberal arts program organized to help students to acquire competence in one field of study and to introduce them to methods of work and ways of thinking in several representative fields of knowledge.

The Second Quadrennial institute of the Mayling Soong foundation was held at the college. "Problems of American Policy in the Pacific" was the title of the institute.

"Windows to the World," which was sponsored by the college government under the guidance of the United Nations Information office, was the first U.N.I.O. project to be undertaken at a college. The entire college participated in the six weeks project aimed at acquainting the students with the conditions, problems and ways of life of various nations.

The Wellesley Institute for Foreign Students conducted for six weeks during the summer was established to orient 45 men and women students from 23 countries to North American college life and community living and to help them acquire greater comprehension of the English language. It was unusual in its attempt to teach students with 11 different language backgrounds, who were registered for entrance to 27 different colleges or universities.

(For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (M. M. HN.)

Wells, Herbert George (1866–1946), British author, was born on Sept. 21 at Bromley, England. For his early career, see *Encyclopædia Britannica*. Historian, sociologist, prophet and Utopian, he authored more than 76 books and was a major literary figure of his time. In 1937, during his first lecture tour in the United States, he predicted the outbreak of war within two years. Wells despaired of the possibilities of peace because he felt that the general edu-

cational standard throughout the world was too low for man to know how to avoid armed conflict. After the start of World War II, he became England's leading pamphleteer, repeatedly expressing his conviction that the nazis could not overcome the English spirit. He branded the Chamberlain cabinet as a "grossly incompetent government," and even after Chamberlain's resignation, he continued to denounce individual cabinet ministers. When the German-soviet nonaggression pact was signed in Aug. 1939, Wells again proved his prophetic discernment in maintaining that the alliance was ephemeral and would be broken by a nazi aggression. In 1941, he published the novel *You Can't Be Too Careful* and one year later won a doctorate in science at the London university with his thesis "Quality of Illusion in the Continuity of the Individual Life in the Higher Metazoa, with Particular Reference to Homo Sapiens." In the latter days of the war, he opposed Winston Churchill, labelling the prime minister as a "would-be British fuehrer" in an article entitled "Churchill Must Go." After the first atomic bomb was dropped on Hiroshima in Aug. 1945, Wells, who had predicted the atomic age in a novel *The World Set Free*, 31 years earlier, warned "this can wipe out everything bad—or good—in this world. It is up to the people to decide which." Perhaps more important than appraisals of his influence was his own evaluation of himself, contained in a self-written obituary issued ten years before his death, in which he said in part: "Wells was a copious and repetitive essayist upon public affairs. . . . His keenest feeling seems to have been a cold anger at intellectual and moral pretentiousness. The question of whether he was to be considered a humorist was never settled and need not trouble us now." After publication of his last book, *Mind at the End of Its Tether* (1944), he said he had nothing more and never would have anything more to say. However, he again aroused public interest in July 1946 with an article in the *Socialist Leader*, in which he called for exile of the British royal family. He implied that its members were involved in financial dealings between the Italian government and Sir Oswald Mosley, British fascist leader—a charge which was ridiculed by the King's Keeper of the privy purse, and Mosley. Wells died in London on Aug. 13.

West Africa, British: see BRITISH WEST AFRICA.

Western Australia. A state of the Australian commonwealth; area: 975,920 sq.mi.; pop. (est. June 30, 1945): 490,152. Chief city: Perth (Dec. 31, 1943, 263,000). Governor: (vacant in 1946); lieutenant governor in 1946: Sir James Mitchell.

History.—The Labour government remained in office throughout 1946, but, as a result of the biennial elections for the legislative council, the Liberals increased their majority in that house. The government appointed William Kitson (chief secretary) to succeed M. F. Troy as agent-general in London. Agricultural returns were above the average and industrial expansion was planned by the government. The plant for potash production, established during the war, was being triplicated, and plans were prepared for the establishment of a major iron and steel industry with an annual output of 110,000 short tons of charcoal iron, as well as methanol and wood naphtha.

Education.—In 1943: state primary schools 748; average attendance 48,337. State secondary schools 6; average attendance 1,770.

Finance.—Revenue (1944-45) £A13,954,000; expenditure (1944-45) £A13,949,000; debt outstanding (June 30, 1945) £A95,895,000.

Communication.—Roads (1940) 29,722 mi.; railways (1945) government 4,381 mi. Motor vehicles licensed (Dec. 31,

1945): cars 30,486; commercial vehicles 25,843; cycles 5,120. Wireless receiving set licences (Dec. 1945) 102,622.

Agriculture and Manufacturing.—Production (in short tons): wheat (1945-46) 615,000; wool (1944-45) 43,000; gold (1945) fine oz. 468,550. Industry and labour (1944-45): factories 1,797; employees 29,146; gross value of output £A31,741,000; unemployment (trade union returns) (Feb. 1946) 1.6%.
(W. D. MA.)

West Indies. An archipelago between Florida and the South American coast opposite the mouth of the Orinoco river. The West Indies include the Greater Antilles (in order of size, Cuba, Haiti, Jamaica and Puerto Rico), the Lesser Antilles between Puerto Rico and the Venezuelan coast, the Bahama group northeast of Cuba, and certain more distant islands, including Curaçao and Aruba near the mouth of Lake Maracaibo in Venezuela. The land area is approximately 92,000 sq.mi. The population is about 13,250,000 (1945 est.) and in racial composition is approximately 75% white and 25% Negro and mulatto in Cuba and Puerto Rico, and from 80% to 100% Negro and mulatto elsewhere, except that in Trinidad about 40% are of East Indian origin. Roman Catholicism is the predominant religion. Languages include Spanish, English, French and Dutch, in addition to various patois largely of African origin. Politically, the West Indies include the three independent republics of Cuba, Haiti and the Dominican Republic, two United States territories, and six British, two French, and one Dutch colony. In addition to prewar bases, the West Indies are the location of five U.S. naval bases, the sites for which were obtained from Great Britain in 1940.

History.—The chief general development of 1946 was the holding of the second West Indian conference and the closer economic and political co-operation that resulted from it. The conference was held in the U.S. Virgin Islands from Feb. 21 to March 13. It had been preceded by an earlier conference, held at Bridgetown, Barbados, in March 1944. The conferences were the outgrowth of an Anglo-United States agreement of March 9, 1942, establishing the Anglo-American Caribbean commission to concern itself with social and economic problems of the two powers' Caribbean possessions. The arrangement was broadened, *de facto*, in 1945 to include representatives of the French and Dutch colonies. Possessions of all four powers sent delegates to the Virgin Islands conference. The conference recommended the holding of successive conferences at two-year intervals. It approved the formal broadening of the territorial scope by which the Anglo-American Caribbean commission became simply the Caribbean commission. Other recommendations included the establishment of an economic section, the setting up of basic norms for social legislation, broadening the work of the previously established research council, publication of a quarterly journal, consideration of widened export markets, agricultural and industrial diversification, soil surveys, the holding of special conferences on industrial development and tourism, control over hotel rates and services, lower freight rates and the elimination of discrimination in the European trade, co-operation in plant and animal disease control, establishment of relations with U.N.E.S.C.O., etc. The governments concerned reached an agreement at Washington July 15 (formally signed Oct. 30) to set up the machinery required. Lawrence W. Cramer, former governor of the U.S. Virgin Islands, was appointed secretary general of the Caribbean commission; it was agreed that the deputy secretary general should be either Dutch or French. Offices of the Caribbean commission were opened at Port of Spain, Trinidad, at the end of October.

The proposed tourist conference was held at New York city, Sept. 30–Oct. 8. It recommended establishment of a Caribbean

Tourist Development association and estimated the West Indies annual tourist potential at 600,000 persons.

Trade and Communication.—The economy of the West Indies is primarily an agricultural export economy, based chiefly on sugar. The only important exceptions are petroleum and asphalt production in Trinidad and oil refining in Curaçao and Aruba, although many of the islands have mineral resources of greater or less potential value. The Cuban sugar crop (much the most important portion of all sugar production) was down in 1946, due to droughts, but greater production was anticipated for 1947.

Cuba maintains the largest mileage, both in railways and highways, of any of the West Indian units. Principal developments during the year were in aviation. Pan American Airways, K.L.M. (Royal Dutch Airlines), and British West Indian Airways all considerably expanded their Caribbean flights.

Agriculture.—Droughts adversely affected sugar and other agricultural production in various West Indian units during 1946. The banana industry, an important one in several islands, was injured by inroads of the Sigatoka disease, although it had almost entirely recovered from the effects of the hurricane of Aug. 20, 1944, felt especially in Jamaica. The St. Thomas conference in March 1946 proposed the early convening of a technical conference of soil scientists in Puerto Rico. West Virginia. The 35th state in the union was conditionally admitted on Dec. 31, 1862, and proclaimed a separate state on April 20, 1863, effective 60 days later. It has an area of 24,282 sq.mi., of which 148 sq.mi. are water surface. The population (1940) was 1,901,974, of which 1,742,320 were white and 41,782 were foreign born. The urban residents numbered 534,292 or 28.1% of the total population. Charleston (pop. 67,914) is the capital. Other cities, in the order of size, are: Huntington (78,836), Wheeling (61,099), Clarksburg (30,579), Parkersburg (30,103), Fairmont (23,105) and Bluefield (20,641).

History.—The chief state officers in 1946 were: governor, Clarence W. Meadows; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney general, Ira J. Parthlow; state superintendent of free schools, W. W. Trent. In the 1946 general election a registered Democratic majority of 178,000 was all but wiped out at the polls. Harley M. Kilgore (D.), was re-elected to the U.S. senate over Thomas B. Sweeney (R.) by about 3,500 votes, and Frank C. Haymond (D.) was elected by about the same majority to the state supreme court of appeals to succeed Judge H. H. Rose, deceased. Representatives in congress elected in Nov. 1946, were: First district, Francis J. Love (R.); second district, Melvin C. Snyder (R.); third district, E. G. Rohrbach (R.); fourth district, Hubert S. Ellis (R.); fifth district, John Kee (D.); sixth district, Dr. E. H. Hedrick (D.).

Education.—For the year 1945-46 the total pupil enrolment (net) in the 4,229 state elementary schools was 283,989. In the 380 state high schools it was 126,684. There were 10,010 elementary and 5,095 high school teachers. The total state appropriation for elementary and secondary education was \$21,-

364,029. The state supported nine teacher-training colleges which in the first semester had a total student enrolment of 5,669 and teaching staff of 245. It also supported the university (Morgantown), West Virginia State college (Negro institute), West Virginia Institute of Technology (Montgomery), and Potomac State school (Keyser, a junior college under control of the university).

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ending June 30, 1946, the total expenditure for old-age assistance was \$3,641,070.50; for the blind, \$184,408; for dependent children, \$2,653,127. The total cost, including administration, was \$6,857,790.88. The total general relief fund was \$1,198,980.99. Eight correctional institutions were largely self-sustaining but they cost the state in excess of \$150,000, additional.

Communication.—In 1945-46 the state contained about 3,350 mi. of steam railway, or 6,677 mi. including double tracks and sidings. There were about 300 mi. of electric railways, 17,161 mi. of improved highways (15,559 hard surfaced), and a road system aggregating 33,186 mi. both primary and secondary. There were a number of air fields and hangars, and others were in process of construction. There were 247,060 telephones (Bell, 218,795, and connecting lines, 28,265), not including 2,700 local nonconnecting phones.

Banking and Finance.—On June 30, 1946, the total deposits of the 103 state banks and trust companies were \$397,649,285.93; the total for the 76 national banks was \$489,646,489.03; resources of 22 federal savings and loan associations were \$28,888,586.82; resources of 20 active building and loan associations were \$9,620,320.77; and resources of 22 loan companies were \$10,134,071.21. State receipts for 1945-46 were \$164,906,647.13; disbursements, \$163,402,728.54; balance, June 30, 1946, \$31,569,877.50. On July 1, 1946, the total state funded indebtedness was \$62,222,000. Total state debt (gross), \$62,222,000; net, \$57,022,476.

Agriculture.—The total cash income from farm crops and livestock in 1945 was \$86,207,000; income from government payments was \$4,148,000. The number of farms in 1945 was 97,600 with a total acreage of 8,741,017, valued at \$341,000,000.

Principal Agricultural Products of West Virginia, 1945

	Yield, 1945	Value, 1945
Corn, bu.	12,996,000	\$20,534,000
Wheat, bu.	1,768,000	2,882,000
Oats, bu.	1,750,000	1,592,000
Buckwheat, bu.	172,000	227,000
Hay (all), tons	1,020,000	21,216,000
Apples (commercial), bu.	1,950,000	6,298,000
Potatoes (Irish), bu.	2,880,000	5,386,000
Barley, bu.	230,000	283,000

Industry.—In 1944-45 industry and business employed 439,274 persons who earned \$959,561,000 in a total estimated production valued in excess of \$1,000,000,000. In the order of the number of persons employed, the largest industrial groups, together with the total sums paid each, were: coal mining and coke making, 106,386—\$302,576,000; iron, steel and metals, 48,922—\$127,025,000; chemical and allied products, 19,326—\$57,778,000; glass and glassware, 15,866—\$32,543,000; lumber and wood products, 13,974—\$20,490,000; clothing and textiles, 13,420—\$23,353,000; clay, stone, etc., 12,313—\$21,841,000; automobiles and trucks, 11,606—\$23,471,000; petroleum and its products, 9,967—\$21,052,000; construction (not buildings), 9,288—\$18,103,000 and public utilities, 9,129—\$18,935,000.

Mineral Production.—The production of crude oil for 1945 was 2,903,000 bbl.; in 1944 the natural gas production was 200,000,000,000 cu.ft.; coal (1944), 163,845,000 short tons; and coke (bee-hive and by-products, 1944), 3,016,548 short tons. The total value of mineral production (1944) was \$612,366,000.

Whaling: see FISHERIES.

Wheat. The 1946 United States wheat crop was the third record-breaking crop in succession being 4% more than in 1945 which was 7% more than in 1944. In only one other year in history, 1915, did the wheat crop exceed 1,000,000,000 bu. The 1946 record was attributed primarily to large acreage of winter wheat, low winter loss and favourable growing weather in the spring.

Total production in 1946 was estimated at 1,155,715,000 bu. compared with 1,108,224,000 bu. harvested in 1945; 1,078,647,000 bu. in 1944 and a 10-yr. average of 843,692,000 bu., 1935-44. The crop was made up of 873,893,000 bu. winter wheat and 281,822,000 bu. spring varieties. The acreage harvested was 67,201,000 ac., 3% more than the 62,120,000 ac. of 1945 and the average of 55,404,000 ac., 1935-44. The 1946 acreage was the largest after 1938. The acreage of winter wheat lost from winter damage was estimated at 3,696,000 ac. and of spring wheat 613,000 ac., a relatively small total, since in 1933 19,000,000 ac. of winter and spring wheat were lost. The average yield for the nation was 17.2 bu. per acre compared with 17 bu. in 1945 and a 10-yr. average of 15.3 bu. Winter wheat averaged 18 bu. per acre and spring wheat 15.1 bu. The notably high yields by states were: Washington 29.5 bu. per acre; Idaho 27.5 bu.; New York 26.3 bu.; Ohio, 26.5 bu.; Michigan 26.5 bu. and Oregon 25.6 bu. The leading wheat state, Kansas, had a yield of 16.2 bu. and the second state, North Dakota, 13.7 bu.

The 1946 winter wheat crop of 873,893,000 bu. was 6% more than the previous record in 1931. The area of winter wheat was 48,510,000 ac., which was exceeded only in 1919 and 1938. The seeding was favoured by good weather in the fall and the winter loss was small, only 7.1%. Harvest was favoured by good weather.

Spring wheat production at 281,822,000 bu. was the smallest crop after 1942. The acreage harvested was 18,691,000 ac. compared with a 10-yr. average of 16,290,000 ac., 1935-44. The

crop got a poor start in the spring because of dry weather in the northwest plains states. Yields were high in the Pacific northwest states. The durum crop yield was 14.6 bu. per acre, almost 2 bu. less than in 1945, but the crop was 2,453,000 bu. compared with an average of 2,488,000 bu. in 1935-44. The dry spring reduced the output in the Dakotas while Minnesota had a yield 2 bu. higher than in 1945. Other spring wheats were also affected by the dry spring and the yield, 15.1 bu., was about a bushel less than in 1945.

Production of wheat by classes was: hard red spring 214,361,000 bu.; durum 36,317,000 bu.; hard red winter 581,832,000 bu.; soft red winter 196,947,000 bu. and white wheat 126,258,000 bu. The production of hard red winter and white wheats was the largest on record. Durum was more than in 1944-45 although at low level.

The demand for wheat for relief became acute in early 1946. The total world requirements for imports were put at 1,200,000,000 bu. for the year ending in June 1946. The requirements of the fall of 1945 had been met with difficulty, largely by exports from North America. Jan. 1 stocks in the United States were estimated at 689,000,000 bu. By July 1 these stocks had shrunk to 101,500,000 bu., the lowest in 20 yr. except for 1937, and only one-half the 1932-41 average. To secure the wheat needed for export the government put a 75% milling rate, compared with 1945, into effect. To speed the movement of wheat off farms the Commodity Credit corporation (CCC) began buying wheat in early spring, paying any market price the farmer would choose up to April 1947. On April 19 the government offered a bonus of 30 cents per bushel for wheat delivered by May 25. On May 13 the wheat price ceiling was raised 15 cents per bushel. These plans brought in about 85,000,000 bu. of wheat for export but had the effect of preventing mills from obtaining sufficient wheat, and bread supplies became short in some localities. The government then loaned wheat from its stocks to be replaced by the mills later if needed for export.

The use of wheat in the United States in the year ending June 30, 1946, was the largest in history; civilian and military

WHEAT being piled on the ground at Brandon, Colo., July 6, 1946, because of lack of storage space to accommodate the bumper crop

food 495,000,000 bu.; seed 82,000,000 bu.; alcohol 21,000,000 bu.; feed 320,000,000 bu. Exports in the same period reached 386,000,000 bu. In December the United States agreed to export a total of 400,000,000 bu. of wheat during the year ending June 30, 1946. In order to reach the quota 15,000,000 bu. of corn was substituted for wheat. This amount of 400,000,000 bu. was an all-time record, compared with the previous record for a single year of 335,000,000 bu. shipped in 1914-15. Exports during the July-September quarter were about 75,000,000 bu. and were estimated to reach 150,000,000 bu. by December. By Oct. 1 total stocks of wheat had increased to 956,521,000 bu. compared with 1,030,383,000 bu. in 1945 and an average of 884,744,000 bu., 1937-44. Stocks retained on farms were relatively large because of transportation delays resulting from shortage of cars.

The price of wheat to farmers averaged \$1.54 per bushel in Jan. 1946 compared with \$1.46 a year earlier and a prewar average of 83 cents in Jan. 1935-39. Little advance occurred until May when the average price was \$1.70 per bushel, not including the 30 cents per bushel bonus offered for immediate delivery in that month. By July 15 the price had advanced to \$1.87 per bushel; September \$1.79; October \$1.88 and November \$1.89. The export demand and shortage of cars for shipment were price-supporting factors. On Oct. 24 price controls were removed from flour, bread and bakery products. The CCC began buying in September and by Oct. 25 had bought 85,000,000 bu. to cover export requirements. Shipments were delayed and elevators and farm storage were filled until November.

Domestic consumption of wheat was estimated at 154 lb. per capita in 1946, compared with 164 lb. in 1945 and 153.1 lb. average, 1935-39. This indicates that domestic consumption was held down about 10 lb. per capita to save supplies for export. About 3.5 lb. of wheat per capita are used each year as breakfast foods. The U.S. people had available about 3,320 calories per day compared with 3,250 calories average, 1935-39. They actually consumed more meat, milk, vegetables and canned foods than in 1945. The use of wheat for making alcohol and beverages was prohibited during most of the year. Use of wheat for livestock feed was also limited to 180,000,000 bu. A goal of 71,100,000 ac. of wheat for 1947 was announced by the United States department of agriculture, about 70% to be winter wheat. With yields as good as in 1946 this would return another billion bushel crop. The chief need was to restore domestic stocks against a crop failure.

The world wheat crop was estimated in late 1946 at about 4,200,000,000 bu. compared with 3,570,000,000 bu. in 1945 and a prewar average of 4,040,000,000 bu., 1935-39. This estimate did not include the soviet union or China. This crop for the 1946-47 year would be the largest after 1940; 18% more than in 1945 and 4% more than the prewar average. The European crop was one-third larger than in 1945 but still 16% less than the prewar average. The greatest improvement was in France, Italy, Spain and the lower Danube valley. Floods reduced the crop in the British Isles and Scandinavia. A few private estimates on the soviet union indicated a gain in wheat production over 1945 but still a shortage compared with prewar. The Canadian crop was estimated at 440,567,000 bu. compared with 305,912,000 bu. harvested in 1945. Argentina's crop was expected to be about 200,000,000 bu. and the western hemisphere as a whole was expected to produce more than 40% of the world's total outside of the soviet union and China.

The Canadian government pegged the export price of wheat at \$1.55 per bushel through most of 1946. This policy was changed in September to sell to countries other than the United Kingdom at about the same as United States export prices. The minimum price guaranteed to Canadian producers until 1950

was \$1.35 per bushel for No. 1 Northern. A 4-yr. contract was made with the United Kingdom to sell 160,000,000 bu. wheat in 1946-47 at \$1.55 per bushel; the same in 1947-48; 140,000,000 bu. in 1948-49 at a negotiated price and 140,000,000 bu. in 1949-50 at a price to be agreed upon. The Australian government guaranteed growers a fixed price for five years which would be related to the export price by agreement.

Table I.—U.S. Wheat Production by States, 1946 and 1945

		(In thousands of bushels)			
State	1946	1945	State	1946	1945
Kansas	216,768	207,939	Utah	6,981	6,776

*Revised estimates by the U.S. department of agriculture on basis of incomplete reports from several countries with adjustments for year of harvest.

45,700,000 bu. in 1935-39 and 824,000,000 bu. in 1945. About half of the exports of 1945-46 came from carry-over stocks. The general situation led the United States government to call for another large crop of wheat in 1947 on an acreage almost as large as was sown in 1945-46. (See also FLOUR.)

(J. C. Ms.)

Whitaker, John Thompson

(1906-1946), U.S. journalist, was born on Jan. 25 at

Chattanooga, Tenn., and was educated at the University of the South (Sewanee, Tenn.). Upon graduation he became a reporter for the *Chattanooga News* and later covered Washington, D.C., and the League of Nations at Geneva for the *New York Herald Tribune*. When Italy readied her troops for the invasion of Ethiopia, Whitaker was the first special correspondent to reach Eritrea. In 1936, he began reporting the Spanish revolution and was an observer when the Franco troops attacked Madrid. This same year, he published a book *And Fear Came*, in which he charged the League of Nations with partial blame for the Ethiopian war. In 1937, he joined the *Chicago Daily News* as a foreign correspondent and covered Latin America, the Vienna putsch, and the German invasion of Czechoslovakia. He was expelled from Italy in 1941 when Mussolini objected to his dispatches, and in 1942 he joined the Office of Strategic Services to become a colonel and the recipient of many decorations for his services in Africa, Italy, Sicily, France and China. It was in the far east, in the closing months of the war, that he was stricken with the malady that caused his death. His works in-

clude, *Americas to the South* (1939) and *We Cannot Escape History* (1943). He died at Washington, D.C., on Sept. 11.

White, Stewart Edward (1873-1946), U.S. novelist, was born on March 12 at Grand Rapids, Mich., the son of a millionaire lumberman. A restless youth, he travelled through the jungles of East Africa, scaled the high Sierras in California, prospected for gold in the Black hills of the Dakotas and bucked the frigid winds of Hudson bay in search of adventure. Before the era of the automobile, he measured the western plains of the United States on horseback and in 1913 mapped German East Africa, for which deed he was named a fellow of the Royal Geographical society of London. He incorporated these experiences in a series of books that brought to his readers a vicarious sense of romance and adventure. One of his earliest books, *The Blazed Trail* (1902) was his most popular work, but his fame is due mainly to his semihistorical books of life in the west. These include *The Gray Dawn* (1915), a tale of the gold rush days in San Francisco, and *The Long Rifle* (1932), a story of the mountain trappers. A lover of birds, White was considered an authority on Michigan bird life. Author of more than 40 books, his works include: *Folded Hills* (1934), *Old California* (1937), *Wild Geese Calling* (1940), *Stampede* and *The Road I Know* (1942), *Speaking for Myself* (1943) and *The Stars Are Still There* (1946). He was co-author of *Pole Star* (1937). White died in San Francisco on Sept. 18.

Wholesale Trade: see BUSINESS REVIEW.

Wilderness Preservation. Threats of civilization to modify remaining U.S. wilderness areas increased in 1946 as postwar development plans matured, yet at the same time wilderness preservation as a distinct aim in U.S. conservation achieved greater prominence than ever before. The Izaak Walton League of America described wilderness protection as one of its four "more important fields" of immediate action, declaring: "If we are to maintain in primeval grandeur and solitude a small fragment of this, our land, we must consolidate the Federal wilderness areas and insist that they be held forever inviolate." The Wilderness society—cooperating with all conservation agencies in mobilizing support as found necessary—established its publication *The Living Wilderness* as a quarterly and, with an augmented staff, enlarged its educational program. Various other conservation and scientific organizations gave express support to the movement. The Outdoor Writers association adopted a resolution declaring that this association—

"(1) endorses the movement for wilderness conservation and commends The Wilderness Society and other organizations for their work in this behalf,

"(2) recommends that all airplane landing fields and other installations—except as necessary for emergency or administrative purposes—be located at the boundaries of the wilderness or wild areas, or at nearby sites, and

"(3) urges all its members to devote themselves to an improvement of the public understanding of the values of the wilderness and the needs in its preservation."

And the Congress of Industrial Organizations in a statement at the American Forest congress in Washington, D.C., on Oct. 9, declared:

"... there are areas whose best use in the interest of all the people calls for their permanent protection as natural, wilderness, or roadless areas, in which the primary values are scenic and recreational in a sense which requires the permanent preservation of primitive characteristics. . . . An essential element of the proper administration of such areas is their permanent dedication to their special use."

General objectives of the movement as stated by the Wilderness society were:

"(1) To enlist the American people in the preservation of our American wilderness.

"(2) To spread the conception that the wilderness is a valuable natural resource of the people and should be conserved as such.

"(3) To promote nation-wide co-operation in resisting the invasion of such wilderness by the sights, sounds, and other influences of civilization, including routes which can be used for mechanized transportation, all commercial developments, and those non-commercial improvements and influences which clash seriously with the primeval environment."

Immediate purposes were to safeguard undeveloped areas in national and state parks and to preserve those portions of the national forests that had been formally designated as wilderness, wild, primitive or roadless areas, in accordance with the special regulations established for their administration by the secretary of agriculture or the chief of the forest service.

A preliminary survey of such areas still remaining in the United States and given public protection as such, conducted by the Wilderness society early in the year, based largely on data from federal land-management agencies, revealed 131. These included 15 on Indian reservations, 72 in national forests, 36 in the national park system, 5 on national wildlife refuges, and 3 on state lands, though the latter were inadequately covered in the survey. The forest service later withdrew from special classification the national forest primitive area that had been left on the boundaries of Olympic national park, in Washington, when the park was established. On Sept. 10 a 78,530-ac. area in the Siskiyou national forest in southwestern Oregon was newly set aside as the Kalmiopsis wild area. The totals thus remained the same.

Outstanding specific problems faced during the year concerned the protection of wilderness areas in New York's Adirondack state forest preserve against a dam-building threat and inconsistent recreational facilities, acquisition of privately owned lands within the Superior roadless area in Minnesota to prevent establishment of resorts in the midst of a wilderness canoe country that had become readily accessible to passenger-carrying hydroplanes, prevention of lumbering invasions threatened in the virgin forests of Olympic national park in Washington and mobilization of opposition to a modification of the San Geronio primitive area in southern California formally proposed by the forest service in Dec. to provide for a highway, hotel resort, and ski-tow on the slopes of San Geronio mountain. Efforts to forestall a commercial project for a skiers' tramway on the primitive San Jacinto mountain in California's San Jacinto state park had apparently failed and plans for the project were under way.

At the year's end these problems of 1946 seemed typical, apparently representing the principal threats to wilderness preservation: lumbering, dam construction for hydroelectric and other purposes, landing areas for aeroplanes, local demands for exploiting mass recreational possibilities of still primitive areas and commercial installations to attract visitors not interested in the wilderness as such. Based on the conviction that there remains enough land in the United States to provide adequately for all types of outdoor recreation, the wilderness movement's basic proposition was the *zoning in perpetuity* of the country's important wilderness remnants as monuments of the past and as areas for observation, scientific study, watershed protection and the kinds of recreation consistent with wilderness preservation and possible only in such areas.

(Principal national sources of specialized information on wilderness preservation were the federal land management agencies—the U.S. department of agriculture and the U.S. department of the interior—and the Wilderness society, 1840 Mintwood place, N.W., Washington 9, D.C.) (H. Z.)

Wildlife Conservation. The status of big game in the United States was described as "generally favourable" in 1946, but the year was marked by setbacks for several other species. The ruffed grouse was at a

"low ebb of abundance." The ring-necked pheasant declined over much of its range, especially in the midwest, as a result of unfavourable nesting weather. The bobwhite quail population was sharply reduced in parts of the northern limits of its range, for similar reasons, and the ducks and geese continued a decline that aroused nation-wide concern.

Hunters increased. Sales of federal migratory-bird hunting stamps (the so-called "duck stamps" required of all wild-fowlers more than 16 years of age) totalled 1,725,505 in the fiscal year ended June 30, 1936, as compared with 1,487,029 in the preceding year and 1,169,362 in 1944, and a sale of "close to 2,000,000" was predicted for the 1946 fall hunting season. Total sales of licences by the several states for hunters of nonmigrant species (not subject to federal protection) had not been summarized for 1946, but the tabulation of sales for the year ended June 30, 1945, showed a total of 8,190,191, an increase of 685,643 over the preceding year, and previous correlations of state hunting licence and federal duck stamp sales indicated a further increase in 1946. Data thus bore out the prediction made early in the year by Albert M. Day (who on April 1 succeeded Ira N. Gabrielson as director of the federal fish and wildlife service): "The wild game of this country is going to face the greatest army of hunters in all history."

Events in waterfowl management were observed with special interest by conservationists, because up-to-date co-ordinated information on this federally protected resource was generally available and it was the consensus that wildlife conservation in general depended on a solution of the same basic problems faced in waterfowl management; namely, provision of adequate habitat and successful regulation of hunting.

In 1945 and 1946, the fish and wildlife service pointed out, droughts dried up vast areas of the Canadian prairie provinces and reduced or destroyed the breeding value of something like 45,000 sq.mi. of territory inhabited by waterfowl, and there were other natural disasters. The service described 1945 and 1946 as "barren years," predicted that they would be eventually offset by fertile years, but also predicted: "The number of hunters will continue to increase. This is the most important fact in the problem of managing the waterfowl resource."

Early in 1946 (following the 1945 hunting season) waterfowl numbers were estimated at 80,000,000 for the continent—a decrease of more than 25,000,000 from the 105,500,000 estimated in 1945 and more than 45,000,000 (or 36%) from the 125,350,000 in 1944. During these two years hunters had increased by more than 47%.

As a corrective measure the 1946 waterfowl hunting seasons were reduced to 40 days in each of 3 zones (as compared with the 80 days allowed in 1945); daily bag limits were reduced from 10 to 7; and the shooting days were ended a half-hour sooner.

In Nov. the fish and wildlife service said that reports from its game management agents in the northern and intermediate zones substantiated "early forecasts that ducks are scarce but hunters plentiful," and in Dec. the service described early returns from duck hunters as bearing out "official predictions that waterfowl have fallen into a marked decline." (Scorecards printed in outdoor and state conservation magazines and in newspapers had been used by many hunters in making volunteer reports.) "In the northern zone, where the shooting season has ended," said the service on Dec. 4, "72 percent of the hunters who have sent in scorecards to date reported less ducks than last year, 28 percent the same or more." On Dec. 20 Director Day commented that "the pessimistic note of 'very few ducks seen' continues to dominate the reports."

At the close of the year official comments were not available either as to the success of the 1946 restrictions on hunting or

as to the 1947 regulation prospects, but the fish and wildlife service did announce that its 13th annual midwinter inventory (scheduled for Jan. 7-17, 1947) would include Mexico, Central America, Alaska and Canada and thus be continental rather than nation-wide. "We propose to do our utmost," said Mr. Day, "to find out what has happened to the ducks."

The waterfowl decline was described as emphasizing "the importance of maintaining and enlarging the national wildlife refuge system," which was augmented during the year by four new national wildlife refuges—Theodore Roosevelt in North Dakota, Tennessee in Tennessee, Tishomingo in Oklahoma and Hagerman in Texas. Refuges totalled 291 with 17,819,495 ac.—271 (9,889,856 ac.) in the United States and 20 (7,929,639 ac.) in Alaska, Hawaii and Puerto Rico—and were classified as follows: 201 (3,213,658 ac.) for migratory waterfowl, 24 (3,870,156 ac.) for other migratory birds and general wildlife, 49 (91,043 ac.) for colonial non-game birds, and 16 (10,642,015 ac.) for big game; the remaining area was the 2,623-ac. Patuxent research refuge in Maryland.

Providing desirable wildlife habitat was increasingly emphasized, and at the year's close the 1947 North American Wildlife conference was being organized on the theme "Americans, Wildlife, and Their Land." Wilderness preservation (see article under this heading) was more widely advocated than heretofore, and conservationists became more insistent that wildlife be considered in proposed water utilization programs for irrigation, navigation, hydroelectric power, flood control or other purposes. As a step to this end, public law 732 enacted by the 79th congress made it mandatory to have biological surveys made and reports thereon prepared before multiple-purpose or other high dams could be constructed or major diversions of water effected. Pollution control was vigorously demanded, and an anti-pollution measure prepared by the house committee on rivers and harbours on the basis of three earlier bills was reported to congress but failed to be enacted. The Izaak Walton League of America described this bill as a measure that "conservationists, public health interests, and all others who wish to see clean waters . . . can support without reservation," and at the close of the year the league was mobilizing support for a similar measure to be introduced in the 80th congress.

A bill that in response to local opposition would have abolished the Parker River National Wildlife refuge in Essex county, Mass., was passed by congress but failed of enactment when the president after adjournment of congress withheld approval, declaring: "It would not be in the public interest to authorize abandonment of this national wildlife refuge."

Significant to wildlife sanctuary policies were two bills that failed of enactment but were predicted as renewed proposals in the 80th congress. One would have permitted the opening of 25% of a national wildlife refuge to hunting. The other would have required the control of predators in Mt. McKinley national park, Alaska, as special protection for "game" species.

Most notable event of the year in the organization of conservation interests was the establishment on Oct. 26 of the Natural Resources Council of America—

" . . . to effect closer cooperation and coordination of the member organizations in the attainment of common objectives; to provide them with information on actions of Congress, the Chief Executive, and Federal administrative agencies affecting natural resources, and other matters within the scope of our objectives; and to make available to the member organizations scientific data and other pertinent information to aid them in intelligent determination of conservation problems."

Formed at a special conference at Mammoth Cave, Ky., by 11 leading organizations, the council had by the year's end established a daily information service for its members, arranged for regular meetings and invited the participation of other organizations.

The principal source of wildlife information in the United States was the Fish and Wildlife service, Merchandise Mart, Chicago 54, Ill., which had available lists of federal publications and compilations—including a list of officials and organizations concerned with wildlife conservation—and the periodical *Wildlife Review* prepared by W. L. McAtee as a listing and critical annotation of books, articles in journals and other publications. Leading private organizations were American Forest association, publisher of *American Forests*, 919 Seventeenth St., Washington 6, D.C.; American Nature association, publisher of *Nature Magazine*, 1214 Sixteenth St., Washington 6, D.C.; Izaak Walton League of America, publisher of *Outdoor America*, 31 North State St., Chicago 2, Ill.; National Audubon society, publisher of *Audubon Magazine*, 1006 Fifth Ave., New York 28, N.Y.; National Parks association, publisher of *National Parks Magazine*, 1212 Sixteenth St., Washington 6, D.C.; National Wildlife federation, publisher of *Conservation News*, 1129 Vermont Ave., Washington 5, D.C.; the Wilderness society, publisher of *The Living Wilderness*, 1840 Mintwood place, Washington 9, D.C.; and the Wildlife Management institute, 822 Investment Bldg., Washington 5, D.C., sponsor of research projects, special investigations, annual North American wildlife conferences and monographs—including a definitive work on *The Puma* by Stanley P. Young and E. A. Goldman issued in 1946. Scientific periodicals were notably *The Journal of Wildlife Management*, *The Journal of Mammalogy* and *The Auk: A Quarterly Journal of Ornithology*—organs respectively of the Wildlife society, the American society of Mammalogists and the American Ornithologists' union. (H. Z.)

Great Britain.—In the principal fields in which economics play a part, namely the conservation, for rational exploitation, of the stocks of fishes and whales, Great Britain and Europe had in 1946 reached, or were within measurable distance of reaching, sound agreements. Conservation from more aesthetic motives of the natural faunistic and floral oecologies of the world was threatened by the ever-increasing growth of human population and, with it, the steadily advancing exploitation of new regions of the earth. That is not to say that conservation was without advocates. In Great Britain, the Royal Society for the Protection of Birds, the British Trust for Ornithology and the British Bird Watchers' union were active in defense of the birds, and in 1946 revised legislation for their protection was being considered. The Society for the Promotion of Nature Reserves energetically defended the wildlife of Great Britain in general, itself administering certain small reserves; the establishment of national parks and nature reserves was part of the postwar reconstruction plan of the government, which was being advised by an expert committee; and the Society for the Preservation of the Fauna of the Empire, founded in 1903, was as vigilant as ever.

Europe.—Efforts were on foot for the reconstitution of the Society for the Preservation of the European Bison, once more seriously reduced in numbers through war. A new association under the name *Ardenne et Gaume* was established in Belgium with the purpose of saving some part of the territory in a state of nature. It was stated with authority that more than 27,000,000 ac. in the U.S.S.R. were occupied by state preserves for the preservation of national monuments and wildlife. For the rest, the European situation was too confused for any serious development of wildlife conservation.

Africa.—In British African territories there were many advocates of the comprehensive destruction of all or most of the native animals. They regarded the native wildlife as a menace to the health of domestic cattle and, through the tsetse fly, of men as well as cattle, and, further, as undesirable competitors with men and their cattle for the fruits of the land. The policy of destruction had long been in operation in Southern Rhodesia outside the Wankie reserve; it was later adopted in the Umfolozi region of South Africa and seemed to find many advocates in the British colonies of East Africa. There were, however, brighter spots in the African scene. In the Belgian Congo the Belgian government continued to apply its enlightened policy and created new reserves in addition to the famous Parc National Albert. In the west, also, the Institut Français de l'Afrique Noire with its colleague Département des Eaux et des Forêts, initiated a progressive policy of conservation. In Madagascar and Mauritius there were movements in favour of the conservation of the native fauna. In Kenya legislation was passed pro-

viding for the establishment of national parks. In South Africa the National Parks board continued its good work in the Hluhluwe and other reserves, and the Wild Life Protection Society of South Africa was endeavouring to make South Africa "conservation conscious," and strongly urged that organized destruction of game should be permitted only if the need for it could be supported by unchallengeable scientific evidence; the Society for the Preservation of the Fauna of the Empire in England urged the same view upon the colonial office. In Nigeria the Nigerian Field society also endeavoured to lead others in the path of conservation. Game is not abundant in Nigeria, but such wildlife as there is was reported to be well protected.

Australasia.—Australia had only recently begun to show signs of interest in the conservation of its fauna and to endeavour to preserve its native animals, in particular the remnant of the once innumerable population of koalas. Largely through the enlightened activities of Sir James Barrett, the conservation of wildlife was being taught in the schools in 1946. The Royal Zoological society of New South Wales called for a comprehensive zoological survey of the subcontinent as a preliminary to active conservation. The Royal Society of Tasmania endeavoured to protect wild nature and there was some hope that, through its efforts, the nearly extinct thylacine, or Tasmanian wolf, might be saved.

New Zealand, distinguished by unique avifauna and by forests of incomparable beauty, had the worst record in the British commonwealth for destruction of nature. By irrational exploitation of the native forests, birds were largely deprived of their habitat, and by the introduction of exotic rodents and small carnivores as well as pigs, goats and deer, the lives of the ground-living birds were in danger and the whole natural oecology of the islands was upset. The New Zealand Forest and Bird Protection society was fighting what seemed to be a losing battle against the sabotage of nature.

Asia.—Reports from Malaya in 1946 were contradictory, but the outlook on the whole was hopeful. During the Japanese occupation the use of firearms was so severely restricted that poaching by shooting was greatly reduced. In the postwar reconstitution of the game department, a new chief warden was appointed, and a former chief warden, E. O. Shebbeare, accepted an invitation to return to Malaya and advise the government on the development of the King George V national park, which offered great opportunities for conservation.

In Ceylon the Ceylon Game and Fauna Protection society, which had for years carried on propaganda in favour of conservation, strongly urged the establishment of a wildlife department. National parks and nature reserves were the responsibility of the forest department, already overburdened with its own work.

An interesting development attributable directly to the war was the establishment of the Jerusalem Naturalists' club for the study of the natural history of the middle east. The club was founded by officers of the British army, and it was hoped that it would continue, to study the natural history of the middle east under more settled conditions.

(H. G. M.)

Wilhelmina (WILHELMINA HELENA PAULINE MARIA OF ORANGE-NASSAU) (1880—), queen of the Netherlands, daughter of William III, king of the Netherlands, and Queen Emma, was born on Aug. 31. She succeeded to the throne in 1890 under the regency of her mother, and was enthroned in 1898. In 1901 she married Henry, duke of Mecklenburg-Schwerin (d. 1934), and in 1909 Princess Juliana, heir to the throne, was born. When the Netherlands was invaded on May 10, 1940, the royal family with members of the government sought refuge in London. On April 27, 1945, it was

announced that Queen Wilhelmina had taken up residence in Holland, near Breda, before returning to the royal palace at The Hague in July.

In 1946 the queen preferred to use a small villa as her headquarters in The Hague, rather than her palace at Noordeinde. The Huis ten Bosch, in The Hague, was being restored. Her country house, Het Loo, near Apeldoorn, was only partly used by the royal family. Some of it had been given over to be used as a rehabilitation centre for ex-resistance workers. On May 12, 1946, Queen Wilhelmina received Winston Churchill at Soestdijk, Princess Juliana's home, during his visit to Holland. In July the queen spent two days in London as guest of the royal family, when she presented King George VI with the insignia of the Grand Cross of the Willem's Orde, and with a number of horses, bred in the Netherlands, for use in the royal stables. In the same month she opened the states general, with a speech from the throne, outlining the tasks of the new government. On the second anniversary of the battle of Arnhem, on Sept. 17, Queen Wilhelmina unveiled the memorial to the fallen at Oosterbeek. She afterward attended the première of the film *Theirs is the Glory* at Arnhem.

(G. J. R.)

Wilkinson, Theodore Stark (1888-1946), U.S. naval officer, was born on Dec. 22 at Annapolis. He was first in his graduating class at the Naval academy in 1909. While still an ensign, he was awarded the congressional medal of honour for his part in the seizure of Veracruz in April 1914, and thereafter he was assigned to various important naval posts both on land and sea. He was secretary of the navy's general board in 1931, head of the planning division of the bureau of navigation, 1936-39, commander of the battleship "Mississippi," 1941, and at the time of the Pearl Harbor attack was chief of naval intelligence. He again returned to sea as commander of a battleship division, 1942, and in early 1943 became deputy commander, South Pacific area and South Pacific force. He later commanded amphibious forces in the South Pacific and participated in the amphibious operations at New Georgia, Treasury Island, Bougainville, Peleliu, the Palaus and the Philippines. He was made a vice-admiral in Aug. 1944. During the congressional hearings on the Pearl Harbor disaster, he testified Dec. 17, 1945, that he knew at 9.15 A.M. of the fatal day that the Japanese were about to break off negotiations and was unsuccessful in trying to reach the chief of naval operations to send a general warning to the fleet. A month before his death, Vice-Adm. Wilkinson became a member of the Joint Strategic Survey committee of the Joint Chiefs of Staff. He was drowned when his automobile plunged from a ferry into the Elizabeth river near Norfolk, Va., Feb. 21. His wife, who was with him in the car, was pushed to safety by the admiral just as the car began to sink.

Winant, John Gilbert (1889-), U.S. diplomatist, was born on Feb. 23, in New York city. He studied at Princeton university and in 1912 he joined the faculty of St. Paul's school as teacher of English and assistant rector. He joined the U.S. army during World War I and was captain of the 8th air observation squadron in France. After the war, he was elected to the New Hampshire legislature, and was governor of New Hampshire for two terms.

Winant joined the International Labour office in 1935, serving as assistant director and director. In 1941, he was appointed ambassador to Great Britain by President Roosevelt and served throughout World War II in this capacity. On Jan. 12, 1946, President Truman appointed him U.S. representative on the United Nations Economic and Social council. He relinquished

his post as ambassador to W. Averell Harriman and devoted all of his time to his duties on the U.N. Council.

Although the verbal exchanges between U.S. and soviet delegates on the council were frequently acrimonious, Winant reported to the state department, Aug. 24, 1946, that most of the disputes had been settled by compromise.

On Dec. 31, 1946, he was awarded the honorary order of merit in King George's New Year list.

Windward Islands. An archipelago in the southern part of the Lesser Antilles in the Caribbean Sea; the name is also that of a British crown colony consisting of four units. The French island of Martinique is the northernmost of the Windward group, while the island of Dominica (a part of the Windward colony) is, geographically speaking, one of the Leeward group. The four parts of the crown colony are: Dominica, area, 304 sq.mi., pop. (est.), 53,899; Grenada (including Carriacou, 13 sq.mi., and lesser islands), area, 133 sq.mi., pop. (est.), 90,586; St. Lucia, area, 233 sq.mi., pop. (est.), 76,174; and St. Vincent (including five of the Lesser Grenadines), area, 150 sq.mi., pop. (1946 census), 61,593. Total area, 820 sq.mi.; total pop., 282,252. The capital of the colony and of Grenada is St. George's (pop., 1946 census, 5,755); capitals of the other units (in the order listed above), with pop. ests. (except as indicated) are Roseau (9,000), Castries (9,000), and Kingstown (1943 census, 4,269). The four units in the Windward Islands are not federated and have no common revenues, tariffs, legislature or laws; they do unite for certain purposes, however. The governor of the colony is *ex officio* administrator of Grenada. The Windward and Leeward Islands (the latter a crown colony to the north) have joint judicial and police services. Governor in 1946: Sir Arthur Grimble.

History.—Administrators of the four Windward Island units met at St. George's early in February to discuss the possibility of union with the Leeward Islands colony. The two colonies reached a tentative agreement early in 1946 on the subject, with St. George's in Grenada being considered as the probable capital. Delegates from the Windward Islands participated in the civil aviation conference in Trinidad early in June.

Education.—The Windward Islands planned to participate in a new teacher training college to be established in Trinidad. A free grant of £500,000 was made to the Windward Islands early in 1946 under the British Colonial Development and Welfare act of 1945, the object being erection of new school buildings.

Finance.—The monetary unit is the pound sterling, although the Trinidad or West Indian dollar is legal tender in St. Lucia and Grenada; the latter is equivalent to 4s. 2d. and exchanges for about 84 cents U.S. The principal financial development of the year was the West Indies currency conference in Barbados beginning May 13, in which the Windwards participated. Recommendations of the conference included establishment of a decimal dollar currency and creation of a Regional Currency board to control it. Great Britain early in 1946 allotted to the Windward Islands £1,850,000, to be spent over a decade, under the 1945 Colonial Development and Welfare act.

Trade and Communication.—Arrowroot exports in 1945 from St. Vincent, which has almost a world monopoly, were 4,575,300 lb., almost all of which went to the United States. Cacao exports from Grenada in the first four months of 1946 were 890 long tons (same period in 1945: 966 tons). Exports of nutmegs from Grenada in 1945 were 2,341 long tons, of which 1,553 tons went to the United States.

British West Indian Airways began providing weekly plane service to St. Lucia and Grenada in 1946. St. Vincent was allocated a grant of £25,000 for road construction during the year.

Agriculture.—The 1945-46 arrowroot crop in St. Vincent was estimated at 30,000 bbl. of starch (1944-45: 22,000 bbl.). Grenadian nutmeg production in 1946 was about two-fifths of the world supply as against one-sixth prior to 1940. Grenada received a development allocation of £42,215 in 1946 for the establishment of three agricultural stations to study soil erosion, stock breeding and feeding, crop rotation, etc. St. Vincent received a soil conservation grant of £27,234. A cacao rehabilitation scheme begun in Grenada in 1946 involved the annual distribution of 80,000 plants.

Wines. Once again the United States made the greatest strides of any country in the world in the wine industry. Not only did consumption increase from approximately 93,000,000 gal. in 1945 to more than 112,000,000 gal. in 1946, but in the face of declining yields in nearly every other country, production exceeded that of 1945 when more than 115,000,000 gal. were produced.

France, while still the largest wine-producing country in the world, produced only about 66% of its normal crop, of good quality but not quite so good as in 1945. Of the total production there were just more than 5,000,000 gal. of champagne (60% of the normal crop), 71,000,000 gal. of Bordeaux, 25,000,000 gal. of Burgundy and Rhone and about 15,000,000 gal. of Alsatian wine.

In Algeria, on the other hand, the season was again a most disastrous one, the production being only 237,000,000 gal., a drop of more than 13,000,000 gal. from the 1945 crop which was only about 50% of normal.

In the Jerez district of Spain, the favourable weather conditions and abundance of rain up to the end of May produced a crop approximately 35% larger than in 1945 and ideal

weather conditions during the vintage assured a crop of exceptional quality. In the north and east of Spain, vintages also increased but were only about $\frac{3}{4}$ of those of normal years.

In Portugal, because of the small flowering of the vines and an attack of mildew and cold weather, the grapes available were far below average. About 29,000 pipes (more than 4,000,000 gal.) of port were made, against 25,000 in 1945. In the south of Portugal, quantities were much on the low side of normal with qualities reasonably good. The total production in Portugal was about 221,000,000 gal. compared with 236,000,000 in 1945.

In South Africa, somewhat more than 32,000,000 gal. of wine were produced, of which more than 21,000,000 gal. were produced for distillation. This production was far below normal.

Reports from Australia indicated an all-time record of approximately 25,000,000 British gal. (about 30,000,000 U.S. gal.), an increase of more than 10,000,000 British gal. as compared with the production of 1945 and by far the largest amount ever produced.

In Argentina the vintage was approximately 234,000,000 gal. against 191,000,000 in 1945 and 285,000,000 in 1944.

The vintage in Chile, while good in quality, was only 93,000,000 gal., a drop of nearly 7% from the previous vintage and considerably below the normal for half a decade. (See also LIQUORS, ALCOHOLIC.) (O. J. W.)

Wisconsin. One of the north-central states, Wisconsin, popularly called the "Badger state," entered the union as the 30th state in 1848. Area, 56,154 sq.mi. of which 1,439 sq.mi. are water. The federal census of 1940 gave its population as 3,137,587, an increase of 6.8% over 1930. The urban population in 1940 was 1,679,144 and the rural 1,458,443. Only 24,835 were non-white. Foreign-born whites numbered 288,774. On July 1, 1945, the bureau of the census estimated the civilian population of the state at 2,952,000. Capital, Madison (pop. 1940, 67,447). Milwaukee is the largest city with a population of 587,472, and other large cities are Racine (67,195), Kenosha (48,765), Green Bay (46,235), La Crosse (42,707) and Sheboygan (40,638).

History.—A special session of the legislature, July 4-5, 1946, authorized a second cost-of-living bonus of \$10 for each state employee earning \$200 or less a month, passed legislation facilitating action by county and local agencies to promote housing for veterans, allotted additional funds for the state emergency board, and ordered an independent survey of state salary scales and personnel utilization. The Progressive party, established in 1934 under the leadership of the La Follette brothers, dissolved itself at a convention at Portage, March 17, and voted to rejoin the Republican party. In the ensuing primary, Aug. 13, the former Progressive forces were turned back in an effort to capture the key nominations. Eighty-three year-old Gov. Walter S. Goodland, denied renomination by the Republican convention, defeated the former Progressive, Ralph Immell, in a three-way race in which the organization candidate ran a poor third, while Judge Joseph V. McCarthy upset Sen. Robert M. La Follette, Jr., in a very close contest for the senatorial nomination. The emergence of a new leadership in the Republican organization under Thomas Coleman, Madison industrialist, signalized by the McCarthy victory, was confirmed in the subsequent Republican sweep of all state offices. The state's representation in congress consisted at the beginning of 1947 of two Republican senators, ten Republican representatives.

The state officers in 1946 were all Republican: W. S. Goodland, governor; Oscar Rennebohm, lieutenant governor; F. R. Zimmerman, secretary of state; J. M. Smith, treasurer; J. E. Martin, attorney general and John Callahan, superintendent of public instruction. The chief justice of the supreme court was

BARRELS OF WINE for export to foreign countries being loaded aboard the "M. V. Thor" at San Francisco, Calif., during 1946

M. B. Rosenberry.

Education.—There were 6,228 elementary schools, 460 secondary schools, 23 county normal schools and 9 teachers' colleges in 1944-45. The enrolment was 343,599 in elementary schools, 141,938 in secondary schools and 483 in county normal schools. There were 14,045 elementary school teachers and 6,148 secondary school teachers. The teachers' colleges had faculties of 409 teaching 3,481 college and 2,125 training school students. State aid for education in the fiscal year 1945-46 totalled \$9,391,000. Total expenditures in all elementary and secondary public schools totalled \$54,722,005.41.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of cases receiving public assistance as of June 1946 was as follows: general relief 5,125; old-age assistance 46,261; aid to dependent children 6,338; aid to blind 1,338; and 341 totally and permanently disabled—a total of 51,806 households. Expenditures for public assistance in the year ending June 30, 1946, were as follows: general relief \$2,209,795; old-age assistance \$16,900,103; aid to dependent children, \$4,537,636; aid to the blind \$508,207; \$70,-450 to totally and permanently disabled—a total of \$24,226,-191. Unemployment benefit payments in 1945 were \$4,264,654 as against \$1,249,692 in 1944 and \$880,512 in 1943. The contributions for 1945 were \$27,575,988 as compared with \$42,-081,693 for 1944 and \$32,600,000 for 1943.

Wisconsin's 13 charitable, penal, mental and correctional institutions were operated in the year ending June 30, 1946, at a cost of \$6,409,238. The average daily population for June 1946 was 8,564.

Communications.—The number of miles of highways as of Jan. 1, 1946, was 84,488 (towns), 2,378 (villages) and 5,960 (cities). The total was 92,826 mi. The expenditures on highways during July 1945-June 1946 was \$31,359,792. The total railway mileage on Jan. 1, 1946, was 6,400.33. The number of airports was 122. There were 687,486 telephones.

Banking and Finance.—At the end of 1945 there were 462

state and 97 national banks. The deposits in state banks totalled \$1,386,490,303, the assets were \$1,466,370,296. National banks had deposits of \$1,466,595,000 and assets of \$1,-546,889,000. The 536 credit unions (14 less than in 1944) listed assets of \$19,064,115. There were 113 building and loan associations with assets of \$134,358,354.

State receipts for the fiscal year ending June 30, 1946, were \$111,150,427; disbursements \$102,303,624. Taxes collected by the state and returned to local subdivisions totalled \$35,113,-139; agency collections returned to counties were \$923,941; state aids amounted to \$30,018,888. Because of a new law segregating certain funds received from state gasoline taxes, motor vehicle registrations and drivers' licence fees, no highway department activities are reflected in state receipts, disbursements or state aids. This segregated fund amounted to \$38,767,829 for the year ending June 30, 1946.

Agriculture.—The total acreage harvested in 1945 was 10,-275,000. The gross farm income excluding government payments was estimated at \$811,248,000, consisting of \$112,704,000 from crops and \$698,544,000 from livestock and its products, including milk. The total was an increase of 5.1% over 1944 which was the highest previous year, and 52% above the World War I peak. Physical production increased slightly. The land used in producing cash crops was small compared with the land used for feed crops, a result of the state's great dairy industry.

Table I.—Leading Agricultural Products of Wisconsin, 1946 and 1945

	1946 (est.)	1945	Value, 1946 (est.)
Corn (bu.)	111,980,000	107,160,000	164,611,000
Oats (bu.)	124,758,000	152,337,000	101,054,000
Canning peas (lb.)	307,640,000	340,400,000	12,859,000
All tame hay (tons)	6,081,000	7,752,000	123,620,000
All clover and timothy (tons)	4,383,000	5,290,000
Alfalfa (tons)	1,517,000	2,112,000

Manufacturing.—The total value of Wisconsin manufactured products in 1939 was \$1,604,507,356. The wages paid were \$251,946,993. The number of wage earners was 200,897 (average for the year). Wisconsin, with an extremely diversified industry, ranked first in the manufacture of cheese, milk products, malt and canned peas at that time.

Between June 1940 and Sept. 1944, Wisconsin manufacturers received \$4,559,261,000 in major war supply and facility contracts. In 1945 the estimated average number of wage earners in Wisconsin manufacturing establishments was 327,225, compared with 364,700 in 1944, while the estimated weekly pay rolls had decreased in the same period from \$17,233,000 to \$15,319,000.

Table II.—Value of Mineral Products of Wisconsin, 1944 and 1943

Mineral	1944	1943
Stone	\$7,741,499	\$6,677,382
Iron ore	4,190,380	3,822,025
Zinc	3,545,172	3,107,592
Sand and gravel	4,128,434	2,595,531

Mineral Production.—The value of all mineral production in Wisconsin for 1944 was \$22,794,000 as compared with \$18,-930,000 in 1943 and \$17,998,036 in 1942. (C. L. L.)

Wisconsin, University of. An institution of higher education at Madison, Wis. Almost 1,000 students received degrees at Wisconsin's annual commencement in May 1946, the 93rd in the university's 97-yr. history.

When the university opened its doors on Sept. 23, 1946, a total of 23,800 students registered for instruction, 18,600 at Madison and 5,200 at 34 extension centres established in cities in all parts of the state during 1946. This was an 88% increase over the highest prewar enrolment of 12,674 in 1939. The extension centre classes, taught by university instructors of regular faculty rank, were held in high schools, vocational schools

and regular university centres for both freshmen and sophomores.

More than 19,000 young people and adults were enrolled in correspondence courses provided by the extension division during the year. More special institutes, 22 to be exact, attended by more than 5,000 citizens, were conducted for labour, agriculture, education, business and industry during 1946 than in any other of the university's 97 years.

Faced with the huge demand for educational services, Wisconsin took many emergency steps during 1946 to meet the situation and carried forward plans, first inaugurated during World War II, involving the expenditure of more than \$50,000,000 over a 10-yr. period for expansion and development of campus and building facilities. Besides the 34 extension centres, other emergency steps taken at Wisconsin to meet the immediate problems of the situation included temporary housing for 5,000 students, temporary classrooms in the form of quonset huts and conversion of other buildings near the campus, 100% classroom use, longer class days and longer school year, larger classes, special courses of study and part-time faculty. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. Fs.)

Withholding Tax: see TAXATION.

Woman's Christian Temperance Union, National: see SOCIETIES AND ASSOCIATIONS.

Women's Army Corps. The Women's Army corps (WAC) became part of the army of the United States when public law 110 was signed by the president on July 1, 1943. Originally, it was created an auxiliary organization by an act of congress, which became law over the president's signature on May 15, 1942.

The purpose of the corps is to make available to the national defense, when needed, the knowledge, skill and special training of the women of the United States.

Col. Oveta Culp Hobby, former Texas newspaperwoman, became first director of the corps and was succeeded on July 12, 1945, by Col. Westray Battle Boyce of Rocky Mount, N.C.

At its top strength, the WAC numbered 100,000, of which about 18,000 served overseas in 21 different countries. Enlistments in the WAC were closed on Aug. 29, 1945. Demobilization of the WAC was carried out on a proportionate basis with that of the men of the army. The estimated July 1, 1946, strength of the Women's Army corps was 1,700 officers and 18,000 enlisted women. From April 1, 1946, to Aug. 1, 1946, 1,326 honourably discharged WACs re-entered the corps for service in the United States and overseas.

Under public law 110 WACs are entitled to the same rights and privileges as male soldiers, such as free postage, government insurance, allowance for dependents and provisions of the G.I. Bill of Rights and Veterans' Administration assistance. They are entitled to wear medals, decorations and ribbons they have earned. Overseas veterans wear the same ribbons as the men, with battle stars for various campaigns. Members of the original auxiliary wear the WAAC service ribbon. Those who never served beyond the continental limits of the United States are entitled to wear the American theatre ribbon after one year of honourable service.

As of June 1, 1946, 43 women had been awarded the Legion of Merit; 538 the Bronze Star; 16 the Purple Heart; 7 the Soldier's Medal; 2 the Air Medal; 2 the Navy's Letter of Commendation; 2 the French Legion of Honour; 5 the French Croix de Guerre; 7 the Most Excellent Order of the British Empire.

The insignie of the corps is the head of Pallas Athena, goddess of wisdom and victory; members, however, wear the insignie of

the branch of service to which they were permanently assigned after completion of basic training.

On July 24 and 26, 1946, bills were introduced in the senate and in the house of representatives, proposing the establishment of the Women's Army corps in the United States army (regular army).

The bills called for an initial corps strength of 5,000 enlisted women and 500 officers, and established the maximum strength at 2% of the regular army male strength authorized from time to time.

The bills also provided for the establishment of an officer reserve corps and an enlisted reserve corps. Generally, the laws and regulations applicable to males and their dependents would be applicable to women and their dependents in like cases.

Women in the regular army would serve at posts, camps and stations in the United States and overseas, in clerical, secretarial, administrative, personnel, statistical, communications, intelligence, hospital technicians, supply and training, and scores of other capacities. (W. B. BE.)

Women's Clubs, General Federation of: see SOCIETIES AND ASSOCIATIONS.

Women's Reserve of the Navy. During the 12 months following V-J day the women's reserve of the U.S. naval reserve was gradually demobilized from a peak strength of 86,000 to a total of approximately 5,600 officers and enlisted women, who volunteered to remain on active duty until July 1, 1947. The majority of these volunteers were secured among WAVES still in service during the period of demobilization but re-enlistments were also opened to a limited number of former WAVES in certain rating groups, especially hospital corps personnel, seamen and those holding aviation ratings. WAVES were assigned to duty throughout the continental shore establishment and performed duties primarily in the fields of aviation, supply, communications and hospital work.

The legislation authorizing the women's reserve was effective only "during the present war and for six months thereafter." The navy department asked the congress to enact appropriate additional legislation in order to provide for the continuing use of women in the peacetime navy both in the regular and in the naval reserve.

During the summer of 1946 provisions were made whereby ex-enlisted WAVES could join the volunteer reserve for inactive duty, thereby permitting them to build up their longevity and keep their highest wartime rating while remaining in a civilian status. WAVE officers automatically continue as members of the volunteer reserve unless they officially resign.

At one time there were more than 4,000 WAVES on duty at air stations, hospitals, the navy yard and other activities in the Hawaiian Islands. By Sept. 1, 1946, all WAVES from this area had been returned to the United States and were either separated from the service or, in the case of those volunteering for extended service, were reassigned to continental shore establishments. Although WAVES could still be ordered to temporary duty to such places as the Aleutians, Bermuda, Argentina (Newfoundland) and Hawaii, it was not anticipated that women would be assigned to permanent duty overseas until such time as the future status of the WAVE program was determined by legislation.

In June 1946 the secretary of the navy approved the wearing of service stripes by enlisted women. These stripes, traditionally known as "hash marks," indicate that the individual has completed four or more years of active service.

As of Sept. 20, 1946, women on active duty in the army and

navy were permitted to wear civilian clothes when on liberty or when in an off-duty status off the station.

Captain Joy Bright Hancock, U.S.N.R., became director of the women's reserve in July 1946, succeeding Captain Jean T. Palmer, who was separated from the service at that time. The director of the women's reserve from its inception until Feb. 1946 was Mrs. Mildred McAfee Horton, President of Wellesley College.

(J. B. Hk.)

Women's Reserve of the U.S. Marine Corps Reserve:
see MARINE CORPS.

Wool. The quantity of wool shorn in the U.S. in 1946 was estimated at 298,978,000 lb. This was 23,039,000 lb., or more than 9% smaller than shorn wool production in 1945 and 20% below the record production in 1942. It was the smallest production after 1928. This continued reduction in shorn wool from preceding years was the result of high labour costs on the ranch and the demand for meat, resulting in the slaughtering of large numbers of breeding stock. The estimated number of sheep shorn was 36,836,000, a decrease of 3,501,000 or 8½% from 1945, and a 20% decrease from the 10-year average, 1935-44. The estimated weight per fleece in 1946 was 8.12 lb. compared with 7.96 lb. in 1945 and the 10-year average of 7.98 lb. Pulled wools were estimated at 65,000,000 lb.

The 1946 world wool output equalled the prewar average. The world production of wool was estimated at 3,700,000,000 lb., but world wool supplies were much larger than before the war because of stocks accumulated during the hostilities. In the fine wool production countries of Australia, South Africa and the U.S., the total production of fine wools in 1946 dropped to 1,500,000,000 lb. in comparison with the record accumulation of 1,900,000,000 lb., shorn during the war years and a prewar (1934-38) average of 1,700,000,000 lb. As of June 30, 1946, according to the U.S. department of agriculture, world stocks of wool were estimated to be 5,000,000,000 lb., or more than 3 times as much as before the war. Of this amount of carry-over wool, 2,600,000,000 lb. were still owned by governmental organizations. Of this latter amount, the United Kingdom-Dominions Wool Disposal Ltd. held 81% and the Commodity Credit corporation (CCC), in the U.S., the remainder.

The Australian wool production in 1946 was estimated at 878,880,815 lb., a decrease of 69,280,129 lb. from 1945. Sheep production showed a total of 98,140,998, a decrease of 6,927,742. In New Zealand the clip was estimated at 352,721,194 lb., or a decrease of 10,962,633 lb. Exports of wool from Argentina, ending Sept. 30, reached a record of 293,000 tons greasy, 12% of the total production. That country had become the second largest producer and exporter of wool.

The first part of the year showed uncertain manufacturing prospects, because of labour complications. These fears were allayed through agreements reached prior to the expiration of contracts of Feb. 1. The strike of the Western Union Telegraph company in January delayed cable service to Great Britain, South Africa and South America. An intense heat wave in New South Wales killed 1,250,000 sheep. A joint organization capitalized by the British, Australian, New Zealand and South African governments, was formed to take over surplus stocks of wool possessed by the British government from its wartime purchases of dominion clips and to arrange the marketing of these, along with that of each annual clip as it became available. Heavy wool consumption by the U.S., in January, amounted to 49,680,000 lb., scoured basis, 90% being of foreign origin.

On Feb. 20 the first reduction in the selling price of the CCC controlled wool took effect. Selling prices were reduced five cents a pound clean basis on the 1943 clip and three cents a

pound on the 1944-45 accumulations. Large sales of Uruguayan wools were made in Montevideo to the U.S.S.R., the Netherlands and Spain. In Australia plans were made to establish 30 new woolen mills, 80% woolen and 20% worsted. The first sale of surplus wool, held by the War Assets corporation, was held in Boston in March, at which time more than 4,000,000 lb. were auctioned off, with approximately 500 interested buyers in attendance. The following month an additional 3,000,000 lb. were sold by auction.

Announcement was made in April that Australian sales were to be resumed in September. It was also understood that similar auction sales would be resumed in London, South Africa and in New Zealand. Considerable talk of legislation was heard in Washington, D.C., relative to assisting domestic wool growers in maintaining their sheep, wool being considered a wartime necessity.

The wool merchants favoured a direct subsidy on sheep, rather than continuing the government purchase of the yearly clips, government control of wool imports and the raising of wool tariffs.

In August reappraisals of the 1943 domestic clip took place and shrinkages were raised 3% to 5% above the original appraisals, thus interesting, to a great extent, the manufacturers in purchasing domestic wools. Australian sales commenced on Sept. 2 in Sydney, the first after 1940, with a sharp rise in price above the old issue prices. France and other continental countries were the principal purchasers. Because of this advance in price of 15% to 20%, the U.S. was unable to meet this competition on account of the Office of Price Administration ceilings, in force from 1941. The first sale in South Africa was held in Capetown on Sept. 4, and was followed by the first London sale held on Sept. 12. Prices advanced 10% to 15%, and even Bradford, England, could not compete with the continent. During the month of September the third sale of War Assets corporation surplus wool was held in Boston, at which time 2,000,000 lb. were sold by auction.

Resulting from the advance in world prices, parity between domestic grown wool and foreign wool widened. On Oct. 7 the CCC raised the selling prices on their holdings of domestic grown wool about five cents a pound clean basis. This raise in price was anticipated prior to that date, and more than 40,000,000 lb. of domestic wool were sold of the 1943-46 domestic clips controlled by this government agency. The OPA ruled, at this time, that manufacturers could purchase wools at the Australian and other wool auctions, competing at any price, without being affected by wool ceilings then in force. Wool merchants, however, were limited in the price which they might pay, based on the maximum prices they paid during a base period fixed between Oct. 1 and Dec. 15, 1941.

The decontrol of prices, including wool, on Armistice day, Nov. 11, brought back free trading in the world's markets for U.S. handlers. On the same day, because of the world's parity prices on wool advancing, the CCC advanced, for the second time, the selling prices of its government-controlled domestic wool, averaging five cents per pound clean basis.

Public hearings on tariffs before the Commission for Reciprocity Information were announced in November and were to be held in Washington, D.C., beginning Jan. 13, 1947. Under the terms provided for in the Tariff Act of 1930, wools and its manufactures constitute Schedule II. The third raise in CCC selling prices took effect Nov. 30 when an advance of two to three cents a pound clean basis occurred. The total of unsold CCC wools, as of Nov. 16, approximated 462,112,071 lb. The total consumption of wool in the U.S. approximated 800,000,000 lb., as compared with consumption during 1935-39 of 590,000,000 lb. (See also SHEEP; TEXTILE INDUSTRY.) (C. M. AN.)

Words and Meanings, New.

The most certain characteristic of a living language is its tendency to change. New conditions of all kinds, new ideas, new inventions—all must be described by new words, by extensions of old words or by new combinations of words. English thus adds many new words to its vocabulary every year, some destined to live long, others to die soon. The words listed below are but a small residue of those collected by the committee preparing this article.

In the 1946 *Britannica Book of the Year* reference was made to the new terms for new inventions which had been "under wraps" during World War II. The list below contains many more such terms and reveals clearly the continuing importance of the science of physics (especially electronics) in the creation of new words. In aviation and medicine as well, the influence of science on word coinage can be seen. In the nonscientific field an indication of a world still beset with problems can be seen in such new terms as "ADA," "buyers' strike," "existentialism," "52-20 club" and "iron curtain."

These words became prominent or were seemingly used for the first time during the years 1945 and 1946. Dates within the parentheses following a word or definition indicate the first recorded use of the new word or meaning in the files of the committee. A preceding hyphen means that the word or meaning is suspected to be older than the date given. If no date is given, the first record on file is 1946.

A.A.A. Proposed, American Authors' authority.

Able day. See **A-day**.

ACS. The initials of antireticular cytotoxic serum, said to retard the coming on of old age. (1944)

ADA. Atomic Development authority, proposed by Bernard Baruch to exercise control over those aspects of atomic energy inimical to global security.

A-day. Short for Atomic day, June 30, 1946 (July 1 Bikini time), when the fourth atomic bomb was dropped in a test at Bikini to determine its effect on a fleet of war vessels. Also Able day, from "able," the signaler's word for "a."

aeropulse. A type of jet-propulsion motor in which the air sucked in from the atmosphere is let into the combustion chamber through shutters equipped with springs which open and close with a pulse-like movement.

americium. Element number 95, named by Glenn T. Seaborg for the two Americas.

A.S.V. Initials of air-to-surface-vessel, a radar device able to detect vessels on the surface of the water. (1945)

athodyd. See **ramjet**.

atomic cloud. The mushroom-shaped, radioactive cloud formed by the explosion of an atomic bomb.

bacitracin. An antibiotic substance which promises to be effective against many bacteria, including those that cause pus and blood poisoning. It was first isolated in a wound of Margaret Tracey, after whom it is named. (1945)

Baker day. The day on which the second atomic bomb of Operation Crossroads was to be set off beneath the surface of the water in the midst of a fleet. So called after the signaler's word for "b." See **Able day**.

BAL. Initials of "British anti-lewisite," an alcohol (2, 3-dithiopropional) which counteracts arsenic and mercury poisoning by combining with the poisons to produce compounds which the body is able to pass off. (1945)

banana money. Japanese currency, so named because it bears the design of a banana. (1945)

Bat (bomb). A glider bomb, containing radar in its tip, which, launched from the wing of its mother ship, is electronically guided until it hits its target. It was developed by the U.S. navy and the Bell Telephone laboratories. (1945)

be-bop. Slang. Name of uncertain origin—possibly from a similar sound made on the trumpet—to describe a recent development of swing music which is unrestrained, unrehearsed, high-note, full of horseplay and often off-key. (1945)

benzene hexachloride. See **666**.

Bloc(k). Code name for a television transmitter attached to a plane which enables one to see what is going on 200 mi. away. It was developed by the U.S. navy in co-operation with the Radio Corporation of America and was used in life-saving and in actual battle.

boom-and-bust, n. A cycle of economic inflation and deflation. (1946)

brideship. A ship carrying a large number of brides of servicemen.

Bungalow Biddy. See **Tourlayer**.

buyers' strike. A movement by consumers to force prices down by not buying. (1946)

Calutron. A word composed from *California* university *cyclotron* to describe an electrical machine that classifies atoms on the basis of their weight differences. It is manufactured by the Westinghouse Electric Corp. (1945)

carbon 14. A radioactive substance of great promise as a synthesizer of food and fuel and as a tracer in biological research.

caretaker, adj. Pertaining to something temporary; stop-gap; as, a "caretaker government." (1945)

chalk. 1. Information, often posted in chalk on slates or blackboards, concerning the odds in horse-race betting. **chalk favourite.** A horse favoured to win. (1936) **chalk player.** One who waits for the last writing or posting of prices or odds so that he can play the favourite. (1934), also **chalk eater** (1942) 2. Hence, by extension, a favourite in horse racing as indicated by such information or "chalk." (1946)

Chromovox. An electric machine devised by Herman R. Goldberg to help teach the deaf to talk by associating voice sounds with certain colours.

cuddle seat. A contrivance for carrying small children, consisting of a seat hung from a strap slung over the shoulder. It was introduced by Australian war brides.

curium. Element number 96, named by Glenn T. Seaborg for the late Pierre and Marie Curie.

cyclophon. A tube used in pulse time modulations (*q. v.*).

DANA. Initials of the Deutsche Allgemeine Nachrichten Agentur (German General News agency), sponsored by U.S. newspapermen as a successor to the DNB, which was controlled and dominated by the nazis.

DFF. Short for diisopropyl fluorophosphate, a poison gas.

Doron. A glass-cloth armour, named for its inventor Brig. Gen. G. F. Dorion, and which is impervious to bullets as large as .45 calibre. (1945)

drone. A plane handled by remote control from a control or mother ship (*q. v.*). (1946)

echo. A radar wave which has been reflected from an object. It makes a pip (*q. v.*) on a radar screen. (1941)

electropult. A small car, something like a trolley, provided with a 1,400-ft.-long track and capable of developing sufficient speed (120 m.p.h.) within 500 ft. to launch a plane.

elevon. A combination *elevator* and *aileron* located in the trailing edge of the wing of a flying wing.

ENIAC. Initials of Electronic Numerical Integrator and Computer, a machine invented by John W. Mauchly and J. Presper Eckert which can solve difficult mathematical problems with great rapidity. (1946)

Exercise Musk Ox. A U.S. expedition into the subarctic and arctic regions to obtain scientific data. See **operation**.

existentialism. A pessimistic literary-philosophic doctrine in France which denies the value and significance of human existence. Jean-Paul Sartre is its chief proponent. (1945)

fact finder. One engaged, as in a labour dispute, to ascertain the facts of a case. (1945)

52-20 club. The veterans of World War II who, rather than take low-salaried jobs, are accepting the \$20 a week unemployment compensation the government will pay for a year (*i.e.*, 52 weeks).

fissionable, adj. Pertaining to that which is subject to fission. (1946)

Flying Ram. The U.S. army XP-79, a small jet-propelled flying wing made by Northrop Aircraft Co. Fourteen feet long, with a wing span of 38 ft., it is flown at speeds of more than 500 m.p.h. by a pilot in a prone position. The plane is welded into a simple magnesium sheet strong enough to withstand the ramming of enemy planes.

flying stove pipe. See **ramjet**.

FPHA. Federal Public Housing authority.

Gopa. Short for "ground-to-air pilotless aircraft," a guided missile of the U.S. army air forces. It is a thin, rocket projectile, ten feet long, to be used against enemy missiles before they strike. It is manufactured by the Boeing Aircraft Co.

G.C.A. Initials of "ground control approach," a radar-operated system in which a ground operator "talks in" (*q. v.*) a plane that must make a blind landing. (1945)

gray market. A modified black market.

guided missile. A missile directed by some means of remote control such as radio, radar or television. (1945)

hoppicopter. A flying machine invented by Horace T. Pentecost which operates on the principle of the helicopter. Its source of energy is a 20-h.p., 2-cylinder engine, attached to the back of the pilot. (1945)

hot, adj. Pertaining to objects which have been made radioactive.

huckster. Slang. A radio advertising man. (1946)

Huff-Duff, n. Pronunciation given by servicemen to the initials (HF DF) of "high frequency direction finder," a device which can determine the location of such objects as ships and aeroplanes as far away as 3,000 mi. Through Huff-Duff lost planes and ships can be told where they are. It was developed by the U.S. navy and the International Telephone and Telegraph Corp.

Huks. Shortening of Hukbalahaps, a Tagalog word meaning "armed peasants," "people's army." (1945)

hydrobomb. A 3,000-lb. aerial torpedo with an explosive charge of 600-1,250 lb., built to withstand launching speeds as high as 350 m.p.h. In the water it is rocket-powered accurately at 40 knots.

IFF. Initials of "identification, friend or foe," equipment carried in an aeroplane which is sensitive only to corresponding sets, in another plane or on the ground, using a pre-arranged code. (1945)

iron curtain. 1. The supposed impenetrable censorship and secrecy dividing soviet-dominated Europe from the remainder of the world. Attributed variously to Winston Churchill and to William Joyce (Lord Haw-Haw). (1946) 2. Any such curtain.

Mad Operator. Slang. Navy nickname for the magnetic air-borne detector which enabled aeroplanes to locate submerged submarines.

missile. Specif. Mil. Term that includes the whole class of pilotless, jet-propelled projectiles.

mop. Slang. A word connoting surprise, anguish; a mild sort of "hubba, hubba, hubba." (1944)

mothered. pp. Controlled by a mother plane.

mother ship. An aeroplane whose pilot controls a drone or push-button plane. Also **mother plane** (1945), **worker plane**.

mycoidin. A substance obtained from mould in the *aspergillaceae* family, of promise in the treatment of tuberculosis. Developed by Drs. Isadore F. Gerber and Milton Gross, it is still in an experimental stage.

Navar. A system developed in the International Telephone and Telegraph Federal Telecommunications laboratories of controlling air navigation and airport traffic from centres containing screens on which electronic images enable a control officer to determine the position of all aircraft within a radius of 80 mi. (-1946)

operation. In the last several years new specified combinations of this word, too numerous for inclusion, have occurred. 1. Such specific military uses as **Operation Neptune** (the naval aspect of the invasion of Normandy) to describe a campaign involve a sense of the word dating from 1749. 2. As a rehearsal, the term apparently goes back to World War I; a new specific combination involving this sense is seen in **Operation Crossroads**, the atomic bomb test at Bikini. 3. Under the influence of the many combinations in senses 1 and 2, operation is now being employed to cover any specific plan or project, especially nonmilitary. Thus, **Operation Dixie** describes the plan of the C.I.O. to organize the south; **Operation Friendship** is a plan of the British Travel Assn. to cement friendships made in England between Americans and Englishmen.

orbit rocket. A theoretical rocket which could be sent out into space, where it would be made to act as a satellite until such time as it might be directed at an enemy.

paludrine. An antimalarial drug developed by English investigators from coal tar. (1945)

performance-observer method. A method to keep horse racing honest. For each entry in a race an observer is appointed who watches the race through binoculars to which is attached a microphone connected with a recorder to make a record of his remarks during the race. (1945)

pip. The indication of an echo (q. v.) on a radar screen. (-1945)

Plesianthropus. An "almost man," some of whose skeletal remains were found by Dr. Robert Broom not far from Johannesburg, South Africa. (1945)

pregnenolone. A synthetic chemical, daily doses of which improve human performance by counteracting fatigue. (1945)

psychodrama. A kind of play invented by Dr. J. L. Morens for neurotics. The patients resolve their neuroses by extemporaneously creating and acting out before their fellow patients the type of situation they fear to face in actual life. (1945)

pulse time modulation. A method of using microwaves whereby a number of phone conversations can be transmitted over a single wave band. Abbrev. PTM.

push-button, adj. Pertaining to the remote-control made increasingly possible by developments in the field of electronics; as, a **push-button plane**, **push-button war**. (1945)

radar scope. 1. Short for radar oscilloscope, a machine for viewing the images produced by radar. 2. A radar screen. (-1946)

radar screen. A fluorescent screen at the end of the radar scope on which the pips are indicated. (-1946)

radioisotope. Short for radioactive isotope.

ramjet. A jet-propulsion unit without moving parts which operates on a continuous stream of air which is compressed by the speed with which the unit "rams into the air." The higher the speed, the greater the compression and hence the efficiency. Also called **athodyd** and **flying stove pipe**.

raticide. See **rodenticide**.

Red Feather. The symbol of the Community Chest.

ribbon city. A city about a mile wide built along a highway. Also **strip city**.

Ring. Code name for a large, free-moving, air-borne television transmitter capable of relaying pictures as far as 200 mi. It was developed by the U.S. navy in co-operation with Radio Corporation of America and was used in life-saving and in actual battle.

rodenticide. A rodent killer. (1945) Also **raticide**.

Sferics. Short for static direction finders, the U.S. army's electronic system for obtaining information on weather conditions. It is reliable for distances up to 3,000 mi. (1944)

Shock wave. A wave resulting from the fact that as a plane approaches the speed of sound, the air flows over the rear of the wing more slowly than the front, causing shocks that affect the lifting efficiency of the plane and eventually batter it to pieces. (1945)

Shoran. Short for "short-range radar," a radar device which uses high-frequency radio waves sent from a plane to ground stations to locate and measure by miles or feet any spot on the earth. Used during World War II to bomb targets through an overcast, it may be used in peacetime for mapping unknown areas. Developed by the Radio Corporation of America. (1945)

sitter. Short for **baby sitter** (1937), one, usually a teen-age girl, who sits with a baby while the grown-ups are out. (1944)

666. A new insecticide (hexachlorobenzene) which promises to kill intestinal parasites. (1945)

Skimobile. A mechanical chain of cars used to pull skiers up a mountain.

SN 7618. A synthetic drug (7-chloro-4-[4-diethylamino-1-methylbutylamino]-quinoline) said to excel atabrine or quinine in the treatment of malaria. So called because it was the 7,618th substance tested.

snake. Nickname of a device used during an advance to destroy wires and detonate mines.

sniperscope. A U.S. army detection device, attached to a .30-calibre carbine, for sighting objects in the dark. Infra-red rays, shot out by electronic equipment powered from a source on sniper's back, hit an object, an image of which is reflected on a screen. Japanese soldiers thus sighted were unaware of the fact. It is manufactured by Electronics laboratories of Indianapolis, Ind.

snooperscope. A U.S. army detection device, operating on the same principle as the sniperscope, which can be attached to a soldier's helmet to enable him to see, or be used by leaders for signalling. It is manufactured by Electronics laboratories of Indianapolis, Ind.

snowmobile. Currently applied also to a light tank, equipped with a glass cabin and rubber tracks in which particles of steel are imbedded for traction. (1943)

Sofar. An underwater sound system, called "Sofar" from the initial letters of "sound fixing and ranging," developed by the U.S. navy and the Oceanographic institution, Woods Hole, Mass., which made possible the location of air and ship survivors as far as 2,000 mi. from shore and thus facilitated sea rescue.

sono-radio buoy. A buoy equipped with hydrophones which pick up sound waves from a submerged submarine and convert them into radio waves for transmitting to aircraft or surface vessels. Also **sonobuoy**. (1945)

stacking, n. The assigning of planes to certain altitudes, say, 1,000 ft. apart, especially over an airport when landings are delayed by bad weather conditions. As the bottom plane lands, each member of the stack drops 1,000 ft. and a new plane can then be brought in on top. Also **stack up, n.** (1943)

synchrotron. A new 300,000,000 electron-volt atom smasher being developed by Prof. Edwin M. McMillan. (1945)

talk down, v.t. To aid a pilot to land a plane in overcast weather by studying the position of his plane on a radar screen and giving him directions. Also **talk in**. (1943)

target-seeking missile. A missile, equipped with a target-seeking mechanism, which is attracted toward its target when it approaches its vicinity.

Tournalayer. A huge machine, made by R. G. LeTourneau, Inc., which can "lay" a 24 ft. x 30 ft. 4-room concrete house in 24 hr. Also called **Bungalow Biddy**. The poured concrete houses are called **Tournaloids**.

transuranic, adj. Pertaining to elements beyond, that is, heavier than, uranium. (1945)

Truman bread (flour). The bread made from 80% wheat flour, adopted in April 1946 to make it possible to send more wheat abroad. The measure was temporary.

truth serum. Popular name for sodium pentathol, under the influence of which an individual will disclose the truth he has been suppressing. (-1946)

U.N. Designated in April 1946 as the official abbreviation of the United Nations.

U.N.E.S.C.O. The United Nations Educational, Scientific and Cultural organization. (1945)

velvet curtain. Term used by the U.S.S.R. to describe British secrecy in British-occupied Europe and the middle east.

WAA. War Assets administration, organized to handle the disposal of surplus U.S. government property.

Waccorporal. A rocket, 16 ft. in length, 12 in. in diameter, weighing 600 lb.-1,000 lb., the nose of which contains weather instruments to determine various facts about the ionosphere at an altitude of about 43 mi. So called from its slim and graceful appearance.

wave guide. Hollow pipes through which radio waves flow.

weaponer. The person who prepares an atomic bomb for dropping by the bombardier. (1945)

window, n. An antiradar device consisting of strips of aluminum foil one-half the length of a radar wave which, when scattered from a plane, confuse the enemy radar operator by producing a number of echoes on his screen. Also called **chaff**, **shaft**.

wire recorder. An electrically-operated machine for recording sound on a thin aluminum wire strung between two spools, one of which winds and the other unwinds. The recording can be heard as often as desired, or it can be rubbed off and a new one made on the same wire. (-1943)

worker plane. See **mother ship**.

X-M bank. The Export-Import bank. (-1946)

(I.W.R.)

Works Agency, Federal: see **FEDERAL WORKS AGENCY**.

World Bank: see **INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT**; **INTERNATIONAL MONETARY FUND**.

World Commerce: see **INTERNATIONAL TRADE**.

World Council of Churches: see **CHRISTIAN UNITY**.

World Federation of Trade Unions. In 1946 the old International Federation of Trade Unions was dissolved to leave a clear field for the new World Federation of Trade Unions, formed in Paris in Oct. 1945, whose membership was more than 71,000,000 by the end of the year. Sixty countries were represented and only one large trade union organization, the American Federation of Labor, remained outside.

A second congress to be held in 1947 was provided for by the constitution. In the meantime business was conducted by a general council, an executive committee and an executive bureau. The bureau was responsible for the detailed direction of business and met as often as required; it was appointed by the executive committee. The members were: Sir Walter Citrine, president; Sidney Hillman (U.S.A.), V. V. Kuznetsov (U.S.S.R.), L. Toledano (Latin America), Evert Kupers (Netherlands), Chu Hsueh Fan (China), Léon Jouhaux (France), G. di Vittorio (Italy), vice-presidents.

Changes had already taken place by the end of 1946. Sir Walter (later Lord) Citrine, the president, took office as a member of the National Coal board in Britain's newly nationalized mining industry, and his place was filled provisionally by Arthur Deakin of the British Trades Union congress. The death of Sidney Hillman (U.S.A.) created a vacancy among the vice-presidents, and he was succeeded by Frank Rosenblum (U.S.A.). The activities of the W.F.T.U. during 1946 included the sending of a commission to the four zones of occupation in Germany and discussion of the ensuing recommendations with the Allied Control council in Berlin, to be followed by a further visit to the four zones. Broadly, the W.F.T.U. recommended greater freedom for the German trade unions, with federation on a zonal basis and a consultative link-up for the four occupational zones. Arrangements were made with the Economic and Social council of the United Nations organization for representation in an advisory and consultative capacity. The W.F.T.U. was also to seek representation in other agencies of the U.N. Missions of inquiry into the trade union position visited countries and places such as Greece, Iran, Tunisia and Trieste. Visits to Japan were planned. A colonial committee was set up to encourage trade unionism in the colonies. Action was taken for the consolidation of peace, in particular by liquidating the remnants of fascism wherever they were to be found, more especially in Spain.

Negotiations continued with the International Trade secretariats to integrate them into the W.F.T.U. as International Trade departments, and a Paris conference was planned for Dec. 1946 to which all secretariats were invited to send three delegates, and the two countries not affiliated to existing International Trade secretariats, namely, U.S.A. (Congress of Industrial Organizations) and U.S.S.R. (All-Union Central Council of Trade Unions) to send six delegates each.

The headquarters of the W.F.T.U. remained in Paris. The secretary-general in 1946 was Louis Saillant; the assistant secretaries were W. Schevenels (Belgium), Michael Falin (U.S.S.R.) and Adolf Germer (U.S.A.). (W. M. Cr.)

World War II. On Dec. 7, 1941, carrier-based planes of Japan blasted U.S. ships at anchor in Pearl Harbor; on Aug. 10, 1945, the Japanese government, terrified by the potentialities of atomic bomb warfare, sued for peace. Between these two dates the United States was involved in totalitarian war on a scale never before contemplated. What did such war accomplish? What lessons were learned? What mistakes were made?

Briefly, World War II removed Germany and Japan from the ranks of world powers, possibly forever. In the process of effecting this, there was indicated the preparation of an eventual meeting ground for the powers of victory. This meeting ground would be the concerted attempt on their part to formulate a plan of living for practically all of the surviving world. The manifestation of such thought was the United Nations assembly wherein the dominating, remaining governments of the world were seriously attempting to chart national and international living so that war might be outlawed and the economic, social and political structure of the universe be stabilized. To be successful, this effort would have to burn out all of the dross of national and international greed, suspicion, and distrust, to the end that there should remain only the refined and purified gold of superlative humanitarianism, to operate permanently as a shield against the possibility of war.

To evaluate the lessons learned from World War II is not easy. The stormy sessions of the United Nations assembly prove that, at least politically. The military lessons are difficult of appreciation. Individual incidents of combat stand out as

mistakes—hindsight, as usual, is better than foresight. The high command has come under the sharp barb of direct condemnatory criticism. Throughout the months of World War II, Gen. George C. Marshall, chief of staff of the armies of the U.S., repeatedly tried to show his countrymen some of the problems that would confront the U.S. as an aftermath of war.

When Hitler unleashed his wehrmacht on Europe, the United States was not even a third-rate military power. It had no field army; it had barely three and one-half divisions spread thin over the entire area of the continental United States and its territorial responsibilities; it lacked motor transportation to train adequately the few troops it had; it had lacked congressional appropriation of funds in sufficient amounts to set up and operate troop manoeuvres which would have strengthened its woefully small forces. Modern arms, equipment, aeroplanes were lacking. Modern thinking was seemingly just as lacking, as witness the conflict at that time between the army air force and the navy—the former pleading for the building and flying of long-range, heavy bombing planes, the latter claiming that the army's mission ended at the shore line and that from there out the navy's big battleships and cruisers took over the job. However, there were isolated instances wherein navy officers did not subscribe to such policies or thoughts. One such was the collaboration of Major General Frederick L. Martin, army air commander in Hawaii and Vice-Admiral Patrick N. L. Bellinger, air defense officer of the Pearl Harbor naval base. These two prepared a historic document which reached Washington, D.C., on Aug. 20, 1941. In it was a detailed statement of how the Japanese would launch their attack on Pearl Harbor and what measures should be taken to forestall the attack. Among other things, this report stated that the Japanese task force would contain six aircraft carriers (it did); to avoid detection it would travel the Great Circle route and approach Hawaii from the north (it did); the attack must be launched at dawn (it was); early on the morning of the previous day the Japanese force must be within 884 mi. of Hawaii (on the morning of Dec. 6 it was 800 mi. due north of Hawaii); on the morning of the day of the attack, the task force must be within 350-mi. striking range (actually it was within 200 mi. on Dec. 7).

This report preceded the Pearl Harbor disaster by four months. Its authors went further than calling the turn on Admiral Yamamoto's plan. They also prescribed the means of breaking the force of the attack and their prescription was the employment of long-range bombardment aviation to intercept a surface fleet. But, the navy wanted no part of such viewpoint. It had blasted against it for 20 years. The events of 1941 had not convinced them. The Baker board (former secretary of war, Newton D. Baker) reported in 1934, after much sifting of evidence, that "the limitations of the aeroplane show that the ideas that aviation, acting alone, can control the sea lanes, or defend the coast, or produce decisive results . . . are all visionary, as is the idea that a large air force is necessary to defend our country." Truly Martin and Bellinger were voices crying in the wilderness. The early Pearl Harbor official investigators, looking for goats upon whom to dump the blame, named Martin, among others. He promptly demanded public court martial. When the investigators realized that, instead of a goat they had a bear by the tail, all charges were dropped against him and he was restored to duty with the assurance that there was no case against him.

In fairness to the army it should be recorded that by 1941 General George Marshall and General Frank Andrews were bending every effort to build an efficient, powerful, land-based bombardment force in aviation. They were clamouring for abolition of the 300-mi. limitation imposed by the navy. The army

was awake—not so the navy, where the big appropriations were apparently still to be spent for building huge battleships.

Among the civilian population conditions were so bad also that many of the so-called intellectuals were sounding off in the public press to the effect that the young men of the U.S. would not fight abroad in defense of their country.

The U.S. guard was down and the enemy struck. A scant four years later that enemy lay broken in humiliating and total defeat in the two main theatres of war, the European and the Pacific. Through the planning of the joint chiefs of staff a military plan of action had been evolved which, under the leadership of General Dwight D. Eisenhower in the European theatre and General Douglas MacArthur in the Pacific theatre, brought ultimate victory to the United States and its Allies.

Costs.—A very brief consideration of the human factor of the two wars presents considerable contrast. World War I saw fewer than 4,500,000 U.S. men in military and naval forces. Their average service in actual war was from seven to eight months. For World War II, the U.S. had 15,000,000 men and women in uniform, many of whom served four or five years. Man-years totalled 40,000,000—10 times that of World War I. The U.S. spent for World War I approximately \$30,000,000,000; during World War II the U.S. spent \$380,000,000,000—more than 12 times as much as for the earlier conflict, and the end

in soldier pensions and benefits was not yet visible in 1946. Furthermore, U.S. spending for the years 1941-46 amounted to more than twice as much as the nation spent for all purposes for the 150 years prior to 1940.

The latest (1946) casualty figures released by the war department for World War II stand at a total of 948,418. This is nearly four times as many as the total casualties suffered in all of the United States' previous wars against a foreign enemy, including World War I. Of the total casualties, the number of army deaths for all theatres was 229,238. Greatest number of casualties was recorded in the European theatre, followed in order by the Mediterranean theatre, the Pacific, China-Burma-India, Africa-middle east, the B-29 command in the China-Burma-India and Pacific areas, the Alaskan department, and the Caribbean and South Atlantic areas.

(See also CANADA.)

Criticism.—The trend of criticism can be illustrated by a few examples:

The capture of Makin was effected between Nov. 20 and 24, 1943. It was really the prelude to the later U.S. advance among the Marshall Islands. A published report covering this operation covers the course of the operation thoroughly. It concludes with this criticism: "At Makin, then, the report of the participants declared, the preparatory naval gunfire and aerial bombing, the selection of beaches, the initial coordination among tanks and ground troops, the performance of com-

UNITED STATES FORCES occupying part of the Venezia Giulia province in northeast Italy being briefed before practice manoeuvres in Aug. 1946

MEDICAL SUPPLIES which had been stocked by the nazis in a German salt mine in preparation for World War II. By 1946 the U.S. army had distributed hundreds of tons of these supplies to needy areas

munications elements, and the 'indiscriminate' fire over the flat terrain were all faulty. The men were said to have carried much burdensome, useless equipment ashore . . ." Certainly such criticism, freely published, doesn't seek to gloss over any mistakes!

In one of the popular weekly magazines, an article of criticism appeared as part of a discussion of the U.S. campaign in southern Italy. In this article, the judgment and tactics of General Mark W. Clark were flayed. Apparently the accusers were the former members of the American 36th division, commanded by Major General Fred L. Walker. The basis of the critical article was the alleged mishandling of the Rapido river crossing in the 1943 Italian campaign.

The charge, a serious one bluntly placed before the reading public, sought to show that lives were needlessly sacrificed in this operation, particularly so among 36th division personnel.

Misjudging what the enemy intentions were led to the worst blue-water defeat in United States navy history. In a half hour of fighting the U.S. lost four cruisers, Aug. 9, 1942, in the battle of Savo Island, off Guadalcanal. With ample warning, the enemy's intentions were misread. Japanese Admiral Mikawa, in his first 'slash, fired all his torpedoes to cripple the "Chicago" and the "Canberra." On his second round, the Jap admiral hit the heavy cruisers "Vincennes" and "Quincy" which soon sank. The badly damaged "Astoria" stayed afloat for some hours later. U.S. Admiral Richmond Kelly Turner and British Vice-Admiral V. A. C. Crutchley were the commanders involved on the losing side. The news of the disaster reached the public in Oct. 1942. The official records bearing on it were brought to public light four years after the event. At the time, the defeat was a bitter blow to morale in the United States since this was its first offensive in the Pacific.

Perhaps more than any one publication, Ralph Ingersoll's book *Top Secret*, published by Harcourt, Brace and Company, Inc., in 1946, sets forth what he believes to be mistakes in the campaigns of World War II. Allowing for personal bias of the author against individuals, there still remains much valid, critical, operational material. This he points vividly in un-

mistakable phraseology. Writing of the effort of the Americans to capture Brest, he states, "Brest was the greatest boondoggle of the American campaign . . . because for months of effort and thousands of casualties, neither a single soldier nor even a pound of American supplies was ever landed there. By the time Brest was taken, there was no need for it."

Striking on Dec. 16, 1944, Hitler unleashed his Ardennes offensive, the "Battle of the Bulge," which so nearly reversed the ultimate course of the war. Ingersoll blames a faulty supply system for the fact that Hitler was allowed time to mount this attack. He claims that, since the U.S. had the Germans completely off balance and badly disorganized and, had the U.S. supply been swift and efficient, the final, demoralizing blow could have been struck against the Germans in 1944. But, the Ardennes battle began and, in one day, the Germans tore a 50-mile gap in the U.S. lines and seemed certain of victory. Field Marshal Sir Bernard Montgomery urged upon General Eisenhower that the battle be considered as two battles, Montgomery fighting on the north face and General Omar Bradley on the south. Apparently he convinced General Eisenhower since he took the 1st and 9th U.S. armies from General Bradley and made them a part of Montgomery's forces. The very thing that the Germans sought to do was now a fact—the Allied command was split. Eventually, the brilliant, sharply concentrated supporting attack of General George Patton's 3rd army enabled Bradley to break through and relieve Bastogne and to smash Marshal Karl Gerd von Rundstedt's offensive. However, there seems to be little justification for the acceptance of Montgomery's viewpoint. Some months earlier, when General Eisenhower had decided that Walcheren Island, fortified by the nazis and the key to Antwerp's use as a supply port, must be captured, relations with this same General Montgomery became considerably strained. Ingersoll writes, "Eisenhower had no choice but to *order* Montgomery to take Walcheren Island . . . Montgomery ignored Eisenhower's first order . . . Eisenhower ordered Montgomery a second time . . . and a second time nothing happened . . . the American War Department was asking how come? . . . Montgomery at last complied and after two further minor postponements the attack was begun."

This incident of conflict in command was nothing new. In

World War I, it was not until after the United States had entered the conflict that any effort was made to set up a unified command for the Allies. When the plan was finally implemented, Ferdinand Foch was the man chosen. This marshal of France had always preached the gospel of *offense*; Henri Pétain, his logical competitor for the position of supreme commander, and the man with whom General John Pershing had to deal most, had always been the apostle of *defensive* warfare. Thus, at the top, to language difficulties, was added the clash of warring personal philosophies of the conduct of war. Furthermore, unity of command was not too literally taken by the British and it was not uncommon for their commander, General Sir Douglas Haig, to ignore Foch's authority. The story was nearly paralleled in World War II. It was not until Feb. 12, 1944, that General Eisenhower was made supreme Allied commander—and all necessary forces in the United Kingdom, British and U.S. (with the exception of the strategic air forces) were placed under a committee of three British commanders in chief.

Research and Experimentation.—Army experts lost no time in plunging into research work to turn some of the lessons of World War II to good account. A few instances are here cited.

On Jan. 10, army signal corps scientists made radar contact with the moon from their station at Evans Signal laboratory, Belmar, N.J.

To study the artificial control of weather, a B-25 medium bomber dropped icy pellets into super-cooled clouds and produced a snowfall.

On Aug. 2 the Manhattan engineer district, key organization in the development of the atomic bomb, delivered the first radioactive isotopes to the nation's research institutions. These were the first peacetime products of the government's atomic energy facilities and took the form of pea-sized units of carbon-14. These, for the next 10,000 or 25,000 years, will emit 37,000,000 beta particles per second and will be used in research in connection with the medical study of cancer, diabetes, photosynthesis, carbon deposition in the teeth and bones, and the utilization of fats by the body.

On Jan. 26 the war department activated the first experimental guided missiles group whose functions were set forth as development of tactics and technique of guided missile operations, training of personnel, development of organizational and equipment requirements, and demonstration of guided missiles in the army air force program. Experiments were planned with three types, (1) air-to-ground, (2) ground-to-ground, and (3) ground-to-air. The German V-2 is an example of the second type and was extensively tested during the year at the Ordnance Proving Grounds, White Sands, N.M. One of the first concerns of this new experimental group was the study of cosmic rays to learn their effect on the elements used in the production of long-range guided missiles.

Army ground forces units known as Task Force Frigid, Task Force Frost and Task Force Williwaw, on Oct. 1 began a seven-months' study of the reaction of modern army equipment in all types of dry cold and wet cold weather. Some 4,500 troops composed the forces who were equipped to pit new army equipment—tanks, self-propelled guns, radars, rations, kitchens, clothing—against the rigours of Alaskan winters.

At Aberdeen Proving Grounds, Aberdeen, Md., extensive experiments were conducted to develop bombs which could be dropped accurately from supersonic planes. Tests in the supersonic wind tunnel and in the free flight aerodynamic range proved that present type bombs were worthless for use with planes travelling faster than sound.

Jet planes made and unmade speed records during the year.

In this field the U.S. had lagged in World War II. It was just beginning to show some progress at the end of the conflict. In Aug. 1946 a P-80 Shooting Star set up an average speed of 592 m.p.h.; the following month an XP-84 Thunderjet was timed at a speed of 619 m.p.h. As the year closed, attention was focused on the coming tests of the Bell XS-1, the air force's first rocket-propelled aeroplane designed to fly at a top speed of 1,700 m.p.h. at an altitude of 80,000 ft. Not designed as a military aeroplane, it is actually a piloted, flying research laboratory to record the effect of transonic and supersonic speeds of aircraft.

In the Bikini Atoll area of the Pacific, atomic bombs were tested during the summer months. Using anchored obsolete Allied and Japanese vessels as targets, bombs were dropped under varying conditions. One of the most exacting studies made from these operations was that dealing with the relative effect and persistence of radioactivity within a bombed area.

Early in the year the ordnance department publicized the invention of a mathematical robot known as Eniac (Electronic Numerical Integrator and Computer). It is the invention of Dr. J. W. Mauchly and J. Presper Eckert, of the Moore School of Electrical Engineering of the University of Pennsylvania where the machine was built. It was the first all-electronic general purpose computer ever developed and the ordnance department requested its construction to break a mathematical bottleneck in ballistic research. The electronic methods of computing used in the Eniac make it possible to solve in hours problems which would take years on a mechanical machine.

Postwar Objectives.—World War II results have set up at least two objectives to engage the attention of army administrative personnel, (1) the creation of a single national defense department and (2) the promulgation of a satisfactory program of universal military training.

General Billy Mitchell was among the first to plead for a single department of national defense. He saw the problem from the viewpoint of the air arm. Sensing the possibilities of air fighting, he begged military heads for a consolidation of

ATOMIC BOMB blast cloud taken 20 min. after the blast over Nagasaki on Aug. 9, 1945. The picture was taken by an industrial worker on the outskirts of the city, and was published in 1946

war and navy departments, making full use, thus, of their combined forces, particularly air power. When official support was not forthcoming, he carried his case to the American people. The result is well-remembered—he was cashiered out of the army in 1925. But, in the days of World War II, when practically all his predictions had come true, a belated award of the congressional medal of honour went to him posthumously. In 1946 there was again a battle under way for a single national defense department. In World War II, ground, air and sea forces were combined in hard-hitting task forces which ultimately won through to complete victory. Yet the navy, despite these practical examples of unified action, was seemingly reluctant to back the unified program. In an Armistice day address at St. Louis, Mo., General George C. Kenney, commanding general of strategic air command, urged the establishment of a single department of national defense with co-equal status for air, land and sea forces. To meet the critics of the movement he said, "Unification does not mean subjugation . . . no submergence of any arm of our military forces." A little later, Nov. 22, Under Secretary of War Kenneth Royall, a veteran of both World Wars, voiced the support of the war department in an address before the national convention of American Veterans of World War II. He there declared that the U.S. could never have an efficient and economically sound defense organization without a single department of national defense with a single administrative head. To this end, the army ground forces and the army air forces are co-operating. William B. Huie in his book, *The Case Against the Admirals*, published in 1946, takes the navy seriously to task for withholding its support of the movement.

On Oct. 3, 1946, the war department released a new plan for universal military training with the hope that it would meet with congressional approval. The basis of the plan is one year

of military service and training for all physically and mentally fit young men of the nation between the ages of 17 and 20. This would include six months of intensive military and technical specialist training and an additional six months, or the equivalent, in one of eight other categories. Speaking before the National Council of Reserve Officers association on Nov. 22, 1946, Secretary of War Robert Patterson had this to say for universal military training: "Had Congress in 1920 enacted the universal military training proposed, the United States would have had nine million trained reserves when Japan invaded Manchuria, ten million when Hitler rose to power, twelve million when Mussolini invaded Abyssinia, fourteen million when Germany invaded the Rhineland, sixteen million when the Nazis seized Poland. The world's war mongers would never have gone forward with their design for world rule had we had available an effective trained reserve. War would have been averted."

SACKS filled with nazi records discovered at Munich and sent to the Berlin document centre in 1946 for sorting

MILDRED BURKE (top), Women's World Champion Wrestler, shown in a match with Dorothy Kauffman, during the summer of 1946. Miss Burke won, throwing her opponent in 14½ min.

Wrestling. Doug Lee of Baltimore, Md., became the "amateur wrestler of 1946" with his victory in the 175-lb. class of the National A.A.U. championships. A three-time champion in lower weights, Lee defeated another triple champion, Dr. M. A. Northrup of the San Francisco Olympic club, in the 175-lb. final. Henry Wittenberg won his fifth national title as champion of the 191-lb. class. The meet's other highlight was the crowning of 17-year-old Dick Hauser of Waterloo, Ia., as the 121-lb. champion. The New York Athletic club won the team title with 17 points to 13 for the Alameda, Calif., Naval Air station. The Baltimore Y.M.C.A. was third with 10. (M. P. W.)

WSA: see WAR SHIPPING ADMINISTRATION.

Wyatt, Wilson Watkins (1905—), U.S. government official and lawyer, was born Nov. 21 in Louisville, Ky. He studied law at the University of Louisville (1922–23) and at the Jefferson School of Law from which he was graduated in 1927. Admitted to the bar in Louisville, he became a successful corporation lawyer, held directorships in several large firms and was prominent in Democratic state politics. In 1941 he was elected mayor of Louisville and after his term ended, President Truman named him national housing expeditor, Dec. 12, 1945. Five weeks later, Wyatt presented Truman with a plan calling for construction over a 2-year period of 2,700,000 low-cost homes. The proposal, which gave priority for purchase or rental to veterans, was later passed in much modified form by congress. To assure the success of the project, both Wyatt and John D. Small, civilian production administration director, ordered a halt on all general housing construction. Earlier (Jan. 28), John W. Snyder, then director of the Office of War Mobilization and Reconversion, delegated his housing powers and authority to Wyatt to expedite the building program. Wyatt ordered, April 20, a reduction in cost ceilings for new houses and set aside 25% of new construction

for rental. On Aug. 4 Wyatt reported that during the first 6 months of 1946 construction was begun on nearly 500,000 homes and completed on 225,000. In efforts to speed the program, Wyatt and Small ordered lumber dealers to hold four-fifths of their sawmill shipments for veterans' housing. Non-residential construction was cut 27% and hoarding of materials for future building was halted. Many real estate organizations, however, criticized the Wyatt program and on Nov. 1 the Reconstruction Finance corporation rejected his efforts to get substantial loans for builders of prefabricated homes. After President Truman sided with the RFC on this issue, Wyatt resigned Dec. 4.

Wyoming. A Rocky mountain state, admitted to the union July 10, 1890, as the 44th state. Leadership in the extension of rights to women gave it the name "Equality state." Land area 97,506 sq.mi.; water area 408 sq.mi.; pop. (1940) 250,742. The rural population was 157,165; urban 93,577; 229,818 native white; 950 Negro; 17,107 foreign born. Capital, Cheyenne (1940: 22,474). Other cities of 10,000 or more: Casper (17,964); Laramie (10,627); Sheridan (10,529).

History.—State officials elected in Nov. 1946 were: governor, Lester C. Hunt, second term (D.); secretary of state, Dr. A. G. Crane (R.); auditor, Everett T. Copenhaver (R.); treasurer, C. J. Rogers (R.); superintendent of public instruction, Edna B. Stolt (R.). Fred H. Blume was re-elected associate justice of the supreme court. Holdover justices were Ralph Kimball and William A. Riner. By rotation William A. Riner became chief justice. A Republican legislature was elected.

The state legislature which normally meets only in odd-numbered years was called into special session in April principally for the purpose of providing an emergency appropriation for the state university.

Education.—In 1946 there were 626 elementary schools with 1,781 teachers and an enrolment of 39,395. There were 123 high schools with 894 teachers and an enrolment of 13,014.

Social Insurance and Assistance, Public Welfare and Related Programs.—Funds allocated in 1946 included \$274,314 for dependent children; \$1,790,233 for old-age assistance; \$204,455.47 for general relief; \$59,199 for aid to the blind; and \$260,888 for general welfare health.

There were three correctional institutions with inmates (average) and expenditures as follows: penitentiary at Rawlins (267 inmates) \$187,278.97; girls' school at Sheridan (52 inmates) \$37,931.35; boys' industrial institute at Worland (46 inmates) \$75,258.94.

Communications.—Wyoming had 4,019 mi. of oiled or paved roads in 1946. Highway construction contracts totalling more than \$8,300,000 including 575 mi. of road were let in 1945 and 1946. The state railroad mileage in 1946 was 1,912.32.

Banking and Finance.—On June 30, 1946, there were 29 state banks with deposits of \$60,031,213.76 and resources of \$63,935,009.21. There were 27 national banks with deposits of \$141,934,762.44 and resources of \$150,026,187.73. There were ten savings and loan associations, all but one insured by the federal government.

Total state receipts for the fiscal year ending Sept. 30, 1946, were \$21,695,325.33. Total disbursements were \$17,299,540.35. The bonded debt Sept. 30, 1946, was \$2,596,000.

Ranching and Agriculture.—Wyoming livestock products sold for approximately \$80,000,000 in 1946. Cattle marketing increased 11%; sheep marketing declined 25%. Other farm products were valued at an estimated \$40,000,000. Crop production was above average.

Manufacturing.—The value of manufactures, excluding oil refining and dairying, was estimated at \$25,000,000. Employ-

Leading Agricultural Products of Wyoming, 1946 and 1945

	Crop	1946	1945
Corn, bu.		1,122,000	1,155,000
Winter wheat, bu.		4,348,000	3,078,000
Spring wheat, bu.		1,140,000	1,155,000
Oats, bu.		4,514,000	4,920,000
Barley, bu.		3,990,000	3,720,000
Hay, tons		1,296,000	1,274,000
Beans, cwt.		1,305,000	1,075,000
Sugar beets, tons		488,000	346,000
Potatoes, bu.		2,498,000	2,362,000

ment in manufacturing in June 1946 was 5,830. Principal products were those of petroleum and coal, employing 2,250, and food, employing 1,440.

Mineral Production.—The taxable valuation of Wyoming mineral products in 1945 was as follows: petroleum \$30,892,000; bituminous coal \$18,900,000; iron \$2,600,000; bentonite \$300,000; natural gas \$1,900,000. (A. T. L.)

X-Ray and Radiology. During 1946, there was continued interest in the artificial radioactive isotopes both for diagnosis and treatment of disease. This interest was greatly stimulated by the dramatic events surrounding the explosion of atomic bombs at Bikini and the world-wide discussion of possible constructive results to be secured by means of atomic fission. An isotope of an element has the same atomic number; that is, the same nuclear charge as the element itself but differs from the latter in mass. For example, the nucleus of the hydrogen atom contains one proton which has a positive charge and no neutrons, but its isotope, heavy hydrogen, contains one proton and one neutron. Since the isotope has only one proton, it can attract only one electron and it behaves chemically like hydrogen, although its nucleus is approximately twice as heavy because of the presence of a neutron.

Elements with a more complex nucleus may have a number of isotopes.

When G. Hevesy in 1923 employed a radioactive isotope of lead (Radium D) to investigate the metabolism of plants, he originated the method of radioactive tracers. Later, when Irene Curie and F. Joliot discovered artificial radioactivity and Ernest O. Lawrence developed the cyclotron, it was found possible to prepare radioactive isotopes of all of the stable elements. After that time biologists have had a unique tool of immense value. Almost any element could be traced in its course through the body. The value of the artificial radioactive elements as tracers lies in the fact that the radioactive isotope of an element behaves chemically and physiologically the same as the stable element.

During 1946, Leslie A. McClintock and Murray M. Fried-

FIRST X-RAY of an entire automobile made in 1946 at the University of Rochester X-ray laboratory showed the inner parts of a jeep. The original X-ray was 145 in. long and 56 in. high

man utilized a variation of the tracer principle in experiments in which metals and dyes combined with specific antibodies were carried to selected sites in tissues. They used purified pneumococcus antibody, type I, combined with uranium injected intravenously into guinea pigs. A subsequent roentgenogram showed deposition of the metal in the thigh at the site of injection of specific antigen polysaccharide pneumococcus, type I. None of the metal was deposited in the opposite thigh, where polysaccharide pneumococcus, type II, had been injected. For similar experiments on the lungs, malachite green was used. The metal or dye evidently remained firmly bound to the antibody and was deposited within a few minutes at the site of the specific antigen. The specificity of the antibody was not altered by combination with the metal or dye.

Another variation of the tracer method was reported by B. V. A. Low-Beer and his associates. Their investigation was based upon the fact that radioactive phosphorus administered orally or intravenously is assimilated by different tissues in varying degrees. Since the rate of deposition of radioactive phosphorus depends upon the rate of metabolism in the given tissue and since malignant growths have a higher metabolic rate than tissues from which they originate, it follows that the phosphorus will be deposited in greater amount in the malignant growth than elsewhere. These facts were established by measurements after removal of the tissues. Low-Beer and his associates discovered that they could estimate the amount of radioactive phosphorus in superficial tissues by measurements with a Geiger-Muller counter. They utilized this method for investigation of tumours of the breast after intravenous injection of 300 to 500 microcuries of radioactive phosphorus in the form of isotonic disodium hydrogen phosphate solution 24 hours before operation. At 2, 4, 6 and 24 hours following injection, surface measurements were made directly over the palpable tumour and over comparable areas of the opposite breast with a Geiger-Muller counter. After removal of the breast, the phosphorus content of the tumour and normal tissues was measured. They reported results of 25 patients, 17 of whom had malignant tumours. Sixteen of these showed at least 25% higher counts over the tumour than elsewhere. The single case of malignant tumour which did not show an increased count was a mucoid cancer with very few cells. There were eight benign tumours and in all of them the count was less than 25% above the normal control areas. They concluded that breast cancers could probably be diagnosed by this method

except for slow-growing tumours such as mucoid carcinoma. They cautioned against depending upon the method for diagnosis until it is confirmed by a much larger series of cases.

From the time of the first production of artificial radioactive isotopes there has been a vast amount of research work to determine their value for the treatment of disease, and a considerable number of them have been used clinically. Chief among the latter were radiophosphorus, radioiodine and radiostrontium. The reports on radioiodine in diseases of the thyroid gland and of radiostrontium in malignant tumours of bone do not indicate that they will supplant established methods of treatment.

Radiophosphorus, P 32, was the most widely used of all the radioactive isotopes in treatment of disease. During 1946 an excellent review based upon the literature and personal experience was published by a well qualified group at Washington university in St. Louis, Mo. The report was the result of nine years' observation and experience based upon treatment of 155 patients with polycythaemia vera, myelogenous leukaemia, lymphatic leukaemia, monocytic leukaemia, Hodgkin's disease, lymphosarcoma, reticulum cell sarcoma, multiple myeloma, Ewing's sarcoma, malignant melanoma, anaplastic carcinoma, mycosis fungoides and xanthomatosis.

The only one of the above diseases in which the results seemed to be an improvement over roentgen irradiation was polycythaemia vera. In this disease, administration of P 32 brings about prompt remissions sometimes lasting two or more years. It was not certain, however, that this treatment would prolong life beyond that secured by roentgen treatment. In chronic myelogenous and lymphatic leukaemia, P 32 had no advantages over roentgen therapy except that it did not produce radiation sickness. In monocytic leukaemia it was found of no value and in Hodgkin's disease was found inferior to roentgen irradiation. It was not found of value in lymphosarcoma, reticulum cell sarcoma, multiple myeloma, lympho-epithelioma nor in the remaining diseases named above.

It was found that P 32 has a profound effect upon the bone marrow; severe leucopenia, thrombocytopenia and anaemia may occur as result of treatment.

An interesting piece of research in which an artificial radioactive salt was utilized was carried out by Gunnar Sohrne. By means of Geiger-Muller tubes, Sohrne determined the time of blood-flow between various portions of the human body by injection of radioactive common salt.

He has also used the method to determine vascularity in a brain tumour. The radioactive sodium chloride solution is injected into a cubital vein and Geiger-Muller tubes are placed symmetrically on each side of the calvarium. If the vascular tumour is situated under one of the tubes its millimeter will react more strongly than the other. (See also CANCER; PHOTOGRAPHY; TUBERCULOSIS.)

Yachting. The yachting season of 1946, the first full season after World War II, was marked, particularly in the United States, by a huge growth in interest and participation in the sport, a growth which would have been even greater

INTERNATIONAL CLASS SLOOPs bearing down on the starting line at Larchmont, New York, July 21, 1946, as the Larchmont Yacht club's 48th annual race week got underway

had postwar difficulties not made it impossible for boatbuilders to keep pace with the demand for new craft.

The revival of ocean and long distance racing aroused great public interest. Howard Fuller's sloop "Gesture" won the 635-mi. race from Newport to Bermuda in a fine fleet of 34 yachts, among them a British entry, "Latifa," and among the smaller boats in this race the class-B prize went to Robert F. de Coppet's new yawl "Suluan." The races to Mackinac Island from Port Huron and Chicago, on the Great Lakes, also saw fine fleets. Robert Schleman's 12-metre sloop "Nyala" set a new Port Huron-Mackinac course record of 30 hr. 31 min. 38 sec. Among the class winners in the Huron-Mackinac race were James Ryder's "Carina" among the cruisers and John Blunt's "Rangoon" in the racing class; while in the much slower race from Chicago to Mackinac top honours went to Ernest Grates' "Blitzen" and Vitas T. Thomas' "Spindle."

British deep-water racing also proved popular in spite of the handicap of war-decayed sails and gear. One of the outstanding boats in a full season of this type of racing was H. G. Hasler's 30-square-metre sloop "Tre Sang," which confounded the conservatives by an outstanding record and no mishaps, though she was the antithesis of the usual ocean-going type of yacht.

International class racing did not get into full swing but there were some events of this nature, including the Star class world championship, held at Havana, Cuba, won by George Fleitz's "Wench II," of the Los Angeles Harbor (Calif.) fleet. The International one-design class held a series in Bermuda in which the Bermudians defeated a Long Island sound team by a decisive margin. The revival of international racing in the six-metre class, which was active in British and Scandinavian waters during 1946, was forecast by challenges by the United States for the Seawanhaka cup, held in Scotland, and by Scandinavian countries for the Gold cup, held by the Seawanhaka Corinthian Yacht club at Oyster Bay, N.Y., the races to be held during 1947.

The sport enjoyed an active revival not only in Sweden, where some sailing was done throughout World War II, and England, but also in the formerly occupied countries of Europe, where, as in the United States, the only limit of the expansion appeared to be the ability to build boats under postwar conditions. The tendency in all countries was noticeably to smaller boats than in prewar days, but many more of them, and a further departure from the old idea of yachting being solely a "rich man's sport." Among the classes of small sailing craft holding championships, the Snipe class title series drew representatives of Brazil, Portugal, Newfoundland and Switzerland, as well as many U.S. entries, and the winner was Robert Davis, of Balboa, Calif. Other class champions were P. A. Somervell, with "Double Scotch" in the Comet class; Walter Swindeman, Jr., with "Yankee Doodle" in the Lightning class; and Roger Willcox, with "Morss," in the 110 class.

Famous trophies for which competition was revived during the year were the King's cup, won by Henry C. Taylor's "Baruna"; Astor cup, won by John B. Shethar's "Sylvia"; Freeman cups, won by L. F. Grant's "Tramp Royal" and Jack Castle's "Fo'Castle II"; Sears cup (U.S. National junior championship) won by the Stage Harbor (Mass.) Yacht club crew; Manhasset cup, won by Philip Benson's "Reaper"; Mrs. Adams trophy (national women's championship) won by the Edgartown (Mass.) Yacht club crew; and the Ocean-Great Lakes Challenge cup, won by the Indian Harbor (Conn.) Yacht club team.

(H. L. St.)

Yale University. Unprecedented increases in student and faculty population were reflected in every aspect of university life in 1946. When the student peak

rose from a prewar high of 5,300 to 8,647, an increase of 65%, and the faculty from 1,000 to 1,200, emergency housing measures were adopted.

Dormitories, private homes and even a hospital were remodelled, 100 Quonset huts and 3 barracks were built to handle the overflow. While making room for the veteran enrolment, the university planned to accommodate several hundred freshmen from secondary schools each year.

Organized studies in the field of American civilization, at both the undergraduate and graduate levels, were set up which cut across traditional departmental fields. Goal of the new courses was objective appraisal of the political facts and cultural development of the U.S.

The various branches of the armed forces terminated training during the year, concluding instruction of 22,000 members of the army, navy and marine corps which had taken place at Yale. The National Yale Alumni Placement Service, created for aiding graduates who are veterans, by the end of the year had helped 1,500 men to find jobs.

Yale strengthened its interest in the far east by establishing an institute of Chinese language and literature to train missionaries, government and commercial representatives in the language and customs of China. The war department sent a group of officers to study for future service as attachés in the far east.

In the sciences, the school of medicine continued its institute of occupational medicine and hygiene to train physicians in industrial medicine and conducted postgraduate refresher courses for doctors who had been in the armed forces. The astronomical station on the grounds of the University of the Witwatersrand, Johannesburg, South Africa, was placed under the joint operation of Yale and Columbia universities. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

(C. A. L.)

Yeast. Preliminary fermentation of corn steep liquor by yeast was shown during 1946 to improve yields of penicillin fermentation in which the steep liquor is used. Pear canning wastes were recommended as a substrate for the growing of *Torulopsis* yeasts. Reports of the U.S. Technical Industrial Intelligence committee describing German yeast industries were released.

Patents issued included two for improvement of stability of active dry yeasts, one by coating with lignin and the other by stimulating spore formation. Other patents claimed improved recovery of sterols from yeast, a device for continuous dewatering of yeast suspensions, a method for producing dry, stable invertase preparations from yeast and manufacture of a fertilizer comprising yeast and lignin from the yeast fermentation of sulphite waste liquor.

Research published during 1946 showed that diets consisting solely of yeast and mineral salts were capable of supporting growth, reproduction and lactation in animals; that yeast is a valuable addition to cereal foods, where it supplements both vitamins and proteins, and that the vitamin content of foods fortified with yeast is relatively stable during storage.

Two enzymes were newly isolated from yeast; hexokinase (an enzyme entering into the intermediate metabolism of carbohydrates) and yeast lactic dehydrogenase, a cytochrome-reducing enzyme. Details of the formation and breakdown of glycogen, and the effect of such stored food reserves upon respiration and fermentation were established.

Yemen: see ARABIA.

Yoshida, Shigeru (1878–), Japanese politician, was born Sept. 22, in Tokyo. Educated at the Tokyo Imperial university, he was graduated from the law college in 1906. He held many minor diplomatic posts in the far east and Europe and was second secretary at the Japanese embassy in Washington (1916–17). He was minister to Sweden, Norway and Denmark in 1928, vice foreign minister, 1928–30, ambassador to Italy, 1930–32 and ambassador to London, 1936–39. Yoshida was arrested in June 1945 allegedly for heading a “defeatist” peace faction. He was freed after Japan’s surrender and became foreign minister in the Kijuro Shidehara cabinet, Oct. 6, 1945.

On May 16, 1946, Yoshida, who had accepted the presidency of the Japanese Liberal party the previous day, was named successor to Shidehara as premier and his cabinet was sworn in May 22. Although he resisted the Allied headquarters directive for reorganization of Japan’s economy, he yielded in Aug. 1946 to the order after Gen. Douglas MacArthur’s headquarters put it on an “either or else” basis. The demands of Japanese labour that Yoshida resign resulted in the premier’s statement, Dec. 31, 1946, in which he said that the tactics of Japanese leftist and labour groups were designed to cause social unrest.

Yost, Fielding Harris (1871–1946), U.S. football coach, was born on April 30 at Fairview, W.Va., and was educated at the University of West Virginia and Lafayette college. At the latter school, he played football and studied law. He turned to football coaching as a career and his first job of importance was at Ohio Wesleyan. In 1901 he was made coach at the University of Michigan. In the succeeding years, Yost, Bob Zuppke of the University of Illinois and Amos Alonzo Stagg of the University of Chicago made the football teams of the “Big Ten” conference nationally famous. Yost’s early teams scored the equivalent of a point-a-minute and Yost achieved a national reputation as a football strategist. Between seasons, he practised law. He also promoted and developed the Tennessee Power company hydroelectric plant (1907–14) and was an official of the Cumberland Valley National bank at Nashville, Tenn. (1912–19). He was appointed director of athletics at the University of Michigan in 1921, and it was then that he began to devote less time to football and more to what he termed a “sports for all” program. Under his guidance, the recreational facilities of the university blossomed and many new buildings were constructed. He retired in 1941. Yost died at Ann Arbor, Mich., on Aug. 20.

Youmans, Vincent (1898–1946), U.S. composer of popular songs, was born on Sept. 27 in New York city. During World War I he entered the navy and was assigned to an entertainment unit where he produced and composed a number of musical shows for the servicemen. After the war, he obtained a job as a “song-plugger” with a New York music publishing house and wrote a number of moderately popular pieces. His initial success was his first full score for the musical comedy, *No, No, Nanette*. Two of his songs, “Tea for Two” and “I Want to be Happy” were “smash hits.” The musical comedy opened in London and New York city in 1925 and was successful in both cities. Its first London engagement ran to 665 performances, and in Chicago the comedy played for a year. Eventually 17 companies playing in *No, No, Nanette* circled the globe, playing in Europe, South America, China, New Zealand and Java. In 1933, Youmans went to Hollywood and wrote the score for the motion picture *Flying*

Down to Rio, from which two songs, “Carioca” and “Orchids in the Moonlight,” enjoyed great popularity. Other of his well-known songs were “Hallelujah,” “Without a Song” and “Time on My Hands.” He retired from the music world in 1933 because of ill health. His last stage production was *Vincent Youmans’ Ballet Revue* (1944). He died in Denver, Colo., on April 5.

Young Men’s Christian Association.

The Young Men’s Christian association is a world-wide fellowship seeking to improve the spiritual, social, recreational and physical life of young people, particularly young men and boys.

Early in 1946 an international convention brought together more than 2,000 representatives of associations in the United States and Canada to examine Y.M.C.A. responsibilities to youth around the world in the light of postwar conditions. North American Y.M.C.A.’s accepted the convention’s challenge to raise \$8,650,000 to restore shattered association buildings and equipment abroad and to meet urgent war-occasioned needs at home. While funds were to be allocated to association movements in all countries according to need, North American Y.M.C.A.s felt particularly close ties with associations in Asia, the middle east, eastern Europe and Latin America which were established with North American aid. Undertaken in 1889, the World Service program had provided trained leaders to help organize Y.M.C.A.s in 28 countries.

Absorbing veterans into on-going programs of personal and vocational counselling, recreation, social activities, athletics, informal and formal education had received emphasis in every U.S. Y.M.C.A. As program aids, most associations are equipped with dormitories, cafeterias, gymnasiums, swimming pools, reading and club rooms. Constantly expanding programs for boys and girls of grade and high school age were conducted in Y.M.C.A. buildings and school and neighbourhood clubs. Student associations were greatly expanded to meet the needs of veterans on the campus. Service to the armed forces continued in 22 army and navy Y.M.C.A.s and 114 Y.M.C.A.-operated U.S.O. clubs.

Expenditures of the 1,345 associations in the United States totalled \$73,537,600, and capital investments totalled \$228,949,800. Officers in 1946 were Kirtley F. Mather, president, and Eugene E. Barnett, general secretary. Headquarters of the National council of the Y.M.C.A. were at 347 Madison avenue, New York 17.

(O. E. P.)

Young Womens Christian Association.

In 1946, the Young Womens Christian association of the United States continued its varied services to women and girls engaged in peacetime activities, as well as for those still affected by war. The World Emergency and War Victims fund carried on its program of material and spiritual aid, sending approximately 185,000 lb. of clothing, food and other essentials to 17 countries in less than 2 years, as well as supplying staff and opening centres for rest and recreation. The 17th national convention of the Y.W.C.A., held in March 1946, in Atlantic City, N.J., voted approval of a program to raise at least \$2,000,000 for the reconstruction of Y.W.C.A.s throughout the world, as well as a \$500,000 fund for further development of Y.W.C.A. work in the U.S. With the clear intent of encouraging interracial co-operation within the Y.W.C.A. as well as in other movements, local and national, with which it is associated, the convention adopted the report of interracial activities in community Y.W.C.A.s and the interracial charter presented by the national

board. A public affairs program stressing international relations was also adopted. In the autumn of 1946, the national board held 15 leadership-institutes in various parts of the U.S., in order to give Y.W.C.A. leaders an opportunity to draft workable plans for dealing with postwar needs of women and girls. The executive body of the Y.W.C.A. of the U.S. is the national board, with headquarters at 600 Lexington avenue, New York 22, N.Y. President in 1946-47, Mrs. Arthur Forrest Anderson; general secretary, Mrs. Harrison S. Elliott. Publications: *The Woman's Press*; *The Bookshelf*. (M. S. Ss.)

Yugoslavia. A federal peoples' republic in southeastern Europe. Area: 95,558 sq.mi.; pop. (est. Jan. 1, 1940) 15,703,000. Capital: Belgrade. Chief cities (1931 census): Belgrade, 238,775; Zagreb, 185,581; Subotica, 100,058; Ljubljana, 59,767; Sarajevo, 78,173. Religion: 6,785,501 Greek Orthodox; 5,217,910 Roman Catholic; 1,561,166 Mohammedans; 231,169 Protestants; 68,405 Jews.

History.—With the election of Nov. 11, 1945, in which the voters could only vote for the unique list of candidates presented by Marshal Tito's Liberation Front government, the outward compromise character of the government ceased and it became openly a government modelled in every instance after the totalitarian example of the soviet union. Even the nationality problem was solved after the soviet model. Yugoslavia was divided into six "states," Bosnia-Herzegovina, Croatia, Macedonia, Montenegro, Serbia and Slovenia, each with its own administration but directed entirely and unified by the Communist party. The new constitution also imitated the soviet model by empowering the praesidium of the assembly, among other executive functions, to represent the new state inside and outside the country. President of the praesidium, supported by six vice-presidents, was Ivan Rybar. Premier of the government was Marshal Tito.

The U.S. government recognized Marshal Tito's government but acting Secretary of State Dean Acheson made public instructions sent to the U.S. ambassador in Belgrade declaring that in view of conditions existing in Yugoslavia, it could not be said that the guarantees of personal freedom and of liberty of speech, press and assembly, promised in the agreement between Marshal Tito and Dr. Ivan Subasitch and underlying the Yalta declaration, had been honoured. Under these circumstances the establishment of diplomatic relations with the present Yugoslav regime "should not be interpreted as implying approval of the policies of the regime, its methods of assuming control or its failure to implement the guarantees of personal freedom promised its people."

On March 24 the Yugoslav government officially announced that on March 13 Gen. Draja Mikhailovitch had been taken a prisoner and would face trial for treason. A request by the U.S. government to permit U.S. army personnel who were in Yugoslavia during the war to testify at the trial was rejected. The trial against Gen. Mikhailovitch and 23 other defendants was held in Belgrade in June. On July 15 Gen. Mikhailovitch was sentenced, with ten other defendants, to death. The other defendants were sentenced to various prison terms.

The execution of Gen. Mikhailovitch opened a new phase of even more bitter antagonism toward the United States and Britain in Yugoslav official policy. This antiwestern agitation against the "imperialism" and "reactionary" character of the democracies was also strengthened by Yugoslavia's expansionist demands upon Italian and Greek territory. The conflict with the United States was sharpened by Yugoslavia's shooting down of U.S. aircraft over Yugoslavia. The Yugoslavs accused the United States of "constant and systematic flights over Yugoslav territory" without permission. The U.S. acting Secretary

of State Dean Acheson declared that only bad weather had forced the U.S. planes to fly over Yugoslav territory, but instead of being helped, as they would be in virtually every other part of the world, "this outrageous performance" had taken place. The U.S. government demanded the release of the U.S. airmen shot down in Yugoslavia and permission for its representatives to investigate the disappearance of another plane with the loss of U.S. lives. The incidents led to much bitterness in the relations between the two countries though Yugoslavia fulfilled the U.S. demands connected with the two aeroplanes shot down and the sacrifice of U.S. lives involved.

The trial of the Catholic archbishop, Aloysius Stepinac, who was sentenced on Oct. 11 to 16 years' imprisonment and confiscation of his property, was regarded by many as part of the fight of the regime against the Catholic clergy which exercised strong influence over Croatian peasants. Archbishop Stepinac, who was the ranking Catholic prelate in Yugoslavia and whose see was in Croatia's capital, Zagreb, was accused of collaboration with the German puppet government of Croatia during World War II. A number of other Catholic priests and monks were sentenced with him. While the relations between the regime and the Catholic church were strained to the utmost, the government tried to win the Serbian Orthodox Church in a way similar to that followed by the soviet government with its own Orthodox Church. A large part of the Orthodox clergy under leadership of the deputy patriarch Bishop Josif was antagonistic to the government, but Patriarch Gavrilko, who returned to Belgrade in Nov. 1946 after an absence of five years, was assumed to be much more friendly toward Marshal Tito's regime.

Under the government of Marshal Tito, Yugoslavia and its capital, Belgrade, became a center of soviet-directed pan-Slavism, a movement revived by the soviet government in the critical hours of World War II. In Dec. 1945 the first postwar pan-Slav congress was held in Belgrade. Besides the European Slav nations, Slav representatives from the United States and Canada attended. Among other demands were a Slav Trieste and an outlet for Bulgaria on the Aegean sea. A second pan-Slav congress met in Dec. 1946 and as a result a permanent pan-Slav committee with its seat in Belgrade was established. For the first time demand for the loyal support of all people of Slav race who were citizens of non-Slavic states and of Slav emigrants to foreign lands for pan-Slav policy and the U.S.S.R. was officially raised. (See also TRIESTE.)

In Sept. 1946 the Yugoslav government suspended the U.S. information service in Belgrade. The information service had maintained a public reading room containing U.S. books and papers, distributed a daily bulletin with texts of official U.S. statements and representative editorial comments from the U.S. press, arranged lectures and established contacts between Yugoslav scholarly and artistic organizations and similar ones in the United States. On Dec. 13 it was announced that Yugoslavia granted permission to reopen the U.S. reading room in Belgrade under condition that it would give information only on the life and culture of the people of the United States and that it would distribute its bulletins only to the official personalities.

On Dec. 5 a law nationalizing all private economic enterprises, public works and industries in Yugoslavia was presented by the government, without any advance notice, to the parliament. This complex legislation was unanimously passed the very same day by both houses of the national assembly. The nationalization comprised all movable and immovable property in 42 branches of the national economy, including mining, metallurgy, all industries processing natural products, food

DANUBE RIVER GUNBOATS, part of a fleet impounded by the U.S. army on charges of smuggling, shown at Vilshofen, Germany. On Aug. 9, 1946, Yugoslavia appealed to the United Nations for the release of 167 craft which belonged to that country. Return of the vessels to the claimant countries began in late November

processing, beverages, building, transportation, and all land, sea and air communications. No new private enterprise in these categories could be founded in the future. Compensation to former owners would be in state bonds on the estimated value of the net assets on Dec. 9, 1946.

Yukon Territory. Yukon, the most northwesterly political division of Canada, created in 1898, is bounded by Alaska, British Columbia, the Northwest Territories and the Arctic ocean. Area, 207,076 sq.mi., of which 1,730 are fresh water; pop. (1941) 4,914 (1944 est.) 5,000. Seat of government: Dawson. Administered by a three-member territorial legislative council elected triennially, and a controller, the Yukon is represented federally by one member of parliament.

History.—Main items of interest in the Yukon in 1946 centred on the aftermath of World War II. White Horse city, which boasted 40,000 population at the height of war construction projects, dropped to 3,000 in 1946. The oil line (Canol) from Normal Wells, Northwest Territories, to White Horse was still owned by the U.S. government in 1946. So were the White Horse refineries.

Communications.—Communications within the territory are maintained by aeroplane, and, during the season of navigation, by steamship. From June till Oct., steamships ply regularly between White Horse and Dawson. A railway from White Horse to Skagway gives access to the Pacific. With the completion of the Canada-Alaska highway, the Yukon was brought into direct road communication with the rest of Canada. Approximately 570 mi. of the highway lie in the Yukon.

On April 1, 1946, the Alaska highway lying between the

Yukon-Alaska boundary and Edmonton was taken over by Canada. In Oct. the telephone line paralleling the highway between White Horse and Edmonton was bought by Canada for \$1,700,000. The 1,600-mi. highway—built between March and Oct. 1943 at a cost of \$125,000,000—was maintained by Canadian army engineers who had 18 camps along it.

A triweekly bus service ran over the highway for 927 mi. between Dawson Creek, B.C., and White Horse. Automobile refuelling and servicing stations and tourist facilities began to appear along the highway in 1946, but gasoline prices ranged from 42 to 86 cents per gal. About 700 travel permits were issued in July, peak month. (C. Cy.)

Natural Resources.—The gross value of production in 1944 was \$5,529,745 (value of Northwest Territories included). Of this total, furs represented \$467,188; lumber \$33,148; fish \$3,131. In 1944, the value of mineral production was \$939,319. In 1945, the available waterpower was 731,000 h.p. Turbine installation was 19,719 h.p. (See also CANADA.)

Zanzibar and Pemba: see BRITISH EAST AFRICA.

Zinc. There were still gaps in 1946 in the official data on zinc production in the important countries, but by adding estimates from various sources a fairly complete table was compiled.

Table I.—World Production of Zinc

	(Thousands of short tons)					
	1939	1940	1941	1942	1943	1944
Australia	79.8	85.1	87.0	83.2	84.8	88.2
Belgium	205.1	84.3	52.1	40.6	48.2	9.8
Canada	175.6	185.7	213.6	215.8	206.5	168.5
France	67.3	41.7	28.6	25.2	19.6	9.2
Germany	254.6	350.1	350.1	346.2	343.9	321.9
Great Britain	58.3	66.2	75.7	79.8	77.5	80.7
Italy	39.0	43.4	42.8	34.8	?	?
Japan	56.5	65.8	67.3	64.2	68.7	66.7
Mexico	39.0	36.8	42.6	57.0	60.0	54.3
Netherlands	22.6	5.6	4.1	5.7	5.0	2.3
Northern Rhodesia	14.2	14.8	15.2	14.4	15.0	16.2
Norway	50.6	19.0	7.1	8.5	16.9	13.0
Poland	120.0	132.0	132.0	?	?	?
Spain	14.8	13.6	21.1	21.1	21.2	19.9
U.S.S.R.	93.7	93.7	?	?	?	?
United States	507.2	675.3	822.0	891.9	942.3	869.3
Total	1,819	1,925	(2,100)	(2,200)	(2,200)	(2,000)

The figures in Table I include so many gaps and estimates that it is not possible to arrive at any world totals after 1940. The figures shown in parentheses are rough approximations based on the year-to-year changes in the figures reported and include the assumption that the over-all changes in other countries are in the same proportion. Since the countries reported cover about 85% of the total output, the variations from the true total should not be great.

While some countries showed increased outputs in 1945, these were more than offset by the decrease in the United States, leaving a downward trend.

United States.—The salient features of the zinc industry in the United States are indicated in Table II.

Table II.—Data of Zinc Industry in the U.S., 1939–45 .

	1939	1940	1941	1942	1943	1944	1945
	(Thousands of short tons)						
Mine production. . .	583.8	655.1	749.1	768.0	744.2	718.6	614.4
Smelter production. .	507.2	675.3	822.0	891.9	942.3	869.3	764.6
Domestic ores. . .	491.1	590.0	652.6	630.0	594.2	574.5	467.1
Foreign ores. . .	16.2	85.3	169.4	261.9	348.1	294.8	297.5
Imports.	67.0	196.8	323.8	404.8	593.2	486.3	478.8
In ore.	36.1	180.3	289.2	368.4	537.0	422.7	381.7
Metal.	30.9	16.5	34.6	36.4	56.2	63.6	97.1
Secondary recovery. .	189.6	222.0	284.0	330.5	368.5	345.5	366.4
Consumption. . . .	626.0	733.1	827.4	728.2	816.8	888.6	852.3
Stocks.	?	88.1	92.0	155.6	261.0	298.5	329.7
Producers.	86.3	20.0	25.1	84.4	170.6	233.7	256.2
Consumers.	?	68.1	66.9	71.2	90.4	64.8	73.5

Mine production declined by 15% in 1945 and smelter production by 12%. Metal produced from foreign ores increased, leaving all of the decline on the domestic side. Ore imports decreased, but metal imports increased, leaving total imports off only 2%. Consumption declined 4%. Mine production continued to decline in 1946, with some improvement after mid-year, bringing the October output back to the 1945 level. The 10-months' total was 470,219 tons, 8% less than the average rate for 1945. Imports continued the 1945 trend, with metal increasing and ore decreasing. Smelter production in the first three-quarters of 1946 was 568,802 tons, about the same as in 1945. Consumption declined after the first quarter of 1945, reaching a low of 41,415 tons in Feb. 1946, but recovered to 73,536 tons in August, and then dropped back to 69,827 tons in September. Consumption for the first three-quarters of 1946 was 563,394 tons.

Canada.—Zinc production in Canada decreased from 275,412 short tons in 1944 to 258,606 tons in 1945, and to 235,917 tons in 1946, 9% under 1945. Exports in ore declined and metal output increased slightly.

Mexico.—Mine production declined to 50,700 short tons in the first 4 months of 1946, nearly a third under the average rate for 1945.

(G. A. Ro.)

Zionism. The advent of 1946, the first year of peace, raised hopes that it would witness the end of the White Paper policy of 1939 which the British government had justified as a necessary prewar and wartime security measure, but which the Permanent Mandates commission of the League of Nations had adjudged to be a violation of the mandate over Palestine. Favourable expectations had been stirred at the London Zionist conference of Aug. 1945, by the accession to power of the Labour party whose platform repudiated the White Paper policy and advocated a Jewish state in Palestine. The urgency of Palestine for the Jews in the displaced persons camps in Europe had been pointed up by President Truman, on the basis of a report by Earl G. Harrison, whom he had sent to Europe in 1945 to investigate the conditions. On Aug. 31, 1945, the president in a letter to Prime Minister Clement Attlee urged that 100,000 certificates for immediate immigration into Palestine be made available to the Jews in the displaced persons (DP) camps.

Following the refusal of Prime Minister Attlee and Foreign Minister Ernest Bevin to comply with President Truman's rec-

ommendation of the 100,000 certificates, the Anglo-American Commission of Inquiry was appointed. It began its hearings in Washington, D.C., on Jan. 7, 1946, and published its unanimous report April 30. It recommended that "100,000 certificates be authorized immediately for the admission into Palestine of Jews who have been the victims of Nazi and Fascist persecution" and "that these certificates be awarded as far as possible in 1946, and that actual immigration be pushed forward as rapidly as conditions will permit." It also recommended that the restrictive land regulations of 1940 be "rescinded and replaced by regulations based on a policy of freedom in the sale, lease, or use of land, irrespective of race, community, or creed." Both of these recommendations called for revocation of the salient prohibitions in the British White Paper of 1939. For the longer-range political status of Palestine, it recommended that Palestine become neither a Jewish nor an Arab state. President Truman urged the adoption of the immediate recommendations, leaving the longer-range recommendations in abeyance. Prime Minister Attlee, however, insisted that the report be dealt with as a unit, that the United States furnish assistance for the implementation of the recommendations and that the Jewish forces of resistance disband and surrender their arms. The Arabs objected to both the immediate and the long-term recommendation. The report became the subject of prolonged discussion and contention.

In the meantime Jews from Poland, where pogroms were raging, were crowding the DP camps, while others from Hungary, Rumania and other lands where postwar anti-Semitism was making life intolerable, were moving to Mediterranean ports where, without certificates, they embarked surreptitiously for Palestine, exceeding by far the 1,500 monthly visas authorized by the British. The British took forceful measures to prevent them from settling in Palestine. At first the refugees were landed and detained in camps in Palestine until they were admissible under the quota. Beginning in August, however, ships carrying uncertified immigrants caught by British naval patrol were transferred to detention camps in Cyprus.

The Jewish community of Palestine, the Yishuv, and mass Jewish opinion the world over, demonstrated against the British attempt to bar Jews from the Jewish National home. Haganah, the main arm of the Jewish underground resistance movement in Palestine, supported by the Jewish community, countered British force against the Jewish immigrants. The Irgun Zvai Leumi and the Sternists, small underground groups without the support of the Jewish community as a whole, resorted to terrorist tactics such as the assassination of British officials and the blowing up of a wing of the King David hotel in Jerusalem housing British administration and military offices.

British military forces turned Palestine into a police state. Military searches were conducted, curfews were imposed, elementary civil rights were violated, some of the troops behaved with barbaric cruelty, Jewish property was destroyed and thousands of Jews were placed in detention camps. On June 29, a Sabbath, members of the Jewish agency for Palestine, recognized under the League of Nations mandate as liaison between the Jewish people and the mandatory, were arrested and placed in Latrun. They were released in September. Charges of the connection between Jewish agency members and the underground resistance were never proved.

Meanwhile, on June 11, a cabinet committee supplemented by a committee of technical experts had been appointed by President Truman to meet in London with a parallel British committee for the purpose of dealing with the implementation of the Anglo-American Inquiry commission's recommendations. On July 31, Herbert S. Morrison, lord president of the council, presented the main features of its report in the house of commons. Since Henry F. Grady headed the U.S. members of the

committee in London, the report became known as the Morrison-Grady report. It proposed cantonization of Palestine in four areas: an Arab province, a Jewish province, a district of Jerusalem and a district of the Negev. All would have limited regional autonomy within the framework of a central government of the mandatory, which would supervise immigration and control foreign affairs, trade and other functions. The Morrison-Grady report was not approved by President Truman. It was rejected by the Jewish agency executive. It was also rejected by the Arabs.

On July 25, the British foreign office announced plans for holding a conference on Palestine and European Jewry, to which Arabs and Jews would be invited and at which the Morrison-Grady report would be the basis of discussion. The Jewish agency executive, meeting in Paris in August, informed the British that its members would go to a conference only if the basis of discussion would be "a viable Jewish State in an adequate area of Palestine."

A conference did convene in London on Sept. 10, attended by representatives of the Arab league, but with no delegation of Jews or Palestinian Arabs. On Oct. 2, the conference recessed without any decision and was to re-open in mid-Jan. 1947.

The World Zionist organization held its 22nd congress in Basel, Switzerland, Dec. 9-24, at which the entire situation was reviewed. It reaffirmed the historic claims to the whole of Palestine and strongly condemned British policy in Palestine. It decided not to go to the London conference under the existing circumstances; and if the circumstances should change, a sub-committee of the general council of the World Zionist organization was to decide whether to go to the conference. The office of president, held for many years by Dr. Chaim Weizmann, was left vacant. A coalition executive representing the major parties was elected, with David Ben Gurion as its chairman and Dr. Abba Hillel Silver as head of the U.S. section. (I. GN.)

Zirconium. The production of zircon in the United States for the first time reached significant proportions in 1945. The small earlier output had been negligible as compared with requirements, which were supplied by imports, mainly from Australia and Brazil; shipments from India had been discontinued from 1943. Imports during late years were as shown in the table.

Imports of Zircon and Baddleyite, 1939-45

(In short tons)

	Australia	Zircon from India	Brazil	Total Zircon	Baddleyite from Brazil	Total Imports
1939	1,526	241	*	1,767	706	2,473
1940	7,387	3,609	*	10,996	1,591	12,587
1941	14,689	963	*	15,652	5,002	20,654
1942	11,145	196	...	11,341	15,283	26,624
1943	11,472	...	110	11,582	8,821	20,403
1944	11,317	...	101	11,418	2,231	13,649
1945	17,138	17,144	792	17,936

*included with baddleyite.

Several thousand tons of zircon were produced in 1945 by the concentration of beach sands in Florida. Shipments of domestic and imported material to consumers in 1945 reached a record high of 16,000 tons, one-fifth of which was used in the production of zirconium, ferrosilicon and other alloys, and the remainder in ceramics, mainly porcelains and refractories.

In the first half of 1946, imports declined sharply to 7,595 tons, and shipments of foreign and domestic zircon to consumers totalled 13,912 tons. Production had increased to approximately the same level as imports. (G. A. Ro.)

Zoology. During 1946 in the United States recovery from immediate effects of World War II continued in zoology, although zoologists and their colleagues in universities and colleges were faced with larger and more numerous classes as the numbers of returning veterans reached a new high. The

American Association of Zoologists met twice jointly with the American Association for the Advancement of Science—once in St. Louis, Mo., on March 28-30 (this was the postponed 1945 meeting), and again in Boston, Mass., Dec. 28-30. There were 189 and 197 papers scheduled at these meetings respectively, compared with 116 in 1944 and 333 in 1940. The \$1,000 prize awarded annually by the association for a distinguished contribution to science was divided between two groups of investigators: one-half went to Quentin M. Geiman and Ralph W. McKee of Harvard university, Cambridge, Mass., for their achievement in growing the human malarial organism outside the body for the first time; the other half went to Tracy M. Sonneborn, Winifred Jacobson and Ruth V. Dippell, Indiana University, Bloomington, Ind., for their studies of heredity in paramecium.

Research and Publication.—Despite the understandable failure of German journals to resume activity, the flow of publications continued at a rate some found alarming. The problems of binding, classifying and storing a mass which doubles every 15 years formed the basis for zoologist Garrett Hardin's fantasy on the end of civilization in *The Last Canute*. Only a few of the abundant publications will be considered here:

Anatomy and Behaviour.—Donald R. Griffin further investigated "echolocation" (location of solid object by reflected sound waves) in bats, finding that they utter supersonic cries the frequency of which drops from 70,000 to 40,000 vibrations per sec. during the time of .001 to .002 sec. they persist. That the relation of nerves to muscles in different vertebrates is no necessary guide to muscle homology was the conclusion of W. L. Straus who in his review said that "present evidence is against the concept of nerve-muscle specificity. Thus resemblances in muscular nerve supply must merely reflect general similarity in development." Carefully controlled studies of the effect of hormones on behaviour by Elizabeth A. Beeman demonstrated that male mice castrated while young fail to develop the aggressive behaviour characteristic of normal adults. In response to implantation of pellets containing male hormone (testosterone propionate), they became fully as aggressive as normal males. When hormone treatment ceased, most, but not all reverted to the docility of the typical castrate. A large amount of experimental and observational studies on behaviour in a wide variety of animals was brought together in book form by Mrs. Ruth Crosby Noble.

Embryology.—Edmund W. Sinnott cautioned against a "narrow materialism" in interpreting development and thought it unlikely that biochemical discoveries would fully account for "the precise spatial distribution of diverse substances which accompany the development of organic form and the differentiation of its parts in an organized pattern." Richard B. Goldschmidt suggested that the interpretation of evolution from the standpoint of gene frequencies alone overlooked the fact that "evolution is to a large extent also a problem of development." What are probably the most accurate maps of the movements leading to the formation of the primitive streak in the chick embryo were prepared by Nelson T. Spratt, Jr., who marked the cells of the blastoderm with carbon particles and traced their subsequent fate. Of cytological interest was the finding of R. R. Humphrey and G. Fankhauser that most of the eggs in ovaries of triploid salamanders (three sets of chromosomes rather than the normal two) degenerated. They further showed by transplantation of the triploid ovaries to normal salamanders that the degeneration was very likely intrinsic to the cells with the extra chromosome set, since the transplanted cells showed a similar degeneration. The idea that the mesonephros undergoes a timed degeneration was controverted by Meredith N. Runner who found mesonephric tubules of rat embryos to persist as grafts in

ANACONDA SNAKE, purchased by Chicago's Brookfield zoo in 1946, being measured at 13 ft. 9 in. The price was determined according to the length of the reptile

the eyes of adults for as long as six times their normal life. F. E. Lehmann produced an important book on the physiological embryology of sea urchins and amphibians—the two groups of animals which have yielded the most information in this field.

Natural History, Biography and Taxonomy.—N. A. Mackintosh drew on all the available evidence in his review of the breeding habits, reproduction, growth rate, migration and distribution of the whalebone whales. On the basis of indirect evidence, he estimates that these largest of all animals reach sexual maturity in two to three years. The complexities of vertebrate predator-prey relations were reviewed by Paul L. Errington. A. Raymond Hall published a complete account of the taxonomy and distribution of mammals in Nevada. Among autobiographies, that of Walter B. Cannon, a distinguished physiologist, should be mentioned not only for its interest to scientists in general, but also as an important and valuable account of the life and thoughts of a socially conscious and penetrating research scientist. Of more purely literary interest is Ivan T. Sanderson's beautifully illustrated anthology of scientific writings from "scientific observation" to "fantastically impossible" stories. (See also ENDOCRINOLOGY; ENTOMOLOGY; GENETICS; MARINE BIOLOGY; PALAEONTOLOGY; PHYSIOLOGY.)

BIBLIOGRAPHY.—Elizabeth A. Beeman, *Anatomical Record*, 96 (1946); W. B. Cannon, *The Way of an Investigator* (1945); P. L. Errington, *Quarterly Reviews of Biology*, 21 (1946); Richard B. Goldschmidt, *American Naturalist*, 80 (1946); Donald R. Griffin, *Anatomical Record*, 96 (1946); A. R. Hall, *Mammals of Nevada* (1946); Garrett Hardin, *Scientific Monthly* (1946); R. R. Humphrey and G. Fankhauser, *Journal of Morphology*, 79 (1946); Ruth C. Noble, *The Nature of Biological Reviews*, 21 (1946) and *The Nature of the Beast* (1945); Meredith N. Spratt, Jr., *Journal of Experimental Zoology*, 103 (1946); W. L. Straus, *Biological Reviews*, 21 (1946). (G. P. DuS.)

Zoological Parks.—*Australia.*—Managements of collections in Australia recorded in 1946 a serious depletion in the list of

foreign animals exhibited. An unique and co-operative effort was made to import African and Asiatic collections; all were to share in their allocation. There existed a useful affiliation of the zoos for determining policy of exporting native animals; concessions were not made to commercial dealers, the zoos having a monopoly in the transactions.

Europe.—The condition of zoos in middle Europe seemed not to have improved at all. Zoos in Great Britain, the Netherlands and Denmark made phenomenal progress in the physical reconstruction of their premises and structures, although no particular innovations seem to have been devised. Important collections of foreign animals were received, most of the world's supply having gone to them.

Africa.—The collections at Ghiza, Pretoria and Johannesburg, were carefully maintained and extensively improved. Pretoria secured a square-mouthed rhinoceros, the first exhibited in modern times. It was probably the most valuable mammal in captivity.

North and South America.—Although zoos of both continents had substantial financial resources in 1946, probably the greatest of all times, no costly or extensive physical improvements were undertaken. Nearly all had architectural plans in hand for modernizing and enlarging their parks. In the United States, New York city and San Diego, Calif., received the largest collections from abroad. At The Chicago Zoological park, Brookfield, Ill., a synoptic collection of invertebrate animals was presented for the first time. An experiment of showing large mammals in back of transparent organic glass was tried at this park. The material proved to be of sufficient strength to hold the large apes, and appeared to be of such worth that it was expected to be used extensively to replace bars and netting. In the United States there was a trend to diversify collections rather than enlarge them, and to present collections so as to illustrate theories and principles of zoology. (Ro. B.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example "Air Transport Command 47, 46, 45, 44" indicates that the entry "Air Transport Command" is to be found in the 1947 *Book of the Year*, the 1946 *Book of the Year*, the 1945 *Book of the Year* and the 1944 *Book of the Year*. The reference "Air Forces of the World: see Aviation, Military 47, 46, 45. See Air Forces of the World 44, 43" indicates that the entry "Air Forces of the World" is to be found in the article "Aviation Military" in the 1947 *Book of the Year*, the 1946 *Book of the Year* and the 1945 *Book of the Year*, and under the heading "Air Forces of the World" in the 1944 *Book of the Year* and the 1943 *Book of the Year*. All black type entries without dates indicate that the same entries appear in all previous issues. Examples, not Advertising 47, 46, 45, 44, 43, but Advertising; not Abyssinia: see Ethiopia 47, 46, 45, 44, 43, but Abyssinia: see Ethiopia.

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
